PANTOLOGIA.

A

NEW CYCLOPÆDIA,

COMPREHENDING
A COMPLETE SERIES OF
Essays, Treatises, and Systems,
ALPHABETICALLY ARRANGED;
WITH A GENERAL DICTIONARY OF
ARTS, SCIENCES, AND WORDS:
THE WHOLE
PRESENTING A DISTINCT SURVEY OF
Human Genius, Learning, and Industry.
ILLUSTRATED WITH
ELEGANT ENGRAVINGS;
THOSE ON NATURAL HISTORY BEING FROM ORIGINAL DRAWINGS BY EDWARDS AND OTHERS, AND BEAUTIFULLY COLOURED AFTER NATURE.

BY JOHN MASON GOOD, ESQ. F.R.S.
MEMBER OF THE AMERICAN PHILOSOPHICAL SOCIETY, AND OF THE LINNEAN SOCIETY OF PHILADELPHIA;
OLINTHUS GREGORY, LL.D.
OF THE ROYAL MILITARY ACADEMY, WOOLWICH, AND HONORARY MEMBER OF THE LITERARY AND PHILOSOPHICAL SOCIETY, NEWCASTLE-UPON-TYNE; AND
MR. NEWTON BOSWORTH,
OF CAMBRIDGE;
ASSISTED BY OTHER GENTLEMEN OF EMINENCE, IN DIFFERENT DEPARTMENTS OF LITERATURE.

VOL. IV.
D — FLU.

LONDON:
PRINTED FOR G. KEARSLEY; J. WALKER; J. STOCKDALE; R. LEA; E. JEFFERY; CROSBY AND CO.; SHERWOOD, NEELY, AND JONES; SUTTABY, EVANCE, AND CO.; J. BLACKLOCK; W. LOWE; J. BOOTH; J. RODWELL; BELL AND BRADFUTE, EDINBURGH; BRASH AND REID, GLASGOW; AND M. KEENE, DUBLIN.

1813.

PANTOLOGIA.

D.

D, The fourth letter of the alphabet, and the third consonant, having a kind of middle sound between *t*, and *th*; its sound is formed by a stronger impulse of the tongue to the upper part of the mouth, than is necessary in the pronunciation of the *t*. Grammarians generally reckon D among the lingual letters, as supposing the tongue to have the principal share in the pronunciation thereof; though the Abbot de Dangeau makes it a palate letter. The letter D is the fourth in the Hebrew, Chaldee, Samaritan, Syriac, Greek, and Latin alphabets; in the first five of which languages it has the same name, though somewhat differently spoken, *e. g.* in Hebrew, Samaritan, and Chaldee *Daleth*, in Syriac *Doleth*, and in Greek *Delta*.

The form of our D is the same with that of the Latins, as appears from all the ancient medals and inscriptions; and the Latin D is no other than the Greek Δ, rounded a little, by making it quicker and at two strokes.

Some learned Greek scholars pronounce the *tau* as a *delta* after the ν, and pronounce πάντα, as if it were written πάνδα; which may be an acceptable softening in the pronunciation, though it is not a fault to say otherwise. In the Latin tongue the D and the T have a great affinity, and are often changed one for another, as *at* for *ad*. And Quintilian laughs at those who scruple to write indifferently, one for the other, *set* for *sed*, *haut* for *haud*, and others, to be seen in ancient inscriptions.

D is also a numeral letter, signifying five hundred; which arises hence, that, in the Gothic characters, the D is half the M, which signifies a thousand. Hence the verse, "*Litera D velut A quingentos significabit.*" A dash added a-top $\overline{\text{D}}$, denotes it to stand for five thousand.

Used as an abbreviation, it has various significations: thus D stands for Doctor; as, M. D. for Doctor of Medicine; D. T. Doctor of Theology; D. D. implies Doctor of Divinity, or "dono dedit;" D. D. D. is used for "dat, dicat, dedicat;" and D. D. D. D. for "dignum Deo donum dedit."

D, in music, is the nominal of that note to which Guido applied the monosyllable *re*. D. C. is often set for Da Capo.

DA, DEL, or DI, in music, signifies *for* or *by*: as *da camera*, for the chamber.

To DAB. *v. a.* (*dauber*, French.) To strike gently with something soft or moist (*Shakspeare*.

DAB. *s.* (from the verb.) 1. A small lump of any thing. 2. A blow with something moist or soft. 3. Something moist or slimy thrown upon one. 4. (In low language.) An artist. 5. In ichthyology. See PLEURONECTES.

DAB-CHICK, a small waterfowl.

DABAL, or DABUL, a town on the coast of Malabar, in the East Indies. Its trade consists of pepper and salt. It belongs to the Portuguese. Lat. 17. 32 N. Lon. 72. 50 E.

To DA'BBLE. *v. a.* (*dabbelen*, Dutch.) To smear; to daub; to wet (*Swift*).

To DA'BBLE. *v. n.* 1. To play in water; to move in water or mud (*Swift*). 2. To do any thing in a slight, superficial, or shallow manner; to tamper (*Pope*).

DA'BBLER. *s.* (from *dabble.*) 1. One that plays in water. 2. One that meddles without mastery; a superficial meddler (*Swift*).

DACCA, a town of Asia, in the kingdom of Bengal, in the East Indies. Lat. 23. 50 N. Lon. 85. 30 E.

DACE, in ichthyology. See CYPRINUS.

DACE FISHING. Dace, dare and roach,

are much the same kind of fishes, in manner of feeding, cunning, size and taste.

The haunts of dace are gravelly, sandy, and clayey bottoms; deep holes that are shaded; water-lily leaves, and the foam caused by an eddy: in hot weather they are to be found on the shallow, and are then best taken with an artificial fly, grasshoppers, or gentles.

Dace spawn about the latter end of March, and are in season about three weeks after; they are not very good till about Michaelmas, and are best in February.

Baits for dace are the oak-worm, red-worm, brandling, gilt-tail, and indeed any worm bred on trees or bushes, that is not too large for his mouth: almost all kinds of flies and caterpillars.

Though dace are as often caught with a float as roach, yet they are not so properly float fishes; for they are to be taken with an artificial gnat, or ant-fly, or indeed almost any other small fly in its season: but in the Thames, above Richmond, the largest are caught with a natural green dun grasshopper, and sometimes with gentles; with both which you are to fish, as with an artificial fly; they are not to be come at till about September, when the weeds begin to rot; but when you have found where they lie, which in a warm day is generally on the shallow, it is incredible what havock you may make; pinch off the first joint of the grasshopper's legs, put the point of the hook in at the head, and bring it out at the tail. And in this way likewise you catch chub, especially if you throw under the boughs.

Fish for roach within six, and for dace within three inches near the bottom.

They will bite at any fly, but especially at the stone caddis, or day fly, the latter end of April, and most part of May: it is an excellent bait, floating at top of the water, and of which you may gather great quantities from the reeds and sedge by the water side: or from hawthorn bushes that grow near the bank of a shallow gravel stream, upon which they greatly delight to hang. They will also bite at ant-flies, of which the blackest are the best, found in mole-hills, June, July, August, and September; which you may preserve for your use, by putting them alive into a glass bottle, having first put into it some of the moist earth whence you gathered them, with some of the roots of the grass of the same hillocks, laying a clod of earth over the bottle: but if you would preserve them above a month, put them into a large runnet, which has been first washed with water and honey on the inside, and then you may retain them three months: yet the best time to make use of them is when they swarm, which is generally about the latter end of July, and the beginning of August.

This sort of fish, in a warm day, rarely refuses a fly at the top of the water; but when you fish under water for him, it is best to be within a handful, or sometimes more, of the ground.

If you would find dace or dare in winter, then, about All-hallow-tide, wherever you see heaths, or sandy grounds ploughing up, follow the plough, and you will find beetle grubs in the form of a white worm, with a red head, as big as the top of a man's little finger and very soft; gather these, and put them into a vessel, with some of the earth whence they were taken, and you may keep them all the winter for an excellent bait.

DACI, in antiquity, the people of Dacia.

DACIA, the ancient name of two countries of Europe: the one on this side of the Danube, called Dacia Aureliana; the other called Dacia Trajani, on the other side of that river. According to M. D'Anville, Dacia was about thirteen hundred miles in circuit.

DACIER (Andrew), a learned Frenchman; born of protestant parents at Castres in Upper Languedoc, in 1651, and educated chiefly at Saumur under Tanaquil Faber, or Le Fevre, whose learned daughter he afterwards married. He published at Paris, in 1681, an edition of Pompeius Festus, for the use of the dauphin. His Horace, with a French version, came out the same year. In 1683 he married, and we do not find that he published any thing till 1691, when his translation of the Reflections of Marcus Antoninus appeared. The next year he published his translation of Aristotle's Poetics. From this time to his death he continued publishing some work or other every year. For his services to literature he was appointed perpetual secretary to the academy, rewarded with a pension of 2000 livres, and made keeper of the books in the king's closet. He died in 1722. Dacier and his wife renounced the protestant religion in 1685. Besides the works abovementioned he translated the works of Plato into French; the Lives of Plutarch; the Manual of Epictetus, &c. (*Watkins*).

DACIER (Anne), the wife of the preceding, and daughter of Le Fevre, professor of Greek at Saumur, where she was born in 1651. Her father discovering her turn for learning, indulged her wish, and gave her a most liberal education. In 1674 she published an edition of Callimachus, which gave so much satisfaction that she was employed to prepare editions of Latin authors for the use of the dauphin; accordingly she published Florus the same year. This book she sent to Christina queen of Sweden, who made her great offers if she would renounce the protestant religion, and reside at her court; but this she refused. In 1681 she published a translation of Anacreon and Sappho, which was followed by versions of some of Plautus's comedies, and of the Plutus and Clouds of Aristophanes. In 1683 she married M. Dacier, who joined with her in renouncing the protestant religion about two years afterwards. In 1688 she translated into French the comedies of Terence, with notes. In 1711 came out her translation of the Iliad; and in 1714 she defended Homer against M. de la Motte, in a book entitled, The Causes of the Corruption of Taste; this was followed in 1716 by another against father Hardouin. The same year came out her version of the Odyssey, which closed her literary labours. She died in 1720. She had two daughters and a son. One of the daughters became a nun, the other died at the age of 18, and the son when he was a child. Madame Dacier was as remarkable for her modesty as for her erudition. A learned German having paid her a visit, begged that she would write her name and a sentence in his book. She excused herself as long as she could, but being strongly importuned she complied, and added to her signature a verse from Sophocles, importing that silence is the ornament of the female sex. (*Watkins*).

DACRYON. See TEARS.

DACTYL. (δακτυλος, *dactylus*.) In ancient poetry, a metrical foot, consisting of one long and two short syllables, as αλκιμος, and cāndĭdŭs. The dactyle and spondee are the only feet or measure used in hexameter verses, the former being esteemed more sprightly, and the latter more solemn and grave. Accordingly, where great activity is signified, we find the dactyls used with much propriety, as in the following verses of Virgil:

Quadrupedante putrem sonitu quatit ungula
campum;

and,

Ferte cito ferrum, date tela, scandite muros.

DACTYLI, in antiquity, a name given to the first priests of Cybele. The word is derived from δακτυλος, *finger*; because their number was then equal to that of the fingers, i. e. ten. These dactyli are generally said, by ancient authors, to be the first who wrought in iron. But respecting them, or the dactyli idæi, as they were often called, the accounts of the ancients differ very widely.

DACTYLIOMANCY, a sort of divination performed by means of a ring. The ring was suspended by a fine thread over a round table, on the edge of which were marked the letters of the alphabet: such of these letters as the ring passed over in vibrating were joined together, and composed the required answer.

DACTYLIS. Cocho-foot-grass. In botany, a genus of the class triandria, order digynia. Calyx two-valved, compressed; one of the valves larger and carinate. Fourteen species; scattered over the globe; of which d. stricta and d. glomerata are common to our own country; the former to our sea-marshes, the latter to our meadows. This last, though eaten with relish by horses, sheep, and goats, is refused by cows.

DACTYLONOMY. (from δακτυλος, finger, and νομος, law.) The art of numbering, or accounting, by the fingers. There is every reason to conclude that dactylonomy was the original mode of computation.

DACTYLUS. (*dactylus*, δακτυλος, a finger: so called from the likeness of its fruit to a finger.) Rough and adstringent; but when perfectly matured, they are much of the nature of the fig. (See CARICA). Senegal dates are most esteemed, they having a more sugary, agreeable flavour, than those of Ægypt and other places.

DAD. DA'DDY. *s.* The child's way of expressing father (*Shakspeare*).

To DADE. *v. a.* To hold up by a leading string (*Drayton*).

DADO, in architecture, the cubical part in the middle of a pedestal between its base and corniche.

DADUCHI. (δαδȣχοι, q. d. torch-bearers, priests of Ceres.) Their manner is, at the feasts of this goddess, to run about the temple, with lighted torches, in imitation of Ceres, who, as they relate, sought thus for Proserpine: from this custom arose the name. Among the Athenians, the high-priest of Hercules was also called daduchus.

DÆDAL LEAF, in botany, a leaf at the same time flexuose and lacerated; or winding and torn.

DÆDALA, a mountain and city of Lycia, where Dædalus was buried, according to Pliny. Also two festivals in Bœotia, so called; one of them observed at Alalcomenos by the Platæans in a large grove, where they exposed in the open air pieces of boiled flesh, and carefully observed whither the crows that came to prey upon them directed their flight. All the trees upon which any of these birds alighted were immediately cut down, and with them statues were made, called Dædala, in honour of Dædalus. The other festival was of a more solemn kind. It was celebrated every sixty years by all the cities of Bœotia, as a compensation for the intermission of the smaller festivals, for that number of years, during the exile of the Platæans.

DÆDALUS, in fabulous history, an Athenian, son of Eupalamus, descended from Erechtheus, king of Athens, was the most ingenious artist of his age, and to him we are indebted for the invention of the wedge, and many other mechanical instruments, and the sails of ships. From envy, he threw his nephew Dalus down from a window and killed him, on account of his ingenuity in the arts. After the murder, Dædalus, with his son Icarus, fled from Athens to Crete, where Minos gave him a cordial reception. Dædalus made a famous labyrinth for Minos, and assisted Pasiphæ, the queen, to gratify her unnatural passion for a bull. For this action, Dædalus incurred the displeasure of Minos, who ordered him to be confined in the labyrinth which he had constructed. Here he made himself wings with feathers and wax, and carefully fitted them to his body, and that of his son, who was the companion of his confinement. They took their flight from Crete; and the heat of the sun melted the wax on the wings of Icarus, who flew too high, and he fell into that part of the ocean, which from him has been called the Icarian sea. The father alighted at Cumæ in Italy, where he built a temple to Apollo, and thence directed his course to Sicily, where he was kindly received by Cocalus, who reigned over part of the country. Many monuments of his ingenuity in Sicily still existed in the age of Diodorus Siculus. He was dispatched by Cocalus, who was afraid of Minos, who had declared war against him, because he had given an asylum to Dædalus. The flight of Dædalus from Crete, with wings, is explained by observing that he was the inventor of sails, which in his age might pass at a distance for wings. (*Paus. Diod. Ovid*, &c.)—There were two statuaries of the same name, one of Sicyon, son of Patroclus, the other a native of Bythinia.

DÆMON, δαιμων, a name given by the ancients to certain spirits or genii, which they say appeared to men, either to do them service or to hurt them. According to the philosophers, dæmons held a middle rank between the celestial gods and men on earth, and carried on all intercourse between them; conveying the addresses of men to the gods, and the divine benefits to men. Dæmon is often used generally as equivalent to a deity, and is accordingly applied to fate or fortune, or whatever else was regarded as a god.

The word dæmon is used indifferently in a good and a bad sense. In the former it was very common among the ancient heathens. But it has been generally thought, that by dæmons we are to understand devils, in the Septuagint version of the Old Testament. Others think the word is in that version certainly applied to the ghosts of such dead men as the heathens deified, in Deut. xxxii. 17. Ps. cvi. 37. That dæmon often bears the same meaning in the New Testament, is shewn by Mr. Joseph Mede, Works, p. 623, &c.

Different orders of dæmons had different stations and employments assigned them by the ancients. Good dæmons were considered as the authors of good to mankind; evil dæmons brought innumerable evils both upon men and beasts. Amongst evil dæmons there was a great distinction with respect to the offices assigned them; some compelled men to wickedness, others stimulated them to madness. See Dæmoniac.

DÆMONIAC. (from *dæmon.*) A human being whose volition and other mental faculties are overpowered and restrained, and his body possessed and actuated by some created spiritual being of superior power. Such seems to be the determinate sense of the word; but it is disputed whether any of mankind ever were in this unfortunate condition.

It has been urged, that the doctrine of dæmoniacal possessions is manifestly repugnant to the perfections of God, and to that fixed order of causes and effects which we discover in nature particularly with regard to the human system: but it does not appear to us that this kind of argument rests upon the firmest foundation. It is from the nature of the effect that we come to know the nature of the cause in any case. In the case, then, of dæmoniacs, the fact being admitted that their reason was disordered in a very extraordinary manner, we have to enquire whether the cause be mechanical or spiritual. Now from a due consideration of the nature of such motions and effects as are called mechanical, it very clearly follows, that the cause, in the instances adduced, cannot be material. Either, then, we must admit that the cause is a separate spirit, or we must formally ascribe the effect of disordering our reason to the Supreme Being. Would it be commendable to ascribe, upon slight grounds, such hurtful effects to a beneficent and good cause; and particularly to the great First Cause? Let it be remembered, that by denying, in such instances, secondary and imperfect causes, we load the most perfect of beings with all that is mean and unworthy.

After all, however, we think that the most satisfactory way of deciding the point is, by appealing to the Holy Scriptures. Mede, Bekker, and some other ingenious men, have maintained that the supposed dæmoniacs were only lunatics or epileptics. But let the story of the dæmoniac which is recorded by Luke, ch. iv. be duly considered, and there will appear sufficient reason for adhering to the received interpretation. Is it at all probable that Jesus should personify a lunacy or an epilepsy, and say, "Hold thy peace and come out of him?" Is it credible that an evangelist should have been left to ascribe this man's disorder to the spirit of an unclean dæmon, if it were only lunacy or the falling sickness; or that a physician of common sense (as Luke certainly was, to say the least) should speak of it as a memorable circumstance that such a distemper did not hurt a man by leaving him? Surely then this story, without seeking for other evidence, must be a convincing proof of the reality of dæmoniacal possession.

DÆMONOMA'NIA. (*dæmonomania*, δαιμωνομανια, from δαιμων, a dæmon, and μανια, madness.) That species of melancholy, where the patient supposes himself to be possessed of devils.

DAFFODIL. In botany. See Narcissus.

Daffodil (Lily). See Amarillis and Pancratium.

Daffodil (Sea). See Pancratium.

To DAFT. *v. a.* (from *do aft.*) To toss aside; to throw away slightly: not used (*Shakspeare*).

DAG. *s.* (*dague*, French.) Not used. 1. A dagger. 2. A hand-gun; a pistol.

To Dag. *v. a.* (from *daggle.*) To daggle; to bemire: a low word.

DAGENHAM, a village near Rumford, in Essex, nine miles from London, remarkable for a breach made by the river Thames, which laid near 50,000 acres of land under water; but after ten years inundation, and several unsuccessful attempts, it was at last effectually drained by captain Perry, whom the czar Peter of Muscovy had employed in his works at Veronitz, on the river Don. In 1765, a second breach was made, which laid 5,000 acres under water; but after the works were several times blown up, it was at last stopped, and the banks secured. See Perry's Account of the Stopping of Dagenham Breach, 8vo. 1721.

DA'GGER. *s.* (*dague*, French.) 1. A short sword; a poniard (*Addison*). 2. A blunt blade of iron with a basket hilt, used for defence. 3. The obelisk: as (†).

DA'GGERSDRAWING. *s.* (*dagger* and *draw.*) The act of drawing daggers; approach to open violence (*Hudibras*).

DAGGER-POINTED, DAGGERED, or MUCRONATE, in natural history, ending in a point like that of a dagger. Applied to the leaf of bromelia ananas, and to the calyx.

To DA'GGLE. *v. a.* (from *dag*, dew.) To dip negligently in mire or water.

To DA'GGLE. *v. n.* To be in the mire (*Pope*).

DA'GGLETAIL. *a.* (*daggle* and *tail.*) Bemired; bespattered (*Swift*).

DAGHESTAN, a province of Asiatic Turkey, having the Caspian sea on the E. the mountains of Caucassus on the W. Circassia on the N. and Shirvan on the S. The inhabitants are Tartars.

DAGHO, an island of the Baltic sea, belonging to Russia, nine miles long, and six broad. Lat. 58. 44 N. Lon. 22. 56 E.

DAGHO, an episcopal town of Albania, in European Turkey. Lat. 42. 30 N. Lon. 19. 39 E.

DAGON, an idol of the Philistines, mentioned in the Book of Kings. Some authors say, that its uppermost part was like the body of a man, and its undermost like a fish: the Hebrew word dag signifies a fish; yet it must be granted that Dagon may come from Dagan, i. e. wheat: and Philo in Eusebius has rendered the word Dagon by that of Σιτω, *frumentum* or *frumenti præses*.

The Philistines held Dagon in great veneration, and erected magnificent temples in his honour. His temple at Gaza must have been very large, since Sampson, having pulled down the pillars that supported it, buried more than 3000 men in its ruins.

DAGY'SA, in zoology, a genus of the class vermes, order mollusca. Body loose, nayant, angular, tubular, and open at each extremity. One species only: found in the Spanish seas: three inches long and one thick. The difference between this and the genus SULPA, which see, is so trifling, that it is scarcely worth while to continue the distinction. Yet it does not become us, at least in the present work, to introduce any innovation, but only to give the result of general science, and investigation, so far as they have successfully proceeded. The worms of this genus have a peculiar power of adhering to each other by their sides.

DAHALAE, in geography, an island in the Red sea, near the coast of Abyssinia. Its whole length from N.W. to S.E. is thirty-seven miles, and its greatest breadth eighteen.

DAHL, the finest river of Sweden, which flows through Dalecarlia and on the S. confines of Gestricia, and falls into the gulf of Bothnia, to the E. of Gesle. Near Escarleby, it forms a celebrated cataract, scarce inferior to the fall of the Rhine at Lauffen.

DAHLIA, in botany. This genus was established by the late Cavanilles, in honour of Dr. Andrew Dahl, a Swedish botanist, and the friend of baron Alstrœmer. It belongs to the class syngenesia, order polygamia frustranea, at least in this cold climate. The stems die every winter, but the root is perennial and tuberous, not very dissimilar to that of the artichoke. Four species have been described.

1. D. pinnata, pinnated as it is called, and figured by Cavanilles in his Icones, Plate v. 1. tab. 80. It is also figured under this name in the fourth volume of Andrews's Botanical Repository. In the Annales du Mus. National Hist. Nat. v. 3. M. Thouin calls this species purpurea, but its colour varies from the common pinnata, being very deep; and Mr. R. A. Salisbury suspects that this purpurea of Thouin is the true rosea of Cavanilles. A paler coloured variety of the pinnata, the seeds of which were sent to Holland-house with the name of rosea by Cavanilles, has been lately figured by Mr. Hooker in the Paradisus Londinensis, and described by the above-mentioned botanist, under the name of sambucifolia: that it is not the true rosea of Cavanilles, is unquestionable; for the leaves were simply pinnate, not bipinnate.

2. D. rosea. Rose-coloured. It is so called and figured by Cavanilles in his Icones; but the plant called rosea by M. Thouin in the Annales, is most probably the very variety of the first species figured by the name of sambucifolia in the Paradisus Londinensis.

3. D. coccinea. Scarlet. This is figured in Curtis's publication; but we entertain a doubt if it is the same with Cavanilles's plant, if the colour is well copied. The plant, we understand, is dead.

4. D. crocata. Saffron-coloured. This plant is not mentioned in any work previous to the Paradisus Londinensis, where it is figured and described by the name of bidentifolia. Though the parcels of seeds which came from Cavanilles himself had the title of crocata, the flowers turned out yellow.

It is not intended here to describe minutely these plants; it is sufficient to say, that they elevate themselves majestically like the holyhock, and bear both axillary and terminal showy flowers late in the autumn.

DAHOMEY, or DAUMA, a country of Africa, on the slave coast, situated about sixty or seventy miles from the Atlantic; called also Fouin. Dahomey, as known at present, is supposed to reach from the sea-coast about 150 or 200 miles inland, though no European has penetrated above half that distance. The capital, Abomey, lies in about nine degrees and fifty minutes of north latitude, and between the third and fourth degree of east longitude, reckoned from the meridian of Greenwich. The soil is a deep, rich clay, of a reddish colour, with a little sand on the surface, except about Calmina, where it is more light and gravelly: but there is not to be found a stone so big as an egg in the whole country, so far as it has been visited by the Europeans; of farinaceous vegetables the country yields a plentiful supply, proportionable to the quantity of culture;

namely maize, millet, or Guinea-corn of different sorts; a kind of peas, or rather kidney-beans, called callavances; and also a species of beans, called ground-beans. The Dahomans, likewise, cultivate yams, potatoes of two sorts, the cassada, or manioka, the plantain, and the banana. Pine-apples, melons, oranges, limes, guavas, and other tropical fruits, also abound in this fertile country. Nor is it destitute of productions adapted for commerce and manufacture; such as indigo, cotton, the sugar-cane, tobacco, palm oil, together with a variety of spices, particularly a species of pepper, very similar in flavour, and indeed scarcely distinguishable from the black pepper of the East Indies. A very curious fruit is produced in Dahomey, as well as in some other parts of Africa, which resembles a small olive in every respect but the colour; being of a dusky reddish hue, changing at the end next the stalk to a faint yellow; the pulp is firm, and almost insipid; the stone is hard like that of the olive. After having chewed one or more of such berries, and spit out or swallowed the pulp at pleasure, a glass of vinegar will taste, to the person trying the experiment, like sweet wine; a lime will seem to have the flavour of a very ripe China orange; and the same change is produced in other acids, without effervescence, or any sensible motion. The Dahomans, like the other inhabitants of tropical climates, plant twice a year, viz. at the vernal and autumnal equinoxes; after which the periodical rains prevail. The language is that which the Portuguese call Lingua Geral, or General Tongue, and is spoken not only in Dahomey Proper, but in Whydah, and the other dependent states; and likewise in Mahee, and several neighbouring places. With respect to the Dahoman religion, it consists of a jumble of superstitious ceremonies, of which it is impossible to convey any satisfactory idea. The government is perhaps the most perfect despotism on earth. See farther Archibald Dalzel's History of Dahomey, 4to.

DAHOON HOLLY. In botany. See Ilex.

DA'ILY. *a.* (ꝺæᵹlıc, Saxon.) Happening every day; quotidian (*Prior*).

Da'ily. *ad.* Every day; very often (*Spenser*).

DA'INTILY. *ad.* (from *dainty*.) 1. Elegantly; delicately (*Bacon*). 2. Deliciously; pleasantly (*Howel*).

DA'INTINESS. *s.* (from *dainty*.) 1. Delicacy; softness (*Ben Jonson*). 2. Elegance; nicety (*Wotton*). 3. Delicacy; deliciousness (*Hakewill*). 4. Squeamishness; fastidiousness (*Wotton*). 5. Ceremoniousness; scrupulosity.

DA'INTY. *a.* (*dain*, old French, delicate.) 1. Pleasing to the palate; delicious (*Bacon*). 2. Delicate; nice; squeamish (*Davies*). 3. Scrupulous; ceremonious (*Shakspeare*). 4. Elegant; effeminately beautiful (*Milton*). 5. Nice; affectedly fine (*Prior*).

Da'inty. *s.* 1. Something nice; a delicacy (*Pope*). 2. A word of fondness formerly in use (*Shakspeare*).

DA'IRY. *s.* (from *dey*, an old word for milk.) 1. The occupation or art of making various kinds of food from milk (*Temple*). 2. The place where milk is manufactured. 3. Pasturage; milk farm (*Bacon*).

Dairy-house, or Dairy, in rural economy, a place appropriated to the management of milk, butter, cheese, &c. See Milk, Butter, Cheese, Churn, and Cows.

A dairy ought to be so situated, that the windows, or lattices, may never front the south, south-east, or south-west; and it should at all times be kept in the neatest order. Lattices are also far preferable to glazed lights, as they admit a free circulation of the air. It has, however, been objected, that the former afford access to the cold air of winter, and to the sun in summer; but either may be easily remedied, by making the frame somewhat larger than the lattice, and constructing it so as to slide backward and forward at pleasure. Across this frame, packthread may be stretched, and oiled paper pasted on it, which will thus admit the light, and effectually keep out the sun and wind.

During the summer, dairy-houses cannot be kept too cool: they ought therefore to be erected, if possible, near a cold spring, or running water; and, where it is practicable to conduct a small stream through the premises, it will much contribute to the convenience and utility of the place. Dr. Anderson observes, in his Practical Essay on the Management of the Dairy (published in the third and fourth volumes of his Recreations in Agriculture, &c.) that, if the water can be introduced by means of a pipe, so as to fall from some height on the floor, it will be productive of many advantages, particularly by preserving a continual freshness, and purity of the air. Dairy-houses should therefore be neatly paved, either with red brick, or smooth hard stone, and laid with a proper descent, so that no water may stagnate. This pavement should be well washed every day during the summer; and all the utensils, here employed, be kept with unremitting attention to cleanliness. Nor should the churns be at any time scalded in the dairy; as the steam arising from hot water, tends greatly to injure the milk. For similar reasons, neither the cheese and rennet, nor the cheese-press, must be suffered to taint the atmosphere; as the whey and curd will diffuse their acidity over the whole building.

All the utensils of the dairy should be made of wood, in preference either to lead, copper, or cast-iron; for these metals are easily soluble in acids; the solutions of the two first are in a high degree poisonous; and though the latter is in itself harmless, the taste of it renders the productions of the dairy very disagreeable. The cream-dishes, when perfectly clean and cool, ought to be filled with the milk, as soon as it is drawn from the cow, and has been carefully strained through a cloth, or cloth-sieve made of hair or silver-wire; the latter of which, as Dr. Anderson justly remarks, is more wholesome than those of other metals. These dishes should never exceed three inches in depth, but may be so wide as to contain a gallon, or a gallon and a half of milk. When filled, they ought to be placed on shelves, to remain there till the cream be completely separated. Now it is to be taken off with nicety, by a skimming-dish (without lifting or removing the milk, or shedding any of it on the floor, which would soon corrupt the air of the room), and then deposited in a separate vessel, till a proper quantity be collected for churning. A firm, neat wooden barrel, which is open at one end, and has a lid closely fitted to it, appears to be well calculated for this purpose; a cock or spigot ought also to be fixed near the bottom, to draw off the thin or serous part, that may drain from the cream; and the inner side of the opening should be covered with a piece of fine silver wire-gauze, in order to prevent the latter from escaping, while the former is allowed to pass.

But, if notwithstanding the fatal consequences arising from the use of metallic utensils, or of earthen vessels glazed with lead, farmers still persist in employing them, it ought to be a constant and indispensable rule, to scald and scour them properly with salt and water every day, and to dry them thoroughly, before the milk is deposited in them. Lastly, it is sincerely to be wished, that all the utensils employed in the dairy, of whatever materials they may consist, should be cleaned with similar care, previously to their being used; and, as long as the least acid smell is perceptible, they ought to undergo repeated scourings, till they are completely sweetened.

DA'IRYMAID. *s.* (*dairy* and *maid.*) The woman servant whose business is to manage the milk (*Dryden*).

DAIS, in botany, a genus of the class decandria, order monogynia. Involucre four-leaved; corol four or five-cleft; berry one-seeded. Three species, natives of the Cape or Tongataba island.

DA'ISY. *s.* (ꝺæᵹeꞅeaᵹe, Saxon, day's eye.) A spring flower. See BELLIS.

DA'ISY (Blue). See GLOBULARIA.

DA'ISY (Ox-eye). See CHRYSANTHEMUM.

DA'ISY (Michaelmas). See ASTER.

DAISY-CUTTER, in veterinary language, a term for a horse that goes so near the ground as frequently to touch it with the tip of his toes, and to be in continual danger of falling. Most broken-kneed horses are of this kind.

DALACA, an island of the Red sea, opposite the coast of Abex, seventy-two miles long, and fifteen broad. The inhabitants are negroes.

DALBERGIA, in botany, a genus of the class diadelphia, order decandria Calyx obsoletely five-toothed; legume foliaceous, flat, not opening; seeds one or two. Seven species; all East India plants, shrubs, or trees. Of these, d. monitaria of Surinam, with very minute, white, spiked flowers, yields from its wood a resin resembling dragon's-blood.

DALE. *s.* (*thal*, German.) A hollow between high grounds.

Valley also (*vallis*, Latin; *vallée*, French), signifies a hollow between high grounds. The one is a northern, and the other a southern word, for the same idea. But, as it is esteemed a perfection in English writing to construct an antithesis with words of collocal origin, it is become usual to oppose *dale* to *hill*, which is also a word of Saxon descent; and to oppose *valley* to *mountain*, which is also a word of French descent. Hence we are accustomed to attach ideas of inferior magnitude to *dale*, and of superior magnitude to *valley*: by standing in opposition to the words *hill* and *mountain*, they have acquired the same relative character for dimension.

DALEA, a province of Sweden, bounded on the north by Dalecarlia, on the east by the Wermerland and the lake Wener, on the south by Gothland, and on the north by Norway and the sea.

DALEA, in botany, a genus of the class diadelphia, order decandria. Wings and keel growing to the column of the stamens; stamens five or ten, united without any separate filaments; legume one-seeded. Fourteen species; all natives of North or South America.

DALECARLIA, a province in Sweden, so called from a river of the same name, on which it lies, near Norway. It is divided into three parts, which they call valleys; and is about 175 miles in length, and 100 in breadth. It is full of mountains, which abound in mines of copper and iron, some of which are of a prodigious depth.

DALECHA'MPIA, in botany, a genus of the class monoecia, order monodelphia. Outer common involucre with three leaflets; inner with two three-cleft leaves. Male umbellule ten-flowered; involucel two-leaved, with numerous chaffs; proper perianth five-leaved; corolless; filaments numerous. Fem. florets three-involucel, three-leaved; proper perianth of eleven leaflets; corolless; style filiform; capsule three-grained. Two species only, d. corolata, of New Grenada; and d. scandens, of the West Indies; the last a climbing plant, as its name imports, rising to a considerable height, and armed on its leaves with bristly hairs, that sting the moment they are touched.

D'ALEMBERT. See ALEMBERT D'.

DALEN (Cornelius van), a Dutch engraver, born about 1640. He engraved a great variety of portraits, and a set of antique statues in a masterly style.

DALIN (Olaus de), a Swedish poet, born at Winsberg in 1708. He wrote a poem, entitled, The Liberty of Sweden, and a tragedy entitled Brunhilda. He is also the author of the General History of Sweden, and other works. He became preceptor to prince Gustavus, and chancellor of the court; and died in 1763.

DALKEITH, a town of Scotland, in Mid Lothian. Lat. 55. 54 N. Lon. 3. 12 W.

DA'LLIANCE. *s.* (from *dally.*) 1. Interchange of caresses; acts of fondness (*Milton*) 2. Conjugal conversation (*Milton*). 3. Delay; procrastination (*Shakspeare*).

DA'LLIER. *s.* (from *dally.*) A trifler; a fondler (*Ascham*).

DA'LLOP. *s.* A tuft, or clump (*Tusser*).

To **DA'LLY.** *v. n.* (*dollen*, Dutch, to trifle.) 1. To trifle; to play the fool (*Calamy*). 2. To exchange caresses; to fondle (*Shakspeare*). 3. To sport; to play; to frolick (*Shakspeare*). 4. To delay (*Wisdom*).

To **DA'LLY.** *v. a.* To put off; to delay; to amuse till a proper opportunity (*Knolles*).

DALMATIA, a province of Europe, which is divided among the Venetians, Hungarians, Ragusans, and Turks. It has Bosnia on the N. the gulph of Venice on the S. Servia on the E. and Morlachia on the W.

DALMATICA, a garment with large open sleeves, worn originally by bishops.

DALRYMPLE (sir David), a Scotch judge. He was born at Edinburgh in 1726. His father was auditor of the exchequer for Scotland, and his mother daughter of the earl of Haddinton. He was educated at Eton, from whence he was sent to Utrecht, where he continued till 1746, and then returned to Edinburgh, and became an advocate. In 1766 he was appointed a judge, on which occasion he took the title of lord Hailes, according to the custom of the country. He died in 1792, leaving two daughters. Lord Hailes wrote and published a great number of books and tracts, as Memorials and Letters relating to the History of Britain in the Reign of James I. and Charles I. two vols. 1762, and 1766; Remarks on the History of Scotland, 1773, 12mo.; Annals of Scotland, 4to. 1779, two vols.; Remains of Christian Antiquity, 1778, three vols.; several Memoirs, intended for a Biographia Scotica, &c.

Though the church of Scotland does not much encourage funeral discourses, a very landable endeavour was made to render the talents and virtues of lord Hailes a theme of instruction to mankind, in a sermon preached soon after his death in the church of Inveresk, by his learned friend, and venerable pastor, Dr. Carlyle; from which we shall transcribe a summary view of his character as a judge, a scholar, a Christian, and a citizen.

"His knowledge of the laws was accurate and profound, and he applied it in judgment with the most scrupulous integrity. In his proceedings in the criminal court, the satisfaction he gave to the public could not be surpassed. His abhorrence of crimes, his tenderness for the criminals, his respect for the laws, and his reverential awe of the Omniscient Judge, inspired him on some occasions with a commanding sublimity of thought, and a feeling solemnity of expression, that made condemnation seem just as the doom of Providence to the criminals themselves, and raised a salutary horror of crimes in the breast of the audience.

"Conscious of the dignity and importance of the high office he held, he never departed from the decorum that becomes that reverend character; which indeed it cost him no effort to support, because he acted from principle and sentiment, both public and private. Affectionate to his family and relations, simple and mild in his manners, pure and conscientious in his morals, enlightened and entertaining in his conversation; he left society only to regret, that, devoted as he was to more important employments, he had so little time to spare for intercourse with them.

"He was well known to be of high rank in the republic of letters, and his loss will be deeply felt through many of her departments. His labours in illustration of the history of his country, and many other works of profound erudition, remain as monuments of his accurate and faithful research for materials, and his sound judgment in the selection of them. Of his unfeigned piety and devotion, you have very often been witnesses where we now are. I must add, however, that his attendance on religious ordinances was not merely out of respect to the laws and for the sake of example (motives which should never fail to have influence on persons of superior rank, for the most obvious reasons), but from principle and conviction, and the most conscientious regard to his duty; for he not only practised all the virtues and charities in proof of his faith, but he demonstrated the sincerity of his zeal by the uncommon pains he took to illustrate primitive Christianity, and by his elaborate and able defences of it against its enemies.

"His profound researches into history, and his thorough knowledge of the laws, made him perfectly acquainted with the progress of the constitution of Britain, from the first dawn of liberty in the common law of the land, and the trial by jury which precede all written records, and afterwards in the origin and establishment of parliaments, through all its vicissitudes and dangers, till at last, by the blessing of divine Providence, which brought many wonderful events to concur to the same end, it was renewed, strengthened, and finally confirmed by the Revolution.

"It was this goodly and venerable fabric of the British constitution which the deceased most respectable character contemplated with admiration and delight (of late, indeed, with a mixture of anxiety and fear), as the temple of piety, as the genuine source of greater happiness and freedom, to a larger portion of mankind than ever flowed from any government upon earth.

"Ill indeed can the times bear the loss of such an affectionate patriot and able guardian of the laws of his country. But we must not murmur at the will of Providence, which in its mercy 'may have withdrawn the good man from the evil to come.' In mercy, I say, to him, whose righteous spirit was so deeply grieved when 'he saw the wicked rage, and the people imagine a vain thing.'"

Such is the memorial which, in the hour of recent sorrow, followed this excellent man to the grave; and we believe it will yet be allowed to be just by all who had the happiness of his lordship's acquaintance, and are what he was, friends to the best interests of mankind.

A large catalogue of the numerous and curious performances of lord Hailes is given under the article Dalrymple, in the Supplement to the Encyclo. Britan.

DALTON, a town of Lancashire, with a market on Saturdays. Lat. 54. 14 N. Lon. 3. 18 W.

DALUS, in antiquity, a narrow slip of pasture, between two pieces of arable land.

DAM. *s.* (from *dame*, which anciently signified mother.) The mother (*Ray*).

DAM. *s.* (*dam*, Dutch.) A mole or bank to confine water (*Mortimer*).

To DAM. *v. a.* (ꝺemman, Saxon; *dammen*, Dutch.) To confine, or shut up, water by moles or dams (*Otway*).

DA'MAGE. *s.* (*domage*, French.) 1. Mischief; hurt; detriment (*Davies*). 2. Loss; mischief suffered (*Milton*). 3. The value of mischief done (*Clarendon*). 4. Reparation of damage; retribution (*Bacon*). 5. (In law.) Any hurt or hinderance that a man taketh in his estate (*Cowell*).

To DA'MAGE. *v. a.* To mischief; to injure; to impair; to hurt; to harm (*Addison*).

To DA'MAGE. *v. n.* To take damage.

DA'MAGEABLE. *a.* (from *damage.*) 1. Susceptible of hurt: as, *damageable* goods. 2. Mischievous; pernicious (*Govern. of Tongue*).

DAMAN OF ISRAEL. In zoology. See DIPUS.

DAMAN, a maritime town of the East Indies, at the entrance of the gulph of Cambaya. It belongs to the Portuguese. Lat. 20. 20 N. Lon. 72. 35 E.

DA'MASCENE. (from *Damascus.*) A small black plum; a damson (*Bacon*).

DAMASCENUS (John), an illustrious father of the church in the eighth century, born at Damascus, where his father, though a Christian, enjoyed the office of counsellor of state to the Saracen caliph; to which the son succeeded. He retired afterwards to the monastery of St. Sabas, and spent the remainder of his life in writing books of divinity. His works have been often printed; but the Paris edition in 1712, two volumes folio, is esteemed the best.

DAMASCIUS, a celebrated heathen philosopher, born at Damascus in the year 540, when the Goths reigned in Italy. He wrote the Life of his master Isidorus; and dedicated it to Theodora, a very learned and philosophical lady, who had also been a pupil to Isidorus. In this life, which was copiously written, he frequently made oblique attacks on the Christian religion. We have nothing remaining of it but some extracts preserved by Photius. Damascius succeeded Theon in the rhetorical school, and Isidorus in that of philosophy, at Athens.

DAMASCUS, now called SCHAM, a considerable town of Syria, in Asiatic Turkey. It is situated on a fertile plain, encompassed with hills, and finely watered by the river Barrady, anciently the Pharphar, the stream of which flows through the city, and supplies the fountains, bagnios, and houses. The appearance of this city is inexpressibly beautiful at a little distance, but not altogether so fine within it, though the mosques, and other public buildings, are in general handsome. In Scham, a considerable silk manufactory is carried on, and several other articles are furnished by the luxuriancy of its neighbourhood. It is the see of an archbishop, and is inhabited by great numbers of Christians and Jews. Lat. 33. 45 N. Lon. 37. 0 E.

DAMASCUS STEEL, a very fine kind of steel, made in some parts of the Levant, and particularly at Damascus, remarkable for its excellent temper; and used chiefly in the making of sword-blades.

Some authors assure us it comes from the kingdom of Golconda in the East Indies; where the method of tempering with alum, which the Europeans have never been able to imitate, was first invented.

DAMASK, a silk stuff, with a raised pattern, so that the right side of the damask is that which has the flowers raised or saturated. Damasks should be of dressed silk, both in warp and woof; and in France, half an ell in breadth: they are made at Chalons, in Champagne, and in some places in Flanders, as at Tournay, &c. entirely of wool, three-eighths of an ell wide, and twenty ells long.

DAMASK is also a kind of wrought linen made in Flanders and in this country. It takes its name on account of its resemblance to damask. It is chiefly used for table linens.

To DA'MASK. *v. a.* (from the noun.) 1. To form flowers upon stuffs. 2. To variegate; to diversify (*Fenton*).

DA'MASK-ROSE. *s.* A red rose (*Bacon*). See ROSA.

DAMASKEENING, or DAMASKING, the art or operation of beautifying iron, steel, &c. by making incisions in them, and filling them up with gold and silver wire; chiefly used for adorning sword-blades, guards, and gripes, locks of pistols, &c. Damaskeening partakes of the mosaic, of engraving, and of carving: like the mosaic, it has inlaid work; like engraving, it cuts the metal representing different figures; and as in chasing, gold and silver are wrought in relievo. There are two ways of damasking: the one, which is the finest, is when the metal is cut deep with proper instruments, and inlaid with gold and silver wire; the other is superficial only.

DAMASO'NIUM, in botany, a genus of the class hexandria, order hexagynia. Spathe one-leaved, five-winged; calyx superior, three-parted; corol three-petalled; berry ten-celled, many-seeded. One species only; a native of India, with radical, heart-shaped, entire leaves, and a one-flowered scape.

DAMATRIUS, the Bœotian name for the Athenian month Pyanepsian.

DAMAUN, a seaport of the Deccan of Hindustan, at the entrance of the gulf of Cambay. It is subject to the Portuguese. Lat. 20. 20 N. Lon. 72. 25 E.

DAME. *s.* (*dame*, French; *dama*, Spanish.) 1. A lady; the old title of honour to women. 2. Mistress of a low family (*L'Estrange*). 3. Woman in general (*Shakspeare*).

DAME'S VIOLET. In botany. See HESPERIS.

DAMIANISTS, in church history, a branch of the ancient acephali severitæ. They agreed with the Catholics in admitting the fourth council, but disowned any distinction of persons in the Godhead; and professed one single nature, incapable of any difference; and yet they called God the Father, Son, and Holy Ghost. They seem to have been a kind of Sabellians. They took their name from Damianus, a bishop of Alexandria, in the sixth century.

DAMIETTA, an ancient and rich town of Egypt, with a good harbour, and a Greek archbishop's see. It is seated on one of the eastern mouths of the Nile, and contains about 80,000 inhabitants. This was the ancient Pelusium. Lat. 31. 22 N. Lon. 31. 55 E.

To DAMN. *v. a.* (*damno*, Latin.) 1. To doom to eternal torments in a future state (*Bacon*). 2. To procure or cause to be eternally condemned (*South*). 3. To condemn; to censure (*Dryden*). 4. To hoot or hiss any public performance; to explode (*Pope*).

DA'MNABLE. *a.* (from *damn.*) 1. Deserving damnation (*Hooker*). 2. Odious; pernicious (*Shakspeare*).

DA'MNABLY. *ad.* (from *damnable.*) In such a manner as to incur eternal punishment (*South*).

DAMNA'TION. *s.* (from *damn.*) Exclusion from divine mercy; condemnation to eternal punishment (*Taylor*).

DA'MNATORY. *a.* (from *damnatorius*, Lat.) Containing a sentence of condemnation.

DA'MNED. *part. a.* (from *damn.*) Hateful; detestable; abominable (*Rowe*).

DAMNI'FICK. *a.* (from *damnify.*) Procuring loss; mischievous.

To DA'MNIFY. *v. a.* (from *damnifico*, Latin.) 1. To endamage; to injure (*Locke*). 2. To hurt; to impair (*Spenser*).

DA'MNINGNESS. *s.* (from *damning.*) Tendency to procure damnation (*Hammond*).

DAMOCLES, one of the flatterers of Dionysius the Elder, of Sicily. He admired the tyrant's wealth, and pronounced him the happiest man on earth. Dionysius prevailed upon him to undertake for a while the charge of royalty, and be convinced of the happiness which a sovereign enjoyed. Damocles ascended the throne, and while he gazed upon the wealth and splendor that surrounded him, he perceived a sword hanging over his head by a horse-hair. This so terrified him, that all his imaginary felicity vanished at once, and he begged Dionysius to remove him from a situation which exposed his life to such fears and dangers. (*Cicero*).

DAMON. The most celebrated of this name is a Pythagorean philosopher, very intimate with Pythias. When he had been condemned to death by Dionysius, he obtained from the tyrant leave to go and settle his domestic affairs, on promise of returning at a stated hour to the place of execution. Pythias pledged himself to undergo the punishment which was to be inflicted on Damon, should he not return in time; and he consequently delivered himself into the hands of the tyrant. Damon returned at the appointed moment, and Dionysius was so struck with the fidelity of these two friends, that he remitted the punishment, and entreated them to permit him to share their friendship, and enjoy their confidence. (*Val: Max.*).

DAMP. *a.* (*dampe*, Dutch.) 1. Moist; inclining to wet; foggy (*Dryden*). 2. Dejected; sunk; depressed (*Milton*).

DAMP. *s.* 1. Fog; moist air; moisture (*Dryden*). 2. A noxious vapour exhaled from the earth (*Woodward*). 3. Dejection; depression of spirit (*Roscommon*).

To DAMP. *v. a.* (from the noun.) 1. To wet; to moisten; to make humid. 2. To depress; to deject; to chill (*Atterbury*). 3. To weaken; to abate; to hebetate (*Milton*).

DAMPIER (William), a famous navigator, descended from a good family in Somersetshire, in England, was born in 1652. Losing his father when very young, he was sent to the sea, where he soon distinguished himself, particularly in the South seas. His voyage round the world is well known, and has gone through many editions. He appears afterwards to have engaged in an expedition concerted by the merchants of Bristol to the South sea, commanded by captain Woods Rogers; who sailed in August 1708, and returned by September 1711: but we have no further particulars of his life or death.

DAMPIER'S STREIGHT, a passage or opening discovered by captain Dampier, between King William's cape in New Guinea, in the South seas, and that tract to the eastward of it, with which it was formerly thought to join.

DA'MPISHNESS. *s.* (from *damp.*) Tendency to wetness; fogginess; moisture (*Bacon*).

DA'MPNESS. *s.* (from *damp.*) Moisture; fogginess (*Dryden*).

DAMPS, in natural history, noxious steams and exhalations, frequently found in mines, pits, wells, and other subterraneous places. See GAS.

DA'MPY. *a.* (from *damp.*) Dejected; gloomy; sorrowful (*Hayward*).

DAMSEL, DAMOISEL, or DAMOISEAU, an appellation anciently given to all young people of genteel or noble extraction of either sex, e. gr. to the sons and daughters of knights, barons, and even of kings. Thus, in history, we read of the damsel Pepin, damsel Louis le Gros, damsel Richard, prince of Wales. Pasquier will have the word a diminutive of dam, an ancient name for lord; as in some authors we read Dam Dieu for Lord God; dam chevalier, &c. Though in its feminine sense he takes it to come from dame. Others derive the word from *domicellus*, or *domnicellus*, a diminutive of *domnus*, *quasi parvus dominus*: accordingly, Du Cange observes, that it has been sometimes written *domenger*. They who hold the signory of Commercy, M. de la Roque tells us, anciently held it in the title of *damoiseau*: and

M. de Marca assures us, that the noblesse of Bern is still divided into three bodies, or classes; the barons, the cavers, and the damsels, *domicellos*, called in that country *domengers*. The kings of Denmark and Sweden have the same title, as appears from Pontanus's History of Denmark, lib. vii. and viii. and Henry of Upsal's History of Suec. lib. iii. From the sons of kings, the appellation passed to those of great lords and barons; and, at length, to those of gentlemen who were not yet knights.

DAMSEL, at present, is applied to all maids or girls not yet married; provided they be not of the lowest class of people.

DAMSEL is sometimes also applied to a kind of utensil put in beds, to warm old men's feet.

DAMSON, the fruit of the prunus damascena, which, when perfectly ripe, affords a wholesome article for pies, tarts, &c. gently opening the body; but when damsons are not perfectly mature, they produce cholicky pains, diarrhœa, and convulsions in children. See PRUNUS and CHRYSOPHYLLUM.

DAN (Tribe of), in ancient geography, lay S.W. of the tribe of Judah, between it and the Mediterranean, contiguous to that of Simeon.

DAN. *s.* (from *dominus*, Latin.) The old term of honour for men (*Prior*).

DANAE, in fabulous history, the daughter of Acrisius, king of Argos, by Eurydice. She was confined in a brazen tower by her father, who had been told by an oracle, that his daughter's son would put him to death. His endeavours to prevent Danae from becoming a mother proved fruitless; as Jupiter, who was enamoured of her, introduced himself to her bed, by changing himself into a golder shower. From his embraces Danae had a son, with whom she was exposed on the sea by her father. The wind drove the bark which carried her to the coasts of the island of Seriphus, where she was saved by some fishermen, and carried to Polydectes, king of the place, whose brother, called Dictys, educated the child called Perseus, and tenderly treated the mother. Polydectes fell in love with her; but as he was afraid of her son, he sent him to conquer the Gorgons. When Perseus had victoriously finished his expedition, he retired to Argos with Danae to the house of Acrisius, whom he inadvertently killed. Some suppose that it was Prœtus, the brother of Acrisius, who introduced himself to Danae in the brazen tower; and instead of a golden shower, it was maintained, that the keepers of Danae were bribed by the gold of her seducer.

DANAE, an ancient coin; somewhat more than an obolus.

DANÆA, in botany, a genus of the class cryptogamia, order filices. Fructification oblong-linear, transversely immersed in the frond, parallel, many-celled; cells in a double row, opening upwards; seeds numerous, very minute. Two species only; d. nodosa, and d. alata.

DANAIDES, in fabulous history, the fifty daughters of Danaus, king of Argos. When their uncle Ægyptus came from Egypt with his fifty sons, they were promised in marriage to their cousins; and before the celebration of their nuptials, Danaus, who had been informed by an oracle that he was to be killed by one of his sons-in-law, made his daughters solemnly promise that they would destroy their husbands. They were provided with daggers by their father, and all, except Hypermnestra, the wife of Lynceus, murdered their cousins the first night of their nuptials, and presented him with the heads of their husbands. Hypermnestra was summoned to appear before her father, but the unanimous voice of the people declared he innocent. The sisters, according to the more received opinion, were condemned in hell to fill with water a vessel full of holes, so that the water ran out as soon as poured into it, and therefore their labour was infinite, and their punishment eternal. Apollodorus has given a catalogue of the names of the Danaides, and their respective husbands.

DANAUS. See DANAIDES.

To DANCE. *v. n.* (*danser*, French.) To move in measure; to move with steps correspondent to the sound of instruments (*Shakspeare*).

To DANCE ATTENDANCE. *v. a.* To wait with suppleness and obsequiousness (*Raleigh*).

To DANCE. *v. a.* To make to dance; to put into a lively motion (*Bacon*).

DANCE, or DANCING, as at present practised, may be defined, "an agreeable motion of the body, adjusted by art to the measures or tune of instruments, or of the voice." But, according to what some reckon more agreeable to the true genius of the art, dancing is "the art of expressing the sentiments of the mind, or the passions, by measured steps or bounds that are made in cadence by regulated motions of the body, and by graceful gestures; all performed to correspond with certain musical sounds."

There is no account of the origin of the practice of dancing among mankind. It is found to exist among all nations whatever, even the most rude and barbarous; and, indeed, however much the assistance of art may be necessary to make any one perfect in the practice, the foundation must certainly lie in the mechanism of the human body itself.

The connection that there is between certain sounds and those motions of the human body called dancing, hath seldom been enquired into, though it is certainly a very curious speculation. The power of certain sounds not only over the human species, but even over the inanimate creation, is indeed very surprising.

It is conjectured by very eminent philosophers, that all the sensations and passions to which we are subject, are intimately connected with the vibrations excited in the nerves of the human body. Hence, musical sounds have the greatest power over those people who are of a delicate sensible frame, and who have strong passions. If it be true, therefore, that every passion in the human breast in some measure depends upon a certain affection of the nervous system, or a certain electric vibration in the nervous fluid, we shall immediately see the origin of the different dances among different nations. One kind of vibration, for instance, raises the passions of anger, pride, &c. which are indispensably necessary in warlike nations. The sounds, for such there are, capable of exciting a similar vibration, would naturally constitute the martial music among such nations, and dances conformable to it would be instituted. This appears to be the case particularly among barbarous nations. Other vibrations of the nerves awaken the passions of joy, love, &c.; and sounds capable of exciting these particular vibrations will immediately be formed into music for dancers of another kind.

Among the Jews, dancing seems to have made a part of the religious worship on some occasions, as we learn from passages in the Psalms; though we do not find either that or singing positively enjoined as a divine precept. The dancing of king David before the ark gave occasion to some complaints from his wife Michal, the haughty daughter of the haughty Saul; it also called forth the sneers of Mr. Bayle, in his dictionary: but it has been examined and vindicated with great learning and ingenuity, and complete success, by Dr. Delany, in his Life of David, king of Israel, vol. i. pp. 389, 428. We persuade ourselves, that most of our readers will be entertained with the dissertation on dancing there referred to. In the Christian churches mentioned in the New Testament there is no account of dancing being introduced as an act of worship, though it is certain that it was used as such in after ages. Mr. Gallini tells us, that "at Limoges, not long ago, the people used to dance the round in the choir of the church which is under the invocation of their patron saint; and at the end of each psalm, instead of the Gloria Patri, they sung as follows: 'St. Maroel, pray for us, and we will dance in honour of you.'" Though dancing would now be looked upon as the highest degree of profanation in a religious assembly, yet it is certain, that considered as an expression of joy, it is no more a profanation than singing, or than simple speaking; nor can it be thought much more absurd, that a Christian should dance for joy that Jesus Christ is risen from the dead, than that David danced before the ark when it was returned to him after a long absence.

Plato reduces the dances of the ancients to three classes. 1. The military dances, which tended to make the body robust, active, and well-disposed for all the exercises of war. 2. The domestic dances, which had for their object an agreeable and innocent relaxation and amusement. 3. The mediatorial dances, which were in use in expiations and sacrifices.

In most cases, dances are indications of joy: but there are people in South America who dance to shew their sorrow; and among the ancients, dancing made a part of the funeral solemnities.

Among the moderns, there are various kinds of dances, as country dances, cotillons, hornpipes, minuets, &c.: for directions to perform these with accuracy, taste, and elegance, we refer to those who professedly teach this art.

In the heavy days of autumn and winter, when the atmosphere is loaded with humid particles, when a sedentary life disposes the human body to hypochondriacal affections, dancing is an admirable amusement. Independently of the beneficial effects which music and a cheerful company display on a susceptible mind, moderate dances possess every advantage of gentle exercise. But those maniacal turnings and gesticulations, which have lately become fashionable in this country, under the appellation of German Vaults (or rather Walzen, i. e. performing a circular motion, like that of a man on the eve of intoxication), are attended with very different effects. It would be superfluous to enumerate the pernicious consequences resulting from that frantic inclination to distort the human frame: we may confidently assert, that Walzen is at present almost universally exploded in the cultivated circles of society among the Germans, who consider it as a dangerous and vulgar dance.

Violent dancing, especially in the heated atmosphere of a crowded assembly, produces a temporary fever, even in the by-standers, who inspire an air exceedingly vitiated by the breath of persons apparently in a semi-delirious trance, and by the suffocating vapour of candles. The blood is unnaturally propelled to the breast and head; hence arise frequent colds, coughs, and periodical headachs; perspiration is wantonly checked; the lungs are forcibly expanded, and the foundation is too often laid for that direful disease, consumption.

DA'NCER. *s.* (from *dance.*) One that practises the art of dancing (*Donne*).

Dancer (Rope), *schœnobates*, a person who walks, leaps, dances, and performs several other feats, upon a small rope or wire. The ancients had their rope-dancers as well as we. These had four several ways of exercising their art: the first vaulted, or turned round the rope like a wheel round its axis, and there hung by the heels or neck. The second flew or slid from above, resting on the stomach, with their arms and legs extended. The third ran along a rope stretched in a right line, or up and down. Lastly, the fourth not only walked on the rope, but made surprising leaps and turns thereon.

Dancers, in ecclesiastical history, a sect that sprung up at Aix-la-Chapelle in 1373, and spread through Flanders. Persons of both sexes were suddenly seized with dancing fits, and continued them, with extreme violence, till they were quite exhausted; and at these times they pretended to receive wonderful visions. The French prophets, or convulsionists, in later times, and some wild methodists in our own country, resembled these more ancient religious dancers.

DANCETTE', in heraldry, is when the outline of any bordure, or ordinary, is indented very largely; the largeness of the indentures being the only thing that distinguishes it from indented.

There is also a bearing of a bend, called double dancetté; thus, he beareth azure, a bend double dancetté argent.

DA'NCING-MASTER. *s.* (*dance* and *master.*) One who teaches the art of dancing (*Locke*).

Dancing-school. *s.* The school where the art of dancing is taught (*L'Estrange.*)

DANDELI'ON. *s.* (*dent de lion*, French.) The name of a plant. See Taraxacum.

DANDINI (Jerome), an Italian jesuit, born at Celena in 1554. He became a celebrated professor of philosophy, and was rector of several colleges. Clement VIII. sent him as his nuncio to the Maronites of Libanus. Of this journey he wrote an account, which was translated into French, and printed in 1675. He died at Forli in 1634. He wrote a Commentary on Aristotle's three books de Anima. (*Watkins*).

Dandini (Pietro), a painter of Florence, born in 1646, and died in 1712. He was in the service of the grand-duke almost constantly, so that few of his pictures are to be found out of his own country. He was very successful in imitating great masters. (*Watkins*).

Dandini (Cæsare), an historical painter, of Florence. He was uncle to the preceding. There are several noble pictures of his painting in the churches of Florence. (*Watkins*).

Dandini (Hercule François), an Italian count and professor of law at Padua; born in 1691, and died in 1747. He wrote, 1. De Forensi scribendi ratione. 2. De servitutibus prædiorum interpretationes per epistolas, &c.

DA'NDIPRAT. *s.* (*dandin*, French.) A little fellow; an urchin.

To DA'NDLE. *v. a.* (*dandelen*, Dutch.) 1. To shake a child on the knee (*Temple*). 2. To fondle; to treat like a child (*Addison*). 3. To delay; to procrastinate (*Shakspeare*).

DA'NDLER. *s.* He that dandles or fondles children.

DA'NDRUFF. *s.* (ꞇan, the itch, and ꝺꞃoꝼ, sordid.) Scabs in the head. See Pitiriasis.

DANEBERG, a town of Lower Saxony, in Germany, belonging to the elector of Hanover. Lat. 53. 4 N. Lon. 11. 29 E

DANEGELT, an annual tax laid on the Anglo-Saxons, first of 1*s.* and afterwards of 2*s.* for every hide of land through the realm, for maintaining such a number of forces as were thought sufficient to clear the British seas of Danish pirates, which heretofore greatly annoyed our coasts. Danegelt was first imposed as a standing yearly tax on the whole nation, under king Ethelred, A.D. 991.

DANE-WORT, in botany. See Ebulus.

DANGEAU (Lewis Courcillon de), a French abbot, who died at Paris in 1723, aged 80. He invented several games for teaching young persons geography, history, and grammar. He also wrote Dialogues on the Immortality of the Soul.

Dangeau (Philip de Courcillon, marquis de), brother of the above, born in 1638, and died at Paris full of honours in 1720. He wrote Memoirs in MS. from which Voltaire and other authors have gleaned many curious particulars.

DA'NGER. *s.* (*danger*, French.) Risk; hazard; peril (*Acts*).

To Da'nger. *v. a.* To put in hazard; to endanger (*Shakspeare*).

Danger (Isles of), three islands in the S. Pacific ocean, seen by commodore Byron in 1765; but were so surrounded by rocks and breakers that it was unsafe to attempt to land. Lat. 10. 15 S. Lon. 169. 28 W.

DA'NGERLESS. *a.* (from *danger.*) Without hazard; without risk (*Sidney*).

DA'NGEROUS. *a.* (from *danger.*) Hazardous; perilous; full of danger (*Dryden*).

DA'NGEROUSLY. *ad.* Hazardously; perilously; with danger (*Hammond*).

DA'NGEROUSNESS. *s.* (from *dangerous.*) Danger; hazard; peril (*Boyle*).

To DA'NGLE. *v. n.* (from *hang.*) 1. To hang loose and quivering (*Smith*). 2. To hang upon any one; to be a humble follower (*Swift*).

DA'NGLER. *s.* (from *dangle.*) A man that hangs about women (*Ralph*).

DANICAN (Andre), better known by the name of Philidor; a celebrated player on chess. He was born at Paris, and resided for several years in England, where he published his Analysis du jeu des Echecs, in 1749. He also composed music with good success. He died in 1795.

DANIEL (judgment of God) the prophet, was descended from the royal family of David, and carried captive to Babylon when very young, A.M. 3398. In the captivity, Daniel eminently distinguished himself in the explanation of Nebuchadnezzar's dreams, and the handwriting against Belshazzar, and in his own escape from the lion's den. Here, likewise, he was favoured with many remarkable visions concerning future events. His prophecies concerning the Messiah, and other great events of aftertimes, are so clear and explicit, that Porphyry objected, that they must have been written after the facts had happened. The Jews do not reckon Daniel among the prophets, because he lived the life of a courtier rather than of a prophet; and because his revelations were not in the prophetic way, but by dream and vision in the night, which they consider as the lowest degree of revelation. But our Saviour, by acknowledging Daniel a prophet, Matt. xxiv. 15, puts his prophetic character beyond dispute. Among the prophets, says sir Isaac Newton, Daniel is most distinct in order of time, and easiest to be understood: and therefore, in things that relate to the last times, he must be made a key to the rest. All his prophecies relate one to another, as if they were but several parts of the same prophecy: the first is the easiest to be understood, and every following prophecy adds something new to the former. It is generally believed, that Daniel died in Chaldea, and that he did not avail himself of the permission granted by Cyrus to the Jews, of returning to their own country. Daniel's name is not prefixed to his book; yet, as Prideaux observes, the many passages, in which he speaks of himself in the first person, are sufficient proof that he was the author of it. The book of Daniel contains a history of many things done in the Babylonian and Persian empires; as well as a prophecy of things to be done, and many calamities to be executed, with a final deliverance to the glory of God's people. The style in which Daniel wrote is neither so lofty nor so figurative as that of the other prophets: it is, however, clear and concise, and his descriptions simple and natural; in short, his language is more like that of a historian than of a prophet. Part of the book of Daniel was originally written in the Chaldee language, viz. from chap. ii. 4. to the end of the vii. chap. it is supposed to be so written, on account of the Chaldean or Babylonish affairs which are treated of in that part. The rest of the book is in Hebrew.

Daniel (Samuel), an English poet and historian. He was born in Somersetshire, 1562, and educated at Magdalen college, Oxford; on leaving which, he became groom of the privy chamber to the queen of James I. At the close of his life he retired to his native country, where he died in 1619. His poems were collected, and printed in 2 vols. 12mo. 1718. He wrote the History of England to the end of the reign of Edward III. which, according to some authors, is the crown of all his works.

Daniel (Gabriel), a French historian. He was born at Roan in 1649, and entered among the jesuits at the age of 18. One of his first productions was a Voyage to the World of Cartesius, a work of great wit, and which has been translated into several languages. His greatest performance, however, is, The History of France; published at Paris in 3 vols. folio, 1713; but afterwards enlarged to 7 vols. 4to. 1722. He also wrote several miscellaneous and theological treatises. He died at Paris in 1728.

DANK, a Persian silver coin, weighing the 16th of a dram.

Dank. *a.* (from *tuncken*, German.) Damp; humid; moist; wet (*Milton*).

DA'NKISH, *a.* Somewhat dank (*Shak.*).

DANMONII, an ancient British nation, supposed to have inhabited that tract of country which is now called Cornwall and Devonshire, bounded on the south by the British ocean, on the west by St. George's channel, on the north by the Severn sea, and on the east by the country of the Durotriges. Some other British tribes were also seated within these limits; as the Cossini and Ostidamnii, who were probably particular clans of the Danmonii; and, according to Mr. Baxter, they were the keepers of their flocks and herds. As the several tribes of the Danmonii submitted without much resistance to the Romans, and never joined in any revolt against them, that people were under no necessity of building many forts, or keeping many garrisons in their country. This is the reason why so few Roman antiquities have been found there, and so little mention is made of it and its ancient inhabitants by Roman writers.

DANNENBERG, or Danneberg, a town of Germany, in the circle of Lower Saxony, and capital of a county of the same name, in the principality of Luneberg, on the Jetze. Beer is the principal article of commerce. The number of inhabitants about 1000.

DANTE, a famous Italian poet, born at Florence in 1265. Dante was of an ambitious turn, and joined one of the factions which then disturbed Florence: but the party to which he belonged proving the weakest, he was banished. He then prevailed on the prince of Verona to make war on the Florentines, which did not answer his expectations; neither could he get himself recalled. He died at Ravenna in 1321. He wrote in his exile a triple poem called Divina Commedia, on Paradise, Purgatory, and Hell, which shews a wonderful imagination; but the satirical spirit which he breathes is very bitter. He attacks the city of Florence the French king, and the pope, in it, with great virulence, as the authors of his misfortunes; whereas, they proceeded from his own turbulent disposition. His works were printed at Venice in 1564, in folio: but the Commedia is the work to which he owes his celebrity. Mr. Boyd's translation of the Inferno, Purgatorio, and Paradiso, has been much admired.

Dante (Peter Vincent), a native of Perouse, who imitated the style of the preceding poet with so much success, that his performances have frequently gone under his name. He was also a good mathematician, and died in 1522.

DANTZIC, the metropolis of the palatinate of Pomerania, in Poland. It is the see of a bishop, and the seat of an university. It is one of the greatest granaries in the world; for upwards of 700,000 tons of corn are annually exported from this place alone. It contains about 200,000 inhabitants, who are for the most part Lutherans. Dantzic was a kind of republic, and its jurisdiction extended about 50 miles round it; the inhabitants maintained a strong garrison at their own expence; but, alas! so anxious are some princes to get possession of the territories of their neighbours, that the king of Prussia, partly by intrigue, and partly by force, annexed to his own dominions Dantzic with its territory in the spring of 1793. It is 160 miles W. by N. of Warsaw. Lat. 54. 22 N. Lon. 18. 37 E.

DANUBE, the largest river in Europe, rising at Doneschingen, in the Black Forest, in the circle of Suabia, in Germany; and running N. E. through Suabia, by Ulm, the capital of that country; and then E. through Bavaria and Austria, passes by Ratisbon, Passau, Ens, and Vienna. It then enters Hungary, and runs S. E. from Presburg to Buda, and so on to Belgrade; after which it divides Bulgaria from Morlachia and Moldavia, discharging itself by several channels into the Black sea, in the province of Bessarabia. It was called the Ister by the ancients. It begins to be navigable for boats at Ulm, and receives several large rivers as it passes along. It is so deep between Buda and Belgrade, that the Turks and Germans have had men of war upon it; and yet it is not navigable to the Black sea, on account of the cataracts.

DANVILLE, a town of United America, in the state of Kentucky: thirty-three miles SSE. of Frankfort.

DANVOU, a town of France, in the department of the Calvados, and chief place of a canton, in the district of Vire: six leagues S. Bayeux.

To DAP. *v. n.* (corrupted from *dip.*) To let fall gently into the water (*Walton*).

DAPA'TICAL. *a.* (from *dapaticus*, Latin.) Sumptuous in cheer (*Bailey*).

DAPHNE, in fabulous history, the daughter of the river Peneus, who being beloved by Apollo, and flying from him to preserve her chastity, was, on her intreaties, changed into a laurel, whose leaves Apollo immediately consecrated to bind his temples, and made that tree the reward of poetry.

DA'PHNE. Spurge-laurel. In botany, a genus of the class octandria, order monogynia. Calyx four-cleft, resembling a corol, withering but permanent, enclosing the stamens; corolless; berry one-seeded. Thirty species, chiefly European, many Asiatic: some of which have lateral and some terminal flowers. The following are those chiefly worth noticing.

1. D. mezereon. Common mezereon or spurge-olive; a low deciduous shrub, found in the woods of Germany, and of our own country; with sessile flowers in threes on the stem, leaves lanceolate. Its seeds are denominated in the dispensatories coccognidia: grana cnidia: COCCI CNIDII, which see. There are four varieties of this elegant plant; all of which are common to our flower and shrub gardens, and have the multiform boast of offering an exquisite perfume along with a beautiful flower, and both so early in the year, as to anticipate almost every other flower: the corol appearing generally in February and often in January. Independently of which, the berries which succeed the flowers are in themselves of captivating hue and lustre, and continue through the whole of the summer.

2. D. thymelæa. Milk-wort-leaved daphne, a native of Spain, with sessile axillary flowers; leaves lanceolate; branches quite simple: a deciduous shrub, about a yard in height; the flowers appear in March, of a greenish hue; and are succeeded by yellow berries.

3. D. laureola. Common spurge-laurel, or ever-green daphne. Found in our own woods, as also in those of Germany and Switzerland; bearing axillary, five-flowered racemes, with glabrous lanceolate leaves. The flowers appear in January and continue till April, and are accompanied with a pleasant perfume.

4. D. cnidium or gwidium. The thymelæa of Gerard. Flax-leaved daphne: with terminal panicled racemes; leaves linear, lanceolate, cuspidate, with a point. A low deciduous shrub of Italy and Spain, sometimes rising to a yard in height. In our own country the flowers do not appear till June, and are rarely followed by seeds.

5. D. cneorum. Spear-leaved daphne; a deciduous shrub of the south of Europe, rising about a foot and a half high: with fascicled, terminal, sessile flowers, red or white; leaves lanceolate, naked, mucronate.

6. D. alpina. Alpine daphne or chamelœa. A native of Italy and the Alps, rising to about a yard in height, with sessile, aggregate, lateral flowers, appearing in March, fragrant in odour; succeeded by red berries that ripen in September.

7. D. odora. Odorous daphne; so named from the exquisite perfume of its flower, which exceeds all the rest of the tribe. It is a native of China and Japan, with a many flowered, terminal, nearly sessile head of flowers, and scattered, oblong-lanceolate, glabrous leaves. In this country it must be cultivated as a green-house plant.

For the medical virtues of the root of the daphne mezereum, see MEZEREUM, under which name it is most known officinally. These plants should be differently raised, according to the different kinds: the mezereon and its varieties are best propagated by sowing the seeds or berries as soon as they become perfectly ripe, which is about August, on beds of light sandy earth. In these beds the young plants may remain till the beginning of the second autumn; when they should be removed, and set out in nursery-rows, at the distance of a foot and a half, and ten or twelve inches in the rows. After having been two years in this situation they are in a proper condition for being planted out where they are to remain.

Most of the other species may be increased both by seeds and layers of the young shoots, or by cuttings. The layers or cuttings should be laid down or planted out in the beginning of the autumn. The last sort can only be propagated by seeds, obtained from its native situation, sown on a gentle hot-bed in the spring or autumn; the young plants being afterwards placed in a green-house.

DAPHNEPHORIA, a festival in honour of Apollo, celebrated every ninth year by the Bœotians. It was then usual to adorn an olive bough with garlands of laurel and other flowers, and place on the top a brazen globe, on which were suspended smaller ones. In the middle were placed a number of crowns, and a globe of inferior size, and the bottom was adorned with a saffron-coloured garment. The globe on the top represented the sun or Apollo. That in the middle was an emblem of the moon, and the other of the stars. The crowns, which were 365 in number, represented the sun's annual revolution. This bough was carried in solemn procession by a beautiful youth of an illustrious family, and whose parents were both living. The youth was dressed in rich garments which reached to the ground, his hair hung loose and dishevelled, his head was covered with a golden crown, and he wore on his feet shoes called Iphicratidæ, from Iphicrates an Athenian, who first invented them. He was called Δαφνηφορος, laurel bearer; and at the time he executed the office of priest of Apollo. He was preceded by one of his nearest relations, bearing a rod adorned with garlands, and behind him followed a train of virgins with branches in their hands. In this order the procession advanced as far as the temple of Apollo, surnamed Ismenius, where supplicatory hymns were sung to the god.

DAPIFER, the dignity or office of grand-master of a prince's household. The word literally signifies a dish-carrier. At the coronation of the emperor of Germany, the arch-dapifer carries the first dish of meat to table on horseback.

DA'PPER. *a.* (*dapper*, Dutch.) Little and active; lively without bulk (*Milton*).

DA'PPERLING. *s.* A dwarf (*Ainsworth*).

DAPPLE. Horses are so called which have partial variegated hues in the coat, of different sizes, constituting small circles, both lighter and darker than the general colour of the horse. Hence we have dapple bays, dapple greys, and sometimes dapple blacks.

To DA'PPLE. *v. n.* To streak; to vary (*Bacon*).

DAR. *s.* A fish; being the dace.

DARAH, or DRAS, a river of Africa, which rises in the greater Atlas, not far from Tefza, and runs into the Atlantic, near Cape Non.

DARAH, or DRAS, a country of Africa, bounded on the north by Morocco, Gezula, and Tafilet, on the east and the south by Zahara, and on the west by Sus, and takes its name from the river Darah, or Dras, which passes through it: the principal produce is indigo and dates: the inhabitants are Arabians and Mahometans.

DARCY (Count), an ingenious philosopher and mathematician, was born in Ireland in the year 1725; but his friends being, like many other great and good families at that period, attached to the house of Stuart, he was at 14 years of age sent to France, where he spent the rest of his life. Giving early indications of a genius for science, he was put under the care of the celebrated Clairaut, under whose tuition he improved so rapidly in the mathematics, that at 17 years of age he gave a new solution of the problem concerning the curve of equal pressure in a resisting medium. This was followed the year after by a determination of the curve described by a heavy body, sliding by its own weight along a moveable plane, at the same time that the pressure of the body causes a horizontal motion in the plane.

Though Darcy served in the war of 1744, he found leisure, during the bustle of a military life, to send two memoirs to the academy: the first of these contained a general principle in mechanics, that of the preservation of the rotatory motion; a principle which he again brought forward in 1750, by the name of the principle of the preservation of action. He was taken prisoner in this war by the English; and such was either the respect paid to science, or the mercy of the cabinet of St. James's, that he was treated, not as an Irish rebel, but as a French subject fighting for his king and his country.

In 1760, Darcy published An Essay on Artillery, containing some curious experiments on the charges of gunpowder, &c. &c. and improvements on those of the ingenious Robins; a kind of experiments which our author carried on occasionally to the end of his life. In 1765, he gave to the public the most ingenious of all his works, his Memoir on the Duration of the Sensation of Sight; in which he endeavours to prove, and indeed completely proves, that a body may sometimes pass by our eyes without producing a sensation attended with consciousness of marking its presence, otherwise than by weakening the brightness of the object which it may chance to cover in its passage. If, in this work, he shall be thought to have taken hints from Dr. Hartley, it is not perhaps too much to say, that some of our most celebrated writers on vision have since been beholden to Darcy. No man, indeed, has cause to be ashamed of being indebted to him; for all his works display, in an eminent degree, the union of genius and philosophy; but as he measured every thing upon the largest scale, and required extreme accuracy in experiment, neither his time, fortune, nor avocations, allowed him to execute more than a very small part of what he projected.

In his disposition, Darcy was amiable, spirited, lively, and a lover of independence; a passion to which he nobly sacrificed, even in the midst of literary society. He died of a cholera morbus in 1779, at 54 years of age. He was admitted of the French academy in 1749, and was made pensioner-geometrician in 1770. His essays, printed in the Memoirs of the Academy of Sciences, are various and very ingenious, and are contained in the volumes for the years 1742, 1747, 1749, 1750, 1751, 1752, 1753, 1754, 1758, 1759, 1760, 1765, and in tom. 1. of the Savans Etrangers.

DARAPTI, among logicians, one of the modes of syllogisms of the third figure, whose premises are universal affirmatives, and the conclusion is a particular affirmative: thus,

DAR- Every body is divisible;
AP- Every body is a substance;
TI. Therefore some substance is divisible.

DARDANARIUS. Usurer, monopolist. A name anciently attributed to such as caused a scarcity, and dearness of provisions, particularly corn, by buying it and hoarding it up, to raise its value, and sell it again at an extravagant rate.

DARDANELLES, two castles of Turkey; the one, called Sestos, seated in Romania; the other, called Abydos, in Natolia. They command the S. W. entrance of the strait of Gallipoli, the ancient Hellespont. At Abydos, the cargoes of all ships sailing from Constantinople are searched. Lat. 46. 0 N. Lon. 26. 30 E.

To DARE. *v. a. pret. I* durst; *part.* I have dared. (ꝺeaꞃꞃan, Saxon.) To have courage for any purpose; not to be afraid; to be adventurous (*Dryden*).

To Dare. *v. a. pret. I* dared. To challenge; to defy (*Roscommon*).

To Dare larks. To catch them by means of a looking-glass (*Carew*).

Dare. *s.* Defiance; challenge (*Shaks.*).

DA'REA, in botany, a genus of the class cryptogamia, order filices. Fructification in scattered, nearly marginal lines: involucre originating laterally from a vein opening towards the margin. Nine species.

DA'REFUL. *a.* (*dare* and *full.*) Full of defiance: not in use (*Shakspeare*).

DARENT, a river of England, in the county of Kent, which runs into the Thames, three miles N. Dartford. The mouth near the Thames is called Dartford Creek.

DAR-FUR, a country in the interior part of Africa, extending, according to Mr. Brown's map, from about 11 to 15. 20 N. lat., and in its greatest breadth from 26 to 29. 15 E. lon. The capital of the country is called Cobbé. For a minute description of this country, the reader may consult Brown's Travels in Africa, &c. from the year 1792 to 1798.

DARIC, in antiquity, a famous piece of gold, first coined by Darius the Mede, about 538 years before Christ; probably during his stay at Babylon. From thence it was dispersed over the east, and also into Greece; so that the Persian daric, which was also called stater, was the gold coin best known in Athens in ancient times. According to Dr. Bernard, it weighed two grains more than one of our guineas; but as it was very fine, and contained little alloy, it may be reckoned worth about 25*s.* of our money.

DARIEN, or the isthmus of Panama, a narrow neck of land, which joins North to South America. It is also the name of a province of Terra Firma, and lies in the form of a crescent about the Bay of Panama. This province is not the richest, though it is of the greatest importance to Spain, and has been the scene of more actions than any other place in the whole continent of America. The immense treasures of Peru are brought hither, and thence exported to Europe. This circumstance has induced many enterprising people to make attempts on Panama, Porto Bello, and other towns of this province, in hopes of obtaining a considerable booty.

Darien, in Georgia, North America, so called by the Scots Highlanders, who settled there in 1736. This settlement is by the side of the river Alatamala, about 12 miles from the sea, where they raised a fort, &c.

DARII, in logic, one of the modes of syllogism of the first figure, wherein the major proposition is an universal affirmative, and the minor and conclusion particular affirmatives: thus,

Da- Every thing that is moved is moved by another;
ri- Some body is moved:
i. Therefore some body is moved by another.

DA'RING. *a.* (from *dare.*) Bold; adventurous; fearless; courageous (*Prior*).

DA'RINGLY. *ad.* Boldly; courageously; fearlessly (*Halifax*).

DA'RINGNESS. *s.* (from *daring.*) Boldness.

DARIUS, a noble satrap of Persia, son of Hystaspes; who conspired with six other noblemen to destroy Smerdis, who usurped the crown of Persia after the death of Cambyses. On the murder of the usurper, the conspirators agreed, that he whose horse neighed first should be appointed king. The groom of Darius previously led his master's horse to a mare, at a place near which the seven noblemen were to pass. On the morrow before sun-rise, when they proceeded all together, the horse recollecting the mare, suddenly neighed. The noblemen dismounted from their horses, and saluted Darius king. Darius was 29 years old when he ascended the throne, and he soon distinguished himself by his military accomplishments. He besieged Babylon, which he took, after a siege of 20 months. From thence he marched against the Scythians, and in his way conquered Thrace, but after several disasters in the wilds of Scythia, retired with shame, and turned his arms against the Indians, whom he subdued. The burning of Sardis, a Grecian colony, incensed the Athenians, and a war was kindled between Greece and Persia, and Mardonius, the king's son-in-law, was entrusted with the care of the war, but his army was destroyed by the Thracians; and Darius, more animated by his loss, sent a more considerable force, under the command of Datis and Artaphernes. They were conquered at the celebrated battle of Marathon, by 10,000 Athenians; and the Persians lost in that expedition no less than 200,000 men. Darius then resolved to carry on the war in person, and immediately ordered a still larger army to be levied: he died in the midst of his preparations, B.C. 485, after a reign of 36 years, in the 65th year of his age. (*Herodot. Justin.* &c.) The second king of Persia of that name was called Ochus or Nothus, because he was the illegitimate son of Artaxerxes, by a concubine. He carried on many wars with success, under the conduct of his generals, and of his son Cyrus. He died B.C. 404, after a reign of 19 years, and was succeeded by his son Artaxerxes. (*Justin*, &c.) The third of that name was the last king of Persia, sirnamed Codomanus. He was the son of Arsaces and Sysigambis, and descended from Darius Nothus. The eunuch Bagous raised him to the throne, but afterwards prepared to poison him. Darius discovered his perfidy, and made him drink the poison which he had prepared against his life. The peace of Darius was early disturbed by Alexander, who invaded Persia to avenge the injuries which the Greeks had suffered from the predecessors of Darius. The king of Persia met his adversary in person, at the head of 600,000 men. This army was remarkable more for its opulence and luxury, than for military courage. With these forces Darius met Alexander. A battle was fought near the Granicus, in which the Persians were easily defeated. Another was soon after fought near Issus; and Alexander left 110,000 of the enemy dead in the field of battle, and took among the prisoners of war, the mother, wife, and children of Darius. The darkness of the night favoured the retreat of Darius, who saved himself by flying in disguise. These losses weakened, but discouraged not Darius: he assembled another more powerful army, and the last decisive battle was fought at Arbela. The victory was long doubtful; but the intrepidity of Alexander, and the superior valour of the Macedonians, prevailed over the effeminate Persians; and Darius, sensible of his ruin, fled towards Media. His misfortunes were now increased. Bessus, the governor of Bactriana, took away his life, in hopes of succeeding him on the throne; and Darius was found by the Macedonians in his chariot, covered with wounds, and almost expiring, B.C. 331. In him the empire of Persia was extinguished 228 years after it had been first founded by Cyrus the Great.

DARK. *a.* (ꝺeoꞃc, Saxon.) 1. Not light; wanting light (*Waller*). 2. Not of a showy or vivid colour (*Boyle*). 3. Blind; without the enjoyment of light (*Dryden*). 4. Opake; not transparent. 5. Obscure; not perspicuous (*Hooker*). 6. Not enlightened by knowledge; ignorant (*Denham*). 7. Gloomy; not cheerful (*Addison*).

DARK. *s.* 1. Darkness; obscurity; want of light (*Shakspeare*). 2. Obscurity; condition of one unknown (*Atterbury*). 3. Want of knowledge (*Locke*).

To DARK. *v. a.* (from the noun.) To darken; to obscure: obsolete (*Spenser*).

DARK-CHAMBER. See CAMERA OBSCURA.

To DA'RKEN. *v. a.* (from *dark*). 1. To make dark; to deprive of light (*Addison*). 2. To cloud; to perplex (*Bacon*). 3. To foul; to sully (*Tillotson*).

To DA'RKEN. *v. n.* To grow dark.

DARKING, or DORKING, a town in Surry, with a market on Thursdays. Lat. 51. 17 N. Lon. 0. 14 W.

DA'RKLING. (a kind of diminutive from *dark*.) Being in the dark (*Shakspeare*).

DA'RKLY. *ad.* (from *dark*.) In a situation void of light; obscurely; blindly (*Dryden*).

DA'RKNESS. *s.* (from *dark*.) 1. Absence of light (*Genesis*). 2. Opakeness; want of transparency. 3. Obscurity; want of perspicuity. 4. Infernal gloom; wickedness (*Shakspeare*). 5. State of being intellectually dark; ignorance; uncertainty (*Locke*). 6. The empire of Satan (*Colossians*).

DA'RKSOME. *a.* (from *dark*.) Gloomy; obscure; not luminous (*Pope*).

DA'RLING. *a.* (ꝺeoꞃlinᵹ, Saxon.) Favourite; dear; beloved (*L'Estrange*).

DA'RLING. *s.* A favourite; one much beloved (*Halifax*).

DARLINGTON, a town in the county of Durham, with a market on Mondays. It contains 4670 inhabitants; has a manufacture of huckabacks and camlets; and is seated on the Skerne, over which is a long stone bridge. Lat. 54. 32 N. Lon. 1. 25 W.

DARMSTADT, a town of Hesse Darmstadt, in the upper circle of the Rhine, Germany. Lat. 49. 43 N. Lon. 8. 40 E.

To DARN. *v. a.* (See DEARN.) To mend holes by imitating the texture of the stuff (*Gay*).

DARNEL, in botany. See LOLIUM.

To DA'RRAIN. *v. a.* 1. To range troops for battle (*Carew*). 2. To apply to the sight (*Spenser*).

DART. *s.* (*dard*, French.) A missile weapon thrown by the hand (*Shakspeare*).

DART, in astronomy and geometry. See SAGITTA.

To DART. *v. a.* (from the noun.) 1. To throw offensively (*Dryden*). 2. To throw; to emit (*Pope*).

To DART. *v. n.* 1. To fly as a dart (*Shakspeare*). 2. To let fly with hostile intention (*Shakspeare*).

DART, a river in Devonshire, which rises at the foot of Dartmoor hills, crosses Dartmoor to Ashburton, and after passing Totness, where it is navigable for small vessels, is joined by the Harebourn, and falls into the English channel at Dartmouth.

DARTER, in ornithology. See PLOTUS.

DARTFORD, in geography, a market town in Kent, having a market on Saturdays. It is situated on the Dover road, about 15 miles from London. The inhabitants amount to more than 2400: the principal manufactories are gunpowder and paper.

DARTMOOR, an extensive moorish tract, in Devonshire, bounded on the N. by bleak hills, and extending southward quite through the centre of the county to the sea. It contains about 80,000 acres, and is watered by the river Dart. Many sheep are bred here, but of a small kind, and subject to the rot. The chief riches of the inhabitants are their black cattle, which thrive well on the coarse sour herbage. On this moor there are just erected large prisons, from the designs of Mr. D. Alexander, a well-known scientific architect, for the reception of persons captured in time of war. A view of these prisons is given in Vancouver's History of Devonshire.

DARTMOUTH, a seaport town of England, situated at the mouth of the Dart, on the English channel; said to have been formerly called Clifton. It is an ancient corporation, and a borough town, sending two members to the British parliament. The harbour is safe, and large enough to contain 500 ships. Here live several considerable merchants, who send out vessels to Newfoundland for fish, which they dispose of in Italy, Spain, Portugal, &c. loading back with wine, fruit, oil, &c. It has a weekly market on Friday, for corn and provisions, and one almost every day for fish: thirty-one miles S. Exeter, and 204 W.S.W. London. Lon. 3. 35 W. Lat. 50. 17 N.

Dartmouth, a town of United America, in the state of New Hampshire: 100 miles N.W. of Boston. Lon. 72. 13 W. Lat. 43. 15 N.

DARWIN (Erasmus, M.D.), a celebrated physician, philosopher, and poet, was born at Elston, near Newark, in Nottinghamshire, Dec. 12, 1731. He received his early education at Chesterfield school, and was from thence removed to St. John's college, Cambridge: being intended for the medical profession, he took the degree of M.B. in 1755, defending in his thesis an opinion that the motion of the heart and arteries is produced by the stimulus of the blood. After he left college he attended the lectures of Dr. Hunter, and then went through a diligent course of study at Edinburgh. He first settled as a physician at Nottingham; but meeting with little success he soon removed to Litchfield, where he resided many years, enjoying a very extensive reputation and a very profitable practice. In the year 1757 he married Miss Mary Howard, daughter of Charles Howard, esq.: by this lady he had five children, two of whom died young; she died in 1770. Soon after the decease of his wife, Dr. Darwin commenced his laborious work the Zoonomia, which, however, he did not think proper to publish till about 1794. In the year 1780 he married Mrs. Pole, the relict of colonel Pole, of Radbourne-hall, near Derby; which occasioned his removal, first to Radbourne, and thence to Derby, where he resided till within a few months of his death. He died April 18th, 1802, at Breadwall Priory, in the 71st year of his age. Besides the Zoonomia, or Laws of Organic Life, in 2 vols. 4to. the doctor published, The Loves of the Plants; The Botanic Garden; The Phytologia, and a Plan for Female Education in Boarding-schools; he also communicated various papers to the Philosophical Transactions, and published some lighter works which need not here be enumerated. Dr. Darwin displayed much learning, taste, and genius, in his different performances; but almost all his powers were subjected to his fancy, which indeed often led him to adopt the most romantic and singular, and sometimes dangerous, opinions. There was one great end, we are told, to the attainment of which all his talents and views were earnestly and uniformly directed. He did not hesitate openly and repeatedly to declare in public company, that the acquisition of wealth was the leading object of all his literary undertakings! He once said to a friend: "I have gained 900*l*. by my Botanic Garden, and 900*l*. by the 1st volume of *Zoonomia*; and if I can every other year produce a work which will yield this sum, I shall do very well. Money, and not fame, is the object I have in view in all my publications." Those who wish to see a complete refutation of the sophisms contained in the Zoonomia will read with pleasure, Observations on the Zoonomia of Dr. Darwin, by Thomas Brown, esq. See also, for an examination of the nature of his poetry, and the tendency of his philosophy, the account of his Temple of Nature, in No. 4 of the Edinburgh Review. In the 7th No. of the same Review, in a critique on Miss Seward's Memoirs of Dr. Darwin, reference is made to an anonymous philosophical poem called Universal Beauty, published in 1735, which is stamped incontrovertibly with all the peculiar characters of what has since been called the Darwinian school.

DARWINIAN THEORY. As we have given a distinct article to the theory of Dr. Brown under the title of Brunonian Theory, we are compelled in point of consistency, to devote a similar article to that of Dr. Darwin. Yet the resemblance between the two is so considerable that having already stated the former, the latter may be discussed in very few words. In reality Darwin himself was fond of commenting upon this similarity, though he was far from relinquishing the originality of his own pretensions: it was his common boast that he was a Brunonian before ever Brown had published a syllable.

The attempt of Darwin was to include in one scheme both general principles and particular facts; and to trace the excitability of the Brunonian theory, and which its author only contemplated as an ultimate resting place, to its actual origin. The excitability of Brown is in the Darwinian dialect denominated sensorial power or spirit of animation; and is conceived to be "a subtile fluid residing in the brain and nerves, and liable to general or partial accumulation." The vital changes effected by this imaginary fluid are:

1st. *Irritation*; "which is an exertion or change of some extreme part of the sensorium residing in the muscles or organs of sense, in consequence of the appulses of external bodies."

2d. *Sensation*; which is "an exertion or change of the central parts of the sensorium or of the whole of it, beginning at some extreme parts of it which reside in the muscles or organs of sense."

3d. *Volition*; "an exertion or change of the central parts of the sensorium or of the whole of it, terminating in some extreme parts of it which reside in the muscles or organs of sense."

4th. *Association*; "an exterior or change of some extreme part of the sensorium, residing in the muscles or organs of sense in consequence of some antecedent or attendant fibrous contractions."

With these assumptions as his guide, Darwin endeavoured to penetrate deeper into the cause of disease than is allowed by a mere knowledge of the condition of the fibre. The powers of the sensorium are the proximate cause; the fibrous action, the excitement of Brown, the proximate effect. And hence by means of an ingenious but highly unsatisfactory statement of the mode by which excitations are produced, he treats of diseases as occasioned by the comparative redundancy, or deficiency of the sensorial power of *irritation*, *sensation*, *volition*, or *association*; these four terms constituting the four classses into which he divides his nosology, and the two opposite measures of *redundancy* and *deficiency*, the two orders of which each class, excepting indeed the last, which is differently divided, consists.

The grand errors in this theory proceed from its not sufficiently distinguishing between cause and effect, between the motion and its source; in substituting mere statements of phenomena for explanations of their origin; and, what is of far more consequence, in attempting to divide that which in itself is in divisible.

Plausible and even splendid therefore as this theory is to the superficial observer, it has already fallen a sacrifice to these radical defects, and may almost be said to have been buried in the same grave with its author. Yet how different was the result to which the author himself looked forward! It is thus he concludes his Zoonomia, which he flattered himself would have lived as long as the earth, and have been diffused to as great an extent. "Thus have I given an outline of what may be termed the sympathetic theory of fevers, to distinguish it from the mechanic theory of Boerhaave, the spasmodic theory of Hoffman, and of Cullen, and the putrid theory of Pringle. What I have thus delivered, I beg to be considered rather as observations and conjectures, than as things explained and demonstrated; to be considered as a foundation and a scaffolding, which may enable future industry to erect a solid and a beautiful edifice, eminent both for its simplicity and utility, as well as for the permanency of its materials—which may not moulder, like the structures already erected, into the sand of which they were composed; but which may stand unimpaired, like the Newtonian philosophy, a rock amid the waste of ages"!

To DASH. *v. a.* (etymology doubtful.) 1. To throw or strike any thing suddenly against something (*Tillotson*). 2. To break by collision (*Shakspeare*). 3. To throw water in flashes (*Mortimer*). 4. To bespatter; to besprinkle (*Shakspeare*). 5. To agitate any liquid, so as to make the surface fly off. 6. To mingle; to adulterate (*Hudibras*). 7. To form or sketch in haste, carelesly (*Pope*). 8. To obliterate; to blot; to cross out (*Pope*). 9. To confound; to make ashamed suddenly; to depress; to suppress (*Pope*).

To DASH. *v. n.* 1. To fly off the surface by a violent motion (*Cheyne*). 2. To fly in flashes with a loud noise (*Thomson*). 3. To rush through water, so as to make it fly (*Dryden*).

DASH. *s.* (from the verb.) 1. Collision (*Thomson*). 2. Infusion (*Addison*). 3. A mark in writing; a line (*Brown*). 4. Stroke; blow: ludicrous (*Shakspeare*).

DASH. *ad.* An expression of the sound of water dashed (*Dryden*).

DASSEN EYLAND, or the ISLE of DEER, one of three small islands to the N. of the Cape of Good Hope. Here are sheep whose tails on an average weigh 18 pounds. Lat. 33. 25 S. Lon. 18. 7 E.

DA'STARD. *s.* (aꝺaꞅꞇꞃıʒa, Saxon.) A coward; a poltroon (*Locke*).

To DA'STARD. *v. a.* To terrify; to intimidate; to desert with cowardice (*Dryden*).

To DA'STARDISE. *v. a.* (from *dastard.*) To intimidate; to deject with cowardice (*Dryden*).

DA'STARDLY. *a.* (from *dastard.*) Cowardly; mean; timorous (*L'Estrange*).

DA'STARDY. *s.* Cowardliness; timorousness.

DASYPHUS. Armadillo. In zoology, a genus of the class mammalia, order bruta. Tuskless; grinders short, cylindrical; in each jaw seven or eight: body covered with a bony shell intersected by zones. Ten species: all natives of South America; yet one, d. septemcinctus, found also in India. They feed on roots, melons, potatoes, flesh, fishes, insects and worms; rest by day, and wander about by night; burrow in the ground; are gentle; defend themselves by rolling into a globular form; the females produce monthly: flesh eatable. They are distinguished into species by the number of bands they possess around their body; the shell, or very curious and complete coat of armour, being in this manner peculiarly and most beautifully divided: and in every instance affording so perfect a coat of armour, that when they are completely coiled up, they are almost beyond the reach of danger. The following may serve as examples.

1. D. tricinctus. Three-banded armadillo. Bands three, moveable; toes five; scales knobbed on the surface; eyes small; ears rounded, short; head oblong, covered by a helmet of one piece; two middle claws of the fore-feet large, length a foot. Inhabits Brazil: feeds on fruit and poultry.

2. D. octocinctus. Eight-banded armadillo. Bands eight; shields two, sprinkled with prominal white knobs; bands spotted triangularly; back iron-grey; sides whitish-grey, spotted with iron-grey; belly whitish. Inhabits Brazil; flesh delicious.

3. D. longicaudus. Long-tailed armadillo. Bands nine; tail long, jointed. Inhabits America; about the size of a cat. See Nat. Hist. Pl. LXXI.

DATA, among mathematicians, a term for such things or quantities as are given or known, in order to find other things thereby that are unknown. Euclid uses the word *data* for such spaces, lines and angles as are given in magnitude, or to which we can assign others equal. From the primary use of the word *data* in mathematics, it has been transplanted into other arts; as philosophy, medicine, &c. where it expresses any quantity, which, for the sake of a present calculation, is taken for granted to be such, without requiring an immediate proof for its certainty; called also the given quantity, number, or power. And hence also such things as are known, from whence either in natural philosophy, the animal mechanism, or the operation of medicines, we come to the knowledge of others unknown, are now frequently in physical writers called *data*.

Data of Euclid, the first in order of the books that have been written by the ancient geometricians, to facilitate and promote the method of resolution or analysis. In general, a thing is said to be given which is either actually exhibited, or can be found out, that is, which is either known by hypothesis, or that can be demonstrated to be known: and the propositions in the book of Euclid's data shew what things can be found out or known, from those that by hypothesis are already known: so that in the analysis or investigation of a problem, from the things that are laid down as given or known, by the help of these propositions, it is demonstrated that other things are given, and from these last that others again are given, and so on, till it is demonstrated that that which was proposed to be found out in the problem is given; and when this is done, the problem is solved, and its composition is made and derived from the compositions of the data which were employed in the analysis. And thus the data of Euclid are of the most general and necessary use in the solution of problems of every kind.

Marinus, at the end of his preface to the data, is mistaking in asserting that Euclid has not used the synthetical, but the analytical method in delivering them: for though in the analysis of a theorem, the thing to be demonstrated is assumed in the analysis; yet in the demonstrations of the data, the thing to be demonstrated, which is, that something is given, is never once assumed in the demonstration; from which it is manifest, that every one of them is demonstrated synthetically: though indeed if a proposition of the data be turned into a problem, the demonstration of the proposition becomes the analysis of the problem. (*Simson's preface to his edition of the Data*).

DA'TARY. *s.* (*datarius*.) An officer of the chancery of Rome.

DATE. *s.* (*datte*, Fr. *datum*, Lat.) 1. The time at which a letter is written, marked at the end or the beginning. 2. The time at which any event happened. 3. The time stipulated when any thing shall be done (*Shakspeare*). 4. End; conclusion (*Pope*). 5. Duration; continuance (*Denham*).

To Date. *v. a.* (from the noun.) To note with the time at which any thing is written or done (*Bentley*).

Date-tree. See Phœnix.

Date-plum (Indian.) See Diospyros.

DA'TELESS. *a.* (from *date*.) Without any fixed term (*Shakspeare*).

DATHOLITE. A translucent siliceous mineral, lately discovered by M. Esmark, at Ahrendal in Norway. Colour, greyish and greenish-white passing into mountain-green. Lustre, shining internally between vitreous and resinous. Fracture small, and imperfectly conchoidal. It is found in large masses, with coarse granular concretions; its more perfect crystals are small, regular, tetrahedral prisms, with truncated angles. It is very hard, and its specific gravity 2.98. According to Klaproth, the following is its composition:

36·5	silex.
35.5	lime.
24.	boracic acid.
4.	loss.
100.	

DATISCA. Bastard-hemp. In botany, a genus of the class diœcia, order dodecandria. Male: calyx five-leaved; corolless; anthers fifteen, long, sessile. Fem.: two-toothed; corolless; styles two; capsule inferior, three-sided, three-horned, one-celled, pervious, many-seeded. Two species.

1. D. cannabina; a native of Canada, with stem smooth.

2. D. hirta; a native of Pennsylvania, with rough, hairy stem.

DATISI, in logic, a mode of syllogisms in the third figure, wherein the major is an universal affirmative, and the minor and conclusion particular affirmative propositions. For example,

Da- All who serve God are kings;
ti- Some who serve God are poor;
si. Therefore some who are poor are kings.

DATIVE, among grammarians, the third case in the declension of nouns. It is called dative, because usually governed by a verb implying something to be given to some person. In English, the dative is expressed by the signs *to* or *for*.

DATU'RA. Thorn-apple. In botany, a genus of the class pentandria, order monogynia. Corol funnel-form, plaited; calyx tubular, angular, deciduous: capsule superior, two-celled, four-valved. Seven species—scattered over the globe: of which the chief are,

1. D. stramonium. Common thorn-apple, found in the wastes of our own country, with spinous, erect, ovate pericarps; ovate, glabrous leaves. It rises about a yard high with a strong perpendicular, round, hollow, green stalk, branching luxuriantly, and to a great extent; at night the upper leaves become erect and inclose the flowers, which have sometimes a tinge of purple or violet. The flowers consists of one large funnel-shaped petal, succeeded by large roundish capsules of the size of middling apples, closely beset with sharp spines which constitute what is called the thorn-apple. For the medical virtues of this plant see Stramonium; under which name it is usually designated in our pharmacopœ'as.

2. D. arborea. A tall tree of Peru, with glabrous leaves, hollow herbaceous stem; glabrous nodding pericarps without spines; large fragrant flowers.

DAVA'LLIA. In botany, a genus of the class cryptogamia, order filices. Fructification in roundish distinct dots near the margin; involucre membranaceous, from the surface half-hooded, distinct, somewhat truncate, opening towards the margin. Nineteen species.

To DAUB. *v. a.* (*dabben*, Dutch.) 1. To smear with something adhesive (*Exodus*). 2. To paint coarsely (*Otway*). 3. To cover with something specious or gross (*Shakspeare*). 4. To lay on any thing gaudily or ostentatiously (*Bacon*). 5. To flatter grossly (*South*).

To Daub. *v. n.* To play the hypocrite (*Shakspeare*).

DAUBENTON (Lewis Mary), a celebrated naturalist, was born at Monbard in Burgundy, in May 1716. He studied medicine, and intended to follow that profession; but Buffon, being appointed intendant of the king's garden in 1735, proposed to Daubenton to reside with him, to apply to natural history, and to assist him in the grand labours which he was then about to undertake. In 1740, the fate and taste of Daubenton were determined for his whole life. More than half a century devoted to the formation of the cabinet of natural history (in 1750 merely a drug shop), which he arranged methodically and enriched with productions of every kind, has given him a distinguished rank among naturalists. Being admitted into the Academy of Sciences in 1744, he never ceased to enrich the collection of its memoirs with various papers, for nearly 50 years. The greater part of them contain new facts and ideas, respecting the classification of shells, on the hippopotamus, the shrew-mouse, bats, fossil-bones and teeth, the situation of the great foramen in man and animals, rumination and the temperament of sheep, descriptions of various animals little known, &c. He died at Paris, January 1, 1800. His funeral was attended by more than 400 persons.

DA'UBER. *s.* (from *daub.*) A coarse low painter (*Swift*).

DA'UBY. *a.* (from *daub.*) Viscous; glutinous; adhesive (*Dryden*).

DAUCUS. Carrot. In botany, a genus of the class pentandria, order digynia. Involucres pinnatifid; flowers somewhat radiating; florets of the centre abortive, fruit muricate. Six species—all exotics, and natives of the South of Europe, except

D. carota, or common carrot, which is indigenous to our own pastures, with bristly seeds; and peticles nerved underneath. The root is highly useful as well for fodder as for the table; concerning both, and especially the first, see Husbandry. It has also been employed on account of the great quantity of saccharine matter it contains, both for sugar and for alkohol. It has not saccharine matter enough to render it ever an article that can vie even with the beet-root, much more with the sugar-cane; but it may be worked up, perhaps, with considerable advantage in distilleries, either alone, or in conjunction with malt.

DAVENANT (Sir William), an English poet. He was born in 1605 at Oxford, where his father kept an inn. The first part of his education he received at the grammar-school of that city, and then he was entered of Lincoln college. He did not remain long at the university, but became page to the duchess of Richmond, and afterwards to lord Brook. In 1628 he commenced author, and formed an intimacy with the first wits of the age. About this time he had the misfortune to lose his nose in consequence of an amour. He succeeded Ben Jonson as poet-laureat, and in 1643 he was knighted by Charles I. When the king's affairs declined he went to France and changed his religion, which recommended him to the patronage of the queen, who sent him to England to advise her husband to save himself by giving up the church, which so displeased him that he ordered Davenant never to come into his presence again. He was next engaged to convey a number of artificers from France to Virginia, but the ship was taken and carried to England, where he would have been certainly executed if Milton and some others had not interceded for his life. He now set up a sort of operas, to support himself, plays being forbidden; but at the restoration he obtained a patent for erecting a playhouse in Lincoln's-inn-fields. He died in 1668, and was interred in Westminster abbey. His works were published together in 1673, consisting of plays and poems (*Watkins*).

DAVENTRY, or Daintry, a borough town of Northamptonshire, having a market on Wednesdays. Lat 52. 15 N. Lon. 1. 10 W.

DA'UGHTER. *s.* (dauhtar, Gothick; ꝺohꞇeꞃ, Saxon; *dotter*, Runick.) 1. The female offspring of a man or woman. 2. A daughter in law, or son's wife. 3. A woman (*Genesis*). 4. (In poetry.) Any descendant. 5. The female penitent of a confessor (*Shakspeare*).

DAVID, king of Israel, born at Bethlehem, 1085 B.C. He was crowned, while a youth and a shepherd, by the prophet Samuel. His valour in killing Goliath procured him a place at the court of Saul, who afterwards endeavoured to take his life, on which David fled from place to place. When that prince fell, David was recognized king by the nation, which he governed with great glory; though the affair of Uriah has blackened his character. However he sorely repented of that crime, and suffered for it. His reign was disturbed by foreign wars, and more by a rebellion excited by his son Absalom, whose death he feelingly lamented. David, on the whole, was a great prince and a good monarch. He died in 1015 B.C. and in the 70th year of his age. A considerable part of the book of Psalms having been composed by him, occasions the whole to be called by his name. A fine history of the life of David was published by Dr. Delany, in 2 vols. 8vo. The doctor has very ably defended the character of the "man after God's own heart" against the objections of deistical cavillers. After rescuing the name of the Jewish prince from obloquy, Dr. Delany concludes with this impressive summary:

"Upon the whole, David's is a character which stands single in the accounts of the world; equally eminent, and unrivalled.

"For, not to insist upon his great personal accomplishments, such as beauty, stature, strength, swiftness, and eloquence; his character is sufficiently distinguished by the noblest qualities, endowments, and events.

"Exalted from an humble shepherd to a mighty monarch, without the least tincture of pride, disdain, or envy: quite otherwise; remarkably humble in exaltation; or rather, humbled by it. Exalted unenvied! Exalted himself, and equally exalting the state he ruled; raising it from contempt, poverty, and oppression, to wealth, dignity, and sway. A man experienced in every vicissitude of fortune and life, and equal to them all. Thoroughly tried in adversity, and tempted by success; yet still superior! Cruelly and unjustly persecuted; yet not to be provoked even to just revenge. In the saddest and suddenest reverse of fortune, depressed by nothing but the remembrance of guilt; and in consequence of that, unhumbled to any thing but God.

"To sum up all; a true believer, and zealous adorer, of God; teacher of his law and worship, and inspirer of his praise. A glorious example, a perpetual and inexhaustible fountain, of true piety. A consummate and unequalled hero, a skilful and a fortunate captain. A steady patriot, a wise ruler, a faithful, a generous, and a magnanimous friend: and, what is yet rarer, a no less generous and magnanimous enemy! A true penitent, a divine musician, a sublime poet, and an inspired prophet. By birth a peasant, by merit a prince. In youth, a hero; in manhood, a monarch; in age, a saint!

"This is David. *What his revilers are, their own revilings tell.*"

David (St.), a native of Wales, and the tutelar saint of that country. He descended from the royal family of the Britons, being uncle to king Arthur, and was son of Xantus, prince of Ceretica, now Cardiganshire. He was brought up in the service of God, and being ordained priest, retired into the Isle of Wight, and embraced an ascetic life. He studied a long time to prepare himself for the functions of the holy ministry; at length, coming out of his solitude, like the Baptist out of the Desart, he preached the word of eternal life to the Britons. He founded twelve monasteries, the principal of which was in the vale of Ross, near Menevia, where he formed many great pastors, and eminent servants of God. By his rule he obliged all his monks to assiduous manual labour, and allowed them the use of no cattle in tilling the ground. They returned late in the day to the monastery; and these labours were never interrupted but by prayers and reading the Holy Scriptures, short repose, and moderate refreshment. Pelagianism springing up a second time in Britain, the bishops, in order to suppress it, held a synod at Brevy, in Cardiganshire. St. David, being invited to it, went thither, and in that venerable assembly confuted and silenced the doctrine, by his eloquence and learning. At the close of the synod, the archbishop of Caerleon resigned his see to St. David, whose tears and opposition were only to be overcome by the absolute command of the synod. He had, however, liberty to transfer his see from Caerleon, then a populous city, to Menevia, now called St. David's. Gyraldus adds, that St. David was the great ornament and pattern of his age. He spoke with great force and energy; but his example was more powerful than his eloquence, and he has in all succeeding ages been the glory of the British church. He continued in his last see many years, and died towards the latter end of the 6th century, in a very advanced age. He was buried in his church of St. Andrew, which hath since taken his name, with the town and whole diocese. His day (August 1), is kept as a festival through the whole principality, as well as by the natives of Wales who reside in London. (*Audley's Companion to the Almanack, pa.* 13).

David's (St.) an episcopal town of Pembrokeshire, in South Wales. It was formerly an archiepiscopal see, and the metropolitan of the British church. The see was removed by David from Caerleon to St. David's, in 577; and lost its archiepiscopal power about 1115, when it became a suffragan to the see of Canterbury. Its annual value was estimated at 426*l.* 2*s.* 1*d.* in the time of Henry VIII. This place is the most western of the main land in Wales. Lat. 51.56 N. Lon. 5. 15 W.

DAVIE'SIA, in botany, a genus of the class decandria, order monogynia. Calyx angular, simple, five-cleft; corol papilionaceous; stigma simple, acute; legume compressed, one-seeded. One species only; a native of Australasia; a rigid shrub with simple pungent leaves.

DAVIS (John), a famous navigator in the sixteenth century, was born at Sandridge, near Dartmouth in Devonshire; and distinguished himself by making three voyages to the most northern parts of America, in order to discover a north-west passage to the East Indies; in which he discovered the straits which bear his name. He afterwards performed five voyages to the East Indies; in the last of which he was slain in a desperate fight with some Japanese, near the coast of Malacca, on the 27th of December 1605. He wrote an account of his second voyage for the discovery of the north-west passage; a voyage to the East Indies; and other tracts.

Davis's straits, an arm of the sea between Greenland and N. America, discovered by captain Davis in 1585, when he attempted to find a N.W. passage to China.

DAVIT, in a ship, that short piece of timber, with a notch at one end, wherein, by a strap, hangs the fish-block. The use of this block is to help up the fluke of the anchor, and to fasten it at the ship's bow, or loof. The davit is shiftable from one side of the ship to the other, as there is occasion. There is also a small davit in the ship's boat, that is set over her head with a shiver, in which is brought the buoy rope, wherewith to weigh the anchor.

To DAUNT. *v. a.* (*domter*, Fr.) To discourage; to fright; to intimidate (*Granville*).

DA'UNTLESS. *a.* (from *daunt.*) Fearless; not dejected (*Pope*).

DA'UNTLESSNESS. *s.* Fearlesness.

DAUPHIN, Dolphin. In astronomy. See Delphinus.

Dauphin, a title given, during the existence of royalty in France, to the eldest son and presumptive heir of the crown. For the reason of which title, see Dauphiny.

DAUPHINY, a province of France, bounded on the W. by the river Rhone, on the N. by the Rhone and Savoy, on the S. by Provence, and on the E. by the Alps. Some part of this country is fertile, producing corn, wine, olives, wood, copperas, silk, crystal, iron, and copper: but the greatest part of it is barren. It was formerly governed by its own princes; the last of whom, Dauphin Humbert, about the year 1343, made his territory over to the king of France, upon condition that the king's eldest son should enjoy it; and it was on this account that the heir to the crown of France was styled Dauphin. This province forms the present departments of Drome, Isere, and Upper Alps.

DAURAT (John), a French poet, born in 1507. He made so great a progress in his studies at Paris, that he was appointed one of the Greek professors in that university. Charles IX. made him poet-laureat, and took great pleasure in his conversation. At the age of eighty he married a young girl, who brought him a son. His poems in Greek, Latin, and French, are exceedingly numerous. He died at Paris in 1588.

DAW. In ornithology. See Corvus monedula.

Daw (Surinam). See Corvus Surinamensis.

Daw (Black and yellow). See Oriolus Persicus.

DAWK. *s.* A hollow or incision in stuff (*Moxon*).

To Dawk. *v. a.* To mark with an incision.

To DAWN. *v. n.* 1. To grow luminous; to begin to grow light (*Pope*). 2. To glimmer obscurely (*Locke*). 3. To begin, yet faintly; to give some promises of lustre or eminence (*Pope*).

Dawn. *s.* (from the verb.) 1. The time between the first appearance of light and the sun's rise (*Dryden*). 2. Beginning; first rise (*Pope*).

DAY, a division of time arising from the appearance and disappearance of the sun.

Day is either natural or artificial.

Day (Artificial), is that which is primarily meant by the word day, and is the time of its being light, or the time while the sun is above the horizon. Though sometimes the twilight is included in the term day-light; in opposition to night or darkness, being the time from the end of twilight to the beginning of day-light.

Day (Natural), is the portion of time in which the sun performs one revolution round the earth; or rather, the time in which the earth makes a rotation on its axis. And this is either astronomical or civil.

Day (Civil), is the time allotted for day in civil purposes, and begins differently in different nations, but still including one whole rotation of the earth on its axis; beginning either at sunrise, sun-set, noon, or midnight. 1st At sunrising, among the ancient Babylonians, Persians, Syrians, and most other eastern nations, with the present inhabitants of the Balearic islands, the Greeks, &c. 2dly, At sun-setting, among the ancient Athenians and Jews, with the Austrians, Bohemians, Marcomanni, Silesians, modern Italians, and Chinese. 3dly, At noon, with astronomers, and the ancient Umbri and Arabians. And 4thly, at midnight, among the ancient Egyptians and Romans, with the modern English, French, Dutch, Germans, Spaniards, and Portuguese.

The day is divided into hours; and a certain number of days makes a week, a month, or a year. The old Latin names for the days in the week are still retained in the journals of parliament and of medical men: they are as follow: *dies Solis, dies Lunæ, dies Martis, dies Mercurii, dies Jovis, dies Veneris,* and *dies Saturni.*

The northern nations, however, have substituted for the Roman divinities, such of their own as most nearly resembled them in their peculiar attributes. Thus, the third day of the week, consecrated by the Romans to Mars, was named from the Scandinavian deity Tyr. In the Danish and Swedish language it is Tyrsdag, from whence our Tuesday. Tyr was an inferior deity, but presided over battles: and Tacitus renders the name Tyr by that of Mars, and makes him inferior to Odin, whom he describes under the name of Mercury. From this Odin or Wodin, we derive Wednesday, answering to dies Mercurii. Thursday is the day of the great god Thor, the most formidable of the northern deities. The goddess Freya, from whose name we derive our Friday, bears a still greater resemblance to Venus: nay, so striking is the analogy, that some authors have considered it as more than probable that the mythology of the barbarous nations of the north had a common origin with that of the Greeks and Romans.

Day (Astronomical), begins at noon, or when the sun's centre is on the meridian, and is counted twenty-four hours to the following noon.

The astronomical day, or the interval of time between two successive transits of the sun's centre over the same meridian, is called, likewise, a solar day. And the interval between two successive returns of the same fixed star to the same meridian, is called a sidereal day.

Mr. Flamstead has shewn, that one day, when the sun is in the equinoctial, is shorter than when he is in the tropics, by forty seconds; and that fourteen tropical days are longer than so many equinoctial ones, by ten minutes. This inequality of the solar days arises from a combination of two causes: the obliquity of the ecliptic, and the eccentricity of the earth's orbit; while the equation of time arises from three causes. See EQUATION OF TIME.

Mr. Euler (in Phil. Trans. vol. xlvi. p. 358), says he has some reasons, deduced from Jupiter's action on the earth, to think, that the earth's revolution upon its axis becomes continually more and more rapid. But M. Laplace (Mecanique Celeste, tom. iii.) proves both from theory, and from a computation of eclipses that took place more than 2000 years ago, that the mean length of the day has undergone no change; thus establishing the invariability of the most essential measure in all astronomical observations.

For the variety in the lengths of days and nights in different climates and seasons, see CLIMATES and SEASONS.

From DAY *to* DAY; without certainty or continuance (*Bacon*).

To-DAY. On this day (*Fenton*).

DA'YBED. *s.* (*day* and *bed.*) A bed used for idleness and luxury (*Shakspeare*).

DA'YBOOK. *s.* (from *day* and *book.*) A tradesman's journal.

DA'YBREAK. *s.* (*day* and *break.*) The dawn; the first appearance of light (*Dryden*).

DAY-FLY. In entomology. See EPHEMERA.

DAYLA'BOUR. *s.* (*day* and *labour.*) Labour by the day (*Milton*).

DAYLA'BOURER. *s.* (from *daylabour.*) One that works by the day (*Milton*).

DA'YLIGHT. *s.* (*day* and *light.*) The light of the day, as opposed to that of the moon, or a taper (*Knolles. Newton*).

DAY-LILY. In botany. See HEMEROCALLIS.

DAY-NET, a net generally used for taking such small birds as play in the air, and will stoop either to prey, gig, or the like; as larks, linnets, buntings, &c. The season of the year for using this net, is from August to November; and the best time is very early in the morning: and the milder the air, and the brighter the sun, the better will be the sport, and the longer its continuance. The place where this net should be laid, ought to be plain champaign, either on shorts tubbles, green lays, or flat meadows, near corn fields, and somewhat remote from towns and villages: the net must lie close to the ground, that the birds creep not out and make their escape.

This net is made of fine packthread, with a small mesh, not exceeding half an inch square: it must be three fathoms long, and one broad; its shape is like the crow-net, and it must be verged about after the same manner, with a small but strong cord, and the two ends extended upon two small, long poles, adapted to the breadth of the net, with four stakes, tail-strings, and drawing-lines.

The net is double, each side being exactly alike; and laid opposite to each other, so even and close, that when they are drawn and pulled over, they must meet and touch.

Fix the net down with strong stakes, very stiff on their lines, so that you may with a nimble twitch cast them backwards and forwards at pleasure; then fasten your drawing-cords, or hard-lines (of which there must be a dozen at least, each two yards long) to the upper end of the foremost staves: and so extend them of such a straightness, that with a little strength they may raise up the nets, and cast them over.

Your net being thus laid, place your gigs, or playing wantons, about twenty or thirty paces beyond, and as much on this side your nets: the gigs must be fastened to the tops of long poles, and turned into the wind, so as to play and make a noise in it. These gigs are a sort of toys made of long goose-feathers, like shuttle-cocks, with little small tunnels of wood, running in broad and flat swan-quills, made round, like a small hoop; whence with longer strings fastened to the pole, they will, with any small wind or air, so move, that birds will come, in great flocks, to play about them.

When you have placed your gigs, next place your decoy; which is a small stake of wood, to prick down in the earth, having in it a mortice-hole, in which a small, long, and slender piece of wood, about two feet long, is fastened, so that it may move up and down at pleasure: and fasten to this longer stick, a small line, which running through a hole in the stick, and so coming up to the place where you are to sit, you may, by drawing the line up and down with your right hand, raise up the longer stick from the ground, as you see occasion.

Fasten a live lark, or some similar bird, to this longer stick, with which the line making it to stir up and down by your pulling, will entice the birds to come to your net.

There is another enticement, to attract these birds, called a looking-glass; which is a round stake of wood, as big as a man's arm, made very sharp at the end, to be thrust into the ground. Artists make it very hollow in the upper part, about five fingers deep; into which hollow they place a three-square piece of wood, about a foot long, and each two inches broad, lying upon the top of the stake, and going with a foot into the hollowness; which foot must have a great knob at the top, and another at the bottom, with a deep slenderness between, to which slenderness you are to fasten a small packthread, which running through a hole in the side of the stake, must come up to the place where you sit. The three-square piece of wood which lies on the top of the stake, must be of such a true poise and evenness, and the foot in the socket so smooth and globular, that it may whirl and turn round upon the least touch, winding the packthread so many times about it, which being suddenly drawn and as suddenly relinquished, will keep the engine in a constant rotation: then fasten with glue, upon the uppermost flat squares of the three-square piece, about twenty small pieces of looking-glass, and paint all the square wood between them of a light and lively red; which in the continual motion will give such a reflection, that the birds will play about to admiration till they are taken.

Both this and the other decoy are to be

placed in the midst between the two nets, at about two or three feet distance from each other; so that in the falling of the nets, the cords may not touch or annoy them: neither must they stand one before or after another, the glass being kept in a continual motion, and the bird very often fluttering. Having placed your net in this manner, as also your gigs and lures, go to the further end of your long drawing-lines and enticing-lines, and having fixed yourself, lay the main drawing-line across your thigh, and with your left hand pull the decoy-line to shew the birds; and when you perceive them play near and about your nets and lures, pull the net over with both hands with a quick, but not too hasty, motion; otherwise your sport will be spoiled.

Remember to lay behind you, where you sit, all the spare instruments and implements to be used; as stakes, poles, line, packthread, knitting-pin, and needle, your decoy-bag, a mallet to knock in the stakes upon occasion: and, lastly, let the first half dozen of birds you take be kept alive for lures, for you must not be unprovided with these upon any account.

In Plate XCII. fig. 1. A shews the bodies of the main net, and how they ought to be laid. B the tail, or hinder lines, staked to the ground. C the fore lines, staked also to the ground. D the knitting-needle. E the bird-lure. F the looking-glass lure. G the line which draws the bird-lure. H the line that draws the glass-lure. I the drawing double lines of the net which pulls them over. K the stakes which stake down the four nether points of the net, and the two tail-lines. L the stakes that stake down the fore-lines. M the single line, with the wooden button to pull the net over with. N the stake that staketh down the single line, and where the sportsman should sit. O the wooden mallet. P the hatchet: and Q the gig.

DAYS IN BANK, are days set down by statute or order of the court, when writs shall be returned, or when the party shall appear on the writ served. They say also, if a person is dismissed without day, he is finally discharged.

DAYS OF GRACE, are those granted by the court at the prayer of defendant or plaintiff. In commerce, days of grace, are the three days allowed for the payment of a bill of exchange, &c. after the same has become due. It is the custom to give ten days in France and Dantzic; eight at Naples; six at Venice, &c.

DAYS-MAN, in the common translation of the Bible, an arbitrator, or one who decides between disputing parties. The word is now used in this sense in some parts of the north of England.

DAYS INTERCALARY. See Bissextile and Intercalary.

DA'YSPRING. *s.* (*day* and *spring.*) The rise of the day; the dawn (*Milton*).

DA'YSTAR. *s.* (*day* and *star.*) The morning star (*Ben Jonson*).

DAY'SWORK, among seamen, the account of a ship's course during twenty-four hours.

DA'YTIME. *s.* (*day* and *time.*) The time in which there is light: opposed to night (*Bacon*).

DA'YWORK. *s.* (*day* and *work.*) Work imposed by the day; daylabour (*Fairfax*).

To DAZE. *v. a.* (ꝺƿæꞅ, Saxon.) To overpower with light (*Fairfax. Dryden*).

DA'ZIED. *a.* Besprinkled with daisies (*Shakspeare*).

To DA'ZZLE. *v. a.* To overpower with light (*Davies*).

To Da'zzle. *v. n.* To be overpowered with light; to lose the power of sight (*Bacon*).

DEACON, Diaconus, an officer in the Christian church. The word is formed from the Latin *diaconus*: of the Greek διακονος, minister, servant.

The institution of deacons may be traced to the Acts of the Apostles, ch. vi. v. 1—6: whence it appears that their business is to take care of the poor, and serve tables; that is, to see that the table of the Lord, the table of the poor, and the table of the pastor or minister, be supplied. Deacons should be chaste, sincere, and blameless, 1 Tim. iii. 8—12. Grotius apprehends that the order of deacons in the Christian church corresponded to that of eleemosynaries in the Jewish synagogue. Their office was, to serve in the agapæ, and to distribute the bread and wine to the communicants, and dispense the alms. Tertullian informs us, that the deacons preached, and, in the absence of the bishop and presbyters, conferred the sacrament of baptism. De Bapt. p. 602.

At Rome, under pope Sylvester, they had only one deacon; then seven were appointed; then fourteen; and, at last, eighteen; who were called cardinal deacons, to distinguish them from those of other churches.

Their office was to take care of the temporalities of the church, to look to the rents and charities, and provide for the necessities of the ecclesiastics, and even of the pope. The collecting of the rents, alms, &c. belonged to the subdeacons; the deacons were the depositaries and distributers. Having thus the management of the revenues of the church in their hands, their authority grew apace, as the riches of the church increased. Those of Rome, as being ministers of the first church, preceded all others, and even at length took place of the priests themselves. Doubtless, it was the avarice of the priests that made them give place to the deacons, who had the disposal of the money.

The office of a deacon, in the church of England, according to the form of ordination, is to baptize, preach, and assist in the administration of the Lord's supper; and, in short, to perform all the other offices in the liturgy, which a priest can do, except that of consecrating the elements of the Lord's supper, and pronouncing the absolution. No person can be ordained a deacon under the age of twenty-three years, unless by a faculty or dispensation obtained from the archbishop of Canterbury: and in order to this, he must be provided with a title to a cure, or be a fellow or chaplain in some college in Cambridge or Oxford, or a master of arts of five years standing, living at his own charge in either of the universities, or be admitted by the bishop who ordains him to some benefice or curacy then void. Otherwise the ordaining bishop shall maintain him, till he is preferred to some ecclesiastical living. And by stat. 13 and 14 Car. II. c. 4, no person is capable of being admitted to any benefice or ecclesiastical promotion, till he be ordained a priest; nor is a deacon capable of a donative, but is only allowed to use his orders as a chaplain to some family, a curate to some priest, or a lecturer without a title.

In the church of Scotland, the deacon's office only requires him to take care of the poor.

DEACONESS, a female deacon; an order of women who had their distinct offices and services in the primitive church. This office appears as ancient as the apostolical age; for St. Paul calls Phebe a servant of the church of Cenchrea. The original word is διακονος, answerable to the Latin word *ministra*. Tertullian calls them *viduæ*, widows, because they were commonly chosen out of the widows of the church; and, for the same reason, Epiphanius, and the council of Laodicea, calls them πρεσβυτιδας, elderly women, because none but such were ordinarily taken into this office. For, indeed, by some ancient laws, these four qualifications were required in every one that was to be admitted into this order. 1. That she should be a widow. 2. That she should be a widow that had borne children. 3. A widow that was but once married. 4. One of a considerable age, 50 or 60 years old: though all these rules admitted of exceptions.

One part of their office was to assist the minister at the baptizing of women, to undress them for immersion, and to dress them again, that the whole ceremony might be performed with all the decency becoming so sacred a rite. Another part of their office was to be private catechists to the women-catechumens who were preparing for baptism. They were likewise to attend the women that were sick and in distress; to minister to martyrs and confessors in prison; to attend the women's gate in the church; and lastly, to assign all women their places in the church, regulate their behaviour, and preside over the rest of the widows; whence in some canons they are styled προκαθημεναι, governesses. This order, which since the tenth or twelfth century has been wholly laid aside, was not abolished every where at once, but continued in the Greek church longer than in the Latin, and in some of the Latin churches longer than in others.

DE'ACONRY. DE'ACONSHIP. *s.* The office or dignity of a deacon.

DEAD. *s.* (ꝺeaꝺ, Saxon.) 1. Deprived of life; exanimated (*Hale*). 2. Without life; inanimate (*Pope*). 3. Imitating death; senseless; motionless (*Psalms*). 4. Unactive; motionless (*Lee*). 5. Empty; vacant (*Dryden*). 6. Useless; unprofitable (*Addison*). 7. Dull; gloomy; unemployed (*Knolles*). 8. Still; obscure (*Hayward*). 9. Having no resemblance of life (*Dryden*). 10. Obtuse; dull; not sprightly (*Boyle*). 11. Dull; frigid; not animated (*Addison*). 12. Tasteless; vapid; spiritless. 13. Uninhabited (*Arbuthnot*). 14. (In theology.) The state of spiritual death, lying under the power of sin.

The DEAD. *s.* Dead men (*Smith*).

DEAD. *s.* Time in which there is remarkable stillness or gloom: as at midwinter and midnight (*South. Dryden*).

To DEAD. *v. n.* (from the noun.) To lose force, of whatever kind (*Bacon*).

To DEAD. *To* DE'ADEN. *v. a.* 1. To deprive of any kind of force or sensation (*Bacon*). 2. To make vapid, or spiritless (*Bacon*).

DEAD-DOING. *particip. a.* (*dead* and *do.*) Destructive; killing; mischievous (*Hudibras*).

DEAD-EYES, in naval affairs, certain blocks with three holes in them, whereby to draw tight the shrouds and stays of a ship.

DEAD-LIFT. *s.* (*dead* and *lift.*) Hopeless exigence (*Hudibras*).

DEAD-LIGHT, amongst seamen, a sort of strong wooden posts, made to fit the cabin-windows: they are always fixed in on any expectation of a storm, and the glass windows taken out, which might otherwise be shattered to pieces by the sea, and let great quantities of water pour into the ship.

DEAD-NETTLE. In botany. See LAMIUM.

DEAD-RECKONING, in navigation, the judgment or estimation which is made of the place where a ship is, without any observation of the heavenly bodies; and is performed by keeping an account of her way by the log, in knowing the course they have steered by the compass, and by rectifying all the allowances for drift, lee-way, &c. according to the ship's known trim. This reckoning, however, is always to be corrected as often as any good observation can be obtained.

DEAD SEA, or LAKE ASPHALTITES. (See ASPHALTITES). A large lake, or inland sea of Palestine, into which the river Jordan runs. This latter contains neither animal nor vegetable life, no verdure on its banks, or fish in its waters. Mr. Maundrel, in his Journey from Aleppo to Jerusalem, informs us, that the Dead sea is enclosed on the east and west with exceedingly high mountains; on the north it is bounded by the plain of Jericho, on which side it receives the waters of Jordan. On the south it is open, and extends beyond the reach of the eye. It is said to be twenty-four leagues long, and six or seven broad. "On the shore of the lake, we found (says he), a black sort of pebble, which being held in the flame of a candle, soon burns, and yields a smoke of an intolerable stench. It has this property, that it loses only of its weight, and not of its apparent bulk, by burning." The hills bordering upon the lake are said to abound with this sort of sulphureous stones. As for the bitumen, there was none at the place where Mr. Maundrel was; but it is gathered near the mountains on both sides in great plenty. He had several lumps of it brought to him at Jerusalem. It exactly resembled pitch, and could scarcely be distinguished from it, but by its sulphureousness of smell and taste. Mr. Wells, in his Scripture Geography, assigns several forcible reasons for the belief, that the present appearances about the Dead sea are really caused by the divine judgment on Sodom and the cities of the plain, vol. i. p. 146.

Mr. Gordon of Clunie, who has recently travelled in Palestine, presented a phial of the Dead sea water to sir Joseph Banks, at whose request it was carefully analysed by Dr. Alexander Marcet. One of the most obvious peculiarities is, the great specific gravity of this water, which Dr. Marcet found to be 1·211. The following is given as the most accurate result of the analysis. On summing up the contents of 150 grains of the water, they appeared to be

	Salts.	*Acids.*
Muriat of lime . .	5·88 grs.	2·89 grs.
Muriat of magnesia .	15·87	8·61
Muriat of soda . .	15·54	7·15
Selenite	0·08	
	36·87	18·65

And consequently the proportions of these salts in 100 grains of the water would be:

Muriat of lime	3·920 grs.
Muriat of magnesia . . .	10·246
Muriat of soda . . .	10·360
Sulphat of lime	0·054
	24·580

Hence it appears, that the Dead sea water now contains about one-fourth of its weight of salts, supposed in a state of perfect desiccation; or, if they be desiccated at the temperature of 180° on Fahrenheit's scale, they will amount to forty-one per cent. of the water! (Phil. Trans. for 1807). This appears to us to furnish the strongest possible confirmation of the Scripture account of the origin of the Dead sea.

DE'ADLY. *a.* (from *dead.*) 1. Destructive; mortal; murderous (*Shakspeare*). 2. Mortal; implacable (*Knolles*).

De'adly. *ad.* 1. In a manner resembling the dead (*Dryden*). 2. Mortally (*Ezekiel*). 3. Implacably; irreconcilably; destructively.

Deadly carrot. See Thapsia.

Deadly nightshade. See Atropa.

DE'ADNESS. *s.* (from *dead.*) 1. Frigidity; want of warmth; want of ardour; want of affection (*Rogers*). 2. Weakness of the vital powers; languor; faintness; inactivity of the spirits (*Lee*). 3. Vapidness of liquors; loss of spirit (*Mortimer*).

DEAF. *a.* (*doof,* Dutch.) 1. Wanting the sense of heating (*Holder*). 2. Deprived of the power of hearing (*Dryden*). 3. Obscurely heard (*Dryden*).

To Deaf. *To* De'afen. *v. a.* To deprive of the power of hearing (*Dryden*).

DE'AFLY. *ad.* (from *deaf.*) 1. Without sense of sounds. 2. Obscurely to the ear.

DE'AFNESS. *s.* (from *deaf.*) 1. Want of the power of hearing; want of sense of sounds (*Holder*). 2. Unwillingness to hear (*King Charles*).

Deafness, the state of a person who wants the sense of hearing; or, the disease of the ear, which prevents its due reception of sounds. Deafness generally arises either from an obstruction or a compression of the auditory nerve; or from some collection of matter in the cavities of the inner ear; or from the auditory passage being stopped up by some hardened excrement; or, lastly, from some excrescence, a swelling of the glands, or some foreign body introduced within it. Those born deaf are also dumb; not being able to learn any language, at least in the common way. However, as the eyes in some measure serve them for ears, they may understand what is said by the motion of the lips, tongue, &c. of the speaker; and even accustom themselves to move their own, as they see other people do, and by this means learn to speak. Thus it was that Dr. Wallis taught two young gentlemen, born deaf, to know what was said to them, and to return pertinent answers. Digby gives us another instance of the same, within his own knowledge; and there was a Swiss physician lately living in Amsterdam, one John Conrad Amman, who effected the same, in several children born deaf, with surprising success.

In the Philosophical Transactions, No. 312, we have an account by Mr. Waller, R. S. secretary, of a man and his sister, each about fifty years old, born in the same town with Mr. Waller, who had neither of them the least sense of hearing; yet both of them knew, by the motion of the lips only, whatever was said to them, and would answer pertinently to the question proposed. It seems they could both hear and speak when children, but lost their sense afterwards: whence they retained their speech, which, though uncouth, was yet intelligible. Such another instance is related by bishop Burnet of a young woman. "At two years old, they perceived she had lost her hearing; and ever since, though she hears great noises, yet hears nothing of what is said to her: but by observing the motions of the mouth and lips of others, she acquired so many words, that out of these she has formed a sort of jargon, in which she can hold conversation whole days with those that can speak her language. She knows nothing that is said to her, unless she see the motion of their mouths that speak to her, so that in the night they are obliged to light candles to speak to her. One thing will appear the strangest part of the whole narration: she has a sister, with whom she has practised her language more than with any body else; and in the night, by laying her hand on her sister's mouth, she can perceive by that what she says, and so can discourse with her in the dark."

It is observable, that deaf persons, and several others thick of hearing, hear better and more easily if a loud noise be raised at the time when you speak to them; which is owing, no doubt, to the greater tension of the ear-drum on that occasion. Dr. Wallis mentions a deaf woman, who, if a drum were beat in the room, could hear any thing very clearly; so that her husband hired a drummer for a servant, that by this means he might hold conversation with his wife. The same author mentions another, who, living near a steeple, could always hear very well if there was a ringing of three or four bells, but never else. See EAR TRUMPET.

The abbé de l'Epée, and M. Sicard, have been very successful in educating the deaf and dumb. De l'Epée's method was translated into English, and published by Cadell and Davies, in 1801: we extract the commencement of the process of instruction, as comprehending the leading principles of the scheme:

"It is not by the mere pronunciation of words, in any language, that we are taught their signification: the words *door, window,* &c. in our own, might have been repeated to us hundreds of times in vain: we should never have attached an idea to them, had not the objects designated by these names been shewn to us at the same time. A sign of the hand or of the eye has been the sole mean by which we learned to unite the idea of these objects with the sounds that struck our ear. Whenever we heard these sounds, the same ideas arose in our minds, because we recollected the signs made to us when they were pronounced.

"Exactly similar must be our measures with the deaf and dumb. Their tuition commences with teaching them a manual alphabet, such as boys at school make use of to hold conversation at one end of a form with their companions at the other. The various figures of these letters strike forcibly the eyes of deaf and dumb persons, who no more confound them, than we confound the various sounds that strike our ears.

"We next write (I say *we*, because in the operations with my deaf and dumb pupils, I frequently have assistance) in large characters with a white crayon, upon a black table, these two words, *the door*, and we shew them the door. They immediately apply their manual alphabet five or six times to each of the letters composing the word *door* (they spell it with their fingers) and impress on their memory the number of letters and arrangement of them; this done, they efface the word, and taking the crayon themselves, write it down in characters, no matter whether well or ill formed; afterwards they will write it, as often as you shew them the same object.

"It will be the same with respect to every thing else pointed out to them, the name being previously written down; which being first on the table, in large characters, may afterwards be inscribed in characters of ordinary size, upon different cards; and these being given to them, they amuse themselves in examining one another's proficiency, and ridicule those that blunder. Experience has manifested that a deaf and dumb person possessing any mental powers will acquire by this method upwards of eighty words in less than three days.

"Take some cards having suitable inscriptions, and deliver them one by one to your pupil; he will carry his hand successively to every part of his body conformably to the name on the card delivered to him. Mix and shuffle the cards as you please; he will make no mistake; or if you choose to write down any of these names on the table, you will see him, in like manner, distinguish with his finger every object whose name is so offered him; and thus clearly prove that he comprehends the meaning of every one.

"By this process the pupil will obtain, in very few days, a knowledge of all the words which express the different parts of our frame, from head to foot, as well as of those that express the various objects which surround us, on being properly pointed out to him as you write their names down on the table, or on cards put into his hands.

"We are not, however, even in this early stage, to confine ourselves to this single species of instruction, amusing as it is to our pupils. The very first or second day we guide their hands to make them write down, or we write down for them ourselves, the present tense of the indicative of the verb *to carry*.

"Several deaf and dumb pupils being round a table, I place my new scholars on my right hand. I put the forefinger of my left hand on the word *I*, and we explain it by signs in this manner: showing myself with the forefinger of my right, I give two or three gentle taps on my breast. I then lay my left forefinger on the word *carry*, and taking up a large quarto volume, I carry it under my arm, in the skirts of my gown *, on my shoulder, on my head, and on my back, walking all the while with the mien of a person bearing a load. None of these motions escape his observation.

"I return to the table; and in order to explain the second person, I lay my left forefinger on the word *thou*, and carrying my right to my pupil's breast, I give him a few gentle taps, making him notice that I look at him, and that he is likewise to look at me. I next lay my finger on the word *carriest*, the second person, and having delivered him the quarto volume, I make signs for him to perform what he has just seen me perform: he laughs, takes the volume, and executes his commission extremely well."

This method is adapted to the conception of the pupil, in his progress through the intricacies of grammar. The following description of the means of initiating him in a knowledge of the tenses of verbs will convey a sufficient idea of the plan to general readers:

"The pupil, though deaf and dumb, had, like us, an idea of the past, the present, and the future, before he was placed under our tuition, and was at no loss for signs to manifest the difference.

---

* "In France, the priests used to go in clerical habits as their ordinary dress."

"Did he mean to express a present action? He made a sign prompted by nature, which we all make in the same case without being conscious of it, and which consists in appealing to the eyes of the spectators to witness the presence of our operation; but if the action did not take place in his sight, he laid his two hands flat upon the table, beating upon it gently, as we are all apt to do on similar occasions: and these are the signs he learns again in our lessons, by which to indicate the present of a verb.

"Did he design to signify that an action is past? He tossed his hand carelessly two or three times over his shoulder: these signs we adopt to characterize the past tenses of a verb.

"And lastly, when it was his intent to announce a future action, he projected his right hand: here again is a sign we give him to represent the future of a verb.

"It is now time to call in art to the assistance of nature.

"Having previously taught him to write out the names of the seven days of the week, one directly under the other, we desire him to set them down in that order, and we then put on each side of his writing what follows before and after the same words under different heads.

Present.

To-day—Sunday—I arrange nothing.

Imperfect.

Yesterday—Monday—I was arranging my books.

Perfect.

Day before yesterday—Tuesday—I arranged my chamber.

Past Perfect.

Three days ago—Wednesday—I had arranged my closet.

Future.

To-morrow—Thursday—I shall arrange my papers.

Future.

Day after to-morrow—Friday—I shall arrange my drawers.

Future.

Three days hence—Saturday—I shall arrange my cupboards.

"*Yesterday, day before yesterday, three days ago*, are explained by the number of times we have slept since the day of which we speak.

"*To-morrow, day after to-morrow, three days hence*, are explained by the number of times we are to sleep till the day in question arrive.

"We next teach our pupil to lay a restriction upon his motions. To express a thing past, he used to throw his arm backwards and forwards towards his shoulder, without rule: we tell him, he must throw it only once for the imperfect, twice for the perfect, and three times for the past perfect; which in truth is analogous to what is signified, the past perfect announcing an action longer past than the perfect; and the latter being in the same predicament with regard to the imperfect."

An asylum for the support and education of the poor was instituted in 1792, under the patronage of the marquis of Buckingham. A spacious building for the reception of the pupils is just erected at the bottom of Kent-street, on the road to Deptford. We sincerely wish an establishment instituted with so laudable a purpose may meet with all the encouragement it deserves: and when it is known that the number of deaf and dumb in this country amounts to several hundreds, we trust the liberality of the British public will need no other stimulus.

DEAL. *s.* (*deel*, Dutch.) 1. Part. 2. Quantity; degree of more or less (*Ben Jonson*). 3. (From the verb.) The art or practice of dealing cards (*Swift*). 4. (*deyl*, Dutch.) Firwood, or the wood of pines (*Boyle*).

DEAL, a seaport in Kent, with a market on Thursdays. It is seated on the straits of Dover, and is a member of the cinque port of Sandwich, governed by a mayor. It contains 917 houses, and 5420 inhabitants. Lat. 51. 13 N. Lon. 1. 29 E.

To DEAL. *v. a.* (*deelen*, Dutch.) 1. To distribute; to dispose to different persons (*Tickel*). 2. To scatter; to throw about (*Dryden*). 3. To give gradually, to one after another (*Gay*).

To DEAL. *v. n.* 1. To traffick; to trade (*Decay of Piety*). 2. To act between two persons; to intervene (*Bacon*). 3. To behave well or ill in any transaction (*Tillotson*). 4. To act in any manner (*Shakspeare*). 5. *To* DEAL *by*. To treat well or ill (*Locke*). 6. *To* DEAL *in*. To have to do with; to be engaged in; to practise (*Atterbury*). 7. *To* DEAL *with*. To treat in any manner; to use well or ill (*South. Tillotson*). 8. *To* DEAL *with*. To contend with (*Sidney*).

To DEA'LBATE. *v. a.* (*dealbo*, Lat.) To whiten; to bleach.

DEALBA'TION. *s.* (*dealbatio*, Lat.) The act of bleaching or whitening (*Brown*).

DE'ALER. *s.* (from *deal.*) 1. One that has to do with any thing (*Swift*). 2. A trader or trafficker (*Swift*). 3. A person who deals the cards.

DE'ALING. *s.* (from *deal.*) 1. Practice; action (*Raleigh*). 2. Intercourse (*Addison*). 3. Measure of treatment (*Hammond*). 4. Traffick; business (*Swift*).

DEAMBULA'TION. *s.* (*deambulatio*, Lat.) The act of walking abroad.

DEA'MBULATORY. *a.* (*deambulo*, Lat.) Relating to the practice of walking abroad.

DEAN, a prime dignitary in most cathedral and collegiate churches; being usually the president of the chapter. He is called *dean*, *decanus*, of the Greek δεκα, ten, as being supposed to preside over ten canons or prebendaries, at least.

Canonists distinguish between deans of cathedral, and those of collegiate churches. The first, with their chapter, are regularly subject to the jurisdiction of the bishop. As to deans of collegiate churches, they have usually the contentious jurisdiction in themselves, that is, they exercise jurisdiction over their canons in all civil or criminal matters; though sometimes this belongs to them in common with the chapter.

In England, as there are two foundations of cathedral and collegiate churches, the old and the new (the latter being those founded by Henry the Eighth on the suppression of the abbots and priors, when their convents were turned into dean and chapter); so there are two ways of creating the deans. Those of the old foundation, as the deans of St. Paul's, York, &c. are raised to their dignity much like a bishop; the prince first sending out his conge d'elire to the chapter; the chapter then choosing, the king yielding his royal assent, and the bishop confirming him, and giving his mandate to instal him. Those of the new foundation, as the deans of Canterbury, Durham, Ely, Norwich, Winchester, &c. are donative, and are installed by a shorter course; only by the king's letters patent, without either election or confirmation. There are some cathedral churches, which never had a dean; as that of St. David's and Landaff, where the bishop is the head of the chapter, and in his absence the archdeacon.

Constantine, we are told, erected an office of nine hundred and fifty persons at Constantinople, taken out of divers trades and professions, whom he exempted from all impositions, and bestowed them on the cathedral church, to render the offices of burial gratis to the defunct, particularly to the poor. These he called *decani*, and *lecticarii*, probably because they were divided by tens; each whereof had a bier, or litter, to carry the bodies in. It is supposed to be these, who, under Constantius, began to be called *copiatæ*; i. e. clerks destined for labour; for they are usually ranked among the clerks, and even before the chantors. By a law of the year 357, it appears, that there were some of these *copiatæ* at Rome.

There are also deans without a chapter, as the dean of Battle in Sussex, dean of the arches, &c. and deans without a jurisdiction, as the dean of the chapel royal. In this sense the word is applied to the chief of certain peculiar churches or chapels.

Dean and chapter, are the bishop's council to assist him in the affairs of religion, and to assent to every grant which the bishop shall make to bind his successors. As a deanery is a spiritual dignity, a man cannot be a dean and prebendary of the same church.

Dean (Rural), or Dean (Urban), was formerly an ecclesiastical person, who had a district of ten churches, or parishes, either in the country or city, within which he exercised jurisdiction.

Dean, a town of Gloucestershire, with a market on Mondays. Lat. 51. 50 N. Lon. 2. 31 W.

Dean forest, in Gloucestershire, takes its name from the above town. It includes that part of the county which lies between the Severn and the shires of Monmouth and Hereford. It contains four market-towns, and twenty-three parishes, and is in general very fertile.

DE'ANERY. *s.* (from *dean.*) 1. The office of a dean (*Clarendon*). 2. The revenue of a dean (*Swift*). 3. The house of a dean (*Shakspeare*).

DE'ANSHIP. *s.* (from *dean.*) The office and rank of a dean.

DEAR. *a.* (ꝺeoꞃ, Saxon.) 1. Beloved; favourite; darling (*Addison*). 2. Valuable; of a high price; costly (*Pope*). 3. Scarce; not plentiful: as, *a* dear *year.* 4. Sad; hateful; grievous (*Shakspeare*).

Dear. *s.* A word of endearment (*Dryden*).

DE'ARBOUGHT. *a.* (*dear* and *bought.*) Purchased at a high price (*Roscommon*).

DE'ARLING. *s.* (now written *darling.*) Favourite (*Spenser*).

DE'ARLY. *ad.* (from *dear.*) 1. With great fondness (*Wotton*). 2. At a high price (*Bacon*).

To DEARN. *v. a.* (ꝺẏꞃnan, Saxon.) To mend clothes.

DE'ARNESS. *s.* (from *dear.*) 1. Fondness; kindness; love (*South*). 2. Scarcity; high price (*Swift*).

DE'ARNLY. *ad.* (ꝺeoꞃn, Saxon.) Secretly; privately; unseen: obsolete (*Spenser*).

DEARTH. *s.* (from *dear.*) 1. Scarcity which makes food dear (*Bacon*). 2. Want; need; famine (*Shakspeare*). 3. Barrenness; sterility (*Dryden*).

To DEARTI'CULATE. *v. a.* (*de* and *articulus*, Lat.) To disjoint; to dismember.

DEARTICULATION. See Diarthrosis.

DEATH. *s.* (ꝺeaꝺ, Saxon.) 1. The extinction of life (*Hebrews*). 2. Mortality; destruction (*Shakspeare*). 3. The state of the dead (*Shakspeare*). 4. The manner of dying (*Ezekiel*). 5. The image of mortality represented by a skeleton (*Shakspeare*). 6. Murder; the act of destroying life unlawfully (*Bacon*). 7. Cause of death (*Kings*). 8. Destroyer (*Bro.*). 9. (In poetry.) The instrument of death (*Dryden*). 10. (In theology.) Damnation; eternal torments (*Church Catechism*).

Death (Symptoms of). The following are the most certain signs of death, if taken collectively. 1. Cessation of the pulse. 2. Total suppression of breathing. 3. Loss of animal heat. 4. Rigidity of the body and inflexibility of the limbs. 5. Relaxation of the lower jaw. 6. Inability of the eyeballs to return to their sockets, when pressed by the finger. 7. Dimness, faintness, and sinking of the cornea, or the uppermost horny coat of the eye. 8. Foam in the cavity of the mouth. 9. Blue spots of various sizes, and on different parts of the body. 10. A cadaverous smell. 11. Insensibility to all external stimulants. All these symptoms, however, says Dr. Willich, if individually considered, are far from being conclusive: they then only afford a certain criterion of death, when most, or all of them, concur at the same time; especially, if the sixth, seventh, and tenth of the signs be strongly marked. (*Dom. Encyclo.*).

DEATH (Apparent), is that state in which life is suspended, either because the body is not susceptible of external stimuli, or the interior organs are in a state similar to that of palsy.

Dr. Struve, in his Practical Essay on the Art of recovering Suspended Animation, lately translated from the German, 12mo. London, 1801; exhibits the following view of all the

Symptoms of Life.—A slight degree of warmth in the region of the heart, accompanied with contractions and dilatations; a vibrating motion of the whole body, especially after being sprinkled with cold water; and a convulsive tension of some muscles.

Doubtful Signs.—Rigidity of the limbs, gradual smoothness of the skin, warmth and redness in particular parts of the body, hiccough, contraction and hissing of the nostrils, a tremulous motion of the whole body, mucus issuing from the nose during the artificial inflation of the lungs, a slight convulsive motion of the mouth, and a firm compression of the teeth.

More certain Signs.—Gentle throbbing of the heart; pulsation of the temporal arteries; a slight convulsive motion of the inner corner of the eye; vibration of the eye-ball; and almost imperceptible convulsions of the muscles surrounding the neck.

Distinct Signs of Life.—A gentle motion of the jaw; gradual redness of the lips and cheeks; contraction of the different muscles in the face; convulsive motions of the toes; sneezing; tremor of the whole body; vomiting; respiration interrupted by coughing and groaning.

DE'ATHBED. *s.* (*death* and *bed.*) The bed to which a man is confined by mortal sickness (*South*).

DE'ATHFUL. *a.* (*death* and *full.*) Full of slaughter; destructive; murderous (*Raleigh*).

DE'ATHLESS. *a.* (from *death.*) Immortal; never-dying; everlasting (*Boyle*).

DE'ATHLIKE. *a.* (*death* and *like.*) Resembling death; still; placid; calm (*Crashaw*).

DE'ATH'S-DOOR. *s.* (*death* and *door.*) A near approach to death (*Taylor*).

DE'ATHSMAN. *s.* (*death* and *man.*) Executioner; hangman; headsman (*Shakspeare*).

DEATH-WATCH, in zoology, the name of the pediculus of old wood, a species of the termes. See TERMES.

Sir Thomas Brown long ago observed, that "he that could extinguish the terrifying apprehensions of the death-watch, might prevent the passions of the heart, and many cold sweats in grandmothers and nurses." With the feelings of these persons a well known satirist sports in the following lines:

———"A wood-worm
That lies in old wood like a hare in her form;
With teeth or with claws, it will bite or will scratch,
And chambermaids christen this worm a death-watch:
Because like a watch it always cries click;
Then woe be to those in the house who are sick,
For sure as a gun they will give up the ghost,
If the maggot cries click, when it scratches the post."

To DEA'URATE. *v. a.* (*deauro*, Lat.) To gild, or cover with gold.

DEAURA'TION. *s.* (from *deaurate.*) The act of gilding.

DEBACCHA'TION. *s.* (*debacchatio*, Lat.) A raging; a madness.

To DEBA'R. *v. a.* (from *bar.*) To exclude; to preclude; to hinder (*Raleigh*).

To DEBA'RB. *v. a.* (from *de* and *barba*, Latin.) To deprive of his beard.

To DEBA'RK. *v. a.* (*debarquer*, Fr.) To disembark; to leave the ship.

To DEBA'SE. *v. a.* (from *base.*) 1. To reduce from a higher to a lower state (*Locke*). 2. To make mean; to degrade (*Hooker*). 3. To sink; to vitiate with meanness (*Addison*). 4. To adulterate; to lessen in value by base admixtures (*Hale*).

DEBA'SEMENT. *s.* (from *debase.*) The act of debasing; degradation (*Government of the Tongue*).

DEBA'SER. *s.* (from *debase.*) He that debases; he that adulterates; he that sinks the value of things.

DEBA'TABLE. *a.* (from *debate.*) Disputable; subject to controversy (*Hayward*).

DEBA'TE. *s.* (*debat*, French.) 1. A personal dispute; a controversy (*Locke*). 2. A quarrel; a contest (*Dryden*).

To DEBA'TE. *v. a.* (*debatre*, French.) To controvert; to dispute; to contest (*Clarendon*).

To DEBA'TE. *v. n.* 1. To deliberate (*Shakspeare*). 2. To dispute (*Tatler*).

DEBA'TEFUL. *a.* (from *debate.*) 1. Quarrelsome; contentious. 2. Contested; occasioning quarrels.

DEBA'TEMENT. *s.* (from *debate.*) Controversy; deliberation (*Shakspeare*).

DEBA'TER. *s.* (from *debate.*) A disputant; a controvertist.

To DEBA'UCH. *v. a.* (*desbaucher*, Fr.) 1. To corrupt; to vitiate (*Dryden*). 2. To corrupt with lewdness (*Shakspeare*). 3. To corrupt by intemperance (*Tillotson*).

DEBA'UCH. *s.* 1. A fit of intemperance (*Calamy*). 2. Luxury; excess; lewdness (*Dryden*).

DEBAUCHE'E. *s.* (from *desbauché*, Fr.) A lecher; a drunkard (*South*).

DEBA'UCHER. *s.* (from *debauch.*) One who seduces others to intemperance or lewdness.

DEBA'UCHERY. *s.* (from *debauch.*) The practice of excess; lewdness (*Spratt*).

DEBA'UCHMENT. *s.* (from *debauch.*)

The act of debauching or vitiating; corruption (*Taylor*).

To DEBE'L. *To* Debe'llate. *v. a.* (*debello*, Latin.) To conquer; to overcome in war: not in use (*Bacon*).

DEBELLA'TION. *s.* (from *debellatio*, Lat.) The act of conquering in war.

DEBEN, a river in Suffolk, which rises near Debenham, and flows to Woodbridge, where it expands into a long narrow arm of the German ocean, a little to the N. of Harwich.

DE BENE ESSE, a Latin phrase used in our law in a doubtful meaning, as to take or do a thing *de bene esse*, is to allow it at present to be well done; but when it comes to be more fully examined, then to stand or fall according to the merit of the thing.

DEBENHAM, a town in Suffolk, with a market on Friday, seated near the head of the Deben, on the side of a hill, twenty-four miles E. of Bury St. Edmunds, and eighty-four N.E. of London. Lat. 52. 22 N. Lon. 1. 17 E.

DEBENTURE, in commerce, a term used at the custom-house, when the exporter of any merchandise is entitled to any bounty or drawback, by act of parliament, on the exportation; in which case this debenture is a peculiar certificate signed by the officers of the customs, which entitles the trader to the receipt of such bounty or drawback. In making out these debentures, care must be taken that the paper or parchment be accompanied by a proper stamp.

DEBETS, among merchants, the sums due to them for goods sold on credit. Sometimes the word denotes the remainders of debts, part of which has been paid on account.

DE'BILE. *a.* (*debilis*, Latin.) Weak; feeble; languid; faint (*Shakspeare*).

To DEBI'LITATE. *v. n.* (*debilito*, Latin.) To weaken; to make faint; to enfeeble. (*Browne*).

DEBILITA'TION. *s.* (from *debilitatio*, Latin.) The act of weakening (*K. Charles*).

DEBILITY, is that feeble state of life in which the vital functions are languidly performed; when the mind loses its cheerfulness and vivacity; when the limbs are tottering with weakness, and the digestive faculty is impaired.

This complaint, which at present is so prevalent even in the bloom of life, and among those who ought to form the most vigorous and robust part of a nation, may arise from a great variety of causes, of which the following are the principal. 1. Descent from enfeebled parents. 2. Changes in the admixture and component parts of the surrounding atmosphere. 3. A sedentary and indolent mode of life. 4. Immoderate sleep; or, in a still more hurtful degree, want of the necessary portion of sleep and repose. 5. Too great exertions either of mind or body. 6. The unnecessary and imprudent use of medicines; lastly, the almost total disuse and exclusion of gymnastic exercise, and the general introduction of sedentary games, the effect of which creates an almost universal apathy to every pursuit that requires exertion.

Debility is the source of numerous disorders, such as spasms, palsy, violent evacuations, hemorrhages, putrid and nervous fevers, fainting fits, and apparent death.

Debi'lity. *s.* (*debilitas*, Latin.) Weakness; feebleness; languor; faintness (*Sidney*).

DEBONA'IR. *a.* (*debonnaire*, French.) Elegant; civil; gentle: obsolete (*Milton*).

DEBONA'IRLY. *ad.* (from *debonair.*) Elegantly; with a genteel air.

DEBT. *s.* (*debitum*, Latin.) 1. That which one man owes to another. 2. That which any one is obliged to do or suffer (*Shak.*).

Debt (National), the engagement entered into by a government, to repay at a future period money advanced by individuals for the public service, or to pay the lenders an equivalent annuity. National debts have arisen from the necessity of obtaining larger sums of money than could be raised at the time they were wanted by direct contributions; and often, when it would not have been absolutely impossible to raise the requisite sum if a heavy tax had been imposed, and strictly levied, it has been deemed more prudent to avoid the evils attendant on such a measure by the less obnoxious expedient of a loan. In most countries, the subordinate governors, to whom is generally consigned the task of providing for the public expenses, being desirous of popularity, have shewn a great predeliction for this mode of obtaining money, as it enables them to support a profuse expenditure, without appearing to oppress the people in so great a degree as they otherwise must: the system of getting into debt, or the funding system, as it is generally called, from particular funds being usually appropriated for payment of interest on the debts contracted, has therefore been adopted by most of the states of Europe, by many of the colonies, and by the American republic.

The principal advantages arising from national debts, and the system of credit on which they are founded, are, 1. The resource they afford in great emergencies, which gives a greater permanency to states, which, in former times, for want of such occasional resources, were more liable to internal derangements and to foreign subjugation. 2. The equalization of taxes. If the supplies were raised within the year, and the expences of war were considerable, every individual would be obliged, in consequence of the additional weight of his contributions, greatly to curtail his expences; and the employment of the poor, and the consumption of the rich, would be considerably diminished; whereas, when taxes are nearly equal, in time of peace and war, the value of every species of property, of industry, and the circulation of wealth, are maintained on as regular, steady, and uniform a footing, as the uncertainty and instability of human affairs will admit. 3. They retain money in the country, which would otherwise be sent out of it; public debts have more influence in this respect than all the laws against the exportation of specie that ever were made. 4. They promote circulation. The taxes which they occasion on the property of the rich, and the encouragement they hold out to the avaricious, prevent the accumulation of private hoards, and bring the whole money and personal property of a country into employment. 5. They attach the people to the government; for every individual creditor is led by his own interest to support the authority on the prosperity and existence of which the security of his property depends. The extent of this influence is so well understood, that it is not probable the government of any country where a public debt has once existed will ever permit it to be wholly paid off. 6. They encourage industry and the acquirement of property, by the facility with which individuals can lay out the surplus of their profits, without the risk of commercial bankruptcies, or the unavoidable expences and small advantage which landed estates yield, and receive interest on their capital with certainty and regularity.

The disadvantages attending the system of incurring national debts are, 1. The facility of carrying on war being much increased: while large sums can be easily borrowed, it may frequently cause wars to be protracted, which would have been much sooner brought to a termination, had the governments engaged in them experienced the difficulty of defraying the whole expence by taxation. 2. The value of the property of those who have lent their money to the state, depending on the public tranquillity, inclines them to support indiscriminately the measures of the government, whatever may be their tendency: they are interested both to preach and practise apathy under every invasion of the constitution of their country. 3. The increase of taxes to pay the interest of the debt, produces an increase in the price of all the necessaries of life, and renders it difficult for the manufacturers of a state in which this system has been carried to a great height, to maintain a successful competition with the subjects of other powers, who may be in a less embarrassed situation. 4. When a nation is encumbered with debts, a pernicious spirit of gambling is encouraged; stock-jobbing, with all its train of evil consequences, necessarily arises; and a monied interest is erected, the sole employment of which is that of drawing every possible advantage from the wants of individuals, or the necessities of the public. 5. Public debts have a very material influence on the distribution of property. Every new loan must be procured from persons already possessing considerable wealth, and such persons will not lend their money without the expectation of making a profit by it; the increase of the debt is, therefore, to them a source of increasing wealth, to which their share of the additional taxes attendant upon it bears but a small proportion; and if the government possesses no revenue but what is drawn from the people, whatever it pays to one description of men must be drawn principally from others: thus the additional income acquired by monied men, by taking advantage of the necessities of the state, is, in fact, a portion of the income of their less affluent fellow-citizens, which is transferred to them through the medium of the government, and which, in a much greater proportion than it increases their wealth, must render those poorer from whom it is drawn.

The national debt of Great Britain commenced in the reign of William III. The war which began in 1689 being very expensive, and the grants of parliament not supplying money so fast as it was wanted, the expedient of mortgaging part of the public revenue was adopted. At first the produce of particular taxes was assigned for repayment of the principal and interest of the money borrowed; large sums were also raised on life-annuities, and annuities for terms of years; and the funds established for payment of these debts being generally inadequate to the charge upon them, occasioned great deficiencies, which, at the conclusion of the war, amounted to 5,160,459*l.* 14*s.* 9¼*d.* and were charged on the continuation of various duties which had been granted for short terms. The total amount of the funded and unfunded debts in the year 1697, was 19,950,945*l.* 19*s.* 8¾*d.* The frequent anticipation of the different funds, and their general deficiency from the diminution of the revenue, in consequence of which the interest due upon money lent to government was often long in arrear, reduced public credit at this period to a very low ebb, and rendered persons who had money very reluctant in advancing it to the government, though paid what would now be called an exorbitant interest: the accumulation of the public debts caused serious apprehensions among people of property of all descriptions.

In the year 1711 a project was formed for relieving the government from the financial difficulties under which it laboured, by permitting the proprietors of various debts and arrears, amounting to 8,971,325*l.* to subscribe them towards raising the capital of a company formed for carrying on a trade to the South Seas. The actual capital of the company was 9,177,967*l.* 15*s.* 4*d.* which for the further accommodation of government was increased in 1715 to ten millions.

The total amount of the national debt on the 31st of December 1716, was 48,364,501*l.* 8*s.* 4*d.* which, on the opening of the following session of parliament, was mentioned in the king's speech and the commons' address, as an insupportable weight, and the government appears to have thought it necessary to concert seriously such measures as might lay the foundation of an effectual plan for its reduction. In consequence of this disposition, all the existing taxes, except the land and malt, were made perpetual; and, having been distributed into three classes, called the Aggregate, South Sea, and General Funds, the surplusses remaining, after satisfying the previous charges upon these respective funds, were formed into a separate fund, called the Sinking Fund, for the express purpose of discharging the principal and interest of such national debts and incumbrances as were incurred before the 25th of December, 1716. (See SINKING FUND.)

The memorable South Sea scheme, in the year 1720, was to have furnished a considerable sum to be employed in the reduction of the public debts; instead of which it increased their amount by an addition to the capital of 3,034,769*l.* 11*s.* 11*d.* while the annual charge was rather augmented than diminished by the allowance for management on the increased capital. The reduction of a part of the interest was, however, secured; and as the company's capital was redeemable, a further reduction of interest might be effected at a future period; but this depended on future circumstances, whereas had the terminable annuities which were converted into redeemable perpetuities by this scheme remained in their original state, there was a certainty of their expiring at a fixed period.

The magnitude of the public debt, and the consequent low price of the funds, appear at the end of the American war to have engaged the serious attention of the government; in consequence of which, some new taxes were imposed, in order to raise a surplus of revenue, as the foundation of a plan for establishing a new sinking fund. In order to ascertain what portion of the revenue might be appropriated to this purpose, a select committee of the house of commons was appointed to examine and state the accounts presented to the house relating to the public income and expenditure, and to report what might be expected to be the annual amount of the income and expenditure in future. On the 21st March, 1786, the committee made their report; and conceiving that the circumstances of the times rendered any average drawn from the amount of the revenue in former periods in a great degree inapplicable to the situation of the country, they formed an account of the public receipt and expenditure to Michaelmas 1785, and to January 1786, from which it appeared, that at the former period there was a surplus of 901,001*l.*, and at the latter a surplus of 919,290*l.* As it was evident that a fund of less than one million per annum would be very inadequate to the purpose for which it was designed, new taxes were imposed for raising the surplus revenue to this sum; and in order the more effectually to prevent ministers from diverting it to any other purpose, the mode was adopted which had been frequently suggested, of vesting the annual sum in the hands of commissioners; some other judicious regulations were also established by the act passed for this purpose. (See SINKING FUND.)

In the year 1789 it was found necessary to borrow 1,005,140*l.* on a tontine scheme, and 187,000*l.* to replace the like sum which had been issued out of the civil list revenue, as a loan to the prince of Orange: the latter was raised on annuities for 18¾ years. The total amount of the public debt in the year 1792, being the year previous to the war with the French republic, was, according to the official account, 238,231,248*l.*; but including the value of the terminable annuities, and the amount of the unfunded debt, the total was 268,267,272*l.* 1*s.* 7*d.*, the annual interest and charges of management on which amounted to 9,752,673*l.* 14*s.* 8*d.* From this amount, however, a deduction is to be made of the stock which had been redeemed by the operation of the sinking fund. With this formidable burthen on the property and industry of the country, a war was entered into, which, from the enormous expenditure attending it, increased the amount of the national debt in a degree beyond all former precedent or conjecture.

As our limits will not allow of our going farther into detail here; we present the reader with the following table, exhibiting the progress of the national debt from its commencement to Midsummer, 1802.

	CAPITAL.	INTEREST.
National Debt at the Revolution, 1688	£. 664,263	39,855
Increase during the reign of William III.	15,730,439	1,271,087
Amount at the accession of Queen Anne	16,394,702	1,310,942
Increase during the reign of Queen Anne	31,969,799	1,841,582
Amount at establishment of Sinking Fund, 1716	48,364,501	3,152,524
Increase during the reign of Geo. I.	4,654,654	
Decrease of annual charge		941,958
Amount at the accession of Geo. II.	53,019,155	2,210,566
Decrease during the Peace	6,064,532	246,541
Amount at commencement of the War, 1739	46,954,623	1,964,025
Increase during the War	31,338,689	1,096,979
Amount at the end of the War in 1748	78,293,312	3,061,004
Decrease during the Peace	3,312,426	389,364
Amount at the commencement of the War, 1755	74,980,886	2,671,640
Increase during the War	66,710,427	2,035,094

DEBT.

Amount at the end of the War, 1762	£.141,691,313	4,706,734
Decrease during the Peace	5,748,262	229,913
Amount at commencement of the American War	135,943,051	4,476,821
Increase during the War	132,157,328	5,035,411
Amount at the conclusion of the American War	268,100,379	9,512,232
Increase in the year 1789	1,189,140	56,863
Amount in 1789	269,289,519	9,569,095
Redeemed during the Peace	9,441,850	283,255
Amount at the commencement of the War in 1793	259,847,669	9,285,840
Increase during the War	350,013,508	11,988,633
	609,861,177	21,274,473
Redeemed during the War	69,243,336	2,089,220
Amount at conclusion of the War in 1802	540,617,841	19,185,253

Since the period at which the above statement terminates, another war has been entered into, which has already added many millions to the public debt; but as the sum to which it may be increased is beyond the reach even of probable estimate, we can only give the following statement of the total amount of the debt on the 1st February, 1808, which will also shew the different descriptions of Stock and Annuities of which it consists:

National Debt.

	£.	s.	d.
Consolidated 3 per Cent. Annuities	422,975,433	4	5¼
Reduced 3 per Cent. Annuities	174,712,794	7	10
3 per Cent. Annuities 1726	1,000,000	0	0
Old and New South-Sea Annuities	24,065,084	13	11½
3 per Cent. Annuities 1751	1,919,600	0	0
Imperial 3 per Cent. Annuities	3,669,300	0	0
Consolidated 4 per Cent. Annuities	49,725,084	17	2
Consolidated 5 per Cent. Annuities	46,674,742	1	8
5 per Cent. Annuities 1797 and 1802	2,070,043	16	9
Bank of England	11,686,800	0	0
	738,498,883	1	9¾
Transferred for Land Tax redeemed to the 1st of February 1808	22,976,829	10	4
	715,522,053	11	5¾
Redeemed by the Commissioners for the Reduction of the Debt	133,395,454	0	0
Debt unredeemed on the 1st of February 1808	£.582,126,599	11	5¾

*** The Long Annuities and other terminable Annuities, having no determinate capital, are not included in the above statement.

Unfunded Debts and Demands outstanding on the 5th of January 1808.

	£.	s.	d.
Exchequer Bills *	28,942,900	0	0
Ditto Bank Charter	3,000,000	0	0
Treasury Bills, Warrants, &c.	727,100	13	1¾
Army	1,063,036	10	11
Barracks	476,586	0	8
Ordnance	1,165,822	13	7
Navy	6,561,237	9	1¼
Civil List Advances	50,430	2	6
	£.41,987,113	9	11

* Of the above sum 2,363,100*l.* has been funded, pursuant to a vote of the House of Commons of the 10th of March 1808. (*Gregory, Grellier, Letts, Nicholson, Morgan, and Rees.*)

On this subject, much more information may be gathered from Price on the National Debt, sir John Sinclair's History of the Public Revenue, Morgan's Tracts on the Public Finances, The History of our Debts and Taxes, &c.

DE'BTED. *particip.* (from *debt.*) Indebted; obliged to (*Shakspeare*).

DE'BTOR. *s.* (*debitor,* Latin.) 1. He that owes something to another (*Swift*). 2. One that owes money (*Philips*). 3. One side of an account book (*Addison*).

DEBULLI'TION. *s.* (*debullitio*, Lat.) A bubbling or seething over.

DECACHORDON, in antiquity, a musical instrument of ten strings, much resembling our harp.

DECACU'MINATED. *a.* (*decacuminatus*, Latin.) Having the top or point cut off.

DECADE, a word used by some old writers for the number ten, and decades for an enumeration by tens. The word is formed from the Latin decas, which is derived from a Greek word of the same import. It has been more peculiarly appropriated to the number of books, q. d. decades, into which the Roman History of Titus Livius is divided. Hence also came decadal arithmetic, the Decameron of Boccacio, &c. The French have adopted the computation of time by decades in their new calendar.

DE'CADENCY. *s.* (*decadence*, Fr.) Decay.

DECAGON, a plane geometrical figure of ten sides and ten angles. When all the sides and angles are equal, it is a regular decagon, and may be inscribed in a circle; otherwise, not.

If the radius of a circle, or the side of the inscribed hexagon, be divided in extreme and mean proportion, the greater segment will be the side of a decagon inscribed in the same circle. And therefore, as the side of the decagon is to the radius, so is the radius to the sum of the two. Whence, if the radius of the circle be r, the side of the inscribed decagon will be $\frac{\sqrt{5}-1}{2} x\, r$.

If the side of a regular decagon be 1, its area will be $\frac{5}{2}\sqrt{5+2\sqrt{5}}=7{\cdot}6942088$; therefore as 1 is to 7·6942088, so is the square of the side of any regular decagon, to the area of the same: so that, if s be the side of such a decagon, its area will be equal to $7.6942088s^2$. (See REGULAR FIGURE.)

DECAGYNIA. (δεκα, ten, and γυνη, a woman or wife.) Ten-styled. The name of one of the orders in Linnéus's artificial system; comprehending those flowers which have ten styles. This occurs only in the class decandria.

DECALOGUE, the ten precepts or commandments delivered by God to Moses, after engraving them on two tables of stone. The Jews, by way of excellence, call these commandments the ten words, from whence they had afterwards the name of decalogue: but it is to be observed, that they joined the first and second into one, and divided the last into two. They understand that against stealing to relate to the stealing of men, or kidnapping; alleging, that the stealing one another's goods or property is forbidden in the last commandment. The church of Rome has struck the second commandment quite out of the decalogue; and to make their number complete, hath split the tenth into two: the reason of which may be easily conceived.

DECAMERIS, a musical term, used by

Souveur and others, to denote the $\frac{1}{3010}$ of an octave. See MERIS.

To DECA'MP. *v. n.* (*decamper*, French.) To shift the camp; to move off.

DECA'MPMENT. *s.* (from *decamp.*) The act of shifting the camp.

DECANDRIA. (δεκα, ten, and ανηρ, a man or husband.) Ten-stamened. The name of the tenth class in Linnéus's artificial system; comprehending all hermaphrodite flowers with ten stamens. It is also the name of an order in the classes monadelphia, diadelphia, gynandria, and diœcia.

To DECA'NT. *v. a.* (*decanto*, Latin.) To pour off gently by inclination (*Boyle*).

DECANTA'TION. *s.* (*decantation*, Fr.) The act of decanting or pouring off clear.

DECA'NTER. *s.* (from *decant.*) A glass vessel made for pouring off liquor clear.

DECANUS, among the Romans, an officer who had ten other officers, or persons, under his charge; whence our English dean.

DECAPHYLLOUS CALYX. In botany, a ten-leaved calyx; as in hibiscus.

To DECA'PITATE. *v. a.* (*decapito*, Lat.) To behead.

DECAPROTI, DECEMPRIMI, among the ancients, were officers who gathered the tributes, or taxes.

DECASMUS, Δεκασμος, in antiquity, the name of an action or process among the Athenians, which was brought against any person who offered a bribe.

DECASTYLE, a building with ten columns in front.

To DECA'Y. *v. n.* (*decheoir*, Fr.) To lose excellence; to decline from the state of perfection; to be gradually impaired (*Pope*).

To DECA'Y. *v. a.* To impair; to bring to decay (*Clarendon*.

DECA'Y. *s.* (from the verb.) 1. Decline from the state of perfection; state of depravation or diminution (*Pope*). 2. The effects of diminution; the marks of decay (*Locke*). 3. Declension from prosperity (*Shakspeare*). 4. The cause of decline (*Bacon*).

DECA'YER. *s.* (from *decay.*) That which causes decay (*Shakspeare*).

DECCAN, an extensive tract of country in Asia, which, according to the signification of its name (the South), has been supposed to include the whole region south of Hindustan Proper. But, in its more accurate sense, it contains only the countries situate between Hindustan Proper, the Carnatic, the Western Sea, and Orissa; namely, the provinces of Candeish, Doulatabad, Visiapour, Golconda, and the W. part of Berar.

DECE'ASE. *s.* (*decessus*, Latin.) Death; departure from life (*Hooker*).

To DECE'ASE. *v. n.* (*decedo*, Latin.) To die; to depart from life (*Chapman*).

DECE'IT. *s.* (*deceptio*, Latin.) 1. Fraud; a cheat; a fallacy (*Job*). 2. Stratagem; artifice (*Shakspeare*).

DECE'ITFUL. *a.* (*deceit* and *full.*) Fraudulent; full of deceit (*Shakspeare*).

DECE'ITFULLY. *ad.* Fraudulently (*Wotton*).

DECE'ITFULNESS. *s.* (from *deceitful.*) Tendency to deceive (*Matthew*).

DECE'IVABLE. *a.* (from *deceive.*) 1. Subject to fraud; exposed to imposture. 2. Subject to produce error; deceitful (*Bacon*).

DECE'IVABLENESS. *s.* (from *deceivable.*) Liableness to be deceived (*Gov. of the Tongue*).

To DECE'IVE. *v. a.* (*decipio*, Latin.) 1 To cause to mistake; to bring into errour; to impose upon (*Locke*). 2. To delude by stratagem. 3. To cut off from expectation (*Locke*). 4. To mock; to fail (*Dryden*). 5. To deprive by fraud or stealth (*Bacon*).

DECE'IVER. *s.* (from *deceive.*) One that leads another into errour; a cheat (*South*).

DECEMBER, the last month in the year, wherein the sun enters the tropic of Capricorn, and makes the winter solstice. In Romulus's year, December was the tenth month, whence the name, viz. from decem, ten. This month contains 31 days.

DECEMFIDOUS CALYX. In botany. A ten-cleft calyx, or rather perianth. As in potentilla and fragaria. See CLEFT.

DECEMLO'CULAR PERICARP. In botany. A ten-celled pericarp or seed-vessel; as in linum.

DECEMPEDA, Δεκαπους, ten-feet rod; an instrument used by the ancients in measuring.

DECE'MPEDAL. *a.* (from *decempeda*, Latin.) Ten feet in length.

DECE'MVIRATE. *s.* (*decemviratus*. Lat.) The dignity and office of the ten governours of Rome; any body of ten men.

DECE'MVIRI, an order of annual magistrates among the Romans, created with a sovereign power to draw up and make laws for the people; thus called, because their number was ten. To the decemviri was given all the legislative authority ever enjoyed by the kings, and after them by the consuls. One among them had all the ensigns and honours of the function; and the rest had the like in their turn, during the year of their decemvirate. They were originally two in number, called duumviri, till the year of Rome 388, when their number was increased to ten; five chosen from the plebeians and five from the patricians. Sylla increased their number to fifteen, called quindecemvirs.

DE'CENCE. DE'CENCY. *s.* (*decence*, Fr.) 1. Proper formality; becoming ceremony (*Spenser*). 2. Suitableness to character; propriety (*South*). 3. Modesty; not ribaldry; not obscenity (*Roscommon*).

DECENNALIA, ancient Roman festivals, celebrated by the emperors every tenth year of their reign, with sacrifices, games, and largesses for the people. The emperor Augustus first instituted these solemnities.

DECE'NNIAL. *a.* (from *decennium*, Latin.) What continues for the space of ten years.

DECENNO'VAL. DECENNO'VARY. *a.* (*decem* and *novem*, Latin.) Relating to the number nineteen (*Holder*).

DE'CENT. *a.* (*decens*, Latin.) 1. Becoming; fit; suitable (*Dryden*). 2. Grave; not gaudy (*Milton*). 3. Not wanton; not immodest.

DE'CENTLY. *ad.* 1. In a proper manner; with suitable behaviour; without ostentation (*Broome*). 2. Without immodesty (*Dryden*).

DECEPTIBI'LITY. *s.* (from *deceit.*) Liableness to be deceived (*Glanville*).

DECE'PTIBLE. *a.* (from *deceit.*) Liable to be deceived; subject to fraud (*Brown*).

DECE'PTION. *s.* (*deceptio*, Latin.) 1. The act or means of deceiving; cheat; fraud; fallacy (*South*). 2. The state of being deceived (*Milton*).

DECE'PTIOUS. *a.* (from *deceit.*) Deceitful.

DECE'PTIVE. *a.* (from *deceit.*) Having the power of deceiving.

DECE'PTORY. *a.* (from *deceit.*) Containing means of deceit.

DE'CERPT. *a.* (*decerptus*, Latin.) Cropped; taken off.

DECE'RPTIBLE. *a.* (*decerpo*, Lat.) That may be taken off.

DECE'RPTION. *s.* (from *decerpt.*) The act of cropping or taking off.

DECERTA'TION. *s.* (*decertatio*, Lat.) A contention; a striving; a dispute.

DECE'SSION. *s.* (*decessio*, Latin.) A departure; a going away.

DECHALES (Claudius Francis Milliet), an excellent mathematician, mechanist, and astronomer, descended from a noble family, was born at Chamberry in 1611. His principal performances are an edition of Euclid's Elements, in which the unserviceable propositions are rejected, and the use of those retained is shewn; a Discourse on Fortification; and another on Navigation. These with others have been collected, first in three vols. folio, afterwards in four, under the title of Mundus Mathematicus: being, indeed, a tolerably complete course of mathematics. He died in 1678, professor of mathematics, at Turin.

To DECHA'RM. *v. a.* (*decharmer*, Fr.) To counteract a charm; to disenchant (*Harvey*).

To DECI'DE. *v. a.* (*decido*, Latin.) 1. To fix the event of; to determine (*Dryden*). 2. To determine a question or dispute (*Glanville*).

DE'CIDENCE. *s.* (*decidentia*, Latin.) 1. The quality of being shed, or of falling off. 2. The act of falling away (*Brown*).

DECI'DER. *s.* (from *decide.*) 1. One who determines causes (*Watts*). 2. One who determines quarrels.

DECIDUA. (*decidua membrana*, from *decido*, to fall down.) Membrana decidua. In anatomy, a very thin and delicate membrane or tunic, which adheres to the gravid uterus, and is said to be a reflection of the chorion, and, on that account, is called decidua reflexa. The tunica decidua comes away after delivery in small pieces mixed with the lochia.

DECIDUOUS LEAF. (*deciduus.*) In botany, falling off in the autumn. Calyx or perianth: falling after the corol opens; as in berberis, and the class tetradynamia. Corol or petals: falling off with the rest of the flower. Applied also to stipules; as in padus, cerasus, populus, tilia, ulmus, quercus, and many other trees; bractes, and legumes. See CADUCOUS.

DECI'DUOUSNESS. *s.* (from *deciduous.*) Aptness to fall.

DECIL, in astronomy, the aspect of two planets which are 36° distant from each other.

DE'CIMAL. *a.* (*decimus*, Lat.) Numbered by ten; multiplied by ten.

DECIMALS, any thing proceeding by tens; as decimal arithmetic, decimal fractions, decimal scales, &c.

DECIMAL ARITHMETIC, in a general sense, may be considered as the common arithmetical computation in use, in which the decimal scale of numbers is used, or in which the places of the figures change their value in a tenfold proportion. In this sense, the word includes both the arithmetic of integers, and decimal fractions. In a more restrained sense, however, it means only

DECIMAL FRACTIONS, which are fractions whose denominator is always a 1 with some number of ciphers annexed, more or fewer according to the value of the fraction, the numerator of which may be any number whatever; as $\frac{1}{10}$, $\frac{3}{100}$, $\frac{7}{1000}$. See the treatise on ARITHMETIC in our first volume.

To DE'CIMATE. *v. a.* (*decimus*, Lat.) To tithe; to take the tenth.

DECIMA'TION. *s.* (from *decimate.*) 1. A tithing; a selection of every tenth. 2. A selection by lot of every tenth soldier for punishment (*Dryden*).

To DECI'PHER. *v. a.* (*dechiffrer*, Fr.) 1. To explain that which is written in ciphers (*Sidney*). 2. To unfold; to unravel; to explain. 3. To write out; to mark down in characters (*South*). 4. To stamp; to characterize; to mark (*Shakspeare*).

DECI'PHERER. *s.* (from *decipher.*) One who explains writings in cipher.

DECI'SION. *s.* (from *decide.*) 1. Determination of a difference (*Woodward*). 2. Determination of an event (*Shakspeare*).

DECI'SIVE. *a.* (from *decide.*) 1. Having the power of determining any difference; conclusive (*Rogers*). 2. Having the power of settling any event (*Philips*).

DECI'SIVELY. *ad.* (from *decisive.*) In a conclusive manner.

DECI'SIVENESS. *s.* (from *decisive.*) The power of argument or evidence to terminate any difference, or settle an event.

DECI'SORY. *a.* (from *decide.*) Able to determine or decide.

DECIUS, a Roman emperor, born A.D. 201, in Pannonia. The emperor Philip sent him to quell a sedition in Mœsia; but instead of obeying his directions, he turned his arms against him, and on his death assumed the imperial diadem. He distinguished himself by his expedition against the Persians, and by his persecution of the Christians. In his march against the Goths, he entered into a bog, where he and his army perished by the attack of the enemy, A.D. 251.

To DECK. *v. a.* (*decken*, Dutch.) 1. To cover; to overspread (*Milton*). 2. To dress; to array (*Shakspeare*). 3. To adorn; to embellish (*Prior*).

DECK OF A SHIP, is a planked floor from stem to stern, upon which the guns lie, and where the men walk to and fro. Great ships have three decks, first, second, and third, beginning to count from the lowermost. Half-deck reaches from the main-mast to the stem of the ship. Quarter-deck is that aloft the steerage, reaching to the round house. Flush-deck is that which lies even in a right line fore and aft, from stem to stern. A rope-deck is made of cordages, interwoven and stretched over a vessel, through which it is easy to annoy an enemy who comes to board her. They are little used but by small vessels, to defend them from privateers. See SHIP-BUILDING.

DECKENDORF, a town of Lower Bavaria, seated near the Danube. Lat. 48. 42 N. Lon. 12. 55 E.

DE'CKER. *s.* (from *deck.*) A dresser; one that apparels or adorns; a coverer.

To DECLA'IM. *v. n.* (*declamo*, Lat.) To harangue; to speak to the passions; to rhetoricate; to speak set orations (*Ben Jonson*).

DECLA'IMER. *s.* (from *declaim.*) One who makes speeches with intent to move the passion (*Addison*).

DECLAMA'TION. *s.* (*declamatio*, Lat.) A discourse addressed to the passions; an harangue; a set speech (*Taylor*).

Among the Greeks, declamation was the art of speaking indifferently on all subjects, and on all sides of a question; of making a thing appear just that was unjust; and of triumphing over the best and soundest reasons. Such sort of declamations, M. de St. Evremond observes, were fit only to corrupt the mind, by accustoming men to cultivate their imagination, rather than to form their judgment, and to seek for versimilitudes to impose upon, rather than solid reasons to convince, the understanding. It is said that a certain orator, named Plotius Gallus, first introduced the use of declamations at Rome. In this way Cicero formed himself for eloquence. The term frequently occurs both in Horace and Juvenal. Among us, declamation is restrained to certain exercises, which scholars perform, to teach them to speak in public. We say, a declamation against Hannibal, against Pyrrhus, the declamation of Quintilian, &c.

In the colleges of the Jesuits, declamations are little theatrical or dramatic performances, consisting of a few scenes not divided into acts, rehearsed by the students by way of exercise, and to form them for speaking in public.

DECLAMA'TOR. *s.* (Lat.) A declaimer; an orator (*Tatler*).

DECLA'MATORY. *a.* (*declamatorius*, Lat.) 1. Relating to the practice of declaiming; pertaining to declamation (*Wotton*). 2. Appealing to the passions (*Dryden*).

DECLA'RABLE. *a.* (from *declare.*) Capable of proof or illustration (*Brown*).

DECLARA'TION. *s.* (from *declare.*) 1. A proclamation or affirmation; open expression; publication (*Tillotson*). 2. (In law.) The showing forth of an action personal in any suit, though it is used sometimes for real actions (*Cowell*).

DECLA'RATIVE. *a.* (from *declare*). 1. Making declaration; explanatory (*Grew*). 2. Making proclamation (*Swift*).

DECLA'RATORILY. *ad.* (from *declaratory.*) In the form of a declaration; not in a decretory form (*Brown*).

DECLA'RATORY. *a.* (from *declare.*) Affirmative; expressive; not decretory; not promissory (*Tillotson*).

To DECLA'RE. *v. a.* (*declaro*, Latin.) 1. To clear; to free from obscurity (*Boyle*). 2. To make known; to tell evidently and openly (*Dryden*). 3. To publish; to proclaim (*Chronicles*). 4. To show in open view (*Addison*).

To DECLA'RE. *v. n.* To make a declaration; to proclaim some resolution (*South*).

DECLA'REMENT. *s.* (from *declare.*) Discovery; declaration; testimony (*Brown*).

DECLA'RER. *s.* (from *declare.*) A proclaimer; one that makes any thing known.

DECLE'NSION. *s.* (*declensio*, Latin.) 1. Tendency from a greater to a less degree of excellence (*South*). 2. Declination; descent (*Burnet*).

DECLENSION, in grammar, an inflection of nouns according to their cases, as nominative, genitive, dative, &c. It is a different thing in the modern languages, which have not properly any cases, from what it is in the ancient Greek and Latin. With respect to languages where the nouns admit of changes either in the beginning, the middle, or ending, declension is properly the expression of all those changes in a certain order, and by certain degrees called cases. With regard to languages where the nouns do not admit of changes in the same number, declension is the expression of the different states a noun is in, and the different relations it has; which difference of relations is marked by particles, as *of*, *to*, *from*, *by*, &c.

DECLI'NABLE. *a.* (from *decline.*) Having variety of terminations.

DECLINATE STEM. In botany, a declined or declining stem. Descending archwise. The least degree of curvature towards the earth. Opposed to ascending.—Applied also to the peduncle, stamen, and style, as likewise to the leaf.

DECLINA'TION. *s.* (*declinatio*, Latin.) 1. Descent; change from a better to a worse state; decay (*Waller*). 2. The act of bending down. 3. Variation from rectitude; oblique motion; obliquity (*Bentley*). 4. Variation from a fixed point (*Woodward*).

DECLINATION, in astronomy, the distance of the sun, a star, planet, or other point of the sphere of the world, from the equator, either northward or southward. It is the same with latitude in geography. Declination is either real or apparent, according as the real or apparent place of the object is considered.

The declination of any heavenly body, as of a star, may be easily found by the following rule: Take the meridian altitude of the star, at any place where the latitude is known; the complement of this is the zenith distance, and is called north or south, as the star is north or south at the time of observation. Then, 1. When the latitude of the place and zenith distance of the star are of different kinds, namely, one north and the other south, their difference will be the declination; and it is of the same kind with the latitude, when that is the greatest of the two, otherwise it is of the contrary kind. 2. If the latitude and the zenith distance are of the same kind, *i. e.* both north, or both south, their sum is the declination; and it is of the same kind with the latitude. (*O. Gregory's Astron. pa.* 34).

Accurate tables of the sun's declination are published regularly in the nautical almanacs.

DECLINATION (Parallels of), are small circles of the sphere parallel to the equator.

DECLINATION (Parallax, or Refraction of), is such an arch of a meridian as is equal to the change produced in the declination by parallax or refraction, respectively.

DECLINATION OF THE MAGNETIC NEEDLE, is the distance of the magnetic from the true meridian in degrees measured upon the horizon. Inclination is the angle which the dipping needle makes with the horizon, as measured on a vertical or azimuth circle. The changes in the declination and inclination may be represented by the words *variation* and *alteration* respectively.

After the discovery of that most useful property of the magnet, or loadstone, namely, the giving hardened iron and steel a polarity, the compass was for many years used without knowing that its direction in any-wise deviated from the poles of the world; and about the middle of the 16th century, so certain were some of its inflexibly pointing to the north, that they treated with contempt the notion of the variation, which about that time began to be suspected. However, careful observations soon discovered, that in England and its neighbourhood, the needle pointed to the eastward of the true north; but the quantity of this deviation being known, mariners became as well satisfied as if the compass had none; because they imagined that the true course could be obtained by making allowance for the true variation.

From successive observations made afterwards, it was found that the deviation of the needle from the north was not a constant quantity, but that it gradually diminished; and at last, about the year 1658 or 1660, it was found at London that the needle pointed due north, and has ever since been getting to the westward; and now the declination is more than 24° to the westward of the north: so that in any one place it may be suspected the declination has a kind of libratory motion, traversing through the north to unknown limits eastward and westward. But the settling of this point must be left to time.

During the time of the said observations it was also discovered that the declination of the needle was different in different parts of the world, it being west in some places when it was east in others; and in places where the variation was of the same name, yet the quantity of it greatly differed. It was therefore found necessary, that mariners should every day, or as often as they had opportunity, make during their voyage proper observations for an amplitude or azimuth; whereby they might be enabled to find the declination of the compass in their present place, and thence correct their courses.

The following table of declinations for different times and places was given by Dr. Halley, in No. 148 of the Philosophical Transactions, and is that on which he founded his theory.

Observed Declinations of the Needle in divers places, and at divers times.

Places observed at.	Longitude from London.	Latitude.	Year of Observation.	Declination observed.
	° ′	° ′		° ′
London	0 0	51 31 n	1580	11 15 e

At London, the declination,

in 1580 was 11° 15′ E.
in 1622 - 6 0 E.
in 1634 - 4 5 E.
in 1658 - 0 0
in 1672 - 2 30 W.
in 1692 - 6 0 W.
in 1723 - 14 17 W.
in 1747 - 17 40 W.
in 1780 - 22 41 W.

And in the month of July from 1790 downwards, as below:

1790 . . 23° 39′ ·0 W.
1791 . . 23 36 ·7
1793 . . 23 50 ·5
1794 . . 23 54 ·4
1795 . . 23 57 ·1
1796 . . 23 59 ·2
1797 . . 24 0 ·3
1798 . . 24 0 ·0
1799 . . 24° 1′ ·8 W.
1800 . . 24 3 ·0
1801 . . 24 4 ·1
1802 . . 24 6 ·0
1803 . . 24 7 ·9
1804 . . 24 8 ·4
1805 . . 24 7 ·8
1806 . . 24 8 ·6

So that the declination here, seems oscillating about a limit.

According to the observations of Mr. Canton for the year 1759 (Phil. Trans. vol. 51. pa. 445.) it appears that the diurnal variation of declination increased from 7′ 8″ in January, to 13′ 21″ in June, and decreased to about 6′ 58″ in December.

Mr. Gilpin found (Phil. Trans. 1806, part ii.) by a mean of 12 years from 1793 to 1805, that the declination appeared to increase or go westward from the winter solstice to the vernal equinox, 0′·80; to diminish or go eastward from the vernal equinox to the summer solstice, 1′·43; to increase again from the summer solstice to the autumnal equinox, 2′·43; and to decrease only 0′·14 from thence to the winter solstice.

Mr. Thomas Harding, in the Transactions of the Royal Irish Academy, vol. iv. has given observations on the declination of the magnetic needle at Dublin, which are rather extraordinary. He says the change in the declination at that place is uniform. That from the year 1657, in which the declination was nothing (the same as at London in that year), it has been going on at the medium rate of 12′ 20″ annually, and was in May 1791, 27° 23′ west: exceeding that at London by 3 or 4 degrees. We know not whether observations subsequent to 1791 favour the same result.

At Paris, according to Orontius Finæus, the declination was,

in 1550	8°	0′ E.
in 1640	3	0 E.
in 1660	0	0
in 1681	2	2 W.
in 1759	18	10 W.
in 1760	18	20 W.
From 1792 to 1794	21	54 W.
1798	22	15 W.
1799	22	0 W.
1800	22	12 W.
1801	22	1 W.
1802	21	45 W.
1803	21	59 W.
1804	22	15 W.

The declinations during this period appearing obviously to vacillate about a limit.

M. Burckardt, an ingenious French astronomer, invented a formula to represent the magnetic declinations observed at Paris; thus, if t denote the number of years from 1663, the tangent of the declination is $0{\cdot}449 \sin.\ (25'\ 7'')\ t + 0{\cdot}0425\ [\sin.\ (50'13'')\ t]^2 + 0{\cdot}0267\ [\sin.\ (1^\circ\ 40'\ 26'')\ t]^4$. It follows from this formula that the eastern declination diminished from 1448, when it was at its maximum of 24° 10′, to 1660 or 1663, when it was nothing at Paris. Reckoning an equal period backward from 1448 gave 1233 for the earlier epoch when there was no declination. A little before this the invention of the mariner's compass is generally dated. According to Burckardt's theorem, the maximum of western declination at Paris will be in the year 1831; though it will not vary more than 20 minutes from that time to 1878. We mention these as curious results of this astronomer's formula; but would by no means be understood as affirming their accuracy.

According to Mr. James Robertson (Phil. Trans. 1806), the magnetic declination at Jamaica has undergone no change since the year 1660, or more than 140 years. Indeed, observations prove abundantly, that the variations of the declination compared with one another in different points of the globe, follow different relations. But there is a fact extremely worthy of attention, that has been remarked by the celebrated Hallé, on the mere inspection of the table of declination published by Van Swinden, whose notice it had escaped. In the table, three places are pointed out, where the needle has experienced the greatest declination: and these are, first, in the middle of the Indian ocean, from 10° to 150° of south latitude, and from 82° to 87° of east longitude (reckoning from the isle of Ferro), where the variation, from the year 1700 to that of 1756, was from 11° to 11° 15′. Secondly, in the Ethiopian ocean, from 5° of north to 20° or 25° of south latitude, and in the interval of 10°, 15°, and 20°, of east longitude; the variation relative to this space, during the same period of time, was from 10° to 10° 45′, principally under the line and to 5° southward. Thirdly, at 50° north latitude, and between 17° of east and 10° of west longitude; where again, in the same period, there was a variation of from 11° to 11° 45′.

Looking at Van Swinden's table, Hallé perceived that these three places formed as it were three centres, round which the numbers indicating the quantities of variation insensibly decreased in proportion as we departed from each centre; so that we have here a new order of observations, answering to the places where the variation was least in the same course of years.

These places are, first, the whole American ocean, without including the gulf of Mexico, that is to say, from the western point of Africa to the farthest of the Bermuda islands. And here also we must remark, that in the ocean between Africa and North America, the variation is much less towards the American than towards the African coasts. Secondly, the environs of the isle of Madagascar, and part of the coast of Zanguebar. Thirdly, that part of the ocean which is to the south and south-east of the Sunda islands, between those islands and New Holland. And lastly, in the same sea, about the 4th degree of south latitude and the 97th of east longitude, that is, in the middle of the space comprised between the western angle of New Holland and the southern point of Africa. In all these different places the declination of the needle has not varied, during the whole 56 years, so much as one degree. (*Encyclop. Méthod.*).

Dr. Halley published in the last century a theory of the variations of the compass. In this work he supposes there are four magnetic poles in the earth; two of which are fixed and two moveable, by which he explains the different variation of the compass at different times in the same place. But it is impossible to apply exact calculations to so complicated an hypothesis. M. Euler, son of the celebrated geometrician of that name, has however shown, that two magnetic poles placed on the surface of the earth will sufficiently account for the singular figure assumed by the lines which pass through all the points of equal variation in the chart of Dr. Halley.

M. Euler first examines the case wherein the two magnetic poles are diametrically opposite; second, he places them in the two opposite meridians, but at unequal distances from the poles of the world; third, he places them in the same meridians. Finally, he considers them situated in two different meridians. These four cases may become equally important; because, if it is determined that there are only two magnetic poles, and that these poles change their situations, it may some time hereafter be discovered that they pass through all the different positions.

Since the needle of the compass ought always to be in the plane which passes through the place of observation and two magnetic poles, the problem is reduced to the discovery of the angle contained between this plane and the plane of the meridian. M. Euler, after having examined the different cases, finds that they also express the earth's magnetism, represented in the chart published by Messrs. Mountaine and Dodson in 1744, particularly throughout Europe and North America, if the following principles are established.

Between the arctic pole and the magnetic pole 14° 53′.

Between the antarctic pole and the other magnetic pole 29° 23′.

53° 18′ the angle at the north pole, formed by the meridian's passing through the two magnetic poles.

250° the longitude of the meridian, which passes over the northern magnetic pole.

As the observations which have been collected with regard to the variation are for the most part loose and inaccurate, it is impossible to represent them all with precision; and the great variations observed in the Indian ocean seem to require, says M. Euler, that the three first quantities should be 14, 35, and 65 degrees.

In the Memoir of MM. Biot and Humboldt "On the variations of the terrestrial magnetism in different latitudes," the position of the magnetic equator is determined from direct observations. The inclination of the plane of this circle to the astronomical equator is stated to be 10° 58′ 56″, its occidental node on that equator being at 120° 2′ 5″ longitude W. from Paris, the other node at 59° 57′ 55″ E. of Paris. The points where the axis of the magnetic equator pierces the earth's surface are, the northern point at 79° 1′ 4″ N. lat. and 30° 2′ 5″ W. long. from Paris; the southern point is situated in the same latitude south, and 149° 57′ 55″ E. long. from Paris.

It would carry us far beyond our limits were we to attempt to sketch the various theories of terrestrial magnetism which have been proposed: we must, therefore, refer to Birch's History of the Royal Society, vol. iii. 131; Halley, in Phil. Trans. No. 148; Canton in Phil. Trans. vols. xlviii and li.; Cavalla's Magnetism, and Lorimer's Supplement to ditto; Montucla, Histoire des Mathematiques, vol. iv. 510; and Gregory's translation of Haüy's Natural Philosophy, vol. ii. 105—130.

Declination of a vertical plane, or wall, in dialling, is an arch of the horizon, comprehended either between the plane and the prime vertical circle, when it is counted from the east or west; or between the plane and the meridian, if it be accounted from the north or south.

DECLINATOR, or **Declinatory**, an instrument in dialling, by which the declination, inclination, and reclination of planes are determined. The construction of this instrument, as somewhat improved by Mr. Jones, is as follows: on a mahogany board ABIK, fig. 9, Pl. 56, is inserted a semicircular arch AGEB of ivory or box-wood, divided into two quadrants of 90° each, beginning from the middle G. On the centre C turns a vertical quadrant DFE, divided into 90°, beginning from the base E; on which is a moveable index CF, with a small hole at F for the sun's rays to pass through, and form a spot on a mark at C. The lower extremity of the quadrant at E is pointed, to mark the linear direction of the quadrant when applied to any other plane; as this quadrant takes off occasionally, and a plumb-line P hangs at the centre on C, for taking the inclinations and reclinations of planes. At H, on the plane of the board, is inserted a compass of points and degrees, with a magnetical needle turning on a pivot over it. The addition of the moveable quadrant index considerably extends the utility of the declinator, by rendering it convenient for taking equal altitudes of the sun, the sun's altitude, and bearing, at the same time, &c.

To apply this instrument in taking the declination of a wall or plane: place the side ACB in an horizontal direction to the plane proposed, and observe what degree or point of the compass the N part of the needle stands over from the north or the south, and it will be the declination of the plane from the north or south accordingly. In this case, allowance must be made for the variation of the needle (if any) at the place; and which, if not previously known, will render this operation very inaccurate. At London it is now 24° 9′ to the west.

Another way more exact may be used, when the sun shines out half an hour before noon. The side ACB being placed against the plane, the quadrant must be so moved on the semicircle AGB, and the index CF on DE, till the sun's rays passing through the hole at F fall exactly on the mark at G, and continued so till the sun requires the index to be raised no higher: you will then have the meridian or greatest altitude of the sun; and the angle contained between G and E will be the declination required. The position of CE is the meridian or 12 o'clock line. But the most exact way for taking the declination of a plane, or finding a meridian line, by this instrument, is, in the forenoon, about two or three hours before 12 o'clock, to observe two or three heights or altitudes EF of the sun; and at the same time the respective angular polar distances GE from G: write them down; and in the afternoon watch for the same, or one of the same altitudes, and mark the angular distances or distance on the quadrant AG: now, the division or degree exactly between the two noted angular distances will be the true meridian, and the distance at which it may fall from the C of the divisions at G will be the declination of the plane. The reason for observing two or three altitudes and angles in the morning is, that in case there should be clouds in the afternoon, you may have the chance of one corresponding altitude.

The quadrant occasionally takes off at C, in order to place it on the surface of a pedestal or plane intended for an horizontal dial; and thereby from equal altitudes of the sun, as above, draw a meridian or twelve o'clock line to set the dial by.

The base ABIK serves to take the inclination and reclination of planes. In this case, the quadrant is taken off, and the plummet P is fitted on a pin at the centre C: then the side IGK being applied to the plane proposed, as QL (fig. 10.) if the plumb-line cuts the semicircle in the point G, the plane is horizontal; or if it cut the quadrant in any point at S, then will GCS be the angle of inclination. Lastly, if applying the side ACB (fig. 10.) to the plane, the plummet cuts G, the plane is vertical; or if it cuts either of the quadrants, it is accordingly the angle of reclination. Hence, if the quantity of the angle of inclination be compared with the elevation of the pole and equator, it is easily known whether the plane be inclined or reclined.

To DECLI'NE, *v. n.* (*declino*, Lat.) 1. To lean downward (*Shakspeare*). 2. To deviate; to run into obliquities (*Exodus*). 3. To shun; to avoid to do any thing. 4. To sink; to be impaired; to decay (*Denham*).

To Decli'ne. *v. a.* 1. To bend downward; to bring down (*Spenser*). 2. To shun; to avoid; to refuse (*Clarendon*). 3. To modify a word by various terminations; to inflect (*Watts*).

Decli'ne. *s.* The state of tendency to the worse; diminution; decay (*Prior*).

DECLI'VITY. *s.* (*declivis*, Latin.) Inclination or obliquity reckoned downward; gradual descent; the contrary to acclivity (*Swift*).

DECLI'VOUS. *a.* (*declivis*, Latin.) Gradually descending; not precipitous.

To DECO'CT. *v. a.* (*decoquo*, *decoctum*, Lat.) 1. To prepare by boiling for any use; to digest in hot water (*Bacon*). 2. To digest by the heat of the stomach (*Davies*). 3. To boil in water (*Bacon*). 4. To boil up to a consistence (*Shakspeare*).

DECO'CTIBLE. *a.* (from *decoct.*) That may be boiled, or prepared by boiling.

DECO'CTION. *s.* (*decoctum*, Lat.) 1. The act of boiling any thing, to extract its virtues (*Bacon*).

Decoction. (*decoctum*, from *decoquo*, to boil.) In pharmacy, any medicine boiled in a watery fluid. In a chemical point of view it is a continued ebullition with water, to separate such parts of bodies as are only soluble at that degree of heat. The following are the chief preparations in modern dispensatories.

D. althææ. This preparation, directed in the Edinburgh Pharmacopœia, may be exhibited as a common drink in nephralgia, and many diseases of the urinary passages, with advantage.

D. chamæmeli. A very common and excellent vehicle for tonic powders, pills, &c. It is also in frequent use for fermentation and clysters.

D. cinchonæ. This way of administering the bark is very general, as all the other preparations may be mixed with it as necessity requires. It is a very proper fomentation for prolapsus of the uterus and rectum.

D. cornu cervi. *Decoctum album.* This preparation of hartshorn possesses absorbent and antacid qualities, and is a very excellent drink in fevers attended with diarrhœa, and acidities of the prima viæ.

D. Geoffrææ. This is by far the most proper form for administering this medicine, which possesses laxative, narcotic, and anthelmintic virtues.

D. guaiaci compositum. This possesses stimulant and diaphoretic qualities, and is generally exhibited in cutaneous diseases which are dependant on a vitiated state of the humours.

D. hellebori albi. The itch and some eruptions of the scalp are occasionally removed by this application, which should be used as a lotion.

D. hordei. Barley decoction is a very nutritive and softening drink, and the most proper of all liquors in inflammatory diseases. It is an excellent gargle in inflammatory sore throats, mixed with a little nitre.

D. hordei compositum. From the pectoral and demulcent qualities of this decoction, it may be administered as a common drink in catarrh, and several affections of the chest.

D. mezerei. An acrid and very stimulating decoction, sometimes exhibited in indolent glandular swellings.

D. pro enemate. A very excellent form for an emollient clyster. A variety of medicines may be added to answer particular indications.

D. pro fomento. This preparation possesses antiseptic properties, and may be directed with advantage in sphacelus.

D. sarsaparillæ. This is much extolled by some practitioners in phthisis, and serves to restore the strength after a long course of mercury.

D. sarsaparillæ compositum. The alterative property of this compound is very great: it is generally given after a course of mercury, where there has been nodes and indolent ulcerations, and with great benefit.

D. senekæ. The chief qualities of the seneka are contained in this form. An addition of a small quantity of liquorice obviates an unpleasant sensation otherwise produced by it in the fauces.

D. ulmi. This may be employed, with great advantage, as a collyrium in chronic ophthalmia. It is given internally in some cutaneous eruptions.

DECO'CTURE. *s.* (from *decoct.*) A substance drawn by decoction.

DECOLLA'TION. *s.* (*decollatio*, Latin.) The act of beheading (*Brown*).

DECOMPO'SITE. *a.* (*decompositus*, Latin.) Compounded a second time (*Bacon*).

DECOMPOSITION, in chemistry, the disunion of substances already joined together; a change which is uniformly succeeded by the formation of new compounds. Few chemical processes take place without a decomposition of some kind; and hence decompositions are almost innumerable in their variety, and depend upon the nature of the chemical substances employed. See ANALYSIS.

DECOMPOSITION OF FORCES. See PARALLELOGRAM OF FORCES.

To DECOMPO'UND. *v. a.* (*decompono*, Latin.) 1. To compose of things already compounded; to compound a second time (*Newton*). 2. To resolve a compound into simple parts.

DECOMPO'UND. *a.* (from the verb.) Composed of things or words already compounded; compounded a second time (*Boyle*).

DECOMPOUND LEAF. In botany, when the primary petiole is so divided that each part forms a compound leaf. The different kinds of the decompound leaf are BIGEMINATE, BITERNATE, and BIPINNATE: which see in their proper places.

DE'CORAMENT. *s.* (from *decorate.*) Ornament; embellishment.

To DE'CORATE. *v. a.* (*decoro*, Lat.) To adorn; to embellish; to beautify.

DECORA'TION. *s.* (from *decorate.*) Ornament; added beauty (*Dryden*).

DECORATION, in architecture, any thing that adorns and enriches a building, church, triumphal arch, or the like, either without-side, or within. The orders of architecture contribute greatly to decoration; and paintings, vases, festoons, &c. are often very successfully applied.

DECORATION is more particularly applied to the scenes of theatres. In operas, and other theatrical performances, the decorations must be frequently changed conformably to the subject. The ancients had two kinds of decorations for their theatres: the first, called *versatiles*, having three sides, or faces, which were turned successively to the spectators: the other called *ductiles*, showing a new decoration by drawing or sliding another before it. This latter sort is still used, and apparently with much greater success than among the ancients, who were obliged to draw a curtain whenever they made a change in the decoration; whereas on our stage the change is made in a moment, and almost without being perceived.

DECORA'TOR. *s.* (from *decorate.*) An adorner.

DECO'ROUS. *a.* (*decorus*, Lat.) Decent; suitable to a character; becoming (*Ray*).

To DECO'RTICATE. *v. a.* (*decortico*, Latin.) To divest of the bark or husk (*Arbuthnot*).

DECORTICA'TION. *s.* (from *decorticate.*) The act of stripping the bark or husk.

DECO'RUM. *s.* (Latin.) Decency; behaviour contrary to licentiousness; seemliness (*Wotton*).

DECORUM, in architecture, is the suitableness of a building, and the several parts and ornaments thereof, to the station and occasion.

To DECO'Y. *v. a.* (from *koey*, Dutch, a cage.) To lure into a cage; to entrap (*L'Estrange*).

DECO'Y. *s.* Allurement to mischief (*Berkley*.

DECOY, a canal, river, pond, or sheet of water, in a marshy situation, surrounded with reeds, and appropriated to the purpose of taking wild-ducks and teal. The management of it requires much art, and the decoy ducks much dextrous training. Wild fowl sleep for the most part during the day, and seek their food towards evening and through the night. Hence as soon as evening sets in the decoy *rises*, as it is termed, and the sport commences. The machinery consists of a great variety of pipes or tubes terminating in nets, which are called tube or funnel nets; reed-skreens, which are placed at certain intervals along every pipe, and prevent the decoy man or his dog from being seen, excepting when necessary, and over the whole is suspended a large net upon hoops, extending over the entire pond or decoy space, and open only at one end. Just before the decoy-ducks are ordered by the whistle of the decoy-man, whose sound they know and obey, to commence their alluring stratagems, a small quantity of hemp seeds is thrown over the skreens to tempt the wild-fowl to advance: the trained birds now begin their *piping*, the wild-fowl make their appearance, and pass slowly, but generally in considerable numbers, over the skreens, and become completely surrounded by the suspended net. If the wild-fowl be inactive, the dog receives a signal to paddle a little at a distance, and they are sure to advance in the hope of catching and devouring what they suppose to be small fishes rising to the surface of the water. The decoy-man now rises and makes his appearance at the opening of the net where the wild-fowl entered; they cannot therefore retreat in that direction, and the net effectually prevents them from ascending perpendicularly; they follow therefore the trained birds into the respective pipes, which become narrower and narrower by degrees, so that at last not more than one at a time can pass forwards: another man is secreted at the end of each pipe, who, after suffering the decoy to escape upon the land on which the funnel terminates, receives the rest one after another, and breaks their necks as he receives them: in doing which much dexterity seems to be required.

A decoy in some seasons is astonishingly lucrative: in 1795 the Tillingham decoy in Essex, at that time in the occupation of Mr. Mascall, netted, after every expence, eight hundred pounds sterling; and the only birds taken were ducks and mallards. In 1799 ten thousand heads of wigeons, teals, and wild-ducks were caught in a decoy of the Reverend Bate Dudley, in the same county. They are generally contracted for by the London poulterers, who formerly gave eighteen shillings per dozen (which, except in the case of duck and mallard, includes twenty-four, or the double dozen); though the price is now advanced to a guinea or five and twenty shillings.

Decoy-duck, a duck that lures others.

To **DECRE'ASE.** *v. a.* (*decresco*, Lat.) To grow less; to be diminished (*Newton*).

To **Decre'ase.** *v. n.* To make less; to diminish (*Daniel*).

Decre'ase. *s.* (from the verb.) 1. The state of growing less; decay (*Prior*). 2. The wain of the moon (*Bacon*).

Decreasing progression, one whose terms decrease by some regular rule, as the arithmetical progression 9, 7, 5, 3, 1, which decreases by the constant subtraction of the number 2. But the phrase is generally restrained to geometrical serieses, whose terms decrease in a regular proportion: as
for example 1, $\frac{1}{2}$, $\frac{1}{4}$, $\frac{1}{8}$, $\frac{1}{15}$, $\frac{1}{36}$, $\frac{1}{64}$, &c.
and again 1, $\frac{1}{3}$, $\frac{1}{9}$, $\frac{1}{27}$, $\frac{1}{81}$, $\frac{1}{243}$, $\frac{1}{729}$, &c.
In the first of these examples the sum of all the terms, *in infinitum*, is 2; the sum of the second progression, *in infinitum*, is $1\frac{1}{2}$. What is here meant, and what ought to be understood in all such cases, is, that, whatever be the number of terms in any such progression, their amount can never equal the determined finite quantity called the *sum*, though it may approach to it in such a manner, that their difference will become smaller than any assignable quantity. The sum of any infinite geometrical series decreasing, is equal to the square of the first term divided by the difference between the first and second as is demonstrated by Malcolm in his Arithmetic. See Series.

To **DECRE'E.** *v. n*, (*decretum*, Latin.) To make an edict; to appoint by edict (*Milton*).

To **Decre'e.** *v. a.* To doom or assign by a decree (*Job*).

Decre'e. *s.* (*decretum*, Latin.) 1. An edict; a law (*Shakspeare*). 2 An established rule (*Job*). 3 A determination of a suit.

Decree, in the civil law, is a determination that the emperor pronounces upon hearing a particular cause between plaintiff and defendant.

Decree is a sentence pronounced by the lord chancellor in the court of chancery, and it is equally binding upon the parties, as a judgment in a court of law. By the laws of England, a decree (notwithstanding any contempts thereof) shall not bind the goods or moveables, but only charge the person. If a decree be obtained and inrolled, so that the cause cannot be reheard, then there is no remedy but by bill of review, which must be on error appearing on the face of the decree, or on matters subsequent thereto, as a release or a receipt discovered since.

Decrees of councils are the laws made by them, to regulate the doctrine and policy of the church.

DE'CREMENT. *s.* (*decrementum*, Latin.) Decrease; the state of growing less; the quantity lost by decreasing (*Brown*).

DECREMENTS, in mathematics, the small part by which a variable and decreasing quantity becomes less and less.

DECRE'PIT. *a.* (*decrepitus*, Lat.) Wasted and worn out with age (*Addison*).

To **DECRE'PITATE.** *v. a.* (*decrepo*, Latin.) To calcine salt till it has ceased to crackle in the fire (*Brown*).

DECREPITA'TION. (*decrepitatio*, from *decrepo*, to crackle.) A kind of crackling noise, which takes place in bodies when heated: it is peculiar to some kinds of salt; which, from a state of solution, are crystallized so rapidly, that the crystals formed burst into minute pieces.

DECRE'PITNESS. Decrepi'tude. *s.* (from *decrepit.*) The last stage of decay; the last effects of old age (*Bentley*).

DECRE'SCENT. *a.* (from *decrescens*, Latin.) Growing less; being in a state of decrease.

DE'CRETAL. *a.* (*decretum*, Latin.) Appertaining to a decree; containing a decree (*Ayliffe*).

Decretal, in the canon law, a letter of a pope determining some point or question in the ecclesiastical law. The decretals composed the second part of the canon-law. The first genuine one acknowledged by all the learned as such, is a letter of pope Siricius, written in the year 385, to Himerus bishop of Tarragona in Spain, concerning some disorders which had crept into the churches of Spain. Gratian published a collection of decretals, containing all the ordinances made by the popes till the year 1150. Gregory IX. in 1227, following the example of Theodosius and Justinian, formed a constitution of his own; collecting into one body all the decisions, and all the causes, which served to advance the papal power: which collection of decretals was called the Pentateuch, becaused it contained five books.

DE'CRETIST. *s.* (from *decree.*) One that studies the decretal (*Ayliff*).

DE'CRETORY. *a.* (from *decree.*) 1. Judicial; definitive (*South*). 2. Critical; definitive (*Brown*).

DECRI'AL. *s.* (from *decry.*) Clamorous censure; hasty or noisy condemnation.

To **DECRY'.** *v. a.* (*decrier*, French.) To censure; to blame clamorously; to clamour against (*Dryden*).

DECUBITUS, in medicine, the manner or posture in which a sick person lies in bed. See Medicine.

DECUMARIA. In botany, a genus of the class dodecandria, order monogynia. Calyx ten-leaved, superior; petals ten; capsule eight or nine celled, many seeded. Two species, both natives of Carolina: one a climbing, and the other a creeping plant.

DECU'MBENCE. Decu'mbency. *s.* (*decumbo*, Latin.) The act of lying down; the posture of lying down (*Brown*).

DECUMBENT FLOWER. In botany. Decumbens flos. Having the stamens and pistils declined or bending down to the lower side of it; as in cassia. Stem: caulis decumbens, lying on the ground with the base higher than the other parts.

DECU'MBITURE. *s.* (from *decumbo*, Latin.) 1. The time at which a man takes to his bed in a disease. 2. (In astrology.) A scheme of the heavens erected for that time, by which the prognosticks of recovery or death are discovered.

DE'CUPLE. (*decuplus*, Latin.) Tenfold (*Ray*).

DECURIO, a subaltern officer in the Roman armies. He commanded a decuria, which consisted of ten men, and was the third part of a turma, or the 30th part of a legion of horse, which was composed of 380 men. There were certain magistrates in the provinces called *decuriones municipales*, who formed a body to represent the Roman senate in free and corporate towns. They consisted of ten; whence the name.

DECURRENT LEAF. Folium decurrens. In botany. A sessile leaf having its base extending downwards along the stem; as in symphytum, verbesina, carduus, sphæranthus. Applied also to the petiole, and the stipule.

DECU'RSION. *s.* (*decursus*, Latin.) The act of running down (*Hale*).

DECU'RSIVELY - PINNATE LEAF. Having the leaflets decurrent, or running along the petiole.

DECURTA'TION. *s.* (*decurtatio*, Latin.) The act of cutting short, or shortening.

DECURY, ten persons ranged under one chief, or leader.

To DECU'SSATE. *v. a.* (*decusso*, Latin.) To intersect at acute angles (*Ray*).

DECUSSATED LEAVES AND BRANCHES. Growing in pairs, which alternately cross each other at right angles; so that if the stem be viewed vertically, or the eye be directed right down it, the leaves or branches will appear to be in fours.

DECUSSATION, a term in geometry, optics, and anatomy, signifying the crossing of two lines, rays, or threads, when they meet in a point, and then go on separately from one another.

DEDDINGTON, a town in Oxfordshire, with a market on Tuesdays. Lat. 52. 2 N. Lon. 12. 1 W.

To DEDE'CORATE. *v. a.* (*dedecoro*, Lat.) To disgrace; to bring a reproach upon.

DEDECORA'TION. *s.* (from *dedecorate.*) The act of disgracing; disgrace.

DEDE'COROUS. *a.* (*dedecus*, Latin.) Disgraceful; reproachful; shameful.

DEDENTI'TION. *s.* (*de* and *dentitio*, Latin.) Loss or shedding of the teeth (*Brown*).

To DE'DICATE. *v. a.* (*dedico*, Latin.) 1. To devote to some divine power (*Numbers*). 2. To appropriate solemnly to any person or purpose (*Clarendon*). 3. To inscribe to a patron (*Peacham*).

De'dicate. *a.* (from the verb.) Consecrate; devote; dedicated; appropriate (*Spelman*).

DEDICATION, the act of consecrating a temple, altar, statue, palace, &c. to the honour of some deity. The use of dedications is very ancient, both among the worshippers of the true God, and among the heathens; the Hebrews call it חנכה *hhanuchah*, imitation; which the Greek translators render εγκαινια, and εγκαινιομος, renewing.

In the scripture we meet with dedications of the tabernacle, of altars, of the first and second temple, and even of the houses of private persons. There are also dedications of vessels, and garments of the priests and Levites, and even of the men themselves.

The heathens had also dedications of temples, altars, and images of their gods, &c. Nebuchadnezzar held a solemn dedication of his statue (*Dan.* iii. 2). Pilate dedicated gilt bucklers at Jerusalem to Tiberius (*Philo de legat*). Petronius would have dedicated a statue to the emperor in the same city (*ibid.* p. 791.) Tacitus (*Hist.* lib. iv. c. 53) mentions the dedication of the capitol, upon rebuilding it by Vespasian, &c.

The Christians finding themselves at liberty under Constantine, in lieu of their ruinous churches, built new ones in every place; and dedicated them with a deal of solemnity. The dedication was usually performed in a synod; at least they assembled a number of bishops to assist at the service. We have the description of those of the churches at Jerusalem and Tyre in Eusebius, and many others in later writers.

Dedication, in literature, is an address prefixed to a book, soliciting patronage, or testifying respect for the person to whom it is made. The dedication of the fourth part of Mr. Edwards's History of Birds is preserved here, not as one we think worthy of imitation, but on account of its singularity. It is this: "To God! the one eternal! the incomprehensible! the omnipresent! omniscient and Almighty Creator of all things that exist! from orbs immeasurably great, to the minutest points of matter, this atom is dedicated and devoted, with all possible gratitude, humiliation, and worship, and the highest adoration both of body and mind, by his most resigned, low, and humble creature, G. E."

DEDICA'TOR. *s.* (from *dedicate.*) One who inscribes his work to a patron with compliment and servility (*Pope*).

DE'DICATORY. *a.* (from *dedicate.*) Composing a dedication; adulatory (*Pope*).

DEDIMUS POTESTATEM, in law, a

commission granted to one or more persons, for the forwarding and dispatching some act appertaining to a judge, or some court; as to take answers in chancery, depositions of witnesses in a cause depending in that court, and levy a fine in the common pleas, &c. where persons live in the country or cannot travel.

DEDIDITII, among the Romans differed from CAPTIVES in this, that the latter were taken by force, whereas the former surrendered themselves.

DEDI'TION. *s.* (*deditio*, Latin.) The act of yielding up any thing; surrendry (*Hale*).

To DEDU'CE. *v. a.* (*deduco*, Latin.) 1. To draw in a regular connected series (*Pope*). 2. To form a regular chain of consequential propositions (*Locke*). 3. To lay down in regular order (*Thomson*).

DEDU'CEMENT. *s.* (from *deduce.*) The thing deduced; consequential proposition (*Dryden*).

DEDU'CIBLE. *a.* (from *deduce.*) Collectible by reason; consequential (*South*).

DEDU'CIVE. *a.* (from *deduce.*) Performing the act of deduction.

To DEDU'CT. *v. a.* (*deduco*, Latin.) 1. To substract; to take away; to cut off; to defalcate (*Norris*). 2. To separate; to dispart: not in use (*Spenser*).

DEDU'CTION. *s.* (*deductio*, Latin.) 1. Consequential collection; consequence (*Dup.*). 2. That which is deducted; defalcation (*Pope*).

DEDU'CTIVE. *a.* (from *deduct.*) Deducible.

DEDU'CTIVELY. *ad.* Consequentially; by regular deduction (*Brown*).

DEDUTTIONE, the name given by Guido to the gradual rising of the voice, in solmization: the falling of the voice, he called *reduttione.*

DEE, a river which rises in the county of Merioneth, in two springs which unite near Pimble Meer into one stream. It passes through that lake, crosses Denbighshire, and separates that county from Cheshire, then runs into the Irish Sea, about 15 miles N.W. from Chester. The same name is given to two rivers in Scotland, and one in Ireland.

DEE (John), an English mathematician, born at London in 1527, and educated at St. John's college, Cambridge. On the founding of Trinity college he was chosen one of the fellows. Falling under the suspicion of magical practices, he went abroad, and took his degree of LL.D. at Louvain. He read lectures in the mathematics there, and at other universities, with great applause. In 1551 he returned to England, and obtained the rectory of Upton-upon-Severn. Soon after the accession of Mary to the throne he was taken up and committed to the Tower, on suspicion of treasonable practices; but after some time he was discharged. In 1570 he edited sir Henry Billingsley's translation of Euclid, to which he prefixed a preface, and added notes, which shew him to have been a deep mathematician. The year following he was at Louvain, where he fell very ill, and so highly was he esteemed by the queen, that she sent over two physicians to attend him. He returned as soon as he was recovered, and went to reside at Mortlake, where he collected a great library, which queen Elizabeth went to see in 1575. Her majesty also held frequent conversations with Dee upon philosophical subjects, but he seems to have received hardly any particular marks of her royal favour. In 1581 he and Edward Kelly began their magical operations, which lasted two years, in which they were joined by a Polish nobleman called Laski, who persuaded them to go to his castle. The confederates accordingly set out for Poland, where they remained some time. Their adventures abroad made so much noise that the queen thought proper to send for Dee home again, who accordingly returned in great pomp. In 1596 he was made warden of Manchester college, and died at Mortlake in 1608. Dee continued his magical studies to the last; and was sometimes very rudely treated by the common people as a conjuror. He published several mathematical works in Latin and English, and wrote many more which were never printed; but in 1659 Dr. Meric Casaubon published, a True and faithful Relation of what passed for many Years between Dr. John Dee and some Spirits, &c. out of the original copy written with Dr. Dee's own hand, kept in the library of sir Thomas Cotton, knt.

DEED. *s.* (ðæð, Saxon.) 1. Action; thing done (*Smallridge*). 2. Exploit; performance (*Dryden*). 3. Power of action; agency (*Milton*). 4. Act declaratory of an opinion (*Hooker*). 5. Written evidence of any legal act (*Bacon*). 6. Fact; reality; the contrary to fiction (*Lee*).

DEED, an instrument written on paper or parchment, which relates principally to the conveyance or transferring of property, and the validity of which consists in the following essential particulars: 1. Proper parties to contract with one another, and a proper subject matter to be contracted for; 2. A good and sufficient consideration; 3. Writing on parchment, or paper, duly stamped; 4. Sufficient and legal words, properly disposed; 5. Reading (if it be desired) before execution; 6. By stat. 29 Car. II. c. 3, sealing, in many cases signing also; and, lastly, delivery, which must be done either by the party himself, or by his attorney, lawfully authorised, and expressed in the attestation. If any of these requisites be wanting, the deed is absolutely void, from the beginning.

DEED-POLL, is a deed polled, or shaved, quite even; in contradistinction from an indenture, which is cut unevenly, and answerable to another writing that comprehends the same words. A deed-poll is properly single, or of one part, and is intended for the use of feoffee, grantee, or lessee; an indenture always consists of two or more parts and parties. Every deed that is pleaded shall be intended to be a deed-poll, unless it is alleged to be indented.

DEE'DLESS. *a.* (from *deed.*) Unactive.

To DEEM. *v. n. particip. dempt* or *deemed.* (ꝺeman, Saxon.) To judge; to conclude upon consideration; to think; to opine (*Dryden*).

Deem. *s.* (from the verb.) Judgment; surmise; opinion: not in use (*Shakspeare*).

DEE'MSTER. *s.* (from *deem.*) A judge. This is the name given to the judges who decide all controversies in the Isle of Man.

DEEP. *a.* (ꝺeep, Saxon.) 1. Having length downward; profound (*Bacon*). 2. Low in situation; not high. 3. Measured from the surface downward (*Newton*). 4. Entering far; piercing a great way (*Shakspeare*). 5. Far from the outer part (*Dryden*). 6. Not superficial; not obvious (*Locke*). 7. Sagacious; penetrating (*Milton*). 8. Politick; insiduous (*Shakspeare*). 9. Grave; solemn (*Shaksp.*). 10. Dark-coloured (*Dryden*). 11. Having a great deal of stillness, or gloom, or sadness (*Genesis*). 12. Depressed; sunk (*Corinthians*). 13. Bass; grave in sound (*Bacon*).

Deep. *s.* (from the adjective.) 1. The sea; the main; the ocean (*Waller*). 2. The most solemn or still part (*Shakspeare*).

Deep-sea line, or Dip-sea line, in the sea-language, a small line used for sounding, when a ship is in very deep water at sea.

At the end of this line is a piece of lead, called the deep sea lead, at the bottom of which is a coat of white tallow, to bring up stones, gravel, shells, or the like, from the bottom, in order to learn the differences of the ground; which being entered, from time to time, in the seamen's books, by comparing of observations, enable them to guess by their soundings, &c. what coast they are on, though they cannot see land.

To DEE'PEN. *v. a.* (from *deep.*) 1. To make deep; to sink far below the surface (*Addison*). 2. To darken; to cloud; to make dark (*Peacham*). 3. To make sad or gloomy (*Pope*).

DEEPING, or Market-Deeping, a town of Lincolnshire, with a market on Thursdays. It is seated on the Welland, in a fenny country. Lat. 52. 42 N. Lon. 0. 21 W. Adjoining to this town are two villages known by the names of *James Deeping*, and *West Deeping*.

DEEP-MOUTHED. *a.* (*deep* and *mouth.*) Having a hoarse and loud noise (*Gay*).

Deep-musing. *a.* (*deep* and *muse.*) Contemplative; lost in thought (*Pope*).

DE'EPLY. *ad.* (from *deep.*) 1. To a great depth; far below the surface (*Tillotson*). 2. With great study or sagacity. 3. Sorrowfully; solemnly (*Donne*). 4. With a tendency to darkness of colour (*Boyle*). 5. In a high degree (*Bacon*).

DE'EPNESS. *s.* (from *deep.*) Entrance far below the surface; profundity; depth (*Knol.*).

DEER, in natural history, as a generic term, applies to the cervus tribe generally. (See Cervus.) Among foresters it is restrained to the individuals of this family that inhabit parks and forests; whose flesh is equally denominated venison, though very different in size, flavour, and estimation. Deer are of two descriptions; the one principally bred and preserved for the chase, the other for the table. For the first, see Red deer, Stag, and Hind; for the second, Fallow deer, Buck, and Doe.

To DEFA'CE. *v. a.* (*defaire*, French.) To destroy; to rase; to ruin; to disfigure (*Prior*).

DEFA'CEMENT. *s.* (from *deface.*) Violation; injury; rasure; destruction (*Bacon*).

DEFA'CER. *s.* (from *deface.*) Destroyer; abolisher; violator (*Shakspeare*).

DE FACTO, something actually in fact, or existing; in contradistinction to de jure, where a thing is only so in justice, but not in fact: as a king de facto is a person that is in actual possession of a crown, but has no legal right to the same; and a king de jure is the person who has just right to the crown, though he is out of possession of it.

To DEFA'LCATE. *v. a.* (*defalquer*, Fr.) To cut off; to lop; to take away part.

DEFALCA'TION. *s.* (from *defalcate.*) Diminution; abatement (*Addison*).

To DEFA'LK. *v. a.* (See Defalcate.) To cut off; to lop away (*Decay of Piety*).

DEFAMA'TION. *s.* (from *defame.*) Calumny; reproach; censure; detraction (*Addison*).

Where any person circulates any report injurious to the credit or character of another, the party injured may bring an action to recover damages proportioned to the injury he has sustained; but it is incumbent upon the party to prove he sustained an injury, to entitle him to damages. In some cases, however, as for words spoken which by law are in themselves actionable, as calling a tradesman a bankrupt, cheat, or swindler, &c. there is no occasion to prove any particular damage; but the plaintiff must be particularly attentive to state words precisely as they were spoken, otherwise he will be nonsuited.

DEFA'MATORY. *a.* (from *defame.*) Calumnious; unjustly censorious; libellous (*Dryden*).

To DEFA'ME. *v. a.* (*de* and *fama*, Latin.) To make infamous; to censure falsely; to dishonour by reports; to calumniate (*Dryden*).

Defa'me. *s.* (from the verb.) Disgrace; dishonour: not in use (*Spenser*).

DEFA'MER. *s.* (from *defame.*) One that injures the reputation of another (*Government of the Tongue*).

To DEFA'TIGATE. *v. a.* (*defatigo*, Lat.) To weary; to tire (*Maine*).

DEFATIGA'TION. *s.* (*defatigatio*, Lat.) Weariness; fatigue.

DEFA'ULT. *s.* (*defaut*, French.) 1. Omission of that which we ought to do; neglect. 2. Crime; failure; fault (*Hayward*). 3. Defect; want (*Davies*). 4. (In law.) Non-appearance in court at a day assigned (*Cowell*).

Default, in hunting, or as it is commonly abbreviated, *fault*, a term implying that the hunted animal has escaped the sight and scent of the hounds; who, while throwing up their noses, as at a loss, and dashing in different directions in hope of recovery, are said to be *at a* *fault.* Different opinions have been formed as to the proper mode of proceeding at this period: whether to try forward, or to try backward: and here a great deal depends upon the game you are pursuing, and the country you are hunting in.

If, in pursuit of deer or fox, the hounds throw up on a fallow or highway, they cannot be got forward too soon, for certain it is that these have neither of them stopt in such places. Yet not so with the hare, who is likely to have thrown herself out by the side of the one, or squatted in a land (or furrow) of the other. Faults with the two former are much more easily and expeditiously hit off than with the latter, with whom they are sometimes almost incessant, particularly with a young or a hard-hunted hare. It should however be a fixed rule, never to abandon a fault, if possible, without recovery; it being, at least, as likely to bring the lost hare to a view as to find a fresh one.

DEFA'ULTER. *s.* One that makes default.

DEFE'ASANCE. *s.* (*defaisance*, French.) 1. The act of annulling or abrogating any contract or stipulation. 2. A condition annexed to an act which performed by the obligee the act is disabled (*Cow.*). 3. The writing in which a defeasance is contained. 4. A defeat; conquest: obsolete (*Spenser*).

DEFE'ASIBLE. *a.* (from *defaire*, Fr.) That may be annulled (*Davies*).

DEFE'AT. *s.* (from *defaire*, French.) 1. The overthrow of an army (*Addison*). 2. Act of destruction; deprivation (*Shakspeare*).

To DEFE'AT. *v. a.* 1. To overthrow; to undo (*Bacon*). 2. To frustrate (*Milton*). 3. To abolish; to undo; to change.

DEFE'ATURE. *s.* (from *de* and *feature*.) Change of feature; alteration of countenance: not in use (*Shakspeare*).

To DE'FECATE. *v. a.* (*defœco*, Latin.) 1. To purge; to purify; to cleanse (*Boyle*). 2. To purify from any extraneous or noxious mixture; to clear; to brighten (*Glanville*).

DE'FECATE. *a.* (from the verb.) Purged from lees or foulness (*Boyle*).

DEFECA'TION. *s.* (*defœcatio*, Lat.) Purification; the act of clearing (*Harvey*).

DEFE'CT. *s.* (*defectus*, Latin.) 1. Want; absence of something necessary; insufficiency) (*Davies*). 2. Failing; imperfection (*Shakspeare*). 3. A fault; mistake; errour (*Hooker*). 4. Any natural imperfection; a blemish (*Locke*).

To DEFE'CT. *v. n.* To be deficient (*Bro.*).

DEFECTIBI'LITY. *s.* (from *defectible*.) The state of failing; imperfection (*Hale*).

DEFE'CTIBLE. *a.* (from *defect*.) Imperfect; deficient; wanting (*Hale*).

DEFE'CTION. *s.* (*defectio*, Latin.) 1. Want; failure. 2. A falling away; apostacy (*Raleigh*). 3. An abandoning of a king, or a state; revolt (*Davies*).

DEFE'CTIVE. *a.* (from *defectivus*, Lat.) 1. Wanting the just quantity (*Brown*). 2. Full of defects; imperfect (*Addison*). 3. Faulty; vitious; blamable (*Addison*).

DEFE'CTIVE OR DEFICIENT NOUNS. (In grammar.) Indeclinable nouns, or such as want a number in some particular case.

DEFE'CTIVE VERB. (In grammar.) A verb which wants some of its tenses.

DEFE'CTIVENESS. *s.* (from *defective*.) Want; faultiness (*Addison*).

DEFE'NCE. *s.* (*defensio*, Lat.) 1. Guard; protection; security (*Swift*). 2. Vindication; justification; apology (*Acts*). 3. Prohibition (*Temple*). 4. Resistance.

DEFENCE, in fortification, all sorts of work that cover and defend the opposite posts; as flanks, casements, parapets, and faussebrays.

DEFENCE (Line of), a supposed line drawn from the angle of the curtain, or from any other part in the curtain, to the flanked angle of the opposite bastion. See CURTAIN and BASTION.

A line of defence represents the flight of a musket-ball from the place where the musketeers stand, to scour the face of the bastion, and ought never to exceed the reach of a musket.

DEFENCE, in law, signifies a plea, or what the defendant ought to make after the plaintiff's count, or declaration, viz. that he defends all the wrong, force, and damages, where and when he ought, &c. If the defendant would plead to the jurisdiction, he must omit the words "where and when he ought;" and if he would shew any disability in the plaintiff, and demand judgment if the plaintiff shall be answered, then he ought to omit the defence of the damage. There is a full defence usually in personal actions.

To DEFE'NCE. *v. a.* (*defensus*, Latin.) To defend by fortification: not in use (*Fairfax*).

DEFENCES, in heraldry, the weapons of any beast, as the horns of a stag, the tusks of a wild boar, &c.

DEFE'NCELESS. *a.* (from *defence*.) 1. Naked; unarmed; unguarded (*Mitlon*). 2. Impotent; unable to make resistance (*Ad.*).

To DEFE'ND. *v. a.* (*defendo*, Lat.) 1. To stand in defence of; to protect; to support (*Shakspeare*). 2. To vindicate; to uphold; to assert; to maintain (*Swift*). 3. To fortify; to secure (*Dryden*). 4. To prohibit; to forbid (*Temple*). 5. To maintain a place, or cause, against those that attack it (*Smith*).

DEFEND, *defendere*, in our ancient laws and statutes, signifies to prohibit or forbid. See DEFENCE. (5 Richard II. cap. 7.) In which sense also Chaucer uses it, in the following passage:

> Where can you say in any manner, age,
> That ever God defended marriage.

See also Milton's Parad. Lost, book ii. line 86.

DEFE'NDABLE. *a.* (from *defend*.) That may be defended.

DEFE'NDANT. *a.* (from *defendo*, Lat.) Defensive; fit for defence (*Shakspeare*).

DEFE'NDANT. *s.* (from the adjective.) 1. He that defends against assailants (*Wilkins*). 2. (In law.) The person accused or sued (*Hudibras*).

DEFE′NDER. *s.* (from *defend.*) 1. One that defends; a champion (*Shakspeare*). 2. An assertor; a vindicator (*South*). 3. (In law.) An advocate.

Defender of the faith (*Fidei defensor*), a peculiar title belonging to the king of England; as Catholicus to the king of Spain. These titles were given by the popes of Rome. That of Fidei Defensor was first conferred by Leo X. on king Henry VIII. for writing against Martin Luther; and the bull for it bears date, quinto idus Oct. 1521. It was afterwards confirmed by Clement VII. But the pope, on Henry's suppressing the houses of religion at the time of the reformation, not only deprived him of his title, but deposed him from his crown also: though in the 35th year of his reign, his title, &c. was confirmed by parliament; and hath continued to be used by all succeeding kings to this day. Chamberlayne says, the title belonged to the kings of England before that time, and for proof of this appeals to several charters granted to the university of Oxford. So that pope Leo's bull was only a renovation of an ancient right.

DEFE′NSATIVE. *s.* (from *defence.*) 1. Guard; defence (*Brown*). 2. (In surgery.) A bandage, plaster, or the like, used to secure a wound.

DEFE′NSIBLE. *a.* (from *defence.*) 1. That may be defended (*Bacon*). 2. Justifiable; capable of vindication (*Collier*).

DEFE′NSIVE. *a.* (*defensif*, Fr.) 1. That serves to defend; proper for defence; not offensive (*Sidney*). 2. In a state or posture of defence (*Milton*).

Defe′nsive. *s.* (from the adjective.) 1. Safeguard (*Bacon*). 2. State of defence (*Clarendon*).

DEFE′NSIVELY. *ad.* In a defensive manner.

DEFE′NST. *part. pass.* (from *defence.*) Defended: obsolete (*Fairfax*).

To DEFE′R. *v. n.* (from *differo*, Latin.) 1. To put off; to delay to act (*Milt.*). 2. To pay deference to another's opinion.

To Defe′r. *v. a.* 1. To withhold; to delay (*Pope*). 2. To refer to; to leave to another's judgment and determination (*Bacon*).

DE′FERENCE. *s.* (*deference*, French.) 1. Regard; respect (*Swift*). 2. Complaisance; condescension (*Locke*). 3. Submission (*Addison*).

DEFERENS VAS. (*deferens*; from *differo*, to convey; because it conveys the semen to the vesiculæ seminales.) In anatomy. See Vas deferens.

DE′FERENT. *a.* (from *deferens*, or *defero*, Latin.) That carries up and down (*Bacon*).

De′ferent. *s.* (from the adjective.) That which carries; that which conveys (*Bacon*).

Deferent, in the old astronomy, an imaginary circle, which, as it were, carries about the body of a planet, and is the same with the eccentric.

DEFI′ANCE. *s.* (from *deffi*, French.) 1. A challenge; an invitation to fight (*Dryden*). 2. A challenge to make any impeachment good. 3. Expression of abhorrence or contempt (*Locke*).

DEFI′CIENCE. Defi′ciency. *s.* (from *deficio*, Latin.) 1. Want; something less than is necessary (*Arbuthnot*). 2. Defect; failing; imperfection (*Spratt*).

DEFI′CIENT. *a.* (*deficiens*, Lat.) Failing; wanting; defective; imperfect (*Wotton*).

Deficient hyperbola, is a curve having only one asymptote, though two hyperbolic legs running out infinitely by the side of the asymptote, but contrary ways.

Deficient interval, in music, one less than the true by a comma.

Deficient numbers, those whose aliquot parts when added together, make sums less than the numbers themselves: as 8, whose parts, 1, 2, and 4, make only 7.

DEFI′ER. *s.* (from *deffi*, French.) A challenger; a contemner (*Tillotson*).

To DEFI′LE. *v. a.* (aꝼilan, Saxon.) 1. To make foul or impure; to dirty (*Shakspeare*). 2. To pollute; to make legally or ritually impure (*Leviticus*). 3. To corrupt chastity; to violate (*Prior*). 4. To taint; to corrupt; to vitiate (*Wakefield*).

To Defi′le. *v. n.* (*deffiler*, Fr.) To march; to go off file by file.

Defi′le. *s.* (*defile*, Fr.) A narrow passage (*Addison*).

Defile, in fortification, a straight narrow passage, through which a company of horse or foot can pass only in file, by making a small front; so that the enemy may take an opportunity to stop their march, and to charge them with so much the more advantage, as those in the front and rear cannot reciprocally come to the relief of one another.

DEFI′LEMENT. *s.* (from *defile.*) The state of being defiled; pollution; corruption (*Milton*).

DEFI′LER. *s.* (from *defile.*) One that defiles; a corrupter; a violator (*Addison*).

DEFI′NABLE. *a.* (from *define.*) 1. Capable of definition (*Dryden*). 2. That may be ascertained (*Burnet*).

To DEFI′NE. *v. a.* (*definio*, Latin.) 1. To give the definition; to explain a thing by its qualities and circumstances (*Sidney*). 2. To circumscribe; to bound (*Newton*).

To Defi′ne. *v. n.* To determine; to decide; to decree (*Bacon*).

DEFI′NER. *s.* (from *define.*) One that defines a thing by its qualities (*Prior*).

DE′FINITE. *a.* (from *definitus*, Lat.) 1. Certain; limited; bounded (*Sidney*). 2. Exact; precise (*Shakspeare*).

Definite, in grammar, is applied to an article that has a precise determinate signification; such as the article *the* in English, *le* and *la* in French, &c. which fix and ascertain the noun they belong to, to some particular, as *the King*, *le Roy*; whereas in the quality *of King*, *de Roy*, the articles *of* and *de* mark nothing precise, and are therefore indefinite.

De'finite. *s.* (from the adjective.) Thing explained or defined (*Ayliffe*).

DE'FINITIVENESS. *s.* (from *definite.*) Certainty; limitedness.

DEFINI'TION. *s.* (*definitio*, Latin.) 1. A short description of a thing by its properties (*Dryden*). 2. Decision; determination.

Definition, in logic, an enumeration of the chief simple ideas of which a compound idea consists; in order to ascertain or to explain its nature and character.

Definitions are of two kinds: the one nominal, or, of the name; the other real, or, of the thing.

Definition of the name, or nominal definition, is that which explains the sense or signification appropriated to a word: or, as Wolfius more accurately considers it, it is an enumeration of certain marks, or characters, sufficient to distinguish the thing defined from any other thing; so as to leave it out of doubt what the subject is that is intended, or denoted by the name. This is what is meant by definition in mathematics.

Such is the definition of a square, when it is said to be a quadrilateral, equilateral, rectangular figure.

By definition of the name, is either meant a declaration of the ideas and characters appropriated to the word in the common usage of the language; or the peculiar ideas, &c. which the speaker thinks fit to denote by that word, i. e. the special sense wherein he proposes to use it, in his future discourse. For it may be observed, that the significancy of any word depends entirely on our will; and we may affix what idea we please to a sound, which itself signifies nothing at all.

The definition of the name, therefore, in the second sense, is merely arbitrary, and ought never to be called in question; only it is to be minded, that we keep inviolably to the same signification. Hence, a definition comes to stand, or to be made use of, as an undoubted or self-evident maxim; as it frequently does, and particularly among geometricians, who, above all other people, make use of such definitions.

Definition of the thing, or real definition, is properly an enumeration of the principal attributes of a thing, in order to convey or explain its nature.

Thus, a circle is defined a figure, whose circumference is every where equidistant from its centre.

Wolfius defines a real definition to be a distinct notion explaining the genesis of a thing; that is, the manner wherein the thing is made, or done: such is that of a circle, whereby it is said to be formed by the motion of a right line round a fixed point. On which footing, what was before instanced as a real definition of a circle amounts to no more than a nominal one.

This notion of a real definition is very strict and just; and affords a sufficient distinction between a real and nominal one. But though it has the advantages of analogy, distinctness, and conveniency, on its side; yet, being only itself a nominal definition, i. e. a definition of the term *real definition*, we must consider it in that light, that is, an idea fixed arbitrarily to that word, and which the author always denotes by that word in the course of his book.

Of the parts enumerated in a definition, some are common to other things beside the thing defined; others are peculiar thereto: the first are called the genus, or kind; and the second, the difference. Thus, in the former definition of a circle, by a figure whose circumference is every where equidistant from its center; the word figure is the kind, as being a name common to all other figures, as well as the circle; the rest are the difference, which specify, or distinguish, this figure from every other figure. And hence arises that rule of F. de Colonia, for the making of a definition. "Take," says he, "something that is common to the thing defined with other things, and add to it something that is proper, or peculiar to the thing; i. e. join the genus and specific difference, and you will have a definition."

The special rules for a good definition are these: 1. A definition must be universal, or adequate, that is, it must agree to all the particular species, or individuals that are included under the same idea. 2. It must be proper, and peculiar to the thing defined, and agree to that alone. These two rules being observed, will always render a definition reciprocal with the thing defined, that is, the definition may be used in the place of the thing defined; or they may be mutually affirmed concerning each other. 3. A definition should be clear and plain; and, indeed, it is a general rule concerning the definition both of names and things, that no word should be used in either of them which has any difficulty in it, unless it has been before defined. 4. A definition should be short, so that it must have no tautology in it, nor any words superfluous. 5. Neither the thing defined, nor a mere synonymous name, should make any part of the definition.

DEFI'NITIVE. *a.* (*definitivus*, Lat.) Determinate; positive; express (*Wotton*).

DEFI'NITIVELY. *ad.* Positively; decisively; expressly (*Hall*).

DEFI'NITIVENESS. *s.* Decisiveness.

DEFLAGRABI'LITY. *s.* (from *deflagro*, Latin.) Combustibility (*Boyle*).

DEFLA'GRABLE. *a.* (from *deflagro*, Latin.) Having the quality of wasting away wholly in fire, without any remains (*Boyle*).

DEFLAGRA'TION. (*deflagratio*, from *deflagro*, to burn.) Calcination. A chemical term, chiefly employed to express the burning or setting fire to any substance; as nitre, sulphur, &c.

To DEFLE'CT. *v. n.* (*deflecto*, Latin.) To turn aside; to deviate from a true course (*Blackmore*).

DEFLECTED, in botany; a branch of a tree, bowed, or bending down archwise.

DEFLECTION, the turning any thing aside from its former course by some adventitious or external cause.

The word is often applied to the tendency of a ship from her true course, by reason of currents, &c. which divert her, and turn her out of her right way.

DEFLECTION OF THE RAYS OF LIGHT, is a property which Dr. Hook observed in 1674-5, and read an account of before the Royal Society, March 18, the same year. He says, he found it different both from reflection and refraction; and that it was made towards the surface of the opacous body perpendicularly.

This is the same property which sir Isaac Newton calls inflection. It is called by others diffraction.

DEFLECTIVE FORCES (from *deflecto*, Lat. to bend or turn aside), are those forces which act upon a moving body in a direction different from that of its actual course, in consequence of which the body is deflected, or turned, or drawn aside, from the direction in which it is moving. Such is the attractive force of the sun upon the earth in its orbit.

DEFLE'XURE. *s.* (from *deflecto*, Latin.) A bending down; a turning aside, or out of the way.

DEFLORATE, in botany. Having discharged the farina or pollen.

DEFLORATION, or DEFLOWERING, the act of violating or taking away a woman's virginity. (See VIRGINITY.) Death or marriage is decreed by the civil law in case of defloration.

To DEFLO'UR. *v. a.* (*deflorer*, French.) 1. To ravish; to take away a woman's virginity (*Ecclus.*). 2. To take away the beauty and grace of any thing (*Taylor*).

DEFLO'URER. *s.* (from *deflour.*) A ravisher; one that takes away virginity (*Ad.*).

DEFLU'OUS. *a.* (*defluus*, Latin.) 1. That flows down. 2. That falls off.

DEFLU'X. *s.* (*defluxus*, Latin.) Downward flow (*Bacon*).

DEFLUXION. *s.* (*defluxio*, from *defluo*, to run off.) In medicine, a discharge of a fluid from any part.

DE'FLY. *ad.* (from *deft.*) Dextrously; skilfully: properly deftly (*Spenser*).

DEFOE (Daniel), a celebrated English writer, was born, we believe, at Elton, in Huntingdonshire, in the year 1660. He was bred a hosier; which profession, however, he soon forsook, and became one of the most enterprising authors that any age has produced. When discontents ran high at the revolution, and king William was obliged to dismiss his Dutch guards, De Foe, who had true notions of civil liberty, ridiculed the enemies of government in his well-known poem, called The True-born Englishman, which had a prodigious sale. The next satire he wrote was entitled Reformation of Manners, aimed at some persons of high rank, who rendered themselves a disgrace to their country. When the ecclesiastics in power breathed too much of a spirit of persecution, De Foe wrote a tract called The Shortest Way with the Dissenters; for which he was called to account, and explained himself with great firmness. He was afterwards sentenced to the pillory for attacking some public measures; which so little intimidated him, that, in defiance of their usage, he wrote A Hymn to the Pillory. It would be endless to enumerate all his publications; but the following are the principal: The History of the Plague in 1665; a novel entitled The History of Colonel Jack; A new Voyage round the World by a Company of Merchants, printed for Bettesworth, 1725; The History of Roxana; Memoirs of a Cavalier; The History of Moll Flanders; The Family Instructor; a book entitled Religious Courtship, which has undergone upwards of 30 editions; and the Life and Adventures of Robinson Crusoe; an admirable performance, of which there have been editions without number, but concerning which there is an anecdote that does the author of it no credit as to the better part of a writer's character, honesty. When captain Woods Rodgers touched at the island of Juan Fernandes, in the South Sea, he brought away Alexander Selkirk, a Scots sailor, who had been left ashore there, and had lived on that desolate place above four years. When Selkirk came back to England, he wrote a narrative of his adventures, and put the papers into the hands of De Foe to digest for publication; who ungenerously converted the materials into the History of Robinson Crusoe, and returned Selkirk his papers again! a fraud for which in a humane view, the distinguished merit of that romance can never atone. For the evidence on which this charge against De Foe stands, see Providence Displayed; or, An Account of the extraordinary Sufferings of Alexander Selkirk, by Mr. Isaac James, of Bristol. Daniel De Foe died at Islington, in 1731. All his productions of the romantic species, but especially the two last mentioned, are much in vogue among country readers; and, on account of their moral and religious tendency, may probably do a great deal of good. Robinson Crusoe is a performance strictly unique, both in the plan and execution. Our praises, however, must be confined to the first volume, which, probably, was all he intended publishing, till the second was drawn from him by motives of gain. De Foe also wrote a History of the Scotch Union, a work which does the author considerable credit: a new edition of it was published a few years ago, in 4to. by Chalmers.

DEFOEDA'TION. *s.* (from *defœdus*, Lat.) The act of making filthy; pollution (*Bent.*).

DEFOLIATION, or shedding the leaves. In botany, a term that implies not so much the action of unleaving, or shedding leaves; as the season in which this action is performed.

The following table, respecting the mean times in which the different trees shed their leaves, is founded upon observation:

Gooseberry-tree and bladder-sena,	Generally shed their leaves about	Oct. 1.
Walnut and ash		—— 15.
Almond-tree, horse-chesnut, and lime-tree,		—— 20.
Maple, hazel-nut, black poplar, and aspen-tree,		—— 25.
Birch, plane-tree, mountain osier, false acacia, pear, and apple-tree,		Nov. 1.
Vine, mulberry, fig, sumac, and angelica-trees,		—— 10.
Elm-tree and willow,		—— 15.
Apricot and elder-trees,		—— 20.

It deserves to be remarked, that an evergreen tree grafted upon a deciduous, determines the latter to retain its leaves. This observation is confirmed by repeated experiments, particularly by grafting the laurel, or cherry-bay, an evergreen, on the common cherry; and the ilex, or evergreen oak, on the oak.

DEFORCEMENT, in law, the casting any one out of his land, or a withholding of lands and tenements by force from the right owner.

Deforcement, in the law of Scotland, is used for resisting, or offering violence to the officers of the law, while they are actually employed in the exercise of their functions, by putting its orders and sentences in execution. The punishment of this crime is confiscation of moveables, joined with some arbitrary punishment, as fine, imprisonment, banishment, or corporal pains, according to the degree of violence, and other circumstances which aggravate the crime.

DEFORCEOR, in law, is a person that overcomes and casts forth another from his lands and tenements by force, and differs from a disseizor on this account: 1. That a man may be disseized without force. 2. A man may deforce another that never was in possession; as where many have a right to lands, as common heirs, and one of them enters and keeps out the rest. A deforceor likewise differs from an intruder, who is made by a wrongful entry only into land, &c. void of a possessor, whilst a deforceor is he that holds out against the right heir.

To DEFO'RM. *v. n.* (*deformo*, Latin.) 1. To disfigure; to make ugly (*Shakspeare*). 2. To dishonour; to make ungraceful (*Dryden*).

Defo'rm. *a.* (*deformis*, Lat.) Ugly; disfigured; of an irregular form (*Milton*).

DEFORMA'TION. *s.* (*deformatio*, Lat.) A defacing; a disfiguring.

DEFO'RMEDLY. *ad.* (from *deform.*) In an ugly manner.

DEFO'RMEDNESS. *s.* (from *deformed.*) Ugliness; a disagreeable form.

DEFO'RMITY. *s.* (*deformitas*, Lat.) 1. Ugliness; illfavouredness (*Shakspeare*). 2. Ridiculousness (*Dryden*). 3. Irregularity; inordinateness (*K. Charles*).

Deformity is immediately opposed to beauty, and denotes the want of that uniformity, symmetry, and variety, necessary to constitute beauty. Accordingly, Dr. Hutcheson defines it by the absence of beauty, or a deficiency in the beauty expected in any species. Deformity and beauty may be considered either as natural or moral. These are both referred by the above-mentioned ingenious writer to an internal sense; and our perceptions of them, as he supposes, arise from an original, arbitrary structure of our own minds, by which certain objects, when observed, are rendered the occasions of certain sensations and affections.

That many objects give no pleasure to our sense is obvious. Many are certainly void of beauty; but then, says this author, there is no form which seems necessarily disagreeable of itself, when we dread no other evil from it, and compare it with nothing better of the kind. Many objects are naturally displeasing, and distasteful to our external senses, as well as others pleasing, and agreeable; as smells, tastes, and some separate sounds: but with regard to our sense of beauty, no composition of objects which give not unpleasant simple ideas, seems positively unpleasant, or painful of itself, had we never observed any thing better of the same kind.

Had there been a species of the form which we now denominate ugly, or deformed, and had we never seen or expected greater beauty, we should have received no disgust from it; though the pleasure would not have been so great in this form as in those we now admire. Our sense of beauty seems designed to give us positive pleasure; but not positive pain, or disgust, any farther than what arises from disappointment.

The chief cause of the personal deformity so frequent at present, is the neglect of paying proper attention to the clothing of infants, by which they are deprived of the free use of their limbs; and thus, in a great measure, rendered unserviceable to society. But, though deformity may apparently be prejudicial to health, it is ultimately a real advantage. Deformed persons, it is true, possess a less share of strength than others; they should, therefore, be naturally more careful to preserve it, as well as their health; which can be effected only by a strict adherence to temperance. This object will likewise be considerably facilitated by moderate exercise, which few, in such a situation, can want strength to perform; and, as they are not calculated for violent exercise, they are consequently exempt from all the disorders arising from that source; and may thus attain a mature old age.

In the work entitled Fugitive Pieces is preserved an excellent essay on bodily deformity, by the late William Hay, esq. who was himself deformed, and who, while he rallies his own figure with great pleasantry, discusses the general subject in a manner equally instructive and agreeable. He considers the natural consequences of bodily deformity; how it affects the outward circumstances; and, lastly, what turn it gives to the mind. The reader will find much amusement and information result from consulting this admirable essay.

DEFO'RSOR. *s.* (from *forceur*, French.) One that overcomes and casts out by force (*Blount*).

DEFOSSION, burying alive: this was inflicted by the Romans on vestal virgins guilty of incontinency.

To DEFRA'UD. *v. a.* (*defraudo*, Latin.) To rob or deprive by wile or trick; to cheat (*Pope*).

DEFRAUDA'TION. *s.* (*defraudo*, Lat.) Privation by fraud (*Brown*).

DEFRA'UDER. *s.* (from *defraud.*) A deceiver; one that cheats (*Blackmore*).

To DEFRA'Y. *v. a.* (*defrayer*, Fr.) To bear the charges of (*Bacon*).

DEFRA'YER. *s.* (from *defray.*) One that discharges expences.

DEFRA'YMENT. *s.* (from *defray.*) The payment of expences.

DEFT. *a.* (ꝺæꝼꞇ, Saxon.) Obsolete. 1. Neat; handsome; spruce. 2. Proper; fitting (*Shakspeare*). 3. Ready; dexterous (*Dry.*).

DEFTERDAR, or Deftardar, in the Turkish and Persian polity, an officer of state, answering to our lord treasurer, who appoints deputies in every province.

DE'FTLY. *ad.* (from *deft.*) Obsolete. 1. Neatly; dexterously (*Shakspeare*). 2. In a skilful manner (*Gay*).

DEFU'NCT. *a.* (*defunctus*, Lat.) Dead; deceased (*Hudibras*).

Defu'nct. *s.* (from the adjective.) One that is deceased; a dead man or woman (*Graunt*).

DEFU'NCTION. *s.* (from *defunct.*) Death (*Shakspeare*).

To DEFY'. *v. a.* (*deffier*, French.) 1. To call to combat; to challenge (*Dryden*). 2. To treat with contempt; to slight (*Shak.*).

Defy'. *s.* (from the verb.) A challenge; an invitation to fight (*Dryden*).

DEFY'ER. *s.* (from *defy.*) A challenger; more properly *defier* (*South*).

DEGE'NERACY. *s.* (from *degeneratio*, Latin.) 1. Departure from the virtue of our ancestors. 2. Desertion of that which is good (*Tillotson*). 3. Meanness (*Addison*).

To DEGE'NERATE. *v. n.* (*degenerer*, French.) 1. To fall from the virtue of our ancestors. 2. To fall from a more noble to a base state (*Tillotson*). 3. To fall from its kind; to grow wild or base (*Bacon*).

Dege'nerate. *a.* (from the verb.) 1. Unlike his ancestors (*Swift*). 2. Unworthy; base (*Milton*).

DEGE'NERATENESS. *s.* Degeneracy; state of being grown wild, or out of kind.

DEGENERA'TION. *s.* (from *degenerate.*) 1. A deviation from the virtue of one's ancestors. 2. A falling from a more excellent state to one of less worth. 3. The thing changed from its primitive state (*Brown*).

DEGE'NEROUS. *a.* (from *degener*, Lat.) 1. Degenerated; fallen from virtue. 2. Vile; base; infamous; unworthy (*South*).

DEGE'NEROUSLY. *ad.* In a degenerate manner; basely; meanly (*Decay of Piety*).

DEGLUTI'TION. *s.* (*deglutition*, Fr.) The act or power of swallowing (*Arbuthnot*). Deglutition is performed in the first place by means of the tongue, driving the aliment into the œsophagus or gullet, and then, by the contraction of the sphincter, and the fleshy fibres of the œsophagus, which, lessening its aperture, protrude the contents downward into the stomach.

DEGRADA'TION. *s.* (*degradation*, Fr.) 1. Dismission from an office or dignity (*Ayliffe*). 2. Degeneracy; baseness (*South*). 3. Diminution of value.

Degradation, a punishment of delinquent ecclesiastics. The canon-law distinguishes it into two sorts: the one summary, by word only: the other solemn, by stripping the person degraded of those ornaments and rights which are the ensigns of his order or degree. The canonists likewise distinguish degradation from deposition; understanding by the latter the depriving a man of his clerical orders, but by the former only the removing him from his rank or degree. In the ancient primitive church, degrading a clergyman was reducing him to the state and communion of laymen. The full import of the phrase, however, is the depriving him of his orders, and reducing him to the simple condition of a layman; a punishment inflicted for several offences, as adultery, theft, or fraud: and clergymen thus reduced were seldom allowed to recover their ancient station, except upon some great necessity or very pressing reason.

To DEGRA'DE. *v. a.* (*degrader*, French.) 1. To put one down from his degree (*Shakspeare*). 2. To lessen; to diminish the value of (*Milton*).

DEGRE'E. *s.* (*degré*, French.) 1. Quality; rank; station (*Prior*). 2. The comparative state and condition in which a thing is (*Bac.*). 3. A step or preparation to any thing (*Sidn.*). 4. Order of lineage; descent of family (*Dryden*). 5. Order or class (*Locke*). 6. Measure; proportion (*Dryden*). 7. The vehemence or slackness of the hot or cold quality (*South*).

Degree, in algebra, a term applied to equations, to distinguish the highest power of the unknown quantity. Thus, if the index of that power be 3 or 4, the equation is respectively of the 3d or 4th degree.

Degree, in geometry or trigonometry, is the 360th part of the circumference of any circle. Every circle being considered as divided into 360 parts, called degrees; which are marked by a small ° near the top of the figure; thus 45° is 45 degrees.

The degree is subdivided into 60 smaller parts, called minutes, meaning first minutes; the minute into 60 others, called seconds; the second into 60 thirds; &c. Thus 45° 12′ 20″ are 45 degrees, 12 minutes, 20 seconds.

The magnitude or quantity of angles is accounted in degrees; for because of the uniform curvature of a circle in all its parts, equal angles at the centre are subtended by equal arcs, and by similar arcs in peripheries of different diameters; and an angle is said to be of so many degrees, as are contained in the arc of any circle comprehended between the legs of the angle, and having the angular point for its centre. Thus we say an angle of 90°, or of 45° 24′. It is also usual to say, such a star is elevated so many degrees above the horizon, or declines so many degrees from the equator; or such a town is situate so many degrees of latitude or longitude. A sign of the ecliptic or zodiac contains 30 degrees.

Degree of latitude, is the space or distance on the meridian through which an observer must move, to vary his latitude by one degree, or to increase or diminish the distance of a star from the zenith by one degree; and which, on the supposition of the perfect sphericity of the earth, is the 360th part of the meridian.

The quantity of a degree of a meridian, or other great circle, on the surface of the earth, is variously determined by different observers: and the methods made use of are also various.

Eratosthenes, 250 years before Christ, first determined the magnitude of a degree of the meridian, between Alexandria and Syene on the borders of Ethiopia, by measuring the distance between those places, and comparing it with the difference of a star's zenith distances at those places; and found it to be $694\frac{4}{9}$ stadia.

Ptolemy fixes the degree at 68⅔ Arabic miles, counting 7½ stadia to a mile. The Arabs themselves, who made a computation of the diameter of the earth, by measuring the distance of two places under the same meridian, in the plains of Sennar, by order of Almamon, make it only 56 miles. Kepler, determining the diameter of the earth by the distance of two mountains, makes a degree 13 German miles; but his method is far from being accurate. Snell, seeking the diameter of the earth from the distance between two parallels of the equator, finds the quantity of a degree,

by one method 57064 Paris toises, or 342384 ft.;
by another meth. 57057 . . . . toises, or 342342 ft.

Since the time of Snell, a degree of latitude has been measured in different places, by various mathematicians: as our limits will not allow of our indulging in a complete historical detail, we shall present our readers with a comparative table of results, and then subjoin a few remarks and references.

TABULAR COMPARISON OF OBSERVATIONS.

Length of a Degree on the Level of the Sea.

Latitude.	Toises.	Fathoms according to Roy.	Measurers.
49° 20′¼ N.	57070		Fernelius, 1525.
52° 4′	57057		Snellius, 1620.
52° 46′	57419		Norwood, published 1636.
66° 20′	57422	61194·3	Maupertuis, 1736-7.
66° 21′ 12″	57209·28		Melanderhielm and Svanberg, 1802.
50° 41′	....	60840	Roy, 1790. The degree perpendicular to the meridian 61182·3 fathoms. Phil. Trans. 1795.
50° 9′ 27″	....	60826·6	
49° 23′	57074		Maupertuis and Cassini, 1739-40.
49° 7′	57064·5		Picart, 1669.
49° 3′	....	60833·0	Mean of Maupertuis, and Cassini, and Liesganig.
48° 43′		60839·4	
47° 40′	57091		Liesganig, 1768.
45° 0′	57028	60777·6	Cassini, 1739-40.
44° 44′	57069	60821·3	Beccaria, 1768.
43° 52′		60773·4	Mean of Beccaria and Boscovich.
43° 0′	56979	60725·5	Boseovich and Lemaire, 1752.
39° 12′	56888·4	60628·5	Mason and Dixon, 1764-8.
12° 32′		60494	Lambton, 1803.
0° 0′	56750	60485·5	Bouguer and Condamine, 1736-43.
38° 13′ S.	57037		Klostermann, 1789.
	56746		La Caille, 1752.
In Egypt.	56880		Nouet. Phil. Mag. xii. 208.
41° 52′½ N.		60516·7	Biot and Arrago, 1808.
51° 13′		60884·	Mudge, 1800-2.
51° 9′		60825·	Do.
52° 2′ 20″		60820·	Do.
51° 35′ 18″		60864·	Do.
The measures indicated as great irregularities as those of colonel Mudge.			Mechain and Delambre, 1790-1805.

From a comparison of the measures of a degree on the meridian, at different parts of the earth, it follows that the earth is not strictly spherical, but more nearly agrees in figure with an oblate spheroid; or in the opinion of some, the segments of two rather unequal spheroids are united at the equator. See Earth and Ellipticity.

The great trigonometrical survey of this kingdom, originated principally from a memorial of M. Cassini de Thury, transmitted by the French ambassador to Mr. Fox, then (1783) secretary of state, setting forth what benefits astronomy would derive from constructing a series of triangles that should connect trigonometrically the two observatories of Greenwich and Paris, and thus determine their relative positions, more accurately than it was supposed could be done by astronomical observations. Both nations at that time enjoyed the blessings of peace; and the scientific men of each country readily obtained from their respective governments the assistance and patronage which such an undertaking required. As the work proceeded, the objects and intentions of the philosophers on both sides of the water gradually expanded; and under the successive superintendance of Roy, Williams, and Mudge, in England; and Cassini, Mechain, Legendre, and Delambre in France; the operations have been conducted with remarkable accuracy, skill, and success.

The occasion of the recent measurement of the degree in Lapland was simply this. It had long been supposed that some errors had been made in the admeasurement in Lapland conducted by MM. Maupertuis, Clairaut, Camus, Lethonnier, and the Abbe Outhier, and the French National Institute wished for a new opportunity of examining into its accuracy: Bonaparte, therefore, at the suggestion of the Institute, wrote a letter personally to the king of Sweden, requesting permission for some members of that body to visit Lapland, in order to determine an arc of the meridian. That high-spirited young monarch replied, that he would consult the Academy of Sciences at Stockholm, whether such an operation was desirable for the interests of science; and if they were of this opinion, he would appoint Swedish mathematicians to undertake it. In consequence of this, Messrs. Svanberg, Ofverboom, Holinquist, and Palander, were appointed, and in 1801, 1802, 1803, went through the work with such assiduity, talent, and success, as reflect much honour on themselves, and on the country to which they belong. Their result differs more than 200 toises from that of Maupertuis; and M. Svanberg accounts for this difference from the circumstance of the French mathematicians having neglected to allow for variation from the level of the sea. From the whole, M. Svanberg now deduces, as the most probable conclusion, $\frac{1}{323 \cdot 065}$ for the ellipticity, and 3963·26 English miles, for the radius of our earth at the equator. See EARTH.

Those who wish to acquaint themselves with the best and most approved methods of conducting these extensive measurements will do well to consult colonel Mudge's various papers on the Grand Trigonometrical Survey; Base du Système métrique décimal, ou Mesure de l'arc du méridien compris entre le parallèles de Dunkerque et Barcelone, par M. Delambre. Exposition des Opérations faites en Laponie, &c. par M. Svanberg, Stockholm, 1805. Traité de Géodésie, par M. Puissaint. A very complete list of papers on this subject is given in the 2d volume of Dr. T. Young's Philosophy.

On the supposition that the earth's figure is that of an oblate spheroid, it has been shewn, 1. That a degree of the earth's equator is the first of two mean proportionals, between the last and first degrees of latitude. 2. If the diameter of the equator be to the axis of the earth, as 180 to 179, the latitude in which the degree of latitude will be equal to a degree of the equator will be 54° 48′ 24″. If the proportion be 230 to 229, the latitude comes out 54° 45′ 31″. 3, If the proportion be 180 to 179, the latitude, where the degree of the meridian will be equal to a degree of a circle, whose diameter is equal to the axis of the earth, will be found to be 35° 20′ 30″; assuming the proportion of 230 to 229, the latitude will be 35° 19′ 25″. (Horsley's Tracts, p. 394, &c.).

The lengths of the degrees on the meridian of an ellipsoid, increase from the equator to the pole very nearly as the square of the sine of the latitude. And the length of the degree at any point, is to the length at the equator, accurately as the cube of a line drawn parallel to the plumb line from a point in the axis equidistant from the centre with the equator, and terminating in a point of the plane of the equator, to the cube of the line drawn from this point to the true pole. Or, if e be the ellipticity, and x the sine of the latitude, the length of the degree will vary as $(1 + (2e + ee)xx)^{\frac{3}{2}}$.

DEGREE OF LONGITUDE, is the space between two meridians that make an angle of 1° with each other at the poles; the quantity or length of which is variable, according to the latitude, being every where as the cosine of the latitude; viz. as the cosine of one lat. is to the cosine of another, so is the length of a degree in the former lat. to that in the latter, on the supposition that the earth is spherical. But taking the earth as a spheroid, the degree of longitude may be found in any given latitude L, by saying, 1. As the equatorial diameter, to the polar, so is, tang. $\overline{90^\circ - L}$, to tang. of an angle A: then, 2. As radius, to sine of A, so is the length of a degree of the equator to the length of a degree on the parallel of the given latitude.

DEGREE IN MUSIC. The difference of position or elevation between any two notes. There are conjunct and disjunct degrees. When two notes are so situated as to form the interval of a second, the degree is said to be conjunct; and when they form a third, or any greater interval, the degree is called disjunct.

According to others, degrees are the little intervals, whereof the concords or harmonic intervals are composed: they are, the greater tone, the less tone, and the semitone. The latter sense of the term is used by ancient authors; the former by the moderns.

DEGREES OF COMPARISON, in grammar, are usually reckoned three, viz. positive, comparative, and superlative. See GRAMMAR.

DEGREE, in universities, denotes a quality conferred on the students or members, as a testimony of their proficiency in the different branches of learning, and entitling them to certain privileges. (See BACHELOR, &c.) At Cambridge, a person must have resided during the greater part of twelve several terms, before he can become a bachelor of arts. If a person of the age of 24 years be admitted of any college, he may take the degree of bachelor of divinity after ten years: but he need not reside more than three terms. A bachelor of laws must be of six years standing complete. A bachelor of physic is usually admitted in the course of his sixth year. A master of arts must have been a bachelor of arts at least three years. After he has been a master of arts seven years, he may become a bachelor of divinity. After he has been B.D. five years, he may become doctor of divinity; or he may take the degree of D.D. per saltum if he be an M.A. of 12 years standing. After a person has been L.L.B. five years, or M.A. seven years, he may take the degree of Doctor of Laws. A bachelor of physic of five years standing, or seven years M.A. may become a Doctor of Physic. The following are entitled to honorary degrees: privy counsellors, bishops, dukes, marquisses, earls, viscounts, barons, sons of noblemen, persons related to the king, baronets, and knights, are entitled to the degree of M.A. only; the others to superior ones. For the exercises, ceremonies, fees, &c. on admission to these several degrees at Cambridge, we refer to Wall's

Account of the Ceremonies in the Senate House; or to the University Calendar.

At Oxford, matters of this kind are on nearly the same footing; though the expences are, we believe, heavier: the expences of a degree of doctor in any of the faculties, in treats and set fees, usually amount to 100*l.*; and those of a master of arts to 20*l.* or 30*l.*

No person can take a degree in either of the English universities (a degree in music excepted) without declaring *bona fide* his assent and consent to every thing contained in the Book of Common Prayer and Thirty-nine Articles. On this account it is usual for those who are liberally educated among the dissenters, to study at one of the Scotch universities; but commonly at Edinburgh, Aberdeen, or Glasgow; and on this account probably it is, that many of the students at the English universities affect to speak with great contempt of degrees obtained in Scotland. The fact is, that in both countries the universities often receive, as well as bestow, honours by the conferring of degrees: and it is equally true, that while in one country degrees can be obtained by men equally ignorant of literature and of science, by mere residence; in one university of the other country, the Brodums and the Solomons can procure degrees by purchase, without any examination or test of talent. So that, though no person can question the right of the universities on both sides of the Tweed to grant degrees and academic honours; no person can deny that both in England and Scotland the right may sometimes be abused, by conferring those distinctions upon ignorance, which were originally intended for men of real talents and extensive attainments.

Degrees, upon mathematical and philosophical instruments, are the divisions by which the changes in the things to which the instruments are applied are indicated. In this sense we speak of the degrees on a thermometer, &c.

By Degre'es. *ad.* Gradually; by little and little (*Newton*).

DEGUSTA'TION. *s.* (*degustatio*, Latin.) A tasting.

DEHISCENT, in botany, the gaping or opening of capsules; it is also put for the season in which this usually happens.

DEHLI, a province of Mogulstan, in Asia, having Junjapore and Bengal on the N. Jamba on the N.E. Bacar on the E. Agra on the S. and Ajmir on the W.

Dehli, the principal town of the above province; it is about ten miles in circumference, and was the residence of the great Mogul when Kouli Khan invaded Industan. The Mogul and his great officers of state were made prisoners in their city, and the conquerors compelled them to deliver up all their riches; but not being satisfied with this, he put several of the great men to the rack. It is surrounded with a brick wall, and defended by a fortress. It is 100 miles N. of Agra. Lat. 28. 20 N. Lon. 78. 15 E.

To DEHO'RT. *v. a.* (*dehortor*, Lat.) To dissuade; to advise to the contrary (*Ward*).

DEHORTA'TION. *s.* (from *dehortor*, Lat.) Dissuasion; a counselling to the contrary; advice against something (*Ward*).

DEHO'RTATORY. *a.* (from *dehortor*, Lat.) Belonging to dissuasion.

DEHO'RTER. *s.* (from *dehort.*) A dissuader; an adviser to the contrary.

DE'ICIDE. *s.* (from *deus* and *cædo*, Lat.) Death of our blessed Saviour (*Prior*).

To DEJE'CT. *v. a.* (*dejicio*, Latin.) 1. To cast down; to afflict; to grieve (*Shakspeare*). 2. To make to look sad (*Dryden*).

Deje'ct. *a.* (*dejectus*, Latin.) Cast down; afflicted; low-spirited.

DEJE'CTEDLY. *ad.* (from *deject.*) In a dejected manner; sadly; heavily (*Bacon*).

DEJE'CTEDNESS. *s.* Lowness of spirits.

DEJE'CTION. *s.* (*dejectio*, Lat.) 1. Lowness of spirits; melancholy (*Rogers*). 2. Weakness; inability (*Arbuthnot*). 3. A stool (*Ray*).

Dejection, in astrology, is applied to a planet when in a sign opposite to that wherein it is of greatest influence. See Exaltation.

DEJE'CTURE. *s.* (from *deject.*) The excrement (*Arbuthnot*).

DEJERA'TION. *s.* (from *dejero*, Lat.) A taking of a solemn oath.

DEIFICA'TION. *s.* (*deification*, French.) The act of deifying, or making a god.

Deification, in the pagan theology, the act or ceremony of deifying their emperors, i. e. of placing them among the gods, and decreeing divine honours to be rendered them. See God and Consecration.

The deification is the same with apotheosis.

DE'IFORM. *a.* (from *deus* and *forma*, Lat.) Of a godlike form.

To DE'IFY. *v. a.* (*deifier*, French.) 1. To make a god of; to adore as god (*South*). 2. To praise excessively (*Bacon*).

To DEIGN. *v. n.* (from *daigner*, Fr.) To vouchsafe; to think worthy (*Milton*).

To Deign. *v. a.* To grant; to permit (*Shakspeare*).

To DEI'NTEGRATE. *v. a.* (from *de* and *integro*, Latin.) To diminish.

DEI'PAROUS. *a.* (*deiparus*, Latin.) That brings forth a god; the epithet applied to the blessed Virgin.

DEISM, the doctrine or belief of the deists. Deism, from Θεος, God, may properly be used to denote natural religion, as comprehending those truths which have a real foundation in reason and nature; and in this sense it is so far from being opposite to Christianity, that it is one great design of the gospel to illustrate and enforce it. Thus some of the deistical writers have affected to use it. But deism more precisely signifies that system of religion, relating both to doctrine and practice, which every man is to discover for himself by the mere force of natural reason, independent of all revelation, and exclusive of it; and this religion Dr. Tindal and others pretend is so perfect, as to be in, capable of receiving any addition or improvement even from divine revelation.

DEISTS, a class of people known also under the denomination of Free-thinkers. The deists hold, that, considering the multiplicity of religions, the numerous pretences to revelation, and the precarious arguments generally advanced in proof thereof, the best and surest way is to return to the simplicity of nature and the belief of one God; which is the only truth agreed to by all nations. They complain, that the freedom of thinking and reasoning is oppressed under the yoke of religion; and that the minds of men are ridden and tyrannized by the necessity imposed on them of believing inconceivable mysteries; and contend that nothing should be required to be assented to, or believed, but what their reason clearly conceives.

Dr. Clarke distinguishes four sorts of deists. 1. Those who profess to believe the existence of an eternal, infinite, independent, intelligent Being, who made the world, without concerning himself in the government of it. 2. Those who believe the being and natural providence of God, but deny the difference of actions as morally good or evil, resolving it into the arbitrary constitution of human laws; and therefore they suppose that God takes no notice of them. With respect to both these classes, he observes, that their opinions can consistently terminate in nothing but downright atheism. 3. Those who, having right apprehensions concerning the nature, attributes, and all-governing providence of God, seem also to have some notion of his moral perfections; though they consider them as transcendent, and such in nature and degree, that we can form no true judgment, nor argue with any certainty concerning them; but they deny the immortality of human souls; alleging that men perish at death, and that the present life is the whole of human existence. 4. Those who believe the existence, perfections, and providence of God, the obligations of natural religion, and a state of future retribution, on the evidence of the light of nature, without a divine revelation: such as these, he says, are the only true deists; but their principles, he apprehends, should lead them to embrace Christianity; and therefore he concludes that there is now no consistent scheme of deism in the world.

The first deistical writer of any note that appeared in this country was Herbert baron of Cherbury. He lived and wrote in the last century. His book, De Veritate, was first published at Paris in 1624. This, together with his book De Causis Errorum, and his treatise De Religione Laici, were afterwards published in London. His celebrated work De Religione Gentilium was published at Amsterdam in 1663, in 4to. and in 1700, in 8vo.; and an English translation of it was published at London in 1705. As he was one of the first that formed deism into a system, and asserted the sufficiency, universality, and absolute perfection of natural religion, with a view to discard all extraordinary revelation, as useless and needless, we shall subjoin the five fundamental articles of this universal religion. They are these: 1. That there is one supreme God. 2. That he is chiefly to be worshipped. 3. That piety and virtue are the principal part of his worship. 4. That we must repent of our sins; and if we do so, God will pardon them. 5. That there are rewards for good men, and punishments for bad men, both here and hereafter. The positions of this and many other deists have been examined with much ability by Dr. Leland, in his View of the Deistical Writers. But we are not sure that we need refer even our hesitating readers to this work, satisfactory as most of its arguments are. Many of the deistical writers would have been forgotten long before this, had they not been kept alive by Leland's book. We have always thought the preserving vipers in spirits a disgusting practice; and we are besides convinced that every correct reasoner, whose turn of mind is not biassed by previous indulgence in vice, on comparing the difficulties and supports of the purest deism (that of Herbert) with those of Christianity, will find abundant reason to prefer the latter, and to say in the language of Scripture, "Their rock is not as our rock, our enemies themselves being judges."

DE'ISTICAL. *a.* (from *deist.*) Belonging to the heresy of the deists (*Watts*).

DE'ITY. *s.* (*deité*, French.) 1. Divinity; the nature and essence of God (*Hooker*). 2. A fabulous god (*Shakspeare*). 3. The supposed divinity of a heathen god (*Spenser*).

DEKHER (John), a learned jesuit, and chancellor of the university of Gratz, in Stiria, where he died in 1619, aged 69. He wrote, 1. Velificatio, seu theomerata de anno ortus ac mortis Domini, 1616, 4to. 2. Tabula Chronographica, à captâ per Pompeium, Jerosolymâ ad deletam à Tito urbem, 1605, 4to.

DELACERA'TION. *s.* (from *delacero*, Lat.) A tearing in pieces.

DELACRYMA'TION. *s.* (*delacrymatio*, Lat.) The waterishness of the eyes.

DELACTA'TION. *s.* (*delactatio*, Lat.) A weaning from the breast.

DELANY (Patrick), a divine of considerable learning and ingenuity. He was the son of a farmer in Ireland, and born in that kingdom about 1686. His learning and degrees were acquired at Trinity college, Dublin, where also he was elected fellow. He formed an early intimacy with Dean Swift, in whose works are some slight pieces, mostly humourous, of Dr. Delany's. He obtained some church preferment from lord Carteret; and in 1732, published in London his work entitled Revelation examined with Candour; and the same year he married. In 1738 appeared his Reflections upon Polygamy. His next publication was the Life of David, King of Israel; which is an ingenious and elaborate performance. (See DAVID.) In 1743 he married a second wife, who was the widow of Mr. Pendarves of Cornwall. The year following he obtained the deanery of Downe. When lord Orrery published his Remarks on the Life and Writings of Swift, Dr. Delany conceived it expedient to give a reply, which he did with great spirit; and his performance certainly affords a better idea of the dean than can be obtained from that of lord Orrery. He continued publishing something or other nearly till his death, which happened at Bath in 1768. His Sermons on Social Duties are very excellent. Indeed all his works exhibit tokens of real piety, as well as of vigorous understanding. His Revelation Examined is an admirable performance, being a complete and eloquent refutation of many of the grand arguments of the deists.

DELAPSE. In medicine. See PROLAPSE.

DELA′PSED. *a.* (from *delapsus*, Latin.) Bearing or falling down.

To DELA′TE. *v. a.* (from *delatus*, Latin.) 1. To carry; to convey (*Bacon*). 2. To accuse; to inform against.

DELA′TION. *s.* (*delatio*, Lat.) 1. A carriage; conveyance (*Bacon*). 2. An accusation; an impeachment.

DELA′TOR. *s.* (*delator*, Lat.) An accuser; an informer (*Government of the Tongue*).

DELAWARE, one of the United States of America, bounded on the N. by Pennsylvania, on the E. by Delaware river and bay, and on the S. and W. by Maryland. It is ninety miles long, and sixteen broad; and in many parts is unhealthy, being seated in a peninsula where the land is generally low. It is divided into three counties, Newcastle, Kent, and Sussex. In 1790 the number of inhabitants was 59,094.

DELAWARE, a county of Pennsylvania, twenty miles long, and eleven broad. In 1790 it contained 9,483 inhabitants. Chester is the capital.

DELAWARE, a river of N. America, which rising in the state of New York, in lake Ustayantho, divides New York from Pennsylvania, and passes through Delaware bay to the Atlantic, having New Jersey on the E. side, and Pennsylvania, and the state of Delaware, on the W. From the mouth of this very extensive bay, at Cape Henlopen, to Philadelphia, it is 118 miles, with a sufficient depth of water for a seventy-four gun ship; above Philadelphia it is navigable for sloops up to the great falls at Trenton, and for boats that carry eight or ten tons, forty miles higher.

To DELA′Y. *v. a.* (from *delayer*, French.) 1. To defer; to put off (*Exodus*). 2. To hinder; to frustrate. 3. To stop or retard the course of (*Dryden*).

To DELA′Y. *v. n.* To stop; to cease from action (*Locke*).

DELA′Y. *s.* (from the verb.) 1. A deferring; procrastination (*Shakspeare*). 2. Stay; stop (*Dryden*).

DELA′YER. *s* (from *delay*.) One that defers.

DELE′CTABLE. *a.* (*delectabilis*, Latin.) Pleasing; delightful (*Philips*).

DELE′CTABLENESS. *s.* Delightfulness; pleasantness.

DELE′CTABLY. *ad.* Delightfully; pleasantly.

DELECTA′TION. *s.* (*delectatio*, Latin.) Pleasure; delight (*More*).

To DE′LEGATE. *v. a.* (*delego*, Latin.) 1. To send away. 2. To send upon an embassy. 3. To intrust; to commit to another (*Taylor*). 4. To appoint judges to a particular cause.

DE′LEGATE. *s.* (*delegatus*, Lat.) A deputy; a commissioner; a vicar; any one that is sent to act for another (*Taylor*).

DE′LEGATE. *a.* (*delegatus*, Lat.) Deputed; sent to act for another (*Taylor*).

DE′LEGATES (Court of). A court wherein all causes of appeal, by way of devolution from either of the archbishops, are decided (*Ayliffe*).

DELEGA′TION. *s.* (*delegatio*, Lat.) 1. A sending away. 2. A putting in commission. 3. The assignment of a debt to another.

DELENI′FICAL. *a.* (*delenificus*, Latin.) Having virtue to assuage or ease pain.

To DELE′TE. *v. a.* (from *deleo*, Latin.) To blot out.

DELETERIOUS. (*deleterius*, δηλητηριος, from δηλεω, to hurt or injure.) Those substances are so called, which are of a baneful or poisonous nature.

DELE′TERY. *a.* Destructive; deadly (*Hudibras*).

DELE′TION. *s.* (*deletio*, Latin.) 1. Act of raising or blotting out. 2. A destruction (*Hale*).

DELF, DELFE. *s.* (from ꝺelꝼan, Saxon, to dig.) 1. A mine; a quarry (*Ray*). 2. Earthen ware; counterfeit China ware, made at Delft in Holland (*Smart*).

DELFT, a city of the United Provinces, and capital of Delftland, in Holland. It is clean and well built, with canals in the streets. It is noted for its manufacture of earthen ware, known by the name of Delft-ware. Lat. 52. 4 N. Lon. 4. 24 E.

DELFT-WARE, a kind of pottery of baked earth, covered with an enamel or white glazing, which gives it the appearance and neatness of porcelain. Some kinds of this enamelled pottery differ much from others, either in their sustaining sudden heat without breaking, or in the beauty and regularity of their forms, of their enamel, and of the painting with which they are ornamented. In general, the fine and beautiful enamelled potteries, which approach the nearest to porcelain in external appearance, are at the same time those which least resist a brisk fire. Again, those which sustain a sudden heat are coarse, and resemble common pottery.

The basis of this pottery is clay, which is mixed, when too fat, with such a quantity of sand, that the earth shall preserve enough of its ductility to be worked, moulded, and turned easily; and yet that its fatness shall be sufficiently taken from it, that it may not crack or shrink too much in drying or in baking. Vessels formed of this earth must be dried very gently, to avoid cracking. They are then to be placed in a furnace to receive a slight baking, which is only meant to give them a certain consistence or hardness. And, lastly, they are to be covered with an enamel or glazing, which is done, by putting upon the vessels thus prepared the enamel, which has been ground very fine, and diluted with water.

As vessels on which the enamel is applied are but slightly baked, they readily imbibe the water in which the enamel is suspended, and a layer of this enamel adheres to their surface: these vessels may then be painted with colours composed of metallic calces, mixed and ground with a fusible glass. When they are become perfectly dry, they are to be placed in the furnace, included in cases of baked earth called seggars, and exposed to a heat capable of fusing uniformly the enamel which covers them. This heat given to fuse the enamel being much stronger than that which was applied at first to give some consistence to the ware, is also the heat necessary to complete the baking of it. The furnace and colours used for painting this ware are the same as those employed for porcelain.

DELHI. In geography. See Dehli.

DELIA, in antiquity, a festival celebrated in the island of Delos, every fifth year, in honour of Apollo.

Delia, a surname of Diana.

DELIAC, Deliacus, among the ancients, a poulterer, or one who fattened and sold fowls: they were so called because the people of the isle of Delos first followed that occupation.

DELIACAL, or Delian problem. See Duplication.

DELIBAMENTA, in antiquity, a libation offered to the infernal gods, which was always poured downwards; hence this act was expressed by the word *defundere*.

DELIBA′TION. *s.* (*delibatio*, Lat.) An essay; a taste.

To DELI′BERATE. *v. a.* (*delibero*, Lat.) To think, in order to choice; to hesitate (*Addison*).

Deli′berate. *a.* (*deliberatus*, Lat.) 1. Circumspect; wary; advised; discreet (*Shakspeare*). 2. Slow; tedious; gradual (*Hooker*).

DELI′BERATELY. *ad.* 1. Circumspectly; advisedly; warily (*Dryden*). 2. Slowly; gradually.

DELI′BERATENESS. *s.* Circumspection; wariness; coolness; caution (*King Charles*).

DELIBERA′TION. *s.* (*deliberatio*, Latin.) The act of deliberating; thought in order to choice (*Hammond*).

DELI′BERATIVE. *a.* (*deliberativus*, Lat.) Pertaining to deliberation; apt to consider.

Deli′berative. *s.* (from the adjective.) The discourse in which a question is deliberated (*Bacon*).

DE′LICACY. *s.* (*delicatesse*, French.) 1. Daintiness; pleasantness to the taste (*Milton*). 2. Any thing highly pleasing to the senses (*Milton*). 3. Softness; feminine beauty (*Sidney*). 4. Nicety; minute accuracy (*Dryden*). 5. Neatness; elegance of dress. 6. Politeness of manners. 7. Indulgence; gentle treatment (*Temple*). 8. Tenderness; scrupulousness (*Addison*). 9. Weakness of constitution. 10. Smallness; tenuity.

DE′LICATE. *a.* (*delicat*, French.) 1. Nice; pleasing to the taste; of an agreeable flavour (*Taylor*). 2. Dainty; desirous of curious meats. 3. Choice; select; excellent. 4. Pleasing to the senses. 5. Fine; consisting of small parts (*Arbuthnot*). 6. Of polite manners; not gross, or coarse. 7. Soft; effeminate; unable to bear hardships (*Shakspeare*). 8. Pure; clear (*Shakspeare*).

DE′LICATELY. *ad.* 1. Beautifully; with soft elegance (*Pope*). 2. Finely, not coarsely. 3. Daintily (*Taylor*). 4. Choicely. 5. Politely. 6. Effeminately.

DE′LICATENESS. *s.* (from *delicate.*) The state of being delicate; tenderness; softness; effeminacy (*Duteronomy*).

DE′LICATES. *s.* (from *delicate.*) Niceties; rareties; that which is choice and dainty (*King*).

DE′LICES. *s. pl.* (*deliciæ*, Lat.) Pleasures (*Spenser*).

DELI′CIOUS. *a.* (*delicieux*, Fr.) Sweet; delicate; that affords delight; agreeable (*Pope*).

DELI′CIOUSLY. *ad.* Sweetly; pleasantly; delightfully (*Revelation*).

DELI′CIOUSNESS. *s.* (from *delicious.*) Delight; pleasure; joy (*Taylor*).

DELIGA′TION. *s.* (*deligatio*, Latin.) A binding up, in surgery (*Wiseman*).

DELI′GHT. *s.* (*delice*, French.) 1. Joy; content; satisfaction (*Samuel*). 2. That which gives delight (*Shakspeare*).

To Deli′ght. *v. a.* (*delector*, Latin.) To please; to content; to satisfy (*Locke*).

To Deli′ght. *v. n.* To have delight or pleasure in (*Psalms*).

DELI′GHTFUL. *a.* (from *delight* and *full.*) Pleasant; charming (*Sidney*).

DELI′GHTFULLY. *ad.* pleasantly; charmingly; with delight (*Milton*).

DELI′GHTFULNESS. *s.* (from *delight.*) Pleasure; comfort; satisfaction (*Tillotson*).

DELI′GHTSOME. *a.* (from *delight.*) Pleasant; delightful (*Grew*).

DELI′GHTSOMELY. *ad.* Pleasantly; in a delightful manner.

DELI′GHTSOMENESS. *s.* (from *delightsome.*) Pleasantness; delightfulness.

DELIMA. In botany. See Tetracera.

To DELI′NEATE. *v. a.* (*delineo*, Latin.) 1. To make the first draught of a thing; to design; to sketch. 2. To paint; to represent a true likeness in picture (*Brown*). 3. To describe; to set forth in a lively manner (*Raleigh*).

DELINEA′TION. *s.* (*delineatio*, Latin.) The first draught of a thing (*Mortimer*).

DELI′NQUENCY. *s.* (*delinquentia*, Lat.) A fault; a failure in duty (*Sandys*).

DELI′NQUENT. *s.* (from *delinquens*, Lat.) An offender (*Ben Jonson*).

To DELI′QUATE. *v. n.* (*deliqueo*, Latin.) To melt; to be dissolved (*Cudworth*).

DELIQUA′TION. *s.* (*deliquatio*, Lat.) A melting; a dissolving.

DELIQUESCENCE, deliquation, or the gradually melting down of crystallized salts, from exposure to the air.

DELIQUIUM, the liquid state, into which a salt is reduced by exposure to the air. Thus alkali reduced by this means to a liquid state was formerly called oil of tartar, *per deliquium*.

Deliquium animi. See Syncope.

DELI'RAMENT. *s.* (*deliramentum*, Lat.) A doting or foolish fancy.

To DELI'RATE. *v. n.* (*deliro*, Latin.) To dote; to rave; to talk or act idly.

DELIRA'TION. *s.* (*deliratio*, Latin.) Dotage; folly; madness.

DELI'RIOUS. *a.* (*delirius*, Latin.) Lightheaded; raving; doting (*Swift*).

DELI'RIUM. (*delirium*, from *deliro*, to rave.) A febrile symptom, consisting in the person's acting or talking unreasonably. It is to be carefully distinguished from an alienation of the mind, without fever.

To DELI'VER. *v. a.* (*delivrer*, French.) 1. To set free; to release (*Prior*). 2. To save; to rescue (*Shakspeare*). 3. To surrender; to put into one's hands (*Samuel*). 4. To give; to offer; to present (*Dryden*). 5. To cast away; to throw off (*Pope*). 6. To disburden a woman of a child (*Peacham*). 7. To speak; to tell; to relate; to utter (*Swift*).

To Deli'ver *over*. *v. a.* 1. To put into another's hands (*Shakspeare*). 2. To give from hand to hand (*Dryden*).

To Deliver *up*. *v. a.* To surrender (*Shakspeare*).

DELI'VERANCE. *s.* (*delivrance*, French.) 1. The act of freeing from captivity, slavery, or any oppression; rescue (*Dryden*). 2. The act of delivering a thing to another. 3. The act of bringing children (*Shakspeare*) 4. The act of speaking; utterance (*Shakspeare*).

DELI'VERER. *s.* (from *deliver.*) 1. A saver; a rescuer; a preserver (*Bacon*). 2. A relater; one that communicates something by speech or writing (*Boyle*).

DELI'VERY. *s.* (from the verb.) 1. The act of delivering, or giving. 2. Release; rescue; saving (*Shakspeare*). 3. A surrender; act of giving up (*Clarendon*). 4. Utterance; pronunciation; speech (*Hooker*). 5. Use of the limbs; activity (*Wotton*). 6. Childbirth. See Midwifery.

DELL. *s.* (from *dal*, Dutch.) A pit; a hole in the ground (*Tickel*).

DELOS, an island of the Archipelago, now called Dili. There are abundance of fine ruins, supposed to be of the Temples of Diana and Apollo, whose birth-place it is said to be. It is six miles in circumference, but it is now quite destitute of inhabitants. Lat. 37. 30 N. Lon. 25. 59 E.

So very sacred was the island of Delos held by the ancients, that no hostilities were practised there, even by the nations that were at war with one another, when they happened to meet in this place. It was called Delos from δηλος, because it suddenly made its appearance on the surface of the sea, by the power of Neptune. (See Apollo.) One of the altars of Apollo, in the island, was reckoned among the seven wonders of the world. It had been erected, according to mythologists, by Apollo when only four years old, and made with the horns of goats, killed by Diana on mount Cynthus. It was unlawful for a man to die, or for a child to be born there; and an edict was issued, which commanded all persons labouring under any mortal or dangerous disease to be instantly removed to the adjacent island called Rhane.

DELPH. See Delft.

DELPHIN, in literary history, a name given to the commentators on the ancient Latin authors, who were employed by order of Louis XIV. of France, for the benefit of the prince, under the care and direction of M. de Montausier his governor, Bossuet and Huet his preceptors. They were thirty-nine in number.

DELPHINIA, in antiquity, feasts celebrated by the inhabitants of Egina, in honour of Apollo, surnamed Delphinius.

DELPHINIUM. Larkspur. In botany, a genus of the class polyandria, order digynia. Calyxless; petals five; nectary cloven, elongated behind into a horn; siliques three or one. Fourteen species; of which a few possess only one capsule, but the majority three. These are chiefly found wild in the south of Europe: three or four of which are cultivated in our gardens. Two or three species in this genus are perennial. Those chiefly worthy of notice are,

1. D. consolida. Common larkspur; found in our own fields, with a one-leafed nectary, and subdivided stem: the petals are easily doubled by propagation, and are in colour usually blue, red, pink, or violet. This plant is called in the dispensatories Calcitrappa, and Consolida regalis, which see.

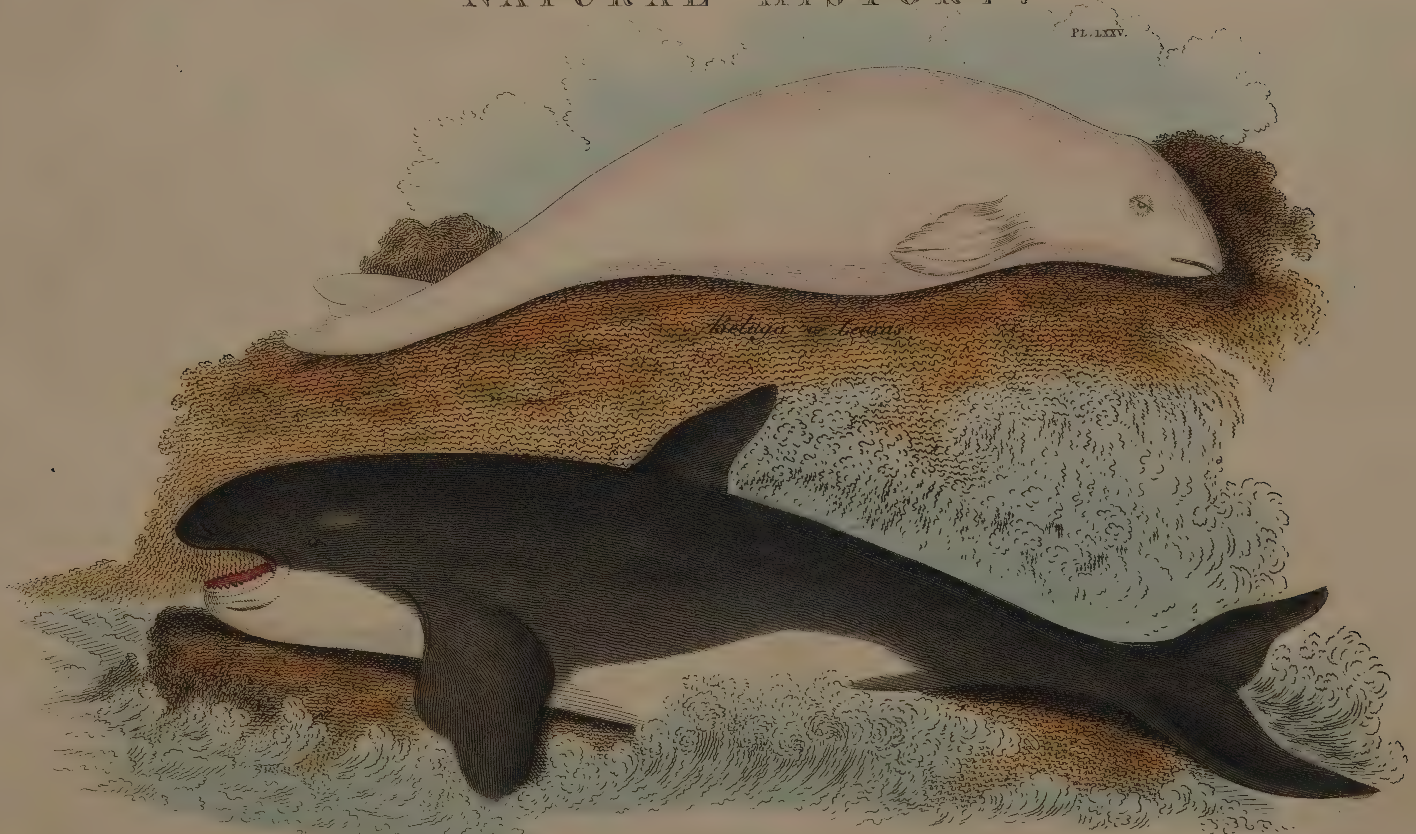
2. D. pereginum; with a two-leaved nectary; corol nine-petalled; leaves many-parted, obtuse. A native of the south of Europe.

3. D. staphisagria. Staves-acre; louse wort; nectary four-leaved, shorter than the petals; leaves palmate, with obtuse lobes. Indigenous also to the south of Europe. The seeds are still an article in some pharmacopœias; and their supposed use will be found under the officinal name Staphisagria, which see.

DELPHINUS, in astronomy, the Dolphin, an old northern constellation. It consists of eighteen stars of the first six magnitudes, viz. 0.0.6.0.2.10.

Delphinus, in zoology, order cete. Teeth in both jaws; bony. The species are the five i. e. following.

1. D. phocæna. Porpoise, or porpus (*le pore poisson.*) Sea-hog. Body subconic; back broad; snout bluntish. Colour of the body blueish, black above; white beneath; head obtuse, eyes small, the entrance to the ear placed behind them, and between them a semilunar fistula; teeth small, acute; in each jaw forty-six; orifice of the penis near the navel linear; anus a little two-lobed, between that and the tail. In the times of Henry VIII. and Elizabeth, reckoned a delicacy and a royal dish. Inhabits the European and Baltic oceans; and is found at times on all the coasts of our own country, following greedily the track of the migratory fishes, as mackerel, herrings, and salmon; tumbling over and darting



Grampus.

Porpesse, or Porpoise.

London, Publish'd by Geo. Kearsley, Fleet Street, Feb? 1. 1809.

in the water; length from five to eight feet. See Nat. Hist. Pl. LXXIV.

2. D. delphis. Dolphin. Body oblong, roundish: snout narrow, sharp, with a broad, transverse projection of the skin, on its upper part; teeth subulate; twenty-one above, nineteen below, locking into each other; mouth extensive, reaching almost to the thorax; kidney conglomerate. Inhabits the European and Pacific seas, and is occasionally found on our own coasts; swims with velocity, preys on fishes; and dexterously fastens itself to the back of whales as they leap out of water, making them bellow with its gripe; swims in nearly a straight line, and only appears of a crooked form, such as is commonly represented in our paintings of this mammal, when leaping out of water itself; from nine to ten feet long: slenderer than d. phocæna. See Nat. Hist. Pl. LXXIV.

3. D. orca. Grampus. Snout turned up; teeth broad and serrate. Another variety, with snout a little truncate; teeth pointed; dorsal fin long and bony: known by the name of sword-grampus. The body of both black above, white beneath; lower jaw much longer than the upper; teeth forty, obtuse; eyes small; spiracle two-celled; fin broader at the base, resembling a scymetar. Inhabits the European and Atlantic seas, and occasionally our own coasts: twenty-four feet long, twelve broad; like d. delphis, but with far more violence attacks and adheres to the backs of whales, and often destroys them: fights likewise with seals, often pushing them from the rocks they inhabit by its long dorsal fin. See Nat. Hist. Pl. LXXV.

4. D. leucas. White dolphin: by the Russians named belluga. Snout conic, obtuse, inclined outwards; without dorsal fin. Head oblong, small; eyes minute, round, prominent; spiracle on the forehead, divided by a partition; teeth nine on each side of each jaw, short, bluntish; pectoral fins soft with five bones: tail cartilaginous, two-lobed; teats two, filled with white milk. Inhabits the arctic pole; sometimes ascends rivers; gregarious; to the touch smooth and slippery; when young, dusky in colour, but afterwards white; eighteen feet long. See Nat. Hist. Pl. LXXV.

5. D. melas: snout obtuse: almost the whole body black, smooth, and shining like oiled silk. The back and sides jetty black; the breast and belly of a somewhat lighter colour. The general length of the full grown ones about twenty feet. The body thick. The dorsal fin does not exceed two feet in length, and rounded at the extremity. The pectoral fins from six to eight feet in length, narrow, and tapering to their extremities. The head obtuse; the upper jaw projects several inches over the lower in a blunt process. It has a single spiracle. The full grown have twenty-two subconoid sharp teeth, a little hooked. Among those stranded lately in Scapay bay, were many young ones, which, as well as the oldest, wanted teeth. The youngest measured about five feet in length, and were still sucklings. The females had two teats, larger than those of a cow, out of which the milk flowed when they were squeezed.

We have introduced this last species into the genus delphinus, from Mr. Neil's Tour through the Hebrides, in which we are told that 310 of this species were driven on shore in Shetland, in 1805. Mr. Neil's description, however, is imperfect; and Dr. Trail, from whom we have taken the specific name and character, has given a much better account in Nicholson's Journal for February 1809, in a paper which states also, that ninety-two of the same species of delphinus were stranded in Scapay bay in Pomona, one of the Orkneys, a few days previous to the great storm in December 1806.

These animals are gregarious, generally swimming in considerable numbers. They frequently enter the bays around the Orkney coast in quest of small fish, which seem to be their food. When one of them takes the ground, the rest surround, and endeavour to assist it: from this circumstance several of them are generally taken at once. Dr. T. has frequently observed an animal, which he conjectures to be of this species, elevating its dorsal fin and a considerable part of its back above the waves, with a slow tumbling motion for many successive times. They are inoffensive, and rather timid. They are chased on shore not unfrequently by a few yawls. They seem generally to follow one as a leader with blind confidence. He once was in a boat when the attempt was made to drive a shoal of them on shore; but when they had approached very near the land, the foremost turned round with a sudden leap, and the whole rushed past with great velocity, but carefully avoided the boat. They are extremely fat, and yield a considerable quantity of good oil.

DELPHOS, in antiquity, now called Castri, the capital of Phocis in Achaia; anciently much celebrated for its temple, and oracle of Apollo. This temple was a magnificent structure, enriched with innumerable gifts; in it was the dark cave Pythium, where the priestess, named Pythia, sitting on a tripos, or three-legged stool, pretended to receive the inspiration of the god, swelling, foaming, and raving, like one distracted. The answers were always ambiguous, and so mysterious, that it was difficult to understand them. At present the town of Castri does not consist of above two hundred houses, and those very ill built. It stands between Salena and Livadia, about ten miles distant from the latter, on the south side of mount Parnassus, so famous in antiquity, and sacred to the Muses and Apollo.

DELTA, one of the ancient divisions of Egypt, so called from its triangular figure. It is 130 miles along the coast from Damietta to Alexandria, and 70 on the sides, from where the Nile begins to be divided into branches.

DELTOID LEAF, in botany, folium deltoides, or deltoideum. Rhombeum ex quatuor angulis, e quibus laterales minus a basi distant quam reliqui. Shaped like a rhomb, having four angles, of which the lateral ones are less distant from the base than the others. Or more correctly, a deltoid leaf has the general appearance of a delta or triangle, but in reality it approaches in figure to a rhomb, and like that has four angles, of which the two side ones are always nearer to each other than the two others at the base and apex; so that the length of the leaf is somewhat greater than the breadth. All this will be best understood by examining a leaf of the common black poplar, which is given as one instance of a deltoid leaf in Linnéus's Specific Characters. Other instances are, several species of chenopodium and atriplex: cochlearia danica: alyssum sinuatum and deltoideum. If it should be objected, that a leaf cannot have the form both of a delta and a rhomb, it should be observed in reply, that Linnéus affirms no more than that this leaf has the appearance of a delta, with a resemblance to a rhomb; and that it would be absurd to expect mathematical exactness in substances so various in their forms as leaves. Dr. Withering translates deltoideus triangularly spear-shaped; and says, that leaves in this form are broad at the base and nearly triangular, but spear-shaped at the point; as in the black poplar.

With respect to mesembryanthemum deltoides, there is no doubt that it was so named, because each side of its succulent leaves is in form of a triangle, and therefore corresponds with the figure of the Greek letter delta.

DELTOIDES. (δελτοιδης, from the Greek Δ or δελτα, and ειδος, a likeness; shaped like the Greek delta.) A muscle of the superior extremity, situated on the shoulder. It arises exactly opposite to the trapezius from one-third part of the clavicule, from the acromium and spine of the scapula, and is inserted, tendinous, into the middle of the os humeri, which bone it lifts up directly; and it assists with the supra-spinatus and coracobrachialis in all the actions of the humerus, except the depression; it being convenient that the arm should be raised and sustained, in order to its moving on any side.

DELU'DABLE. *a.* (from *delude.*) Liable to be deceived (*Brown*).

To DELU'DE. *v. a.* (*deludo*, Latin.) 1. To beguile; to cheat; to deceive (*Dryden*). 2. To disappoint; to frustrate.

DELU'DER. *s.* (from *delude.*) A beguiler; a deceiver; an impostor; a cheat (*Granville*).

To DELVE. *v. a.* (ꝺelꝼan, Saxon.) 1. To dig; to open the ground with a spade (*Philips*). 2. To fathom; to sift (*Shakspeare*).

Delve. *s.* (from the verb.) A ditch; a pit; a den; a cave (*Ben Jonson*).

DE'LVER. *s.* (from *delve.*) A digger.

DE'LUGE. *s.* (*deluge*, French.) 1. A general inundation (*Burnet*). 2. An overflowing of the natural bounds of a river (*Denham*). 3. Any sudden and resistless calamity.

Deluge, Diluvium, in natural history, a flood, or inundation of water, covering the earth, either in the whole or in part. We meet with various accounts of deluges in ancient history, both sacred and profane: that which happened in Greece, in the time of Deucalion, called *diluvium Deucalioneum*, is famous: this deluge only overflowed Thessaly. Its date is fixed to the year before Christ 1529, being the third year before the Israelites coming out of Egypt, according to the computation of Petavius, Rat. Temp. par. i. lib. i. cap. 7. The deluge of Ogyges happened near 300 years before that of Deucalion, 1020 years before the first Olympiad, and 1796 before Jesus Christ, according to the same author, Rat. Tem. par. i. lib. i. cap. 4. par. ii. lib. ii. cap. 5. This only ravaged Attica. These two deluges are frequently mentioned, in ancient Greek authors, under the denomination of *cataclysmus prior* and *posterior*. Of the like kind were those inundations in the Netherlands, which, in 1727, overwhelmed and covered with sea all that part now called the gulf Dollart in the United Netherlands; and in 1421, all that part situated between Brabant and Holland.

But the most memorable deluge is that which we particularly, by way of eminence, call the deluge, or the universal deluge, or Noah's flood; recorded in Scripture as a general inundation sent by God to punish the corruption of the world, at that time, by destroying every thing (Noah and his family, and what was shut up with him in the ark, only excepted) from the face of the earth. This flood makes one of the most considerable epochas in chronology. Its history is given by Moses, Gen. ch. vi. and vii. Its time is fixed, by the best chronologers, to the year from the creation 1656, answering to the year before Christ 2293. From this flood, the state of the world is divided into diluvian and antediluvian.

The deluge has been, and remains, a subject of much enquiry and dispute among naturalists, critics, &c. The points chiefly controverted may be reduced to three: first, its extent, viz. whether it were general, or partial; secondly, its natural cause; and, thirdly, its effects.

1. The immense quantity of water requisite to furnish an universal deluge, has occasioned several authors to suspect it only partial. An universal deluge, they think, had been unnecessary, considering the end for which it was brought: viz. to extirpate the wicked inhabitants. The world was then but new, and the people not very many: the holy Scriptures making only eight generations from Adam to Noah. It was but a small part of the earth that could be yet inhabited: the country about the Euphrates, which is supposed to have been the scene of the first antediluvian inhabitants, was sufficient to bear them all. Now Providence, say they, which ever acts wisely and frugally, would never have disproportioned the means to the end, so far as to overflow the whole globe, only to drown a little corner of it. They add, that, in the Scripture-language, the whole earth expresses no more than all the inhabitants; and on this principle advance, that an overflowing of the Euphrates and Tigris, with a vehement rain, &c. might answer all the phenomena of the deluge.

But the deluge was universal. God declared to Noah, Gen. vi. 17, that he was resolved to destroy every thing that had breath under heaven, or had life on the earth, by a flood of waters: such was the menace; such the execution. The waters, Moses assures us, covered the whole earth, buried all the mountains, and were no less than fifteen cubits above the highest of them: every thing perished therein; birds, beasts, men, and all that had life, excepting Noah, and those with him in the ark, Gen. vii. 19, &c. Can an universal deluge be more clearly expressed? If the deluge had only been partial, there had been no necessity to spend a hundred years in the building of an ark, and shutting up all the sorts of animals therein, in order to re-stock the world: they had been easily and readily brought from those parts of the world not overflowed, into those that were; at least, all the birds would never have been destroyed, as Moses says they were, so long as they had wings to bear them to those parts where the flood did not reach. If the waters had only overflowed the neighbourhood of the Euphrates and Tigris, they could not be fifteen cubits above the highest mountains; they could not have risen to that height but they must spread themselves, by the laws of gravity, over the rest of the earth; unless, perhaps, they had been retained there by a miracle; and, in that case, Moses, no doubt, would have related the miracle, as he did that of the waters of the Red sea, and the river Jordan, which were sustained in a heap, to give passage to the Israelites, Exod. xiv. 22. and Josh. iii. 16. Add, that in regions far more remote from the Euphrates and Tigris, viz. in Italy, France, Switzerland, Germany, England, &c. there are frequently found in places many scores of leagues from any sea, and even in the tops of high mountains, whole trees sunk deep under ground; as also teeth and bones of animals, fishes entire, sea-shells, ears of corn, &c. petrified; which the best naturalists are agreed could never have come there but by the deluge: to which may be added the almost universal traditions of this great event in all countries of the globe.

The consideration of the various theories which have been offered to account for the cause, explain the effects, and evince the reasonableness of a belief in the deluge, would take up much more space than we can devote to the purpose. We, therefore, refer those whose inclination leads them to such disquisitions, to the following works. Burneti Telluris Theor. Sacra, Keill's Examination of Burnet's Theory of the Earth, Whiston's New Theory of the Earth, and Keill's Remarks on ditto; Saurin's Dissertations, Delany's Revelation examined with Candour, Whitehurst on the Formation of the Earth, Bryant's Analysis of Ancient Mythology, vol. ii., and Kirwan's Paper in the sixth volume of the Transactions of the Royal Irish Academy.

To **De'luge.** *v. a.* (from the noun.) 1. To drown; to lay totally under water (*Blackmore*). 2. To overwhelm; to cause to sink (*Pope*).

DELU'SION. *s.* (*delusio*, Latin.) 1. A cheat; guile; deceit; treachery. 2. A false representation; illusion; errour; a chimerical thought (*Prior*).

DELU'SIVE. Delu'sory. *a.* (from *delusus*, Latin.) Apt to deceive; beguiling; imposing on (*Woodward. Glanville*).

DEMADES, an Athenian, who, from a sailor, became an eloquent orator. He was taken prisoner at the battle of Cheronæa, by Philip, by whom he was greatly esteemed. He was put to death, with his son, on suspicion of treason, B.C. 322. One of his orations is extant. (*Diod.*).

DE'MAGOGUE. *s.* (δημαγωγος.) A ringleader of the rabble (*South*).

DEMAIN, or **Demesne**, in its popular sense, denotes the lord's manor place, with the lands thereto belonging; which he and his ancestors have from time to time kept in their own manual occupation. See **Manor.**

Demain, or **Demesne**, in a law sense, signifies, according to Hottoman, *patrimonium domini*, the lord's patrimony; called also domain, and by the civilians *dominicum*. The same author proves those lands to be demain, which a man holdeth originally of himself; and those to be *feodum*, which he holdeth of a superior lord. In England, no common person has any demain, simply understood; for all depends either mediately, or immediately, on the crown. When a man, therefore, in pleading, would signify his land to be his own, he saith, that he is or was seised thereof in his domain, as of fee; whereby he means, that although his land be to him and his heirs for ever, yet it is no true demain, but depends upon a superior lord, and he holdeth by service, or rent in lieu of service, or by both service and rent.

Demain is sometimes also taken, more largely, for lands and tenements held for life, &c. and sometimes more strictly for such only as are generally held in fee.

Demain is sometimes again used for a distinction between those lands that the lord of a manor has in his own hands, or in the hands of his lessee, demised upon a rent, for a term of years, or life; and such other lands, pertaining to the said manor, which belong to the free or copy-holders. The reason why the copy-hold is accounted demain, is because they, who are tenants to it, are judged in law to have no other right but at the will of the lord; so that it is reputed still, after a sort, to be in the lord's hands; and yet, in common speech, that is ordinarily called demain which is neither free nor copy-free.

Demain, again, is used in a more special signification, in opposition to frank-fee.

DEMAND. *s.* (*demande*, Fr.) 1. A claim; a challenging (*Locke*). 2. A question, an interrogation. 3. The calling for a thing in order to purchase it (*Addison*).

Demand, in law, calling upon a man for any sum or sums of money, or any other thing due. By the several statutes of limitation, debts, claims, &c. are to be demanded and made in time, or they will be lost by law. There are two manner of demands, the one in deed, the other in law; in deed, as in every precepe there is an express demand; in law, as, in every entry in land, distress for rent, taking or seizing of goods, and such like acts, which may be done without any words, are demands in law.

Where there is a duty which the law makes payable on demand, no demand need be made; but if there be no duty till demand, in such case there must be a demand to make the duty.

To DEMA'ND. *v. a.* (*demander*, French.) 1. To claim; to ask for with authority (*Shakspeare*). 2. To question; to interrogate (*Peacham*).

DEMA'NDABLE. *a.* (from *demand.*) That may be demanded, requested, asked for (*Bacon*).

DEMA'NDANT. *s.* (from *demand.*) He who is actor or plaintiff in a real action (*Coke*).

DEMA'NDER. *s.* (*demandeur*, French.) 1. One that requires a thing with authority. 2. One that asks a question. 3. One that asks for a thing in order to purchase it (*Carew*). 4. A dunner; one that demands a debt.

DEMARCHUS, in antiquity, the chief of a region or district. The chief magistrate of the city of Neapolis was also called demarchus.

DEME'AN. *s.* (from *demener*, Fr.) Mien; presence; carriage (*Spenser*).

To DEME'AN. *v. a.* (from *demener*, Fr.) 1. To behave; to carry one's self (*Tillotson*). 2. To lessen; to debase; to undervalue (*Shakspeare*).

DEME'ANOUR. *s.* (*demener*, Fr.) Carriage; behaviour (*Clarendon*).

DEME'ANS, or DEME'SNES. *s. pl.* An estate in lands.

To DEME'NTATE. *v. n.* (*demento*, Latin.) To make mad.

DEMENTA'TION. *s.* (*dementatio*, Lat.) Making mad, or frantick.

DEME'NTIA. (*dementia*, from *de* and *mens*, without mind.) Madness, delirium, absence of intellect.

DEMERARA, or DEMERARY. See ISSEQUIBO.

DEME'RIT. *s.* (*demerite*, Fr.) The opposite to merit; ill-deserving (*Temple*).

To DEME'RIT. *v. a.* (*demeriter*, Fr.) To deserve blame or punishment.

DEMERSE LEAF, in botany, growing below the surface of the water. Frequent in aquatic plants. The same explanation applies to submerse.

DEME'RSED. *a.* (from *demersus*, Latin.) Plunged; drowned.

DEME'RSION. *s.* (*demersio*, Latin.) A drowning.

DEMESNE. See DEMAIN.

DEMETÆ, in ancient geography, were inhabitants of South Wales, occupying those parts which are now called Caermarthenshire, Pembrokeshire, and Cardiganshire.

DEMETRIA, in antiquity, a festival in honour of Ceres, called by the Greeks Demeter.

DEMETRIOWITZ, a town of Smolensko, in Russia, seated on the river Ugra. Lat. 53. 40 N. Lon. 36. 5 E.

DEMETRIUS PHALERUS, a celebrated orator and peripatetic philosopher, was the scholar of Theophrastus. He acquired so much authority at Athens, that he governed the city for ten years; and ruled with so much wisdom and virtue, that they set up thirty-six statues in honour of him. Demetrius composed more works in prose and verse than any other peripatetic of his time; and his writings consisted of poetry, history, politics, rhetoric, harangues, and embassies. None of them are extant except his rhetoric, which is usually printed among the Rhetores Selecti.

DEMETRIUS, a cynic philosopher, disciple of Apollonius Tyanæus, in the age of Caligula. The emperor wished to gain the philosopher to his interest by a large present; but Demetrius refused it with indignation, and said, "If Caligula wish to bribe me, let him send me his crown." Vespasian was displeased with his insolence, and banished him to an island. The cynic derided the punishment, and bitterly inveighed against the emperor. He died in a great old age; and Seneca observes, that "nature had brought him forth to show mankind that an exalted genius can live securely, without being corrupted by the vices of the world."

DEMI. (*demi*, Fr. from *dimidium*, Lat.) A word much used in composition with other words to signify half. In words borrowed from the Latin we use semi. See SEMI.

DEMI BASTION, a fortification having only one face and one flank. See BASTION.

DEMI-CADENCE, a term used in church-music. When the last or final sound of a verse in a chant is on the key-note, it is called a full, or complete cadence: but if it fall on any other than the key-note, as the fifth or third, it takes the name of an imperfect or demi-cadence. The termination in this case is postponed to the succeeding verse. Almost all our double chants afford examples of a demi-cadence. (*Busby*).

DE'MI-CANNON (Lowest). A great gun that carries a ball thirty pounds weight.

DE'MI-CANNON (Ordinary). A great gun that carries a shot thirty-two pounds weight.

DE'MI-CANNON (Of the greatest size). A gun that carries a ball of thirty-six pounds weight (*Wilkins*).

DEMI-CROSS, an instrument used by the Dutch to take the altitude of the sun or a star at sea; instead of which we use the cross-staff, or forestaff.

DE'MI-CULVERIN (Of the lowest size). A gun that carries a ball nine pounds weight.

DE'MI-CULVERIN (Ordinary). A gun that carries a ball ten pounds eleven ounces weight.

DE'MI-CULVERIN (Elder sort). A gun that carries a ball twelve pounds eleven ounces weight (*Clarendon*).

DE'MI-DEVIL. *s.* Half a devil (*Shakspeare*).

DEMIDITONE, in music, a minor third.

DE'MI-GOD. *s.* An hero partaking of divine nature; half a god (*Pope*).

DE'MI-LANCE. *s.* A light lance (*Dryden*).

DEMI-LUNE, or HALF-MOON, a small

flanked bastion, placed before the point of a bastion when it is too weak.

DEMI-QUAVER, a note in music, two of which are equal to a quaver. See SEMIQUAVER and QUAVER.

DEMISEMIQUAVER, in music, one-fourth of a quaver.

DEMITONE. In music. See SEMITONE.

DE′MI-WOLF. *s.* Half a wolf (*Shakspeare*).

DEMI′SE. *s.* (from *demetre, demis, demise*, Fr.) Death; decease (*Swift*).

To **DEMI′SE.** *v. a.* (*demise*, Fr.) To grant at one's death; to bequeath (*Swift*).

DEMI′SSION. *s.* (*demissio*, Lat.) Degradation; diminution of dignity (*L'Estrange*).

To **DEMI′T.** *v. a.* (*demitto*, Lat.) To depress; to hang down; to let fall (*Brown*).

DEMIURGE. (from δημιος, which denotes a public servant, and εργον, work.) In the mythology of the eastern philosophers, was one of the Æons employed by the Supreme Deity in the creation of the world. He had a compound character of shining virtues, and excessive arrogance and ambition.

DE′MOCRACY. *s.* (δημοκρατια.) A form of government, in which the sovereign power is lodged in the body of the people (*Temple*).

DEMOCRA′TICAL. *a.* (from *democracy*.) Pertaining to a popular government; popular (*Brown*).

DEMOCRITUS, a famous philosopher of antiquity. He was born at Abdera in Thrace, about 460 B.C. His father was a man of prodigious wealth, but Democritus preferred philosophy to riches, and spent the whole of his patrimony in travelling to acquire knowledge. There was a law in his country, that whoever reduced himself to poverty should be deprived of the rites of sepulture. Democritus had incurred this rigid sentence, but his talents were so greatly admired, that the magistrates decreed he should be buried at the public expence, and besides made him a liberal present. Some, however, charged him with insanity, and Hippocrates was sent for, to cure him; but the physician made no scruple to say, that they who had sent for him were more mad than the patient. He is said to have put out his eyes that he might be able to philosophize the better; but this is not well-founded. He was constantly laughing at the follies of mankind, and therein differed from Heraclitus, who was always weeping for the same cause. He died at the age of 109, B.C. 361. None of his writings have come down to us. He was the author of the atomical philosophy, and the precursor of Epicurus. Pliny numbers him among those who had a knowledge of chemical and magical arts, which he learned of the Egyptian priests.

DEMOIVRE (Abraham), an eminent mathematician, was born at Vitri in Champagne, May 1667. The revocation of the edict of Nantz, in 1685, determined him to fly into England, sooner than abandon the religion of his fathers. He laid the foundation of his mathematical studies in France, and perfected himself at London; where a mediocrity of fortune obliged him to employ his talents in this way, and to read public lectures for his better support. The Principia Mathematica of Newton, which chance is said to have thrown in his way, made him comprehend at once how little he had advanced in the science he professed. He fell hard to work: he succeeded as he went along; and he soon became connected with, and celebrated among, the first-rate mathematicians. His eminence and abilities soon opened to him an entrance into the Royal Society of London, and afterwards into the Academy of Sciences at Paris. His merit was so known and acknowledged by the former, that they judged him a fit person to decide the famous contest between Newton and Leibnitz. The collection of the Academy of Paris contains no memoir of this author, who died at London, Nov. 1754, soon after his admission into it; but the Philosophical Transactions of London have several, and all of them interesting. He published also some capital works, such as, Miscellanea Analytica, de seriebus et quadraturis, &c. 1730, 4to. But, perhaps, he has been more generally known by his Doctrine of Chances, or, Method of calculating the Probabilities of Events at Play. This work was first printed 1718, in 4to. and dedicated to sir Isaac Newton: it was reprinted, 1738, with great alterations and improvements; and a third edition was afterwards published with additions, and a Treatise on Annuities, dedicated to lord Carpenter.

To **DEMO′LISH.** *v. a.* (*demolir*, Fr.) To throw down buildings; to raze; to destroy (*Tillotson*).

DEMO′LISHER. *s.* (from *demolish*.) One that throws down buildings; a destroyer.

DEMOLI′TION. *s.* (from *demolish*.) The act of overthrowing buildings; destruction (*Swift*).

DE′MON. *s.* (*dæmon*, Lat.) A spirit; generally an evil spirit; a devil. See DÆMON.

DEMONI′ACAL. DEMO′NIACK. *a.* (from *demon*.) 1. Belonging to the devil; devilish. (See DÆMONIAC.) 2. Influenced by the devil (*Milton*).

DEMO′NIACK. *s.* (from the adjective.) One possessed by the devil (*Bentley*).

DEMO′NIAN. *a.* Devilish (*Milton*).

DEMONO′CRACY. *s.* (δαιμων and κρατεω.) The power of the devil.

DEMONO′LATRY. *s.* (δαιμων and λατρεια.) The power of the devil.

DEMONO′LOGY. *s.* (δαιμων and λογος.) Discourse of the nature of devils.

DEMO′NSTRABLE. *a.* (*demonstrabilis*, Lat.) That may be proved beyond doubt or contradiction; that may be made evident (*Glanville*).

DEMO′NSTRABLY. *ad.* In such a manner as admits of certain proof; evidently (*Clarendon*.)

To **DEMO′NSTRATE.** *v. a.* (*demonstro*, Lat.) To prove with the highest degree of certainty (*Tillotson*).

F 2

DEMONSTRA'TION. *s.* (*demonstratio*, Lat.) 1. The highest degree of deducible or argumental evidence (*Hooker*). 2. Indubitable evidence of the senses or reason.

Demonstration, in logic, a syllogism in form containing a clear and irrefragable proof of the truth of a proposition.

A demonstration is a convincing argument, the two first propositions whereof are certain, clear and evident; whence of necessity arises an infallible conclusion.

The method of demonstrating things in mathematics is the same with that of drawing conclusions from principles in logic. In effect, the demonstrations of mathematicians are no other than series of enthymemes; every thing is concluded by force of syllogism, only omitting the premises, which either occur of their own accord, or are recollected by means of quotations. To have the demonstration perfect, the premises of the syllogisms should be proved by new syllogisms, till at length you arrive at a syllogism, wherein the premises are either definitions, or identic propositions.

Indeed it might be demonstrated, that there cannot be a genuine demonstration, i. e. such a one as shall give full conviction, unless the thoughts be directed therein according to the rules of syllogism. Clavius, it is well known, resolved the demonstration of the first proposition of Euclid into syllogism; Herlinus and Dasipodius, demonstrated the whole six first books of Euclid, and Henischus, all arithmetic, in the syllogistic form.

Yet many persons, and even mathematicians, usually imagine, that mathematical demonstrations are conducted in a manner far remote from the laws of syllogism; so far are they from allowing that these derive all their force and conviction from these. But we have men of the first rank on our side the question. M. Leibnitz, for instance, declares that demonstration to be firm and valid which is in the form prescribed by logic; and Dr. Wallis confesses, that what is proposed to be proved in mathematics is deduced by means of one or more syllogisms: the great Huygens, too, observes, that paralogisms frequently happen in mathematics, through want of observing the syllogistic form. See Syllogism.

Problems consist of three parts: a proposition, resolution, and demonstration.

In the proposition is indicated the thing to be done.

In the resolution, the several steps are orderly rehearsed, whereby the thing proposed is performed.

Lastly, in the demonstration it is shewed, that the things enjoined by the resolution being done, that which was required in the proposition is effected. As often, therefore, as a problem is to be demonstrated, it is converted into a theorem; the resolution being the hypothesis, and the proposition the thesis: for the general tenor of all problems to be demonstrated is this; that the thing prescribed in the resolution being performed, the thing required is done.

The schoolmen make two kinds of demonstration: the one τȣ διοτι, or *propter quod*; wherein an effect is proved by the next cause. As when it is proved, that the moon is eclipsed, because the earth is then between the sun and moon. The second τȣ οτι, or *quia*; wherein the cause is proved from a remote effect: as when it is proved, that fire is hot, because it burns; or that plants do not breathe, because they are not animals; or that there is a God from the works of creation. The former is called *demonstration à priori*, and the latter *demonstration à posteriori*.

Demonstration (Affirmative), is that which, proceeding by affirmative and evident propositions, dependent on each other, ends in the thing to be demonstrated.

Demonstration (Apagogical). See Apagogical.

Demonstration (Geometrical), is that framed of reasonings drawn from the elements of geometry.

Demonstration (Mechanical), is that, the reasonings whereof are drawn from the rules of mechanics.

Demonstration a priori, is that whereby an effect is proved from a cause, either a next, or remote one; or a conclusion proved by something previous, whether it be a cause, or only an antecedent.

Demonstration a posteriori, is that whereby either a cause is proved from an effect, or a conclusion is proved by something posterior; whether it be an effect, or only a consequent.

DEMO'NSTRATIVE. *a.* (*demonstrativus*, Latin.) 1. Having the power of demonstration; invincibly conclusive; certain (*Hooker*). 2. Having the power of expressing clearly (*Dryden*). 3. That which shows: as *demonstrative* pronouns.

DEMO'NSTRATIVELY. *ad.* 1. With evidence not to be opposed or doubted (*South*). 2. Clearly; plainly; with certain knowledge (*Brown*).

DEMONSTRA'TOR. *s.* (from *demonstrate.*) One that proves; one that teaches.

DEMO'NSTRATORY. *a.* (from *demonstrate.*) Having the tendency to demonstrate.

DEMOSTHENES, the celebrated orator of Athens, was son of a rich blacksmith, called Demosthenes, and of Cleobule. He was but seven years of age when his father died, and his guardians having embezzled the greatest part of his possessions, his education was totally neglected; and for whatever advances he made in learning, he was indebted to his own industry and application. He became the pupil of Isæus and Plato, and applied himself to study the orations of Isocrates. At the age of 17, he gave an early proof of his eloquence and abilities against his guardians, from whom he obtained the retribution of the greatest part of his estate. His rising talents were, however, impeded by weak lungs, and a difficulty of pronunciation, especially of the letter ρ, but these obstacles were soon conquered by unwearied application. To correct the stammering of his voice, he spoke with pebbles in his mouth; and removed the distortion of his features, which accompanied his utterance, by watching the motions of his countenance in a looking-glass. That his pronunciation might be loud, and full of emphasis, he frequently ran up the steepest and most uneven walks, where his voice acquired force and energy; and on the sea-shore, when the waves were uncommonly agitated, he declaimed aloud, to accustom himself to the noise and tumults of a public assembly. He also confined himself in a subterraneous cave, to devote himself more closely to studious pursuits; and to eradicate all curiosity of appearing in public, he shaved one half of his head. His abilities, as an orator, raised him to consequence at Athens, and he was soon placed at the head of government. In this public capacity he roused his countrymen from their indolence, and animated them against the encroachment of Philip of Macedonia. In the battle of Cheronæa, however, Demosthenes betrayed his pusillanimity, and saved his life by flight. After the death of Philip, he declared himself warmly against his son and successor, Alexander. Though he had boasted that all the gold of Macedonia could not tempt him, yet he suffered himself to be bribed by a small golden cup from Harpalus. This forced him to retire to Egina, whence, when Antipater made war against Greece, he was recalled and received with much splendor at Athens. His triumph and popularity were but of short duration. Antipater and Craterus were near Athens, and demanded all the orators to be given up. Demosthenes, with all his adherents, fled to the temple of Neptune in Caluria; and when he saw that all hopes of safety were vanished, he took a dose of poison, which he always carried in a quill, and expired in the 60th year of his age, B.C. 322.

Demosthenes has been deservedly called the prince of orators. Indeed no orator had ever a finer field than Demosthenes in his Olynthiacs and Philippics, which are his capital orations; and undoubtedly to the greatness of the subject, and to that integrity and public spirit which breathe in them, they owe a large portion of their merit. Cicero calls him a perfect model, and such as he himself wished to be. These two great orators have been often compared together; but the judgment hesitates to which to give the preference. The archbishop of Cambray, however, seems to have stated their merits with great justice and perspicuity in his Reflections on Rhetoric and Poetry. The passage, translated, is as follows: "I do not hesitate to declare that I think Demosthenes superior to Cicero. I am persuaded no one can admire Cicero more than I do. He adorns whatever he attempts. He does honour to language. He disposes of words in a manner peculiar to himself. His style has great variety of character. Whenever he pleases, he is even concise and vehement: for instance, against Catiline, against Verres, against Antony. But ornament is too visible in his writings. His art is wonderful, but it is perceived. When the orator is providing for the safety of the republic, he forgets not himself, nor permits others to forget him. Demosthenes seems to escape from himself, and to see nothing but his country. He seeks not elegance of expression; unsought for he possesses it. He is superior to admiration. He makes use of language, as a modest man does of dress, only to cover him. He thunders, he lightens. He is a torrent which carries every thing before it. We cannot criticise, because we are not ourselves. His subject enchains our attention, and makes us forget his language. We lose him from our sight: Philip alone occupies our minds. I am delighted with both these orators; but I confess that I am less affected by the infinite art and magnificent eloquence of Cicero, than by the rapid simplicity of Demosthenes." La Harpe, also, has some fine remarks on the different kinds of eloquence of Cicero and Demosthenes, and their comparative fitness for the audiences they had respectively to address: but they are too long to be transcribed into this place.

Demosthenes is said to have composed 65 orations, of which only a few have reached our times. Among the best editions of these, are that of Frankfort, 1604, folio, with Wolfius's Latin version; of Reiske, 12 vols. 8vo. Leips. 1770; of Auger, 4to. Paris, 1790. Of the select orations the best edition is by Mountenoy. Cant. 1731. Lond. Oct. 1785. The curious in bibliography are very eager to obtain the genuine editio princeps of Demosthenes, which is by Aldus, Venet. fol. 1504.

DEMU′LCENT. *a.* (*demulcens*, Latin.) Softening; mollifying; assuasive (*Arbuthnot*).

DEMU′LCENTS. (*demulcentia, medicamenta;* from *demulceo*, to soften.) Medicines are thus called, which possess a power of diminishing the effects of stimuli on the sensible solids of the body. There are two orders of demulcents. 1. Lenient demulcents, as starch, gum arabic, and olive oil: these are best adapted to irritable constitutions, and persons with a remarkable disposition to have their secretions morbidly augmented. 2. Diluent demulcents, as water and watery substances: these are calculated for such as have a diminution of the secretions, and whose habits are naturally torpid.

To DEMU′R. *v. n.* (*demeurer*, French.) 1. To delay a process in law by doubts and objections (*Walton*). 2. To pause in uncertainty; to suspend determination (*Hayward*). 3. To doubt; to have scruples (*Bentley*).

To Demu′r. *v. a.* To doubt of (*Milton*).

Demu′r. *s.* (from the verb.) Doubt; hesitation; suspense of opinion (*South*).

DEMU′RE. *a.* (*des mœurs*, French.) 1. Sober; decent (*Spenser*). 2. Grave; affectedly modest (*Swift*).

To Demu′re. *v. n.* (from the noun.) To look with an affected modesty (*Shakspeare*).

DEMU′RELY. *ad.* (from *demure.*) 1. With affected modesty; solemnly (*Bacon*). 2. Solemnly (*Shakspeare*).

DEMU′RENESS. *s.* (from *demure.*) 1.

Modesty, soberness; gravity of aspect. 2. Affected modesty; pretended gravity.

DEMU'RRAGE. *s.* (from *demur.*) An allowance made to masters of ships, for their stay in a port beyond the time appointed.

DEMURRER, in law, a stop put to any action upon some point of difficulty which must be determined by the court, before any further proceedings can be had in the suit.

DEMURRER TO EVIDENCE, is where a question of law arises thereon; as if the plaintiff in a suit gives in evidence any records, deeds, writings, &c. upon which a law-question arises, and the defendant offers to demur upon it, then the plaintiff must join in such demurrer, or wave his evidence.

DEMURRER TO INDICTMENTS, is when a criminal joins issue upon a point of law in an indictment or appeal, allowing the fact as laid to be true.

DEN. *s.* (ꝺen, Saxon.) 1. A cavern or hollow running with a small obliquity under ground (*Hooker*). 2. The cave of a wild beast (*Dryden*). 3. *Den*, in a local name, may signify either a valley or a woody place (*Gibson*).

DENARIUS, in Roman antiquity, the chief silver coin among the Romans, worth in our money about sevenpence three farthings. As a weight, it was the seventh part of a Roman ounce. In our law-books an English penny is often called Denarius.

DENA'Y. *s.* Denial; refusal (*Shakspeare*).

DENBIGH, a town of North Wales, the capital of the county of the same name. It stands on the side of a rocky hill, on a branch of the river Clwyd; and is called by the Welsh Cledvyrn yn Rhos, i. e. The craggy hill in Ross. Denbigh contains 552 houses, and 2391 inhabitants; it sends one member to the British parliament, and has a market on Wednesdays. Lat. 53. 11 N. Lon. 3. 35 W.

DENBIGHSHIRE, a county of Wales, bounded on the south by Merioneth and Montgomery shires, on the north by Flintshire and the Irish sea, on the west by Caernarvon and part of Merionethshire. It is about 40 miles long and 21 broad. The air is wholesome, but sharp, the country being pretty hilly, and the snow lying long on the tops of the mountains. The soil in general is barren; but the vale of Clwyd, so called, from its being watered by that river, is a very fertile pleasant spot of great extent, and well inhabited. The county contains about 410,000 acres of land, 13,048 houses, and 60,352 inhabitants. They send one member to parliament, besides one for the county town.

DENDERA, the ancient Tentyris or Tentyra, a town or large village of Egypt, built near the ruins of the ancient city at a short distance from the west bank of the Nile, about 242 miles S. of Cairo. Some of the ruins near this place are very magnificent. Lat. 26. 10 N. Lon. 31. 40 E.

DENDERMOND, a strong town of Flanders, in the Austrian Netherlands. Lat. 51. 3 N. Lon. 4. 10 E.

DENDRITES, or **ARBORIZATIONS.** This appellation is given to figures of vegetables which are frequently observed in fossil substances. They are of two kinds; the one superficial, the other internal. The first are chiefly found on the surface of stones, and between the strata and in the fissures of those of a calcareous nature. Stones of a similar kind, when very compact, sometimes also exhibit internal arborizations; such are the marbles of Hesse, of Angersburg in Prussia, and of Baden-Dourlach on the left bank of the Rhine.

DENDROBIUM, in botany, a genus of the class gynandria, order monandria. Calyx (in some species reversed) three-leaved, oblong, somewhat spreading; the two lowermost leaves extending at the base, on their underside, and cohering so as to form a pouch, bearing some resemblance to a spur; petals two, oblong, lateral; nectary a lip of various shapes in different species, its base included in and often connected with the pouch of the calyx, destitute of a spur; capsule oblong or ovate, with three or six angles or ribs, one cell and three valves, bursting between the ribs; seeds numerous, minute, each clothed with a chaffy tunic. Thirty-two species; natives of the East or West Indies; resembling the orchis tribe, and growing parasitically for the most part on the trunks or branches of old trees.

DENDRO'LOGY. *s.* (δενδρον and λογος.) The natural history of trees.

DENDROMETER, (from δενδρον, a tree, and μετρεω, I measure), an instrument for measuring trees. The same name has also been applied, though with no propriety, to instruments contrived to measure distances and magnitudes from a single station.

DENDROPHORIA, in antiquity, the carrying of one, or more, trees, in ceremony, through a city, at certain feasts, and in honour of certain deities. The persons who performed the office of carrying the trees were called dendrophori, i. e. tree-bearers.

DENEB, an Arabic term, signifying tail, used by astronomers as a name to some of the fixed stars: as Deneb Alesed, Lion's-tail; Deneb Kaitos, the Whale's-tail. See CAUDA.

DENEHIA, in botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; downless; calyx imbricate; florets of the ray two lipped. One species only; a Cape plant, with striate, downy branched stem; leaves half clasping, oblong-lanceolate, obtuse with a point undulate; downy underneath, entire; flowers terminal in a close panicle.

DENHAM (Sir John), an eminent English poet, the only son of sir John Denham, chief baron of the exchequer in Ireland, and one of the lords commissioners there, was born in Dublin in 1615; but his father, in 1617, being made a baron of the Exchequer in England, he received his education in this country. In his youth he followed gaming more than any thing else; but, in 1641, published a tragedy called the Sophy, which was much admired by the best judges; and, in 1643, wrote his famous poem called Cooper's Hill, which Mr. Dryden pronounces will ever be the standard of good writing for majesty of style. The lines which have excited the most attention are the following in a description of the river Thames:

> "O could I flow like thee, and make thy stream
> My great example—as it is my theme!
> Tho' deep, yet clear; tho' gentle, yet not dull;
> Strong without rage; without o'erflowing, full."

Of these lines Dr. Johnson says: "So much meaning is confined in so few words; the particulars of resemblance are so perspicaciously collected, and every mode of excellence separated from its adjacent fault, by so nice a line of limitation; the different parts of the sentence are so accurately adjusted, and the flow of the last couplet is so smooth and sweet, that the passage, however celebrated, has not been praised above its merit. It has beauty peculiar to itself, and must be numbered among those felicities which cannot be produced at will by wit and labour, but must rise unexpectedly in some hour propitious to poetry." Denham was sent ambassador from Charles II. to the king of Poland; and at the restoration was made surveyor-general of his majesty's buildings, and created knight of the Bath. On obtaining this post, he is said to have renounced his poetry for more important studies; though he afterwards wrote a fine copy of verses on the death of Cowley. He died at his office in Whitehall in 1668; and his works have been often since printed.

DENI'ABLE. *a.* (from *deny.*) That may be denied (*Brown*).

DENI'AL. *s.* (from *deny.*) 1. Negation; the contrary to confession (*Sidney*). 2. Refusal; the contrary to grant (*Shakspeare*). 3. Abjuration; contrary to acknowledgment of adherence (*South*).

DENI'ER. *s.* (from *deny.*) 1. A contradictor; an opponent (*Watts*). 2. A disowner; one that does not own or acknowledge (*South*). 3. A refuser; one that refuses (*K. Charles*).

Denier, a small French copper coin, of which twelve make a sol. There are two kinds of deniers, the one tournois, the other parisis, whereof the latter is worth a fourth part more than the former. See Money.

To **DE'NIGRATE.** *v. a.* (*denigro*, Latin.) To blacken; to make black (*Boyle*).

DENIGRA'TION. *s.* (*denigratio*, Latin.) A blackening, or making black (*Boyle*).

DENIZA'TION. *s.* (from *denizen.*) The act of enfranchising, or making free (*Davies*).

DE'NIZEN. **De'nison.** *s.* (*dinasddyn*, Welsh, a man of the city.) A freeman; one enfranchised (*Davies*).

To **De'nizen.** *v. a.* (from the noun.) To enfranchise; to make free (*Donne*).

DENMARK, a kingdom of Europe, bounded on the E. by the Baltic sea, on the W. and N. by the ocean, and on the S. by Germany. The country is generally flat, and the soil a barren sand. The air is rendered foggy by the neighbourhood of the seas and lakes, of which it is full. Denmark, properly so called, consists of Jutland and the islands of Zealand and Funen, with the little isles about them; but the king of Denmark's dominions contain the kingdom of Norway, and the duchies of Holstein, Oldenburgh, and Delmenhorst. There is no considerable river, and the winter continues seven or eight months. In the summer the heat is very great, and the days are long. The commodities are corn, pulse, horses, and large beeves. The kingdom of Denmark was formerly limited and elective; but in 1660, it was made absolute and hereditary. This was the consequence of a revolution almost unparalleled in history; a free people voluntarily resigning their liberties into the hands of their sovereign. The inhabitants are Protestants since the year 1522, when they embraced the confession of Augsburg. The forces which the king of Denmark has usually on foot are near 40,000. The revenues are computed at 500,000l. a year, which arise from the crown lands and duties. The produce of Norway consists in pitch, tar, fish, oil, and deal boards. Copenhagen is the capital.

DENNIS (John), an English critic, born in London in 1657. He received his education at Cambridge, where he took his degree of B.A. but was expelled the university for attempting to assassinate a person in the dark. He then went abroad, and on his return set up as a gentleman and man of wit. In 1692 he wrote a pindaric ode on king William, after which he published several other poems, two of which, on the battles of Blenheim and Ramilies, procured him the favour of the duke of Marlborough, who gave him 100l. and procured him a place in the custom-house. In 1704 appeared his play called Liberty asserted; in which were so many strokes against the French nation, that he conceived that no negociation for peace would take effect unless he was delivered up; and he went so far as to desire the duke of Marlborough to use his interest in his behalf, but his grace encouraged him by saying, that "he had made no provision for himself, and yet he could not help thinking that he had done the French almost as much mischief as Mr. Dennis." In 1713 he attacked Mr. Addison's Cato, which occasioned a whimsical pamphlet, called, The Narrative of Dr. Robert Norris, concerning the strange and deplorable Frenzy of Mr. John Dennis. The critique on Cato, however, is by no means devoid of merit; it displays a considerable knowledge of the philosophy of the human mind, and has many strokes of fine satire; but a good deal of it seems written with a pen dipt in gall.

Mr. Dennis certainly was possessed of much erudition, and a considerable share of genius. In prose, he is far from a bad writer, where abuse or personal scurrility does not mingle itself with his language. In verse, he is extremely unequal; his numbers being at some times spirited and harmonious, and his subjects elevated and judicious; and at others, flat, harsh, and puerile.—As a dramatic author, he deserves not to be held in any consideration. It was justly said of him by a wit, that he was the most complete instructor for a dramatic poet, since he could teach him to distinguish good plays by his *precepts*, and bad ones by his *examples*.

DENO'MINABLE. *a.* (*denomino*, Latin.) That may be named or denoted (*Brown*).

To **DENO'MINATE.** *v. a.* (*denomino*, Latin.) To name; to give a name to (*Hammond*).

DENOMINA'TION. *s.* (*denominatio*, Latin.) A name given to a thing (*Rogers*).

DENO'MINATIVE. *a.* (from *denominate.*) 1. That gives a name; that confers a distinct appellation. 2. That obtains a distinct appellation (*Cocker*).

DENOMINA'TOR. *s.* (from *denominate.*) The giver of a name (*Brown*).

Denominator of a fraction, is the number below the line, shewing the nature and quality of the parts which any integer is supposed to be divided into. Thus, in the fraction $\frac{7}{8}$, the denominator is 8, and shews that the integer is divided into 8 parts, of which the fraction contains 7.

Denominator of a ratio, is sometimes used in the sense of the exponent of a ratio.

DENOTA'TION. *s.* (*denotatio*, Lat.) The act of denoting.

To **DENO'TE.** *v. a.* (*denoto*, Latin.) To mark; to be a sign of; to betoken; to show by signs.

To **DENOU'NCE.** *v. a.* (*denuncio*, Latin.) 1. To threaten by proclamation (*Milton*). 2. To threaten by some outward sign or expression (*Dryden*). 3. To give information against (*Ayliffe*).

DENOU'NCEMENT. *s.* (from *denounce.*) The act of proclaiming any menace (*Brown*).

DENOU'NCER. *s.* (from *denounce.*) One that declares some menace (*Dryden*).

DENS. (*dens*, *quasi edens*; from *edo*, to eat, or from οδους, οδοντος.) A tooth. Many herbs have this specific name, from their fancied resemblance to the tooth of some animal; as *dens leonis*, the dandelion; *dens canis*, dog's tooth, &c.

Dens leonis. See Taraxacum.

DENSE. *a.* (*densus*, Lat.) Close; compact; approaching to solidity (*Locke*).

Dense panicle, in botany. Densa panicula. Having abundance of flowers very close. A greater degree of congesta, heaped.

DENSITY, (from the Latin *densitas*), strictly speaking, denotes vicinity or closeness of particles. But in mechanical science it is used as a term of comparison, expressing the proportion of the number of equal moleculæ, or the quantity of matter in one body, to the number of equal moleculæ in the same bulk of another body: density, therefore, is directly as the quantity of matter, and inversely as the magnitude of the body.

Since it may be shewn experimentally that the quantity of matter in different bodies is proportional to their weight, of consequence, the density of any body is directly as its weight, and inversely as its magnitude: or, the inverse ratio of the magnitudes of two bodies, having experimentally equal weights (in the same place) constitutes the ratio of their densities.

Density of the air. See Air, Atmosphere, and Pneumatics.

Density of the planets. See Astronomy, § viii.

DENTAGRA. (*dentagra.*) The tooth-ach: also an instrument for drawing the teeth.

DE'NTAL. *a.* (*dentalis*, Latin.) 1. Belonging or relating to the teeth. 2. (In grammar.) Pronounced principally by the agency of the teeth (*Holder*).

DENTALIUM. Tooth-shell. In zoology, a genus of the class vermes, order testacea. Animal a terebella; shell univalve, tubular, straight or slightly curved, with an undivided cavity open at both ends. Twenty-two species; mostly inhabiting the seas of Europe and India; two of them found on our own coasts; and about five or six known only from fossile specimens. The shell is commonly white or green; and either ribbed, striated, or dotted: those on our own coast are:

1. D. Entalis, with a white shell, reddish or pale yellow, polished with striæ so very minute as scarcely to be visible without a glass.

2. D. imperforatum. Found at Sandwich. Minute; shell white; opake, transversely striate, imperforate. Still inferior in size, however, is

3. D. minutum, with a round straitish smooth cell; inhabiting the Mediterranean: but so diminutive as not to be discerned by the naked eye; and resembling a small bristle on one of the spines of the echines. See Nat. Hist. Pl. LXXVII.

DENTARIA. Tooth-wort. In botany, a genus of the class tetradynamia, order siliquosa; silique bursting elastically, with the valves revolute and shorter than the partition; stigma notched at the end; calyx leaves meeting longitudinally. Seven species; all European plants, and one, d. bullifera, found in the retired shady parts of our own fields, with its lower leaves pinnate, its upper simple. This plant is to be distinguished from the pellitory of Spain, which is also called dentaria. It is the plumbago europæa; foliis amplexicaulibus, lanceolatis scabris, of Linnéus. The root was formerly esteemed, prepared in a variety of ways, as a cure for the tooth-ache, arising from caries.

DENTATE LEAF. In botany. A toothed leaf. Quod acumina horizontalia, folii consistentia, spatio remota habet. Having horizontal points of the same consistence with the leaf, with a space between each. Dr. Berkenhout observes, that if, instead of horizontal, Linnéus had written, in the plane of the disk, it would have been more intelligible. In Delin. Pl. it is; margine acuminibus patentibus remotis; having spreading points (or teeth), remote from each other, about the edge. Exemplified in leontodon hastile, autumnale, alpinum, hispidium, hirtum. Primula veris et minima. Epilobium montanum.

DENTATE ROOT. A toothed root. Consisting of a concatenation of joints, resembling a necklace.

DENTATE SINUATE. Toothed, and at the same time with sinuses, bays or large hollows about the edge. Tooth sinuate.

DENTATUS. (*dentatus*; from *dens*, a tooth, from its tooth-like process.) Dentata-Epistrophæus. The second vertebra of the neck. It differs from the other cervical vertebræ, by having a tooth-like process at the upper part of the body.

DENTED. *a.* Indented, toothed.

DENTELLA. In botany, a genus of the class pentandria, order monogynia. Calyx five-parted, superior; corol funnel-form, five-cleft; the segments three-toothed; capsule globular, two-celled, many-seeded; stigmas two. One species only; a native of New Caledonia; with filiform stem rooting at each joint; leaves opposite lanceolate, very entire; flowers axillary, solitary.

DENTALLARIA. See PLUMBAGO.

DENTES LACTEI. The milk teeth. See TEETH, and DENTITION.

DENTICLES, or DENTILS, in architecture, an ornament in corniches, bearing some resemblance to teeth; particularly affected in the Ionic and Corinthian orders; and of late also in the Doric. They are cut on a little square member, properly called denticulus; and the notches, or ornaments themselves, dentils, from *dens*, tooth. Vitruvius prescribes the breadth of each dentil, or tooth, to be half its height; and the metopa, or interval between each two, he orders to be two-thirds of the breadth of the dentil.

DENTICULATE, in botany. (*denticulus*, from *dens*.) Toothletted, having small teeth or notches. Applied to the leaf; as in hesperis matronalis, leontodon taraxacum, epilobium tetragonum. Applied to the calyx; and to the seed; as in bidens.

DENTI'CULATED. *a.* (*denticulatus*, Latin.) Set with small teeth.

DENTICULA'TION. *s.* (*denticulatus*, Latin.) The state of being set with small teeth (*Grew*).

DENTIFRICE. (*dentifricium*, from *dens*, a tooth, and *frico*, to rub). A medicine to clean the teeth.

Various are the compositions sold for the purpose of keeping the teeth in good preservation; they are mostly composed of earthy substances, finely powdered, and mixed with alum. Acids, though very effectual for cleansing the teeth, are decidedly mischievous. Charcoal is at present in high reputation as a dentifrice; but the sepia or cuttle-fish, sold by the chemists and finely powdered, and which is picked up on the sands of the southern coast, is much valued for this purpose.

DENTILLARIA. (from *dentella*, a little tooth: so called, beccuse its root is denticulated.) See DENTARIA.

To DENTI'SE. *v. a.* (*denteler*, French.) To have the teeth renewed (*Bacon*).

DENTIST. *s.* (French.) One who confines himself to the extraction of teeth, and to the various operations required by their defects, redundancies, accidents, or disorders.

DENTITION. (*dentitio*, from *dentis*, to breed teeth). The breeding or cutting of the teeth. The first dentition takes place about the sixth or seventh month, and the teeth are termed the primary or milk teeth. About the seventh year these fall out, and are succeeded by others, which remain during life, and are called the secondary or perennial teeth. The last dentition takes place between the ages of twenty and five-and-twenty, when the four last grinders appear; they are called dentes sapientiæ.

The process and economy of teething in different animals, and in different stages in the life of the same animal, is a very important branch of natural history, more especially as a variation in the number, structure, and disposition of the teeth, has been selected by Linnéus as the grand characteristic distinction between the various orders of the mammal class of animals; and as various diseases are often generated in young animals, and especially in infants, during their production. The term *dentition*, indeed, is usually limited to a consideration of the growth of the teeth in connexion with these diseases alone; and, on this explanation of the term, *dentition* is a mere branch of the general subject of *odontology*. We have no desire to innovate upon received opinions, or to strain words in common use to a sense which does not belong to them in common language. On this account we have preferred the term *odontology* to that of *dentition*, as the head-piece of an article that ought to embrace in one comprehensive and systematic view whatever appertains to the history, physiology, and pathology of the teeth, and shall refer our readers to the article ODONTOLOGY accordingly.

DENUDATÆ (*denudor*, to be stripped naked.) The seventh of the natural orders, in Linnéus's Philos. Bot. comprehending a few genera which have flowers that appear at a different time from the leaves, and therefore have a naked appearance; as colchicum.

To DENU'DATE. *v. a.* (*denudo*, Lat.) To divest; to strip; to make naked (*D. of Piety*).

DENUDA'TION. *s.* (from *denudate*.) The act of stripping, or making naked.

To DENU'DE. *v. a.* (*denudo*, Latin.) To strip; to make naked; to divest (*Clarendon*).

DENUNCIA'TION. *s.* (*denunciatio*, Lat.) The act of denouncing; the proclamation of a threat; a public menace (*Ward*)

DENUNCIA'TOR. *s.* (from *denuncio*, Latin.) 1. He that proclaims any threat. 2. He that lays an information against another (*Ayliffe*).

To DENY. *v. a.* (*denier*, French.) 1. To contradict; not to confess (*Genesis*). 2. To refuse; not to grant (*Dryden*). 3. To abnegate; to disown (*Joshua*). 4. To renounce; to disregard (*Spratt*).

DENYS (St.), a town of France, in the department of Paris. Here is an ancient and magnificent church, in which were the tombs of many of the French kings. In 1793, after the abolition of royalty, these tombs were all destroyed, and the name of the town was changed to that of Franciade! Lat. 48. 56 N. Lon. 2. 26 E.

To DEOBSTRU'CT. *v. a.* (*deobstruo,* Lat.) To clear from impediments (*More*).

DEOBSTRUENTS. (*deobstruentia, medicamenta*; from *de,* and *obstruo,* to obstruct.) Medicines that are exhibited with a view of removing any obstruction.

DEODAND, in our customs, a thing given, or forfeited, as it were to God, for the pacification of his wrath in a case of misadventure, whereby a man or woman comes to a violent end, without the fault of any reasonable creature: thus, if a horse should kill his keeper; he was to be sold and the price distributed to the poor, as an expiation of that fatal event.

To DEO'PPILATE. *v. a.* (*de* and *oppilo,* Latin.) To deobstruct; to clear a passage.

DEOPPILA'TION. *s.* (from *deoppilate.*) The act of clearing obstructions (*Brown*).

DEO'PPILATIVE. *a.* (from *deoppilate.*) Deobstruent (*Harvey*).

DEOSCULA'TION. *s.* (*deosculatio,* Lat.) The act of kissing (*Stillingfleet*).

To DEPAI'NT. *v. a.* (*depeint,* French.) 1. To picture; to describe by colours (*Spenser*). 2. To describe (*Gay*).

To DEPA'RT. *v. n.* (*depart,* French.) 1. To go away from a place (*Susanna*). 2. To desist from a practice (*Kings*). 3. To be lost; to perish (*Esdras*). 4. To desert; to revolt; to fall away; to apostatize (*Isaiah*). 5. To desist from a resolution or opinion (*Clarendon*). 6. To die; to leave the world (*Luke*).

To Depa'rt. *v. a.* To quit; to leave; to retire from: not in use (*Ben Jonson*).

To Depa'rt. *v. a.* (*partir,* French.) To divide; to separate: a chemical term.

Depa'rt. *s.* (*depart,* French.) 1. The act of going away (*Shakspeare*). 2. Death (*Shakspeare*). 3. (With chemists.) An operation so named, because the particles of silver are *departed* or divided from gold.

DEPA'RTER. *s.* (from *depart.*) One that refines metals by separation.

DEPA'RTMENT. *s.* (*departement,* Fr.) Separate allotment; province or business assigned to a particular person (*Arbuthnot*).

Department, in geography, one of the districts or distinct provinces into which France was divided by the National Assembly, A.D. 1790, afterwards in 1795, and finally established in the 8th year of the republic. Those of Corsica, the Elbe, and Piedmont, were afterwards added; and the whole number of departments amounts to 109. See Ain, Alps, &c.

DEPA'RTURE. *s.* (from *depart.*) 1. A going away (*Addison*). 2. Death; decease; the act of leaving the present state of existence (*Sidney*). 3. A forsaking; an abandoning (*Tillotson*).

Departure, in navigation, is the easting or westing of a ship in respect of the meridian it departed or sailed from: or it is the difference of longitude, either east or west, between the present meridian the ship is under, and that where the last reckoning or observation was made. This departure, any where but under the equator, must be accounted according to the number of miles in a degree, proper to the parallel the ship is under.

DEPA'SCENT. *a.* (*depascens,* Latin.) Feeding.

To DEPA'STURE. *v. a.* (from *depascor,* Latin.) To eat up; to consume by feeding upon it (*Spenser*).

To DEPA'UPERATE. *v. a.* (*depaupero,* Latin.) To make poor; to impoverish (*Arbuthnot*).

DEPE'CTIBLE. *a.* (from *depecto,* Latin.) Tough; clammy; tenacious (*Bacon*).

To DEPE'INCT. *v. a.* (*depeindre,* Fr.) To depaint; to describe in colours (*Spenser*).

To DEPE'ND. *v. n.* (*dependeo,* Latin.) 1. To hang from (*Dryden*). 2. To be in a state influenced by some external cause (*Bacon*). 3. To be in a state of dependance (*Shakspeare*). 4. To be connected with any thing (*Rogers*). 5. To be in suspense (*Bacon*). 6. *To* Depend *upon.* To rely on; to trust to; to be certain of (*Clarendon*).

DEPE'NDANCE. Depe'ndancy. *s.* (from *depend.*) 1. The state of hanging down from a supporter. 2. Something hanging upon another (*Dryden*). 3. Concatenation; connexion; relation of one thing to another (*Locke*). 4. State of being at the disposal or under the sovereignty of another (*Tillotson*). 5. The things or persons of which any man has the dominion or disposal (*Bacon*). 6. Reliance; trust; confidence (*Hooker*).

DEPE'NDANT. *a.* (from *depend.*) In the power of another (*Hooker*).

Depe'ndant. *s.* (from *depend.*) One who lives in subjection, or at the discretion of another; a retainer (*Clarendon*).

DEPE'NDENCE. Depe'ndency. *s.* (from *dependeo,* Latin.) 1. A thing or person at the disposal or discretion of another (*Collier*). 2. State of being subordinate, or subject (*Ba.*). 3. That which is not principal; that which is subordinate (*Burnet*). 4. Concatenation; connexion (*Shakspeare*). 5. Relation of any thing to another (*Burnet*). 6. Trust; reliance; confidence (*Stillingfleet*).

DEPE'NDENT. *a.* (*dependens,* Latin.) Hanging down (*Peacham*).

Dependent leaf, in botany, a leaf hanging down; or pointing directly to the ground. Applied also to the sleep of plants; when the leaves, which are erect in the day, hang down at night.

Depe'ndent. *s.* (from *dependens,* Latin.) One subordinate (*Rogers*).

DEPE′NDER. *s.* (from *depend.*) One that reposes on the kindness of another (*Shak.*).

DEPERDI′TION. *s.* (from *deperditus*, Latin.) Loss; destruction (*Brown*).

DEPESTA, in antiquity, a wine vessel which the Sabines set on the table of their gods, at a festival.

DEPHLEGMATION, in chemistry, the depriving any liquid of part of the superfluous water which it may contain, whence it has in one respect the effect of concentration. Thus sulphuric acid is dephlegmated by boiling for a time, which expels at first little else than mere water. Vinegar is dephlegmated by partial freezing, the ice that first forms being only the watery portion, containing none of the acid.

To DEPHLE′GM. *To* Dephle′gmate. *v. a.* (*dephlegmo*, low Latin.) To clear from phlegm, or aqueous insipid matter (*Boyle*).

DEPHLE′GMEDNESS. (from *dephlegm.*) The quality of being freed from phlegm (*Boyle*).

DEPHLOGISTICATED AIR. See Oxygen.

Dephlogisticated marine acid. See Acid and Oxymuriatic acid.

Dephlogisticated nitrous air. See Nitrous oxyd.

To DEPI′CT. *v. a.* (*depingo, depictum*, Latin.) 1. To paint; to pourtray (*Taylor*). 2. To describe; to represent an action to the mind (*Felton*).

DEPI′LATORY. *s.* (*de* and *pilus*, Latin.) An application used to take away hair.

DEPI′LOUS. *a.* (*de* and *pilus*, Lat.) Without hair (*Brown*).

DEPLANTA′TION. *s.* (*deplanto*, Latin.) The act of taking plants up from the bed.

DEPLE′TION. *s.* (*depleo, depletus*, Lat.) The act of emptying (*Arbuthnot*).

DEPLO′RABLE. *s.* (from *deploro*, Latin.) 1. Lamentable; dismal; sad; calamitous; miserable; hopeless (*Clarendon*). 2. Contemptible; despicable: as, *deplorable* nonsense.

DEPLO′RABLENESS. *s.* (from *deplorable.*) The state of being deplorable; misery.

DEPLO′RABLY. *ad.* (from *deplorable.*) Lamentably; miserably (*South*).

DEPLO′RATE. *a.* (*deploratus*, Latin.) Lamentable; hopeless (*L'Estrange*).

DEPLORA′TION. *s.* (from *deplore.*) The act of deploring, or of lamenting.

To DEPLO′RE. *v. a.* (*deploro*, Latin.) To lament; to bewail; to mourn (*Dryden*).

DEPLO′RER. *s.* (from *deplore.*) A lamenter; a mourner.

DEPLUMA′TION. *s.* (*deplumatio*, Latin.) 1. A pluming, or plucking off the feathers. 2. (In surgery.) A swelling of the eyelids, accompanied with the fall of the hairs from the eyebrows (*Phillips*).

To DEPLU′ME. *v. a.* (*de* and *plumo*, Lat.) To strip of its feathers.

To DEPO′NE. *v. a.* (*depona*, Latin.) 1. To lay down as a pledge or security. 2. To risk upon the success of an adventure (*Hudibras*).

DEPO′NENT. *s.* (from *depono*, Latin.) 1. One that deposes his testimony in a court of justice; an evidence; a witness. 2. (In grammar.) Such verbs as have no active voice are called *deponents* (*Clarke*).

To DEPO′PULATE. *v. a.* (*depopulor*, Latin.) To unpeople; to make waste (*Bacon*).

DEPOPULA′TION. *s.* (from *depopulate.*) The act of unpeopling; havock; waste (*Milt.*).

DEPOPULA′TOR. *s.* (from *depopulate.*) A dispeopler; a destroyer of mankind.

To DEPO′RT. *v. a.* (*deporter*, French.) To carry; to demean; to behave (*Pope*).

Depo′rt. *s.* (from the verb.) Demeanour; behaviour (*Milton*).

DEPORTA′TION. *s.* (*deportatio*, Latin.) 1. Transportation; exile into a remote part of the dominion. 2. Exile in general (*Ayliffe*).

DEPO′RTMENT. *s.* (*deportment*, French.) 1. Conduct; management (*Wotton*). 2. Demeanour; behaviour (*Swift*).

To DEPO′SE. *v. a.* (*depono*, Latin.) 1. To lay down; to lodge; to let fall (*Woodward*). 2. To degrade from a high station (*Dryden*). 3. To take away; to divest (*Shakspeare*). 4. To give testimony; to attest (*Bacon*). 5. To examine any one on his oath (*Shakspeare.*)

To Depo′se. *v. n.* To bear witness (*Sidney*).

DEPO′SITARY. *s.* (*depositarius*, Latin.) One with whom any thing is lodged in trust (*Shakspeare*).

To DEPO′SITE. *v. a.* (*depositum*, Latin.) 1. To lay up; to lodge in any place (*Bentley*). 2. To lay up as a pledge, or security. 3. To place at interest (*Spratt*). 4. To lay aside (*D. of Piety*).

Depo′site. *s.* (*depositum*, Latin.) 1. Any thing committed to the trust and care of another. 2. A pledge; a thing given as a security. 3. The state of a thing pledged (*Bac.*).

DEPOSI′TION. *s.* 1. The act of giving publick testimony. 2. The act of degrading one from dignity.

Deposition, in law, the testimony given in court by a witness upon oath. In chancery, deposition is a testimony set down in writing, by way of answer to the interrogations exhibited in chancery, where such witness is called deponent. Depositions in one cause may be used at the hearing of another, where they are between the same parties, &c. without any motion: this is not permitted in other courts, without a special order in the court of chancery. The depositions in chancery, after the cause is determined there, may be given in evidence in a trial at bar, in any of the other courts.

DEPO′SITORY. *s.* (from *deposit.*) The place where any thing is lodged (*Addison*).

DEPOT, a term which is now anglicised, and employed to denote a deposit or reserve for stores, provisions, &c.: it is principally used in a military sense.

DEPRAVA′TION. *s.* (*depravatio*, Latin.) 1. The act of making any thing bad (*Swift*). 2. Degeneracy; depravity (*South*). 3. Defamation: not in use (*Shakspeare*).

To DEPRA′VE. *v. a.* (*depravo*, Latin.) To vitiate; to corrupt; to contaminate (*Hooker*).

DEPRA′VEDNESS. *s.* (from *deprave.*) Corruption; taint; vitiated state (*Hammond*).

DEPRA'VEMENT. *s.* (from *deprave.*) A vitiated state; corruption (*Brown*).

DEPRA'VER. *s.* (from *deprave.*) A corrupter.

DEPRA'VITY. *s.* (from *deprave.*) Corruption.

To DE'PRECATE. *v. a.* 1. To beg off; to pray deliverance from (*Smal.*). 2. To implore mercy of: not proper (*Prior*).

DEPRECA'TION. *s.* (*deprecatio*, Latin.) Prayer against evil (*Brown*).

DE'PRECATIVE. DE'PRECATORY. *a.* (from *deprecate.*) That serves to deprecate; apologetick (*Bacon*).

DEPRECA'TOR. *s.* (*deprecator*, Latin.) One that averts evil by petition.

To DEPRE'CIATE. *v. a.* (*depretiare*, Latin.) 1. To bring a thing down to a lower price. 2. To undervalue (*Addison*).

To DE'PREDATE. *v. a.* (*deprædari*, Lat.) 1. To rob; to pillage. 2. To spoil; to devour (*Bacon*).

DEPREDA'TION. *s.* (*deprædatio*, Latin.) 1. A robbing; a spoiling (*Hayward*). 2. Voracity; waste (*Bacon*).

DEPREDA'TOR. *s.* (*deprædator*, Latin.) A robber; a devourer (*Bacon*).

To DEPREHE'ND. *v. a.* (*deprehendo*, Latin.) 1. To catch one; to take unawares (*Hooker*). 2. To discover; to find out a thing (*Bacon*).

DEPREHE'NSIBLE. *a.* (from *deprehend.*) 1. That may be caught. 2. That may be understood, or discovered.

DEPREHE'NSIBLENESS. *s.* 1. Capableness of being caught. 2. Intelligibleness; easiness to be understood.

DEPREHE'NSION. *s.* (*deprehensio*, Lat.) 1. A catching or taking unawares. 2. A discovery.

To DEPRE'SS. *v. a.* (from *depressus*, Lat.) 1. To press or thrust down. 2. To let fall; to let down (*Newton*). 3. To humble; to deject; to sink (*Addison*).

DEPRESSED LEAF. In botany, hollow in the middle; or having the disk more depressed than the sides. This term has reference to succulent leaves only; and is opposed to convex, in Philos. Bot. and to compressed, in Delin. Pl. Applied also to seeds, as in cynoglossum.

DEPRE'SSION. *s.* (*depressio*, Latin.) 1. The act of pressing down (*Wotton*). 2. The sinking or falling in of a surface (*Boyle*). 3. The act of humbling; abasement (*Bacon*).

DEPRESSION OF EQUATIONS, in algebra, an operation by which an equation is reduced so as to become of lower dimensions.

If any equation contain equal roots, these may be found, and the equation reduced as many dimensions lower, as there are equal roots. For if the original equation $x^{n} - px^{n-1} + qx^{n-2} - \&c. = o$, have m equal roots, the equation $nx^{n-1} - \overline{n-1}.\ px^{n-2} + \overline{n-2}\ qx^{n-3} - \&c. = o$, has $m-1$ of those roots, as may be readily shewn. Hence, when there are m equal roots, the two equations have a common measure of this form $x-a^{m-1}$ (a being one of the roots) which may be obtained in the usual way, and m roots of the original equation may thus be known. Divide this equation by $\overline{x-a}^{m}$, and the resulting equation, of $n-m$ dimensions, contains the other roots.

Thus, let the cubic $x^3-px^2+qx-r=o$, have two equal roots; then $3x^2-2px+g=o$ has one of them; and the two equations have a common measure which is a simple equation: the quantities $3x^3-3px^2+3qx-3r$, and $3x^2-2px+q$, have also the same common measure, which being found, we have $\frac{6q-2p^2}{3}x-\frac{qr-pq}{3}$ for a divisor of the equation $x^3-px^2+qx-r=o$; this divisor being likewise put $=o$, we obtain $x=\frac{qr-pq}{6q-2p^2}$. Thus two roots of the equation are discovered; and, since p is the sum of all the roots, the third root is the difference between p and the sum of the two equal roots.

If two roots of an equation be of the form $+a$, $-a$, differing only in their signs; change the signs of the roots, and the resulting equation has two roots $+a$, $-a$, thus we have two equations with a common measure, x^2-a^2, which may be found, and the equation depressed, as in the preceding case. (*See Waring's Med. Alg. cap.* 3.)

DEPRESSION OF THE SUN OR A STAR, in astronomy, is its distance at any time below the horizon, measured by an arc of a vertical circle.

DEPRESSION OF THE POLE, that bringing of the elevated pole nearer the horizon which is occasioned by the motion of the observer toward the equator.

DEPRESSION OF THE VISIBLE HORIZON, denotes its sinking or dipping below the true horizontal plane; whether caused by some variation of the atmosphere, or by the different height of the observer's eye above the surface of the sea.

Thus, in fig. 1. Pl. 57, where the observer is situated above the earth at A; without refraction the visual ray would be AE, and in that case E is the most distant point which could be seen; but by refraction, the ray FG, coming from the point G, may be seen at F, so as to go on from thence in the line FA; and then the view is extended as far as G, and the depression of the horizon of the sea is in the line AF, which points higher than AE, but extends the view farther. From an inspection of the figure it is evident, that, if the refraction were greater, the view would be extended still farther, as to M; though the depression of the horizon of the sea would then be less, as is shewn by the line ALM: whence also it appears, that, by reason of the difference of refraction in the air, our horizon is sometimes more extensive than at others.

The depression, or dip, may be readily calculated: for, in fig. 2. the eye being at B, the

sensible horizon is FG, and the depression is the angle FBA: but this angle as well as ACB is the complement of ABC; therefore the angle C is equal to the depression. Hence, we have
CA : CB :: rad. : sec. of C:
or as CB : CA :: rad. : cosin. of C.
By either of which analogies a table may be readily constructed, for any heights BD. The depression by calculation is in all cases greater than that by observation; but the difference is variable, as is the refraction which causes it. Tables of the depression are given in the Requisite Tables for the Nautical Almanac.

DEPRESSOR, (*depressor*, from *deprimo*, to press down). In anatomy. Several muscles are so termed, because they depress the parts into which they are inserted.

Depressor alæ nasi. See Depressor labii superioris alæque nasi.

Depressor anguli oris. Triangularis of Winslow. Depressor labiorum communis of Douglas. A muscle of the mouth and lip, situated below the under lip. It arises, broad and fleshy, from the lower edge of the lower jaw, near the chin; and is inserted into the angle of the mouth, which it pulls downwards.

Depressor labii superioris alæque nasi. Depressor alæ nasi of Albinis. Incisivus medius of Winslow. Depressor labii superioris proprius of Douglas. A muscle of the mouth and lip, situated above the mouth, that draws the upper lip and ala nasi downwards and backwards. It arises thin and fleshy, from the superior maxillary bone, immediately above the joining of the gums, with the two incisor teeth and cuspidatus; from thence it runs upwards, and is inserted into the upper lip and root of the ala of the nose.

Depressor labii inferioris. Quadratus of Winslow. Depressor labii inferioris proprius of Douglas. A muscle of the mouth and lip, that pulls the under lip and skin of the side of the chin downwards, and a little outwards.

Depressor labii superioris proprius. See Depressor labii superioris alæque nasi.

Depressor labiorum communis. See Depressor anguli oris.

Depressor oculi. See Rectus inferior oculi.

Depre′ssor. *s.* (*depressor*, Lat.) He that keeps or presses down.

DEPRIMENS. See Rectus inferior oculi.

DE′PRIMENT. *a.* (*deprimens*, Lat.) That presses or pulls downward (*Derham*).

DEPRIVA′TION. *s.* (from *de* and *privatio*, Latin.) 1. The act of depriving, or taking away from. 2. The state of losing (*Bentley*).

Deprivation, in the common law, the act of bereaving, divesting, or taking away a spiritual promotion or dignity: as when a bishop, vicar, prebendary, or the like, is deposed or deprived of his preferment, for some matter or fault, in facet, or in law. It is of two kinds; *beneficio*, and *ab officio*.

Deprivation a beneficio, is when for some great crime a minister is wholly and for ever deprived of his living or preferment; which differs from suspension, in that the latter is only temporary.

Deprivation ab officio, is when a minister is for ever deprived of his order: which is the same, in reality, with what we otherwise call deposition and degradation; being usually for some heinous crime deserving death, and is performed by the bishop in a solemn manner.

To DEPRI′VE. *v. a.* (from *de* and *privo*, Lat.) 1. To bereave one of a thing (*Claren.*) 2. To hinder; to debar from (*Dryden*). 3. To release; to free from (*Spenser*). 4. To put out of any office (*Bacon*).

DEPTFORD, a town of Kent, rendered famous for its fine dock-yard, belonging to the king, where ships for the royal navy are built. In this town are two hospitals, one of which, containing 21 houses, was incorporated in the reign of Henry VIII. in the form of a college, and is called the Trinity House of Deptford Strond. The other, which was built by the corporation belonging to the former, consists of 38 houses; both hospitals being for the use of decayed pilots or masters of ships, or their widows; the men are allowed 20*s.* and the women 16*s.* per month. This town is 4 miles E. of London. The number of inhabitants in 1801, was 17,548; but there has been a gradual increase since that time; so that now the inhabitants are supposed to amount to above 20,000.

DEPTH. *s.* (from *deep* or *diep*, Dutch.) 1. Deepness; the measure of any thing from the surface downward (*Bacon*). 2. Deep place; not a shoal (*Dryden*). 3. The abyss; a gulph of infinite profundity (*Proverbs*). 4. The middle or height of a season: applied commonly to winter (*Clarendon*). 5. Abstruseness; obscurity (*Addison*).

Depth of a squadron or battalion, is the number of men in the file.

To DE′PTHEN. *v. a.* (*diepen*, Dutch.) To deepen or make deeper.

To DEPU′CELATE. *v. a.* (*depuceler*, Fr.) To deflour; to bereave of virginity.

DEPU′LSION. *s.* (*depulsio*, Latin.) A beating or thrusting away.

DEPU′LSORY. *a.* (from *depulsus*, Latin.) Putting away; averting.

To DE′PURATE. *v. a.* (*depurer*, French.) To purify; to cleanse (*Boyle*).

De′purate. *a.* (from the verb.) 1. Cleansed; freed from dregs. 2. Pure; not contaminated (*Glanville*).

DEPURA′TION. *s.* (*depuratio*, Latin.) 1. The act of separating the pure from the impure part of any thing (*Boyle*). 2. The cleansing of a wound from its matter.

To DEPU′RE. *v. a.* (*depurer*, French.) 1. To free from impurities. 2. To purge (*Ral.*)

DEPUTA′TION. *s.* (*deputation*, French.) 1. The act of deputing, or sending away with a special commission. 2. Vicegerency (*South*).

DEPUTATUS, a name applied by the ancients, to those who made armour.

Deputatus, denotes also a kind of usher or tipstaff to the patriarch of Constantinople.

To DEPU'TE. *v. a.* (*deputer*, French.) To send with a special commission; to impower one to transact instead of another (*Roscom.*).

DE'PUTY. *s.* (*deputé*, Fr. from *deputatus*, Latin.) 1. A lieutenant; a viceroy (*Hale*). 2. One that transacts business for another (*Hooker*).

To DEQUA'NTITATE. *v. a.* (from *de* and *quantitas*, Latin.) To diminish the quantity of.

DER. In the beginning of names of places, is derived from ꝺeoꞃ, a wild beast, unless the place stands upon a river; then from the British *dur*, i. e. water (*Gibson*).

To DERA'CINATE. *v. a.* (*deraciner*, Fr.) To pluck or tear up by the roots (*Shakspeare*).

To DERA'IGN. *To* Dera'in. *v. a.* (*disrationare*, or *dirationare*, Lat.) To prove; to justify (*Blount*). 2. To disorder; to turn out of course.

DERA'IGNMENT. *s.* (from *deraign.*) 1. The act of deraigning or proving. 2. A disordering, or turning out of course. 3. A discharge of profession; a departure out of religion (*Blount*).

DERA'Y. *s.* (from *desrayer*, Fr.) Tumult; disorder; noise.

DERBENT, a strong town of Shirvan, a province of Persia, in Asia, said to be founded by Alexander the Great. It was always a place of importance, and is a strong pass from Muscovy and Tartary into Persia. The Muscovites took this town in 1723, and it was ceded to them in 1735, by a treaty with Kouli Khan, emperor of Persia. Lat. 42. 8 N. Lon. 50. 0 E.

DERBY, the capital town of the county of the same name, having markets on Wednesdays, Fridays, and Saturdays. It is seated on the river Derwent, over which there is a handsome stone bridge, and a small brook runs through the town, under several bridges. Here are five parish churches. Upon the Derwent is Sir Thomas Lombe's curious engine for the manufacturing of silk, for a perfect model of which the parliament of Great Britain allowed him 14,000l. It is governed by a mayor, and sends two members to parliament. All Saints' church is a beautiful Gothic structure, erected in the reign of queen Mary, at the charges of the maidens and bachelors of the town. It gave the title of earl to the Stanley family. The Scotch rebels came as far as this town in 1745, and then returned back to Scotland. Derby contains 2170 houses, and 10,832 inhabitants. Lat. 52. 58 N. Lon. 1. 25 W.

DERBYSHIRE, an English county, bounded on the N. by Yorkshire; on the E. by Nottinghamshire; on the S. by Leicestershire and a point of Warwickshire; on the W. by Staffordshire; and on the N.W. by Cheshire. It extends 59 miles in length from N. to S. and 34 from E. to W. where broadest; but in the S. point it is not above six. It is divided into six hundreds, in which are 11 market towns, and 106 parishes. It is seated in the diocese of Lichfield and Coventry, and sends four members to parliament; two for the county, and two for the town of Derby. The air, especially on the E. side, is wholesome and agreeable: but in the mountains of the Peak, towards the N. it is sharp and cold. The N. and W. parts are hilly and stony. The hills in the northern part of the county, by attracting the passing clouds, cause the rain to descend there in greater abundance than on the circumjacent counties. Little timber, or even underwood, grows here, and the fields are universally enclosed by stone walls. This county contains about 1,600,000 acres of land, about one-eighth of which are uncultivated. The number of houses, in 1800, was 33,191, and of inhabitants 161,142. It furnishes 939 men to the national militia. The principal rivers are the Derwent, Dove, Erwash, and Trent.

Derbyshire spar. See Fluor spar.

To DERE. *v. a.* (ꝺeꞃian, Saxon.) To hurt (*Sp.*).

DEREHAM, a town of Norfolk, having a market on Fridays, where great quantities of woollen yarn are sold. Lat. 52. 42 N. Lon. 1. 0 E.

DERELI'CTION. *s.* (*derelictio*, Latin.) An utter forsaking or leaving (*Hooker*).

DERELI'CTS. *s.* pl. (In law.) Goods wilfully thrown away, or relinquished.

DERHAM (William), an English divine and philosopher. He was born at Stoughton, near Worcester, in 1657, and educated at Trinity college, Oxford. On entering into orders he obtained the vicarage of Wargrave, in Berkshire. In 1689 he was presented to the rectory of Upminster, in Essex. Here he devoted himself to philosophical pursuits, became a member of the Royal Society, and contributed largely to the Philosophical Transactions. In 1713 he published his Physico-Theology, being the substance of his Boyle's Lectures, with curious notes; and in 1730 appeared his Astro-Theology, which had also been delivered at the same lecture. In 1716 he was made canon of Windsor, and in 1730 the university of Oxford conferred on him the degree of D.D. He assisted various writers, and published some pieces of Mr. Ray. The last thing he published of his own writing was Christo-Theology, or a Demonstration of the divine Authority of the Christian Religion, 1730. In his younger days he published a treatise, entitled, The Artificial Clockmaker, in 12mo. which has been several times reprinted. He died at Upminster, in 1735.

Dr. Derham had many papers inserted in different volumes of the Phil. Trans. He also edited some works of Dr. Halley's and Dr. Hooke's. He was very exemplary in the discharge of his duties as a parish priest: and being well skilled in medical science, he exerted himself generously as a physician to the bodies as well as the souls of his parishioners.

To DERI'DE. *v. a.* (*derideo*, Lat.) To laugh at; to mock; to turn to ridicule (*Tillotson*).

DERI'DER. *s.* (from the verb.) A mocker; a scoffer (*Hooker*).

DERI'SION. *s.* (*derisio*, Latin.) 1. The act of deriding or laughing at (*Addison*). 2. Contempt; scorn; a laughing stock (*Milton*).

DERI'SIVE. *a.* (from *deride.*) Mocking; scoffing (*Pope*).

DERI'SORY. *a.* (*derisorius*, Lat.) Mocking; ridiculing.

DERI'VABLE. *a.* (from *derive.*) Attainable by right of descent or derivation (*South*).

DERIVA'TION. *s.* (*derivatio*, Latin.) 1. A draining of water (*Burnet*). 2. (In grammar.) The tracing of a word from its original (*Locke*). 3. The transmission of any thing from its source (*Hale*).

Derivation. (*derivatio*, from *derivo*, to drain off). The doctrines of derivation and revulsion, talked of by the ancients, are now wholly exploded, at least in the limited manner in which it was formerly understood. Derivation means the drawing away any disease from its original seat to another part.

DERIVATIONS (Calculus of). See Calculus.

DERI'VATIVE. *a.* (*derivativus*, Latin.) Derived or taken from another (*Hale*).

Deri'vative. *s.* (from the adjective.) The thing or word derived from another (*South*).

DERI'VATIVELY. *ad.* (from *derivative.*) In a derivative manner.

To DERI'VE. *v. a.* (from *derivo*, Latin.). 1. To turn the course of water (*South*). 2. To deduce, as from a principal (*Boyle*). 3. To communicate to another, as from the origin and source (*Hooker*). 4. To receive by transmission (*South*). 5. To communicate to by descent of blood (*Felton*). 6. To spread; to diffuse gradually from one place to another (*Davies*). 7. To trace a word from its origin.

To Deri've. *v. n.* 1. To come from; to owe its origin to (*Prior*). 2. To descend from (*Shakspeare*).

DERI'VER. *s.* (from *derive.*) One that draws or fetches, as from the original.

DERMA. (Δερμα, the skin.) See Cutis.

DERMALOGY. (from δερμα, the skin; and λογος, a treatise.) A treatise on the skin or integumentation. Dermatology.

DERMATODES. (Δερματοειδες; from δερμα, a skin or leather, and ειδος, likeness.) See Duramater.

DERMATOLOGY. Dermatologia. (*dermatologia*, δερματολογια; from δερμα, the true skin, and λογος, a discourse.) A treatise upon the skin.

DERMATO-PATHOLOGIA. (*dermato-pathologia*; from δερμα, the skin, and παθολογια, the pathology.) A treatise on diseases of the skin.

DERMESTES. Leather-eater. In zoology, a genus of the class insecta, order coleoptera. Antennas clavate; the club perfoliate; three of the joints thicker; thorax convex slightly margined; head inflected, and hid under the thorax. The larvas or grubs of this tribe devour dead bodies, skins, leather, and almost any animal substance, and are exceedingly destructive to books and furniture. Eighty-five species; chiefly inhabitants of Europe, and nine of our own country. They may be thus distributed.

A. bifid jaw.

B. one-toothed jaw: the apate of Fabricius.

C. feelers four, clavate, the last joint larger: the colydium-tribe of Fabricius. The following are mostly worthy of remark.

1. D. lardarius: black; shells cinereous on the upper half. Inhabits Europe; and as an insect, is the most common pest of museums, libraries, and preparations of natural history: it is also found in old bacon: the larva is oval and hairy.

2. D. domesticus. Black; shells grey, edged round with black; thorax gibbous, covered with ferruginous down. Inhabits Europe, and is the little insect that makes the round holes in our furniture, reducing it to powder.

3. D. fumatus. Oblong, testaceous, eyes black. Inhabits Europe, on flowers and in houses, and has a great resemblance.

4. D. violaceus. Blueish-black; thorax downy; legs black; being splendid and elegant. Inhabits Europe, and found in dead bodies.

5. D. Surinamensis. Testaceous; thorax crenate; carinate on the back; shells striate, body brownish. Inhabits South America; in flour and meal that have been kept too long. See Nat. Hist. Pl. LXXII.

DERN. *a.* (ꝺeaꞃn, Saxon.) Obsolete. 1. Sad; solitary. 2. Barbarous; cruel.

DERNIE'R. *a.* (French). Last. (*Ayliffe*).

Dernier resort. See Resort.

To DE'ROGATE. *v. a.* (*derogo*, Latin.) 1. To do an act contrary to a law or custom, as to diminish its former extent (*Hale*). 2. To lessen the worth of any person or thing; to disparage.

To De'rogate. *v. n.* 1. To detract; to lessen reputation (*Hooker*). 2. To degenerate; to act beneath one's rank.

De'rogate. *a.* (from the verb.) Degraded; lessened in value (*Shakspeare.*)

DEROGA'TION. *s.* (*derogatio*, Latin.) 1. The act of weakening or restraining a former law or contract (*South*). 2. The act of lessening or taking away the honour of any person or thing (*Hooker*).

DERO'GATIVE. *a.* (*derogativus*, Latin.) Detracting; lessening the honour of (*Brown.*)

DERO'GATORILY. *ad.* (from *derogatory.*) In a detracting manner.

DERO'GATORINESS. *s.* (from *derogatory.*) The act of derogating.

DERO'GATORY. *a.* (*derogatorius*, Lat.) That lessens the honour of (*Bacon*).

DERRIS, in zoology, a genus of the class vermes, order mollusca. Body cylindrical, composed of articulations; mouth terminal; feelers two. One species only; found on the coast of Pembrokeshire: moves by an undulatory motion of the body.

DERRY. See Londonderry.

DERVIS, or Dervich, a name given to a sort of monks among the Turks, who lead a very austere life, and profess extreme poverty, though they are allowed to marry. The word is originally Persian, דרויש, signifying a beggar, or person who has nothing: and because the religious, and particularly the followers of Mevelava, profess not to possess any thing, they call both the religious in general, and the Mevelavites in particular, Dervises or Derviches. The dervises, called also Mevelavites, are a Mahometan order of religious: the chief or founder whereof was one Mevelava. They are now very numerous. Their chief monastery is that near Cogna in Natolia, where the general makes his residence, and where all the assemblies of the order are held; the other houses being all dependent on this, by a privilege granted to this monastery under Ottoman I.

The dervises affect a great deal of modesty, patience, humility, and charity. They always go bare-legged and open-breasted, and frequently burn themselves with hot irons to inure themselves to patience. They always fast on Wednesdays, eating nothing on those days till after sun-set. Tuesdays and Fridays they hold meetings, at which the superior of the house presides. One of them plays all the while on a flute, and the rest dance, turning their bodies round and round with the greatest swiftness imaginable. Long custom to this exercise from their youth has brought them to such a habitude, that it does not discompose them at all. This practice they observe with great strictness, in memory of Mevelava their patriarch's turning miraculously round, as they pretend, for the space of four days, without any food or refreshment; his companion Hamsa playing all the while on a flute: after which he fell into an ecstacy, and therein received wonderful revelations for the establishment of his order. They believe the flute an instrument consecrated by Jacob and the shepherds of the Old Testament, because they sang the praises of God upon it. They profess poverty, chastity, and obedience, and really observe them while they remain dervises; and if they choose to go out and marry, they are always allowed.

The generality of dervises are mountebanks: some apply themselves to legerdemain, postures, &c. to amuse the people; others give in to sorcery and magic: but all of them, contrary to Mahomet's precept, are said to drink wine, brandy, and other strong liquors, to give them the degree of gaiety their order requires. Beside their great saint Mevelava, there are particular saints honoured in some particular monasteries; as Kederele, greatly revered in the monasteries of Egypt, and held by some to be St. George; and by others, with more probability, the prophet Elias. The dervises are great travellers; and, under pretence of preaching, and propagating their faith, are continually passing from one place to another: on which account they have been frequently used as spies.

There are also dervises in Persia, called in that country Abdals, q. d. servants of God. They lead a very penurious, austere life, and preach the Alcoran in the streets, coffee-houses, and wherever they can meet with auditors. The Persian dervises retail little but fables to the people, and are in the utmost contempt among the men of sense and letters. There are in Egypt two or three kinds.

DERWENT, a river which rises in Derbyshire, and falls into the Trent, near Nottingham.

Derwent, a river which rises in the N. Riding of Yorkshire, and running S. falls into that of the Ouse.

Derwent, a river of Cumberland, which falls into the Irish sea, a little below Cockermouth.

Derwent-water, a lake of Cumberland, in the vale of Keswick. It is three miles in length, and a mile and a half wide. Five islands rise out of this lake, which add greatly to the beauty of its appearance. On one of them is an elegant modern-built house.

DESAGULIERS (John Theophilus), an ingenious philosopher, born in 1683 at Rochelle, from whence his father, who was a minister, brought him when an infant to London, on the revocation of the edict of Nantes. He was educated at Christ college, Oxford, where he proceeded to the degree of LL.D. In 1714 he was chosen F.R.S. He was the first person who ever read lectures on experimental philosophy in London, and he had the honour to read them before George II. Frederic prince of Wales, and the rest of the royal family. The duke of Chandos gave him the living of Edgware, and afterwards another in Essex. He was several times grand master of the English free-masons. He died in London, in 1749.

Dr. Desaguliers communicated many curious and valuable papers to the Royal Society, which appear in the Phil. Trans. He translated s'Gravesande's Natural Philosophy, and some other works. He also gave an edition of Gregory's Elements of Catoptrics and Dioptrics; and likewise published a comprehensive and valuable Course of experimental Philosophy, in 2 vols. 4to. Recollecting that this gentleman was much noticed by the learned and the great, and possessed two church livings, we cannot account for the circumstance of his dying in obscurity and indigence: yet such, it would seem, was the case; at least, if we may credit the poet Cawthorne, who speaking of the neglected Desaguliers, asks,

"How he who taught two gracious kings to
view,
All Boyle ennobled, and all Bacon knew,
Died in a cell, without a friend to save,
Without a guinea, and without a grave."

DESART, a large extent of country entirely barren, and producing nothing. The Desart, absolutely so called, is that part of Arabia south of the Holy Land, where the children of Israel wandered forty years.

DESAULT (Peter Joseph), a celebrated French surgeon, was born in Feb. 1744, at Magny Vernois, a village near Lure. He was destined for the church, but his genius led him to the study of the healing art, to which he applied with great avidity. He also paid great attention to mathematics. At the age of 19 he went to Paris, where he gave himself up to such a course as was most likely to produce an excellent surgeon: and his reputation was soon established. In 1779 he invented the bandage now in use for fractures. He succeeded Ferrand as chief surgeon of the Hotel-Dieu in Paris. In 1788 he succeeded in his long projected scheme of establishing a clinical school; and when his lectures commenced, his auditory soon became very numerous. More than 600 from different countries constantly attended, in order to learn a new system, consisting of a simple mode of treatment, disengaged from ancient prejudices, and a complex incoherent practice.

A few of his improvements are here specified. 1. The method of ligature employed by the ancients in the cure of umbilical hernias of children, having been generally omitted in the practice of the moderns, he again introduced and perfected this mode, and demonstrated, by his success, its superiority over compressive bandages. 2. He was one of the first men in France to extract the loose cartilages (cartilages flottans) in joints. 3. He employed a new treatment, that of a methodical compression, in respect to schirrosities of the rectum; in order to which he introduced a candle or bougie, the size of which he gradually augmented. 4. He simplified, and rendered more commodious, the reduction of luxations of the humerus. 5. Fatal experience having pointed out the danger of employing the trepan in wounds of the head, he substituted another method of treatmenr (l'usage de l'émétique) now adopted by many practitioners. 6. He made several very useful improvements on chirurgical instruments: such as those employed in the cases of polypus in the womb and nostrils (la pince à gaîne et des porte-næuds pour la ligature des polypes, &c.); for cutting through obstructions in the different cavities (le kiotomé); and for the fistula in ano. In cases of incision he introduced the use of the instrument (le gorgeret) invented by Marchetti, well known among foreigners, but almost totally neglected in France before this period.

He at the same time retrenched the use of a great number of superfluous ones, and banished all practices attended with greater pain than utility. Avoiding every thing that was complex, he proved that the art of healing, in imitation of nature, ought to be simple in its means, and fruitful in its resources.

In 1791 he published his Journal de Chirurgerie, which was edited by his pupils, and destined to describe the most interesting occurrences in his school, and also extracts from his lectures, which were then dedicated to the investigation of the maladies incident to the urinary passage. This was translated into English by the late Mr. Gosling.

In consequence of an unjust accusation of Chaumette, he was thrown into the horrid prison of the Luxembourg, from which few departed but in the way to the Guillotine: he was, however, liberated at the end of three days.

On the establishment of L'Ecole de Santé, Desault was appointed clinical professor; and for external maladies he soon after obtained from the government the conversion of the Eveché into an hospital for surgical operations. In the midst of these plans, the troubles that occurred in the month of May, 1795, unfortunately affected his mind, and made him dread lest the days of proscription should return. It was in vain that his friends attempted to soothe his sufferings; for on the night of the 29th of May, a malignant fever made its appearance, and a nearly continual delirium ensued until his death, which occurred on the first of June 1795, on which day he breathed his last, in the arms of his pupils, at the age of 51. Th French republic, eager to pay homage to his memory, presented his widow with a pension of 2000 livres per annum. A son, Alexis Mathias Desault, was the sole fruit of his marriage; and he has left but one work behind him, in which the name of his friend Chopart is joined with his own. It is entitled Traité des Maladies Chirurgicales et des Operations qui leur conviennent, 2 vols. 8vo.

DE'SCANT. *s.* (*discanto*, Italian.) 1. A song or tune composed in parts (*Milton*). 2. A discourse; a disputation; a disquisition branched out into several heads (*Shakspeare*).

Descant, in music, the art of composing in several parts. It is of three kinds, namely, plain, figurative, and double. *Plain descant* is the groundwork of all compositions, consisting altogether in the orderly placing of many concords answering to simple counter-point. *Figurative descant* is that wherein discords are concerned as well as concords; and this properly may be denominated the ornament or rhetorical part of music. For in this are introduced all the varieties of points, fuges, syncopes or bindings, diversity of measures, intermixtures of discording sounds, or whatever else art and fancy can exhibit, which set forth and adorn the composition; whence it is named florid or figurative descant. *Double descant* is so called when the parts are so contrived that the treble may be made the bass, and the bass the treble.

To De'scant. *v. n.* 1. To sing in parts. 2. To discourse at large; to make speeches: in censure or contempt (*Milton*).

To DESCE'ND. *v. n.* (*descendo*, Latin.) 1. To come from a higher place to a lower; to fall; to sink (*Matthews*). 2. To come suddenly; to fall upon as from an eminence (*Pope*). 3. To make an invasion (*Dryden*). 4. To proceed as from an original (*Collier*). 5. To fall in order of inheritance to a successor (*Locke*). 6. To extend a discourse from general to particular consideration (*D. of Piety*).

To Desce'nd. *v. a.* To walk downward upon any place (*Milton*).

DESCE'NDANT. *s.* (*descendant*, French.) The offspring of an ancestor (*Bacon*).

DESCE'NDENS. *a.* (*descendens*, Latin.) 1. Falling; sinking; coming down (*Ray*). 2. Proceeding from another, as an original or ancestor (*Pope*).

DESCE'NDIBLE. *a.* (from *descend.*) 1. Such as may be descended. 2. Transmissible by inheritance (*Hale*).

DESCENDING, in music, making a transition from one note to another which is less acute.

Descending latitude, is the latitude of a planet in its return from the nodes to the equator.

DESCE'NSION. *s.* (*descensio*, Latin.) 1. The act of falling or sinking; descent. 2. A declension; a degradation (*Shakspeare*). 3. (In astronomy.) *Right* descension is the arch of the equator, which descends with the sign or star below the horizon of a direct sphere. *Oblique* descension is the arch of the equator, which descends with the sign below the horizon of an oblique sphere.

DESCE'NSIONAL. *a.* (from *descension.*) Relating to descent.

Descensional difference, is the difference between the right and oblique descensions of the same star, or point of the heavens.

DESCENSUS. (*descensus*, from *descendo*, to move downwards). Chemists call it a distillation per descentum, by descent, when the fire is applied at top, and round the vessel, whose orifice is at the bottom.

DESCE'NT. *s.* (*descensus*, Latin.) 1. The act of passing from a higher to a lower place (*Blackmore*). 2. Progress downwards (*Locke*). 3. Obliquity; inclination (*Woodward*). 4. Lowest place (*Shakspeare*). 5. Invasion; hostile entrance (*Clarendon*). 6. Transmission of any thing by succession and inheritance (*Locke*). 7. The state of proceeding from an original or progenitor (*Atterbury*). 8. Birth; extraction; process of lineage (*Shakspeare*). 9. Offspring; inheritors (*Milton*). 10. A single step in the scale of genealogy; a generation (*Hooker*). 11. A rank in the scale of subordination (*Milton*).

Descent, in general, is the tendency, or passage, of a body from a higher to a lower place; thus all bodies, unless otherwise determined by a force superior to their gravity, descend towards the centre of the earth: the planets too may be said to descend from their aphelion to the perihelion of their orbits, as the moon does from the apogee to the perigee. Heavy bodies, meeting with no resistance, descend with an uniformly accelerated motion; for the laws relative to which see Acceleration. See also Deviation, and Inclined plane.

Descent (Line of swiftest). See Curve of quickest descent.

Descent, or Hereditary succession, is the title of which a man on the death of his ancestor acquires his estate by right of representation, as his heir at law: and an estate so descending to the heir is in law called the inheritance.

Descent is of three kinds; by common law, by custom, or by statute. By common law, as where one hath land of inheritance in fee-simple, and dieth without disposing thereof in his life-time, and the land goes to the eldest son and heir of course, being cast upon him by the law.

Descent of fee-simple by custom, is sometimes to all the sons, or to all the brothers (where one brother dieth without issue), as in gavel-kind; sometimes to the youngest son, as in borough English; and sometimes to the eldest daughter, or the youngest, according to the customs of particular places. Descent by statute is of fee-tail, as directed by the statute of Westminster, 2 de donis.

Descent, in genealogy, the order or succession of descendants in a line or family; or their distance from a common progenitor. Thus we say, one descent, two descents, &c.

Descent, in heraldry, is used to express the coming down of any thing from above; as, a lion en descent, is a lion with his head towards the base points, and his heels towards one of the corners of the chief, as if he were leaping down from some high place.

Descent, in fortification, are the holes, vaults, and hollow places made by undermining the ground.

The descent into the moat or ditch is a deep passage made through the esplanade and covert-way, in form of a trench, whereof the upper part is covered with madriers and clays, to secure the besiegers from the enemy's fire. In wet ditches this trench is on a level with the surface of the water, but in dry ones it is sunk as deep as the bottom of the ditch.

To DESCRI'BE. *v. a.* (*describo*, Latin.) 1. To delineate; to mark out: as, a torch waved about the head *describes* a circle. 2. To mark out any thing by the mention of its properties (*Watts*). 3. To distribute into proper heads or divisions (*Joshua*). 4. To define in a lax manner.

DESCRI'BER. *s.* (from *describe.*) He that describes (*Brown*).

DESCRI'ER. *s.* (from the verb.) A discoverer; a detecter (*Crashaw*).

DESCRI'PTION. *s.* (*descriptio*, Latin.) 1. The act of delineating any person or thing by perceptible properties. 2. The sentence or passage in which any thing is described (*Dryden*). 3. A lax definition (*Watts*). 4. The qualities expressed in a description (*Shakspeare*).

To DESCRY'. *v. a.* (*descrier*, French.) 1. To give notice of any thing suddenly discovered: obsolete. 2. To spy out; to examine at a distance (*Shakspeare*). 3. To detect; to find out any thing concealed (*Wotton*). 4. To discover; to perceive by the eye; to see any thing distant or obscure (*Prior*).

Descry'. *s.* (from the verb.) Discovery; thing discovered (*Shakspeare*).

DESEADA, or Desiderada, the first of the Caribbee Islands, discovered by Columbus, in his second voyage, 1494. Lat. 16. 40 N. Lon. 16. 20 W.

Deseada, or Cape Desire, the southern point of the Streights of Magellan, in S. America, at the entrance of the Pacific ocean. Lat. 53. 4 S. Lon. 74. 18 W.

To DE'SECRATE. *v. a.* (*desecro*, Latin.)

To divert from the purpose to which any thing is consecrated (*Salmon*).

DESECRA′TION. *s.* (from *desecrate.*) The abolition of consecration.

DE′SERT. *s.* See Desart.

De′sert. *a.* (*desertus*, Lat.) Wild; waste; solitary; uninhabited (*Locke*).

To Dese′rt. *v. a.* (*deserter*, French.) 1. To forsake; to fall away from; to quit meanly or treacherously (*Dryden*). 2. To leave; to abandon (*Bentley*).

Dese′rt. *s.* (from *deserve.*) 1. Qualities or conduct considered with respect to rewards or punishments; degree of merit or demerit (*Hooker*). 2. Proportional merit; claim to reward (*South*). 3. Excellence; right to reward; virtue (*Shakspeare*).

DESE′RTER. *s.* (from *desert.*) 1. He that has forsaken his cause or his post (*Dryden*). 2. He that leaves the army in which he was enlisted (*Decay of Piety*). 3. He that forsakes another (*Pope*).

Deserter, in a military sense, a soldier who by running away from his regiment or company abandons the service.

A deserter is, by the articles of war, punishable by death, and, after conviction, is hanged at the head of the regiment he formerly belonged to, with his crime written on his breast, and suffered to hang till the army leave that camp, for a terror to others. But the court-martial has a proper discretionary power for the exercise of lenity, whenever such lenity may seem likely to be beneficial to the general discipline.

DESE′RTION. *s.* (from *desert.*) 1. The act of forsaking or abandoning a cause or post (*Rogers*). 2. (In theology.) Spiritual despondency; an opinion that grace is withdrawn (*South*).

DESE′RTLESS. *a.* (from *desert.*) Without merit; without claim to favour (*Dryden*).

To DESE′RVE. *v. a.* (*deservir*, French.) 1. To be worthy of either good or ill (*Hooker*). 2. To be worthy of reward (*South*).

DESE′RVEDLY. *ad.* (from *deserve.*) Worthily; according to desert (*Milton*).

DESE′RVER. *s.* (from *deserve.*) A man who merits rewards (*Wotton*).

DESHACHE, in heraldry, is where a beast has its limbs separated from its body, so that they still remain on the escutcheon, with only a small separation from their natural places.

DESHAIS (John Baptist Henry), a celebrated French painter, born at Rouen in Normandy, in 1729. As early as 1751 he won the first prize of the academy, and became a pupil in the king's school, under Carlo Vanloo. After studying there and at Rome he was elected into the academy. He died in 1765. His principal pictures are those of the marriage of the Virgin, the resurrection of Lazarus, and Joseph and his mistress.

DESI′CCANTS. *s.* (from *desiccate.*) Applications that dry up the flow of sores (*Wise.*).

To DE′SICCATE. *v. a.* (*desicco*, Latin.) 1. To dry up; to exhaust of moisture (*Hale*). 2. To exhale moisture (*Bacon*).

DESICCATION, in chemistry, evaporation to driness, or any other mode by which driness in a substance containing moisture is produced.

DESI′CCATIVE. *a.* (from *desiccate.*) That has the power of drying.

To DESI′DERATE. *v. a.* (*desidero*, Lat.) To want; to miss; to desire in absence (*Cheyne*).

DESIDERATUM, (from *desidero*, I desire,) is used to signify a desirable perfection in any art or science: thus, it is a desideratum with the blacksmith to render iron fusible by a gentle heat, and yet preserve it hard enough for ordinary uses; with the glass-man and looking-glass maker, to render glass malleable; with the clock-maker, to bring pendulums to be useful, where there are irregular motions; with the brazier and copper-smith, to make malleable solder; with the ship-wright, to build vessels that will sail under water; with the diver, to procure manageable instruments for conveying fresh air to the bottom of the sea, sufficient for respiration and the burning of lights: with the assay-master, to melt or copel ores of metals immediately without the use of bellows or furnaces; and with the carvers and joiners, to fashion wood in moulds like plaster of Paris, or burnt alabaster.

To DESI′GN. *v. a.* (*designo*, Lat.; *dessiner*, French.) 1. To purpose; to intend any thing. 2. To form or order with a particular purpose (*Stillingfleet*). 3. To devote intentionally (*Clarendon*). 4. To plan; to project; to form in idea (*Dryden*). 5. To mark out (*Locke*).

Desi′gn. *s.* (from the verb.) 1. An intention; a purpose. 2. A scheme; a plan of action (*Tillotson*). 3. A scheme formed to the detriment of another (*Locke*). 4. The idea which an artist endeavours to execute or express (*Addison*).

In building, we use the term *ichnography*, when by *design* is only meant the plan of a building, or a flat figure drawn on paper. *Orthography*, when some face, or side, of the building is raised from the ground. And *scenography*, when both front and sides are seen in perspective.

Design, in manufactories, expresses the figures with which the workman enriches his stuff, or silk, and which he copies after some painter, or eminent draughtsman, as in diaper, damask, flowered silk, tapestry, and the like.

In undertakings of such kinds of figured stuffs, it is necessary, says M. Savary, that before the first stroke of the shuttle, the whole design be represented on the threads of the warp; we do not mean in colours, but with an infinite number of little packthreads, which, being disposed so as to raise the threads of the warp, let the workmen see, from time to time, what kind of silk is to be put in the eye of the shuttle, for woof. This method of preparing the work is called reading the design and reading the figure, which is performed in the following manner: A paper is provided, considerably broader than the stuff, and of a length proportionate to what is intended to be represented on it. This they divide lengthwise by as many black lines as there are intended threads in the warp; and cross these lines, by others drawn breadthwise, which, with the former, make little equal squares; on the paper thus squared, the draughtsman designs his figures, and heightens them with colours as he sees fit. When the design is finished, a workman reads it, while another lays it on the simblot.

To read the design, is to tell the person who manages the loom the number of squares, or threads, comprised in the space, intimating at the same time whether it is ground or figure. To put what is read on the simblot, is to fasten little strings to the several packthreads, which are to raise the threads named; and thus they continue to do till the whole design is read. Every piece being composed of several repetitions of the same design, when the whole design is drawn, the drawer, to begin the design afresh, has nothing to do but raise the little strings, with slip-knots, to the top of the simblot, which he had let down to the bottom: this he is to repeat as often as is necessary till the whole is manufactured. The ribbon-weavers have likewise a design, but far more simple than that now described. It is drawn on paper, with lines and squares representing the threads of the warp and woof. But instead of lines of which the figures of the former consist, these are constituted of points only, or dots, placed in certain of the little squares, formed by the intersection of the lines. These points mark the threads of the warp that are to be raised, and the spaces left blank denote the threads that are to keep their situation: the rest is managed as in the former.

Design is also used, in painting, for the first idea of a large work, drawn roughly, and in little, with an intention to be executed and finished in large.

DESI′GNABLE. *a.* (*designo*, Lat.) Distinguishable; capable to be particularly marked out (*Digby*).

DESIGNA′TION. *s.* (*designatio*, Latin.) 1. The act of pointing or marking out by some particular token (*Swift*). 2. Appointment; direction (*Bacon*). 3. Import; intention (*Locke*).

DESIGNATOR, a Roman officer, who assigned each person his place and rank in public ceremonies, processions, &c.

DESI′GNEDLY. *ad.* (from *design.*) Purposely; intentionally; not inadvertently (*Ray*).

DESI′GNER. *s.* (from *design.*) 1. One that designs or intends, a purposer. 2. A plotter; a contriver (*Decay of Piety*). 3. One that forms the idea of any thing in painting or sculpture (*Addison*).

DESI′GNING. *part. a.* (from *design.*) Insidious; treacherous; deceitful (*Southern*).

DESI′GNLESS. *a.* (from *design.*) Without design; unknowing; inadvertent.

DESI′GNLESSLY. *ad.* Without intention; ignorantly; inadvertently (*Boyle*).

DESI′GNMENT. *s.* (from *design.*) 1. A purpose and intent (*Glanville*). 2. A scheme of hostility (*Shakspeare*). 3. The idea, or sketch, of a work (*Dryden*).

DESI′RABLE. *a.* (from *desire.*) 1. That is to be wished with earnestness (*Rogers*). 2. Pleasing; delightful (*Addison*).

DESIRE, according to the common acceptation of the term, may be considered as an eager longing for some apparent good, centered in particular objects, situations, or circumstances. This general description comprehends two different acts of the mind concerning such objects, which lord Kaimes expresses thus: "Desire, taken in its proper sense, is that internal act which by influencing the will, makes us proceed to action. Desire, in a lax sense, respects also actions and events that depend not on us; as when I desire that my friend may have a son to represent him; or that my country may flourish in arts and sciences: but such internal act is more properly termed a wish than desire." Though this observation does not fully mark the difference, it plainly indicates that there is one. In the first sense, desire may be defined, as by Dr. Cogan, that uneasy sensation excited in the mind by the view or contemplation of any desirable good, which is not in our possession, which we are solicitous to obtain, and of which the attainment appears at least possible. See Wish.

To Desi′re. *v. a.* (*desirer*, French.) 1. To wish; to long for (*Deuteronomy*). 2. To express wishes; to appear to long (*Dryden*). 3. To ask; to intreat (*Shakspeare*).

DESI′RER. *s.* (from *desire.*) One that is eager of any thing; a wisher (*Shakspeare*).

DESI′ROUS. *a.* (from *desire.*) Full of desire; eager; longing after; wishing for (*Hooker*).

DESI′ROUSLY. *ad.* Eagerly; with desire.

DESI′ROUSNESS. *s.* Fulness of desire.

To DESI′ST. *v. n.* (*desisto*, Lat.) To cease from any thing; to stop (*Milton*).

DESI′STANCE. *s.* (from *desist.*) The act of desisting; cessation (*Boyle*).

DESI′TIVE. *a.* (*desitus*, Lat.) Ending; concluding; final (*Watts*).

DESK. *s.* (*disch*, a table, Dutch.) An inclining table for the use of writers or readers (*Walton*).

DESMOND, in geography, the name of an ancient district of Ireland, which contained part of the present counties of Kerry and Cork.

DE′SOLATE. *a.* (*desolatus*, Lat.) 1. Without inhabitants; uninhabited (*Broome*). 2. Deprived of inhabitants; laid waste (*Jer.*). 3. Solitary; without society.

To De′solate. *v. a.* (*desolo*, Latin.) To deprive of inhabitants; to lay waste (*Thomson*).

DE′SOLATELY. *ad.* In a desolate manner.

DESOLA′TION. *s.* (from *desolate.*) 1. Destruction of inhabitants; reduction to solitude (*Spenser*). 2. Gloominess; sadness; melancholy (*Sidney*). 3. A place wasted and forsaken (*Jeremiah*).

DESPA′IR. *s.* (*desespoir*, French.) 1. Hopelessness; despondence (*Dryden*). 2. That which causes despair; that of which there is no hope (*Shakspeare*). 3. (In theology.) Loss of confidence in the mercy of God (*Spratt*).

Dr. Cogan calls despair a permanent fear of losing some valuable good, of suffering some dreadful evil, or of remaining in a state of actual misery, without any mixture of hope. It generally succeeds to ineffectual efforts, which have been repeatedly made; and of consequence is excited where no means can be devised equal to the magnitude of the supposed evil.

To DESPA′IR. *v. n.* (*despero*, Lat.) To be without hope; to despond (*Wake*).

DESPA′IRER. *s.* (from *despair.*) One without hope (*Dryden*).

DESPA′IRFUL. *a.* (*despair* and *full.*) Hopeless: obsolete (*Sidney*).

DESPA′IRINGLY. *ad.* (from *despairing.*) In a manner betokening hopelessness (*Boyle*).

To DESPA′TCH. *v. a.* (*depescher*, French.) 1. To send away hastily (*Temple*). 2. To send out of the world; to put to death (*Shakspeare*). 3. To perform a business quickly (*Locke*). 4. To conclude an affair with another (*Shakspeare*).

DESPA′TCH. *s.* (from the verb.) 1. Hasty execution (*Granville*). 2. Conduct; management: obsolete (*Shakspeare*). 3. Express; hasty messenger or message.

DESPA′TCHFUL. *a.* (from *despatch.*) Bent on haste (*Pope*).

DE′SPERATE. *a.* (*desperatus*, Latin.) 1. Without hope (*Shakspeare*). 2. Without care of safety; rash (*Hammond*). 3. Irretrievable; unsurmountable; irrecoverable (*Locke*). 4. Mad; hot-brained; furious (*Spenser*).

DE′SPERATELY. *ad.* 1. Furiously; madly (*Brown*). 2. In a great degree; violently (*Addison*).

DE′SPERATENESS. *s.* (from *desperate.*) Madness; fury; precipitance (*Hammond*).

DESPERA′TION. *s.* (from *desperate.*) Hopelessness; despair; despondency (*Hammond*).

DE′SPICABLE. *a.* (*despicabilis*, Lat.) Contemptible; vile; mean; sordid (*Hooker*).

DE′SPICABLENESS. *s.* Meanness; vileness; worthlessness (*Decay of Piety.*)

DE′SPICABLY. *ad.* (from *despicable.*) Meanly; sordidly; vilely (*Addison*).

DESPI′SABLE. *a.* (from *despise.*) Contemptible; despicable; regarded with contempt (*Arbuthnot*).

To DESPI′SE. *v. a.* (*despiser*, old French.) 1. To scorn; to condemn; to slight (*Pope*). 2. To abhor (*Shakspeare*).

DESPI′SER. *s.* (from *despise.*) Contemner; scorner (*Government of the Tongue*).

DESPI′TE. *s.* (*spijt*, Dutch; *depit*, Fr.) 1. Malice; anger; malignity (*Spratt*). 2. Defiance; unsubdued opposition (*Rowe*). 3. Act of malice, or opposition (*Milton*).

To DESPI′TE. *v. a.* (from the noun.) To vex; to offend; to disappoint (*Raleigh*).

DESPI′TEFUL. *a.* (*despite* and *full.*) Malicious; full of spleen (*King Charles*).

DESPI′TEFULLY. *ad.* (from *despiteful.*) Maliciously; malignantly (*Matthew*).

DESPI′TEFULNESS. *s.* (from *despiteful.*) Malice; hate; malignity (*Wisdom*).

DESPI′TEOUS. *a.* (from *despite.*) Malicious; furious: out of use (*Spenser*).

To DESPO′IL. *v. a.* (*despolio*, Latin.) 1. To rob; to deprive (*Spenser*). 2. To divest by any accident (*Woodward*). 3. To strip: not in use (*Spenser*).

DESPOLIA′TION. *s.* (from *despolio*, Lat.) The act of despoiling or stripping.

To DESPO′ND. *v. n.* (*despondeo*, Lat.) 1. To despair; to lose hope (*Dryden*). 2. (In theology.) To lose hope of the divine mercy (*Watts*).

DESPO′NDENCY. *s.* (from *despondent.*) Despair; hopelessness; desperation.

DESPO′NDENT. *a.* (*despondens*, Latin.) Despairing; hopeless (*Bentley*).

To DESPO′NSATE. *v. a.* (*desponso*, Lat.) To betroth; to affiance.

DESPONSA′TION. *s.* (from *desponsate.*) The betrothing persons to each other.

DE′SPOT. *s.* (δεσποτης.) An absolute prince; one that governs with unlimited authority.

The word, in its first origin, signified the same with the Latin *herus*, and the English *master:* but in time it underwent the same fate on medals, as, among the Latins, Cæsar did with regard to Augustus: ΒΑϹΙΛΕΥϹ answering to Augustus, and ΔΕϹΠΟΤΗϹ, *despotes*, to Cæsar. Thus, Nicephorus having ordered his son Stauracius to be crowned, the son, out of respect, would only take the name ΔΕϹΠΟΤΗϹ, leaving to his father that of ΒΑϹΙΛΕΥϹ. For it is to be noted, that it was just about the time that the emperors began to cease to use Latin inscriptions. This delicacy, however, did not last long; for the following emperors preferred the quality of ΔΕϹΠΟΤΗϹ to that of ΒΑϹΙΛΕΥϹ, particularly Constantine, Michael Ducas, Nicephorus Botoniates, Romanus Diogenes, the Comnenii, and some others. In imitation of the princes, the princesses likewise asumed the title of ΔΕϹΠΟΙΝΑ. It was the emperor Alexius, surnamed the angel, that created the dignity of despot, and made it the first after that of emperor, above that of Augustus or Sebastocrator and Cæsar.

DESPO′TICAL. DESPO′TICK. *a.* (from *despot.*) Absolute in power; unlimited in authority; arbitrary (*South*).

DESPO′TICALNESS. *s.* (from *despotical.*) Absolute authority.

DE′SPOTISM. *s.* (*despotisme*, French; from *despot.*) Absolute power.

To DESPU′MATE. *v. n.* (*despumo*, Latin.) To throw off parts in foam; to froth.

DESPUMA′TION. (*despumatio*, from *despumo*, to clarify.) The clarifying of any liquor, by throwing up its foulness in a froth, and removing it.

DESQUAMA′TION. (*desquamatio*, from *desquamo*, to scale off.) The falling off of the cuticle or skin, in the form of small scales.

DESSAU, or DESSAW, a town of Upper Saxony, in Germany, and province of Anhalt; it is subject to its own prince. Lat. 51. 53 N. Lon. 12. 22 E.

DESSE'RT. *s.* (*desserte*, French.) The last course at an entertainment (*King*).

To DE'STINATE. *v. a.* (*destino*, Lat.) To design for any particular end (*Ray*).

DESTINA'TION. *s.* (from *destinate.*) The purpose for which any thing is appointed; the ultimate design (*Hale*).

To DE'STINE. *v. a.* (*destino*, Latin.) 1. To doom; to appoint unalterably to any state or condition (*Milton*). 2. To appoint to any use or purpose (*Arbuthnot*). 3. To devote; to doom to punishment or misery (*Prior*). 4. To fix unalterably (*Prior*).

DESTINIES. In mythology. See PARCÆ.

DE'STINY. *s.* (*destinée*, French.) 1. The power that spins the life, and determines the fate, of living beings (*Shakspeare*). 2. Fate; invincible necessity (*Denham*). 3. Doom; condition in future time (*Shakspeare*).

DE'STITUTE. *a.* (*destitutus*, Latin.) 1. Forsaken; abandoned (*Hooker*). 2. Abject; friendless (*Psalms*). 3. In want of (*Dryden*).

DESTITU'TION. *s.* (from *destitute.*) Want; the state in which something is wanted (*Hooker*).

To DESTRO'Y. *v. a.* (*destruo*, Latin.) 1. To overturn a city; to raze a building to ruin (*Genesis*). 2. To lay waste; to make desolate (*Knolles*). 3. To kill (*Hale*). 4. To put an end to; to bring to nought (*Bentley*).

DESTRO'YER. *s.* (from *destroy.*) The person that destroys; a murderer (*Raleigh*).

DESTRU'CTIBLE. *a.* (from *destruo*, Lat.) Liable to destruction.

DESTRUCTIBI'LITY. *s.* (from *destructible.*) Liableness to destruction.

DESTRU'CTION. *s.* (*destructio*, Lat.) 1. The act of destroying; subversion. 2. Murder; massacre (*Waller*). 3. The state of being destroyed; ruin (*Shakspeare*). 4. A destroyer; a depopulator (*Psalms*). 5. (In theology.) Eternal death (*Matthew*).

DESTRU'CTIVE. *a.* (*destructivus*, low Lat.) That has the quality of destroying; wasteful; causing ruin and devastation (*Dryden*).

DESTRU'CTIVELY. *ad.* Ruinously; mischievously; with power to destroy (*Decay of Piety*).

DESTRU'CTIVENESS. *s.* (from *destructive.*) The quality of destroying or ruining (*Decay of Piety*).

DESTRU'CTOR. *s.* (from *destroy.*) Destroyer; consumer (*Boyle*).

DESUDA'TION. *s.* (*desudatio*, Latin.) A profuse and inordinate sweating.

DE'SUETUDE. *s.* (*desuetudo*, Lat.) Cessation from being accustomed; discontinuance of practice or habit (*Hale*).

DESULTOR, in antiquity, a vaulter or leaper, who, leading one horse by the bridle, and riding another, jumped from the back of one to the other, as the custom was after they had run several courses or heats. Eustathius, on Homer's Iliad, lib. iv. assures us, that instead of two, they had sometimes four or six horses all abreast, and would jump from the first to the fourth or sixth, which was the master piece of their art.

DESULTO'RIOUS. DE'SULTORY. *a.* (*desultorius*, Latin.) Removing from thing to thing; unsettled; immethodical (*Norris*).

To DESU'ME. *v. a.* (*desumo*, Lat.) To take from any thing; to borrow (*Hale*).

To DETA'CH. *v. a.* (*detacher*, French.) 1. To separate; to disengage (*Woodward*). 2. To send out part of a great body of men on an expedition (*Addison*).

DETACHMENT, in military affairs, a certain number of soldiers drawn out from several regiments or companies equally, to be employed as the general thinks proper, whether on an attack, at a siege, or in parties to scour the country.

A detachment of two or three thousand men is a command for a brigadier; eight hundred for a colonel; four or five hundred for a lieutenant-colonel. A captain never marches on a detachment with less than fifty men, a lieutenant, an ensign, and two serjeants. A lieutenant is allowed thirty and a serjeant; and a serjeant ten or twelve men. Detachments are sometimes made of intire squadrons and battalions.

DETACHMENT, in naval affairs, is a certain number of ships of a fleet or squadron, chosen by an admiral or commodore from the others to execute some particular service.

DETA'CHMENT. *s.* (from *detach.*) A body of troops sent out from the main army (*Blackmore*).

To DETA'IL. *v. a.* (*detailler*, French.) To relate particularly; to particularize (*Cheyne*).

DETA'IL. *s.* (*detail*, French.) A minute and particular account (*Woodward*).

To DETA'IN. *v. a.* (*detineo*, Latin.) 1. To keep what belongs to another (*Taylor*). 2. To withhold; to keep back (*Broome*). 3. To restrain from departure (*Judges*). 4. To hold in custody.

DETA'INDER. *s.* (from *detain.*) The name of a writ for holding one in custody.

DETA'INER. *s.* (from *detain.*) He that holds back any one's right; he that detains.

To DETE'CT. *v. a.* (*detectus*, Latin.) To discover; to find out any crime or artifice (*Shakspeare*).

DETE'CTER. *s.* (from *detect.*) A discoverer; one that finds out what another desires to hide (*Decay of Piety*).

DETE'CTION. *s.* (from *detect.*) 1. Discovery of guilt or fraud (*Spratt*). 2. Discovery of any thing hidden (*Woodward*).

DETENTS, in clock-work, are those stops, which, by being lifted up or let down, lock or unlock the clock in striking.

DETENT WHEEL, or HOOP WHEEL, in a clock, that wheel which has a hoop almost round it, wherein there is a vacancy at which the clock locks.

DETE'NTION. *s.* (from *detain.*) 1. The act of keeping what belongs to another (*Shakspeare*). 2. Confinement; restraint (*Bacon*).

To DETE'R. *v. a.* (*deterreo*, Lat.) To discourage by terrour; to fright from any thing (*Tillotson*).

To DETE′RGE. *v. a.* (*detergo*, Latin.) To cleanse a sore (*Wiseman*).

DETE′RGENT. *a.* (from *deterge.*) That has the power of cleansing (*Arbuthnot*).

DETE′RGENTS. (*detergentia, medicamenta*, from *detergo*, to wipe off.) Those applications are so termed by surgeons, which possess the property of cleansing foul ulcers.

DETERIORA′TION. *s.* (from *deterior*, Lat.) The act of making any thing worse.

DETE′RMENT. *s.* (from *deter.*) Cause of discouragement (*Boyle*).

DETE′RMINABLE. *a.* (from *determine.*) That may be certainly decided (*Boyle*).

To DETE′RMINATE. *v. a.* (*determiner*, French.) To limit; to fix: not in use (*Shakspeare*).

Dete′rminate. *a.* (*determinatus*, Latin.) 1. Definite; determined (*Bentley*). 2. Established; settled by rule (*Hooker*). 3. Decisive; conclusive (*Shakspeare*). 4. Fixed; resolute (*Sidney*). 5. Resolved (*Shakspeare*).

Determinate number. See Number.

Determinate problem, is that which has but one solution, or a certain limited number of solutions; in contradistinction to an indeterminate problem, which admits of infinite solutions.

Such, for instance, is the problem, to form an isosceles triangle on a given line, so that each of the angles at the base shall be double of that at the vertex; which has only one solution: or this, to find an isosceles triangle whose area and perimeter are given; which admits of two solutions.

Determinate section, the name of a Tract, or General Problem, written by the ancient geometrician Apollonius. None of this work has come down to us, excepting some extracts and an account of it by Pappus, in the preface to the seventh book of his Mathematical Collections. He there says that the general problem was, "To cut an infinite right line in one point, so that of the segments contained between the point of section sought, and given points in the said line, either the square on one of them, or the rectangle contained by two of them, may have a given ratio, either to the rectangle contained by one of them and a given line, or to the rectangle contained by two of them."

Pappus farther informs us, that this Tract of Apollonius was divided into two books; that the first book contained six problems, and the second three; that the six problems of the first book contained sixteen epitagmas, or cases, respecting the dispositions of the points; and the second book nine. Farther, that of the epitagmas of the six problems of the first book, four were maxima, and one a minimum: that the maxima are at the second epitagma of the second problem, at the third of the fourth, the third of the fifth, and the third of the sixth; but that the minimum was at the third epitagma of the third problem. Also, that the second book contained three determinations; of which the third epitagma of the first problem, and the third of the second were minima, and the third of the third a maximum. Moreover, that the first book had twenty-seven lemmas, and the second book twenty-four; and, lastly, that both books contained eighty-three theorems.

From such account of the contents of this Tract, and the lemmas also given by Pappus, several persons have attempted to restore, or recompose, what they thought might be nearly the form of Apollonius's tract, or the subject of each problem, case, determination, &c.; among whom are Snellius, an eminent Dutch mathematician of the last century; a translation of whose work was published in English by Mr. John Lawson, in 1772, together with a new restoration of the whole work by his friend Mr. William Wales.

DETE′RMINATELY. *ad.* 1. Resolutely; with fixed resolve (*Sidney*). 2. Certainly; unchangeably (*Tillotson*).

DETERMINA′TION. *s.* (from *determinate.*) 1. Absolute direction to a certain end (*Locke*). 2. The result of deliberation (*Calamy*). 3. Judicial decision (*Swift*).

DETE′RMINATIVE. *a.* (from *determinate.*) 1. That uncontrollably directs to a certain end (*Bramhall*). 2. That makes a limitation (*Watts*).

DETE′RMINATOR. *s.* (from *determine.*) One who determines (*Brown*).

To DETE′RMINE. *v. a.* (*determiner*, Fr.) 1. To fix; to settle (*Shakspeare*). 2. To conclude; to fix ultimately (*South*). 3. To bound; to confine (*Atterbury*). 4. To adjust; to limit; to define (*Locke*). 5. To influence the choice (*Locke*). 6. To resolve (*Samuel*). 7. To decide (*Locke*). 8. To put an end to; to destroy (*Shakspeare*).

To Dete′rmine. *v. n.* 1. To conclude; to form a final conclusion. 2. To settle opinion (*Locke*). 3. To end; to come to an end (*Hayward*). 4. To make a decision (*Shakspeare*). 5. To end consequentially (*Temple*). 6. To resolve concerning any thing (*Shakspeare*).

DETERRA′TION. *s.* (*de* and *terra*, Lat.) Discovery of any thing by removal of the earth; the act of unburying (*Woodward*).

DETE′RSION. *s.* (from *detergo*, Lat.) The act of cleansing a sore (*Wiseman*).

DETE′RSIVE. *a.* (from *deterge.*) Having the power to cleanse.

Dete′rsive. *s.* An application that has the power of cleansing wounds (*Wiseman*). See Detergent.

DETERSOR. (from *detergo*, I clear away.) In antiquity, a servant who cleared the tables after meals.

To DETE′ST. *v. a.* (*detestor*, Latin.) To hate; to abhor; to abominate (*South*).

DETE′STABLE. *a.* (from *detest.*) Hateful; abominable; odious (*Hayward*).

DETE′STABLY. *ad.* Hatefully; abominably; odiously (*South*).

DETESTA′TION. *s.* (from *detest.*) Hatred; abhorrence; abomination (*Sidney*).

DETE′STER. *s.* (from *detest.*) One that hates.

To DETHRO′NE. *v. a.* (*detroner*, French.) To divest of regality; to throw down from the throne; to deprive of regal dignity.

DETINUE, in law, is a writ which lies where any man comes to goods or chattels either by delivery or by finding, and refuseth to redeliver them; and it lies only for the detaining, when the detaining was lawful. In this writ the plaintiff shall recover the thing detained; and therefore it must be so certain, as that it may be specifically known. Therefore it cannot be brought for money, corn, or the like, for that cannot be known from other money or corn, unless it be in a bag or sack, for then it may be distinguishably marked.

In order, therefore, to ground an action of detinue, which is only for the detaining, these points are necessary: 1. That the defendants came lawfully by the goods, as either by delivery to him, or finding them. 2. That the plaintiff have a property. 3. That the goods themselves be of value. And 4. That they be ascertained in point of identity. Upon this, the jury, if they find for the plaintiff, assess the respective values of the several parcels detained, and also damages for the detension, and the judgment is conditional, that the plaintiff recover the said goods, (or if they cannot be had) their respective values, and also the damages for detaining them.

DETONATING JAR. It is frequently necessary in the analysis of some gasses, to take the electric spark on given quantities in close vessels, such as mixtures of oxygen and hydrogen, which last forms the eudiometer of Volta, and bears his name. It consists of a thick glass tube quite open at bottom, and near the top are two perforations, in which small wires are cemented, that approach each other within the jar near enough to communicate the electric spark from an adjoining machine, whereby the inclosed gasses are fired. In most cases it is used with mixtures of gasses that detonate strongly when fired, which is attended with some inconveniences. If the jar in which the experiment is fired be closely stopped, a very small quantity of hydrogen and oxygen will burst pretty thick glass; and if it be entirely open, so that all the force of the explosion may be spent on the liquid in which the lower end is immersed, a good deal of it (especially if it be quicksilver) is thrown out and dispersed to a distance. These inconveniences are entirely remedied by the detonating jar, described here as invented by Mr. Pepys, in which the jar is supported by a heavy iron stand, which has a strong spring near the foot, that draws out in the manner of the steel-yard, when the concussion is given; and thus much larger quantities may be safely detonated than can be done by the common apparatus, without spilling any of the quicksilver.

DETONA′TION. (*detonatio*, from *detono*, to make a noise.) The noise produced by the explosion of nitre, or substances containing nitre, when heated, which is greater or less, according to the manner and quantity of the composition, the sudden or gradual application of the heat, the coolness of the vessels, &c.

To DE′TONIZE. *v. a.* (from *detono*, Lat.) To calcine with detonation (*Arbuthnot*).

To DETO′RT. *v. a.* (*detortus*, Latin.) To wrest from the original import (*Dryden*).

To DETRA′CT. *v. a.* (*detractum*, Latin.) 1. To derogate; to take away by envy, calumny, or censure (*Bacon*). 2. To take away; to withdraw (*Boyle*).

DETRA′CTER. *s.* (from *detract.*) One that takes away another's reputation (*Swift*).

DETRA′CTION. *s.* (*detractio*, Lat.) The withdrawing or taking off from a thing; the impairing or lessening a man in point of fame (*Ayliffe*).

DETRA′CTORY. *a.* (from *detract.*) Defamatory by denial of desert; derogatory (*Brown*).

DETRA′CTRESS. *s.* (from *detract.*) A censorious woman (*Addison*).

DETRAHENS QUADRATUS. See PLATYSMA MYOIDES.

DETRANCHE, in heraldry, a line bendwise, proceeding always from the dexter side, but not from the very angle, diagonally athwart the shield.

DE′TRIMENT. *s.* (*detrimentum*, Latin.) Loss; damage; mischief; harm (*Evelyn*).

DETRIME′NTAL. *a.* (from *detriment.*) Mischievous; harmful; causing loss (*Addison*).

DETRI′TION. *s.* (*detero*, *detritus*, Latin.) The act of wearing away.

To DETRU′DE. *v. a.* (*detrudo*, Latin.) To thrust down; to force into a lower place (*Davies*).

To DETRU′NCATE. *v. a.* (*detrunco*, Lat.) To lop; to cut; to shorten.

DETRUNCA′TION. *s.* (from *detruncate.*) The act of lopping or cutting.

DETRU′SION. *s.* (*detrusio*, Lat.) The act of thrusting or forcing down (*Keil*).

DETRUSOR URINÆ. The muscular coat of the urinary bladder was formerly so called.

DETTINGEN, a village of the circle of the Upper Rhine, in Germany. The Austrians and English repulsed the French in 1743, at this place. It is four miles W. of Aschaffenburg. Lat. 49. 55 N. Lon. 9. 5 E.

DETURBA′TION. *s.* (*deturbo*, Lat.) The act of throwing down; degradation.

DEVASTA′TION. *s.* (*devasto*, Latin.) Waste; havock; desolation; destruction (*Garth*).

DEUCALION, in mythology, was the son of Prometheus, who married Pyrrha, the daughter of Epimetheus. Some have supposed that Deucalion, whom the Greeks have represented under a variety of characters, and concerning whom their poets have given many fabulous accounts, was the same with the patriarch Noah; and that Deucalion's flood in Thessaly, as well as that of Ogyges in Attica, and of Prometheus in Egypt, were the same with that of Noah, recorded in Scripture. Diodorus Siculus expressly says, that in the deluge which happened in the time of Deucalion, almost all flesh died. Apollodorus having mentioned Deucalion εν-λαρνακί, consigned to an ark, takes notice, upon his quitting it, of his offering up an immediate sacrifice, Διϊ φυξιω, to the God who delivered him. As he was the father of all mankind, the ancients have given him great dignity and universal monarchy; though sometimes he is reduced to a petty king of Thessaly. Apollonius Rhodius makes him a native of Greece, and the son of Prometheus. We may learn, however, from their confused history, that the person represented was the first of men, through whom religious rites were renewed, cities built, and civil polity established in the world: none of which circumstances are applicable to any king of Greece. Philo assures us, that the Grecians call the person Deucalion, but the Chaldæans style him Noe, in whose time there happened the great eruption of waters. But as Lucian has given us the most particular history of the deluge, and that which comes nearest to the account given by Moses; and as he was a native of Samosata, a city of Commagene upon the Euphrates, a part of the world where memorials of the deluge were particularly preserved, and where an obvious reference to that history may be observed in the rites and worship of the country, we shall here give an extract from what he says on the subject.

Having described Noah under the name of Deucalion, he says that the present race of mankind are different from the men who first existed; for those of the antediluvian world were all destroyed. The present world is peopled from the sons of Deucalion; having increased to so great a number from one person. In respect to the former brood, they were men of violence, and lawless in their dealings. They regarded not oaths, nor observed the rites of hospitality, nor shewed mercy to those who sued for it. On this account they were doomed to destruction; and for this purpose there was a mighty eruption of waters from the earth, attended with heavy showers from above; so that the rivers swelled, and the sea overflowed, till the whole earth was covered with a flood, and all flesh drowned. Deucalion alone was preserved to repeople the world. This mercy was shewn to him on account of his justice and piety. His preservation was effected in this manner: he put all his family, both his sons and their wives, into a vast ark which he had provided, and he went into it himself. At the same time animals of every species, boars, horses, lions, serpents, whatever lived upon the face of the earth, followed him by pairs; all which he received into the ark, and experienced no evil from them; for there prevailed a wonderful harmony throughout by the immediate influence of the Deity. Thus were they wafted with him, as long as the flood endured.

After this he proceeds to mention, that upon the disappearing of the waters, Deucalion went forth from the ark, and raised an altar to God. Diod. Sic. lib. i. p. 10. Apollod. lib. i. p. 20. Apollon. Rhod. lib. iii. v. 1085. Philo Jud. de Præmeo & Pœna, vol. ii. p. 412. Lucian de Deâ Syriâ, vol. ii. p. 882. Ovid Metamorp. i. 260, 320, &c.

Dr. Bryant produces a variety of monuments, that bear an obvious reference to the deluge, in the Gentile History, besides this account of Deucalion and his flood. Analysis of Ancient Mythology, vol. ii. p. 193—250.

DEUCE. *s.* (*deux*, French.) Two (*Shakspeare*).

To DEVE'LOP. *v. a.* (*developer*, French.) To disengage from something that enfolds and conceals; to disentangle (*Pope*).

DEVENTER, a city of the United Provinces, the capital of Overyssel, with a university. Lat. 52. 18 N. Lon. 5. 56 E.

DEVEREUX (Robert), earl of Essex, the son of Walter Devereux, viscount Hereford, was born at Netherwood, in Herefordshire, in the year 1567. He succeeded to the title of earl of Essex at ten years of age; and about two years after was sent, by his guardian lord Burleigh, to Trinity-college in Cambridge. He took the degree of master of arts in 1582, and soon after retired to his seat at Lampsie, in South Wales. He did not, however, continue long in this retreat; for we find him, in his seventeenth year, at the court of queen Elizabeth, who immediately honoured him with singular marks of her favour. Authors seem very unnecessarily perplexed to account for this young earl's gracious reception at the court of Elizabeth. The reasons are obvious: he was her relation, the son of one of her most faithful servants, the son-in-law of her favourite Leicester, and a very handsome and accomplished youth. Towards the end of (the following year) 1585, he attended the earl of Leicester to Holland; and gave signal proofs of his personal courage during the campaign of 1586, particularly at the battle of Zutphen, where the gallant Sidney was mortally wounded. On this occasion the earl of Leicester conferred on him the honour of knight banneret. After this period he rose rapidly in royal favour; and this elevation naturally affected the young earl, so that he grew petulant and vain; it also very naturally produced enemies and rivals in other courtiers of that day: after many artful contrivances, related in the histories of the reign of Elizabeth, but too numerous to detail here, they at length completely effected his ruin. Being of a haughty disdainful spirit, he could ill brook some slights which he received from the queen; but hastily and angrily made use of some unjustifiable expressions respecting her majesty. His enemies having intelligence of all his actions and speeches, sent for him to attend the council, which he refused, and began to arm in his own defence. Some blood was shed before he surrendered, upon which he was made close prisoner, arraigned before his peers, and sentenced to be beheaded, which was executed February 25, 1601.

DEVE'RGENCE. *s.* (*devergentia*, Latin.) Declivity; declination.

To DEVE'ST. *v. a.* (*devester*, French.) 1. To strip; to deprive of clothes (*Denham*). 2. To take away any thing good (*Bacon*). 3. To free from any thing bad (*Prior*).

DEVE'X. *a.* (*devexus*, Latin.) Bending down; declivous; incurvated downward.

DEVE'XITY. *s.* (from *devex.*) Incurvation downward; declivity.

To DE'VIATE. *v. n.* (*de via decedere*, Lat.) 1. To wander from the right or common way (*Pope*). 2. To go astray; to err; to sin; to offend.

DEVIA'TION. *s.* (from *deviate.*) 1. The act of quitting the right way; errour; wandering (*Cheyne*). 2. Variation from established rule (*Holder*). 3. Offence; obliquity of conduct (*Clarissa*).

DEVIATION, in the old astronomy, a motion of the deferent, either toward or from the ecliptic.

DEVIATION OF A FALLING BODY, from the vertical line, is a necessary consequence of the earth's rotation. To comprehend the reason of this phenomenon, imagine a heavy body placed at a considerable distance from the surface of the earth, at the summit of a high tower, for example. If the earth be immoveable, the body suffered to descend from the top will fall at the foot of the tower, according to the vertical direction; but if the earth turn on its axis, the body which participates in that motion will have a velocity of rotation greater than the bottom of the tower, because it is farther from the axis. Hence, when it descends with the motion compounded of that velocity, and the one produced by gravity, it will deviate a little from the vertical in the direction of the earth's motion, and consequently after its fall, it will be found a little to the eastward of the tower. This is confirmed by experience.

M. Guglielmini was the first who called the attention of philosophers to this subject. On causing heavy bodies to fall from an altitude of 241 feet, he found a deviation of eight lines towards the east of the vertical. M. Benzenberg, professor of physics and astronomy at Dusseldorp, made 28 experiments with balls well turned and polished, which were made to fall from a height of 262 French feet: at a medium they produced five lines of deviation towards the east, according to the determination of the plumb-line, and the theory gives four lines six-tenths. The last experiments made at Bologna, by M. Guglielmi, gave nearly the same results: yet so many are the causes that may destroy the accuracy of the experiments, and so trifling the deviation required by the theory, that we confess we are not inclined to lay much stress upon the results of these philosophers. Of the truth of the theoretic investigations, however, there can be no doubt: we shall, therefore, give here M. Laplace's ultimate theorem. Let h be the height from which the body falls, g = double the space gravity causes a body to descend in the first second from quiescence, n = the angle of the earth's rotation in the same time, at the rate of $360^\circ \div 0{\cdot}99727$ in a day, and θ = the colatitude of the place, and Δ = the deviation towards the east: then, we have $\Delta = \frac{2}{3} nh \sin. \theta \sqrt{\frac{2h}{g}}$. (*Bulletin des Sciences*, No. 75.)

DEVI'CE. *s.* (*devise*, French.) 1. A contrivance; a stratagem (*Atterbury*). 2. A design; a scheme formed; project; speculation (*Hooker*). 3. The emblem on a shield (*Prior*). 4. Invention; genius (*Shakspeare*).

DEVIL. (*Diabolus*), an evil angel, one of those celestial spirits who were cast down from heaven for pretending to equal themselves with God. There is no mention of the word devil in the Old Testament, but only of the word Satan and Belial: nor do we meet with it in any heathen authors, in the sense in which it is taken among Christians, that is, as a creature revolted from God. Their theology went no farther than to evil genii or dæmons. Some of the American idolaters have a notion of two collateral independent beings, one of whom is good, and the other evil; which last they imagine has the direction and superintendance of this earth, for which reason they chiefly worship him; whence those that give us an account of the religion of these savages give out, with some impropriety, that they worship the devil. The Chaldeans, in like manner, believed both a good principle and an evil one; which last they imagined was an enemy to mankind. Isaiah, speaking, according to some commentators, of the fall of the devil, calls him Lucifer, from his former elevation and state of glory: but others explain this passage of Isaiah in reference to the king of Babylon, who had been precipitated from his throne and glory. The Arabians call Lucifer, Eblis; which some think is only a diminutive or corruption of the word Diabolus.

The Greek word Διαβολος, meaning primarily an accuser or slanderer, is, according to Parkhurst, applied to the devil, because he originally accused or slandered God in Paradise, as averse to the increase of man's knowledge and happiness (see Gen. iii. 5. John viii. 44.), and still slanders him by false and blasphemous suggestions; and because, on the other hand, he is the accuser of our brethren, which "accuseth them before our God day and night," Rev. xii. 9, 10. (Comp. Job i. 6.); whence also he is called our adversary, αντιδικος, 1 Pet. v. 8. Farther, Διαβολος is used either for the prince of the evil spirits, as in Mat. iv. 1. Rev. xii. 9. xx. 2.; or, for those evil spirits in general. And Christ calls Judas Διαβολος, John vi. 70, because under the influence of that malignant spirit, he would turn his accuser and betrayer.

By this same Greek word, the LXX constantly render the Hebrew שטן, when meaning Satan or the devil (see Job, ch. i. ii.), and from them no doubt it is that the writers of the New Testament have so commonly used it in that sense, in which it likewise occurs, Wisd. ii. 24.

DEVIL'S DUNG. See ASSAFŒTIDA.

DEVIL-IN-A-BUSH. In botany. See NIGELLA.

DEVIL'S BIT. See SCABIOSA.

DE'VILISH. *a.* (from *devil.*) 1. Partaking of the qualities of the devil; diabolical; mischievous (*Sidney*). 2. An epithet of abhorrence or contempt (*Shakspeare*).

DE′VILISHLY. *ad.* In a manner suiting the devil; diabolically (*South*).

DE′VIOUS. *a.* (*devius*, Lat.) 1. Out of the common track (*Holder*). 2. Wandering; roving; rambling (*Thomson*). 3. Erring; going astray from rectitude (*Rowe*).

To DEVI′SE. *v. a.* (*deviser*, French.) To contrive; to form by art; to invent (*Peacham*).

To Devise. *v. n.* To consider; to contrive.

Devise, or Device, in heraldry, painting, and sculpture, any emblem used to represent a certain family, person, action, or quality; with a suitable motto, applied in a figurative sense.

Devise, in law, the act whereby a person bequeaths his lands or tenements to another, by his last will and testament. The person who makes this act is called the devisor, and he in whose favour the act is made is termed in law the devisee.

To Devi′se. *v. n.* (from the noun.) To grant by will.

DEVI′SER. *s.* (from *devise.*) A contriver; an inventer (*Grew*).

DEVI′SOUR. *s.* (from *devise.*) He that gives by will.

DE′VITABLE. *a.* (*devitabilis*, Lat.) Possible to be avoided; avoidable.

DEVITA′TION. *s.* (*devitatio*, Lat.) The act of escaping or avoiding.

DEVIZES, a borough in Wiltshire, with a market on Thursday, and a manufacture of serges, and other woollen stuffs. It contains 1593 houses, 7910 inhabitants, and sends two members to parliament. Lat. 51. 20 N. Lon. 2. 2 W.

DEVO′ID. *a.* (*vuide*, Fr.) 1. Empty; vacant; void (*Spenser*). 2. Without any thing; free from (*Dryden*).

DEVO′IR. *s.* (*devoir*, French.) 1. Service: not in use (*Knolles*). 2. Act of civility or obsequiousness (*Pope*).

To DEVO′LVE. *v. a.* (*devolvo*, Lat.) 1. To roll down (*Thomson*). 2. To move from one hand to another (*Addison*).

To Devo′lve. *v. n.* To fall in succession into new hands (*Decay of Piety*).

DEVOLU′TION. *s.* (*devolutio*, Latin.) 1. The act of rolling down (*Woodward*). 2. Removal successive from hand to hand.

DEVONSHIRE, a county of England, bounded on the south by the English channel, on the north by the Bristol channel, on the east by Somersetshire, and on the west by Cornwall. It is about 69 miles long, and 66 broad. The soil is various; in the western parts of the county it is coarse and moorish, bad for sheep, but proper for black cattle. The southern parts have plenty of grass and corn, and may be called the garden of Devonshire: but in the north and west the land is more over-run with hills and moors. The county in general is well watered with rivers and brooks, which abound with fish, and the sea produces herrings and pilchards, which are of great advantage for home consumption, and for exportation abroad. There are chalybeate and other mineral waters.

Devonshire contains about 775,000 acres of land, nearly 300,000 of which are uncultivated, including woodlands. It lies in the diocese of Exeter; contains 33 hundreds, 1 city, 37 market towns, 394 parishes, 61,190 houses, 396,100 inhabitants, and sends 26 members to parliament. The principal rivers are the Tamar, Ex, Teigne, and Dart. Exeter is the chief town. This county furnishes 1512 men to the national militia.

DEVONSHIRING, in agriculture, a name formerly applied to the process of paring and burning.

DEVORA′TION. *s.* (from *devoro*, Latin.) The act of devouring.

To DEVO′TE. *v. a.* (*devotus*, Lat.) 1. To dedicate; to consecrate (*Shakspeare*). 2. To addict; as to a sect, or study (*Watts*). 3. To condemn; to resign to ill (*Pope*). 4. To addict; to give up to ill (*Grew*). 5. To curse; to execrate (*Dryden*).

DEVO′TEDNESS. *s.* (from *devote.*) The state of being devoted or dedicated (*Boyle*).

DEVOTE′E. *s.* (*devot*, French.) One erroneously or superstitiously religious; a bigot.

DEVO′TION. *s.* (*devotion*, French.) 1. The state of being consecrated or dedicated. 2. Piety; acts of religion (*Dryden*). 3. An act of external worship (*Hooker*). 4. Prayer; expression of devotion (*Spratt*). 5. The state of the mind under a strong sense of dependance upon God; piety (*Law*). 6. An act of reverence, respect, or ceremony (*Shakspeare*). 7. Strong affection; ardent love (*Clarendon*). 8. Earnestness; ardour (*Shakspeare*). 9. Disposal; power (*Clarendon*).

Devotion, among the Romans, was a sort of sacrifice, or ceremony, whereby they consecrated themselves to the service of some person. The ancients had a notion, that the life of one might be redeemed by the death of another: and hence were those devotions so frequent for the lives of the emperors.

DEVO′TIONAL. *a.* (from *devotion.*) Pertaining to devotion; religious (*K. Charles*).

DEVO′TIONALIST. *s.* (from *devotion.*) A man zealous without knowledge.

To DEVOU′R. *v. a.* (*devoro*, Lat.) 1. To eat up ravenously (*Shakspeare*). 2. To destroy or consume with rapidity and violence (*Joel*). 3. To swallow up; to annihilate (*South*). 4. To enjoy with avidity (*Dryden*).

DEVOU′RER. *s.* (from *devour.*) A consumer; he that devours (*Decay of Piety*).

DEVOU′T. *a.* (*devotus*, Latin.) 1. Pious; religious (*Rogers*). 2. Filled with pious thoughts (*Dryden*). 3. Expressive of devotion or piety (*Milton*).

DEVOU′TLY. *ad.* (from *devout.*) Piously; with ardent devotion; religiously (*Addison*).

DEUSE. *s.* (from *Dusius*, the name of a species of evil spirits.) The devil: a ludicrous word.

DEUTEROCANONICAL, in the school

theology, an appellation given to certain books of Holy Scripture, which were added to the canon after the rest; either because they were not written till after the compilation of the canon, or because of some disputes as to their canonical authority. The word is Greek; being compounded of δευτέρος, second, and κανονικος, canonical. The Jews, it is certain, acknowledge several books in their canon, which were put there later than the rest. They say, that, under Ezra, a great assembly of their doctors, which they call, by way of eminence, the great synagogue, made the collection of the sacred books, which we now have in the Hebrew Old Testament: and they agree, that they put books therein which had not been so before the Babylonish captivity. Such are those of Daniel, Ezekiel, Haggai, &c. and those of Ezra and Nehemiah.

The deuterocanonical books, in the modern canon, are, the book of Esther, either the whole, or at least the seven last chapters of it; the epistle to the Hebrews; that of James; and that of Jude; the second of St. Peter; the second and third of St. John; and the Revelation. The deuterocanonical parts of books are, the hymn of the three children; the prayer of Azariah; the histories of Susanna, of Bel and the dragon; the last chapter of St. Mark; the bloody sweat, and the appearance of the angel, related in St. Luke, ch. xxii. and the history of the adulterous woman in St. John, ch. viii. See CANON.

DEUTERO'GAMY. *s.* (δευτερος and γαμος.) A second marriage.

DEUTERONOMY, one of the sacred books of the Old Testament; being the fifth book of the law, and the last of those written by Moses; closing, according to the computation of Usher, the history of 2552½ years, from the beginning of the world to the death of Moses. The word is Greek, compounded of δευτερος, second, and νομος, law. It does not appear that Moses made any division of what he wrote, into books; or that he gave different names and titles to the different parts of his work; nor do the Jews, even at this day, distinguish them in the copies they use in the synagogues, but write them all running as one single work, without any other distinction beside that of little and great parasches. It is true, in the other copies, used by private persons, they are divided into five parts, as among us; but they give them no other name, than the first word wherewith each division begins; much as we do in quoting a decree or chapter of the canon law.

The book of Deuteronomy was so called because this last part of the work of Moses comprehends a repetition, or recapitulation, which that legislator made to the Israelites, before his death, of the law he had before delivered to them at large: and hence Deuteronomy is still called, by the rabbins, משנה *Mischneh*, repetition; משנה תורה repetition of the law, second law: they likewise call it ספ־תוכחות the Books of Reprimands; on account of the twenty-eighth chapter, which is full of blessings, promised to such as keep the law; and of curses threatened to such as trangress it.

The book of Deuteronomy was written in the fortieth year after the delivery from Egypt, in the country of the Moabites beyond Jordan; Moses being then in the 120th year of his age. It contains, in Hebrew, eleven parasches, though only ten in the editions of the rabbins at Venice; 20 chapters, and 955 verses. In the Greek, Latin, and other versions, it contains 34 chapters: the last was not written by Moses. Some say, it was added by Joshua, immediately after Moses's death: others will have it added by Ezra, which is the most probable opinion; who likewise made some interpolations in the book itself, as chap. ii. ver. 12. chap. iii. 11, and 14.

DEUTEROPOTMI. (from δευτερὸς, *secundus*, and ϖοτμος, *fortuna*, or *mors*.) Among the Athenians, a designation given to such who had been thought dead, and, after the celebration of the funeral rites, unexpectedly recovered. It was unlawful for the deuteropotmi to enter into the temple of the Eumenides, or to be admitted to the holy rites, till after they were purified by being let through the lap of a woman's gown, that they might seem to be new born.

DEUTEROS, the Greek numerical term for the Ælian mode in music.

DEUTERO'SCOPY. *s.* (δευτερος and σκοπεω.) The second intention (*Brown*).

DEUTRIA, in botany, a genus of the class decandria, order trigynia. A Japan tree, with opposite branches; leaves opposite, ovate, pointed, serrate, rough; racemes terminal.

DEUX PONTS, or ZWEYBRUCKEN, the capital of a duchy of the same name, in Germany. It was taken by the French in 1676, but given to the king of Sweden by the treaty of Ryswick. It is 50 miles S.W. of Mentz. Lat. 49. 10 N. Lon. 7. 26 E.

DEW, *ros*, a thin, light, insensible mist, or rain, ascending with a slow motion, and falling while the sun is below the horizon. Casaubon derives the word from the Greek δευω, I moisten. Naturalists usually rank dew among the number of meteors of the watery kind. Some define it a vapour liquified, and let fall in drops; others, a vapour having a like relation to frost, as rain has to snow, &c. Among the dissertations of Mons. Huet, is a letter to shew that dew does not fall, but rises. M. Gersten likewise adopted the same opinion. But it ought not to be disguised, that philosophers in general have been contented with very loose explanations on this subject. We are not aware that it would be consistent with our duty to record here any of the fanciful hypotheses which have been advanced: we shall, therefore, content ourselves with laying before our readers the account of the phænomena of dew given by M. C. A. Prieur, which is more ingenious and satisfactory than any we have seen.

This writer had recourse to three fundamental principles, formerly laid down by M. Mange, which are as follows: 1. The air in like circumstances dissolves more water the greater its density, that is to say, the more it is mechanically compressed. 2. And also more the higher its temperature. 3. Under equal pressure, and at like temperature, air holding water in solution, has a less specific gravity than air alone; and this specific gravity is less the greater the proportion of water to be dissolved. It must also be recollected, that the changes of pressure and weight which may take place in certain columns of the atmosphere must necessarily disturb the equilibrium, and produce motion or currents in the same.

These principles being established, let us suppose for a moment, to render our inquiry more simple and easy, that the earth, deprived of its rotatory motion, shall remain motionless in the presence of the sun, and let us besides dismiss from our consideration all local influence, and in general all those causes which might disturb the regularity of the effects. In this state of things, the air exposed to the rays of the sun will be heated, and principally in the part contiguous to the earth, on account of its greater density, and the reverberation of the planet. This heated air will acquire a greater dissolving power, and will, in fact, dissolve much water if that fluid be present. It will take it from the seas, lakes, rivers, ponds, and other reservoirs, whose surface is exposed to its action, and will even absorb a portion of the humidity of the ground.

Let us in the next place consider, what happens in any assumed vertical column in the atmosphere, and first in that placed immediately beneath the sun. The air heated at the lower part dissolving water, and thus becoming specifically lighter, will rise, and be replaced by other contiguous air. An ascending current will, therefore, be established in the column. If this column were separated from the others, as if it were contained in a vertical tube, in proportion as the lower air rose loaded with water, the upper air would descend, become charged in its turn; rise and be replaced; and that perpetually. And the air holding water in solution, would in consequence of under saturation from cold and diminished pressure, when it had arrived at a certain height, let fall the excess of water, and form a mist or cloud, which might continue to rise by virtue of its acquired motion, but which, after a certain accumulation, would fall again in rain. It may also be conceived, that this translation of the air upwards and downwards would be made either by a mutual infiltration, or currents in both directions, which would be constantly and regularly kept up.

But this is not entirely the case with our vertical column, because it is not in fact separated from the others in its vicinity. These also are subjected to the same operations, with the exception only, that the effects are less the more remote they are from the column immediately beneath the sun. The heat, the solution of water, and the force of ascension, gradually diminish as the distance from this central column increases. If, therefore, the surface of the earth were a plane, the proper representation of the rising air would be a cone with its summit directed to the sun; and on the other hand, as the absolute weight of each column is increased by the whole of the water it has dissolved, the equilibrium requires that there should be on all sides a lateral divergence, which must evidently take place where the pressure is least. Thus, on the same supposition of the earth being a plane, we should observe the upper air descend and precipitate itself along the sides of the cone, producing, by this oblique direction to the axis, a current in all sides directed from the sun; and this current would be increased by the vacuum formed at those places where the air is sufficiently elevated, and could precipitate its superabundant water. On applying this image to the exterior of our globe, the conical surface will be converted into a cap, enveloping the enlightened portion of the earth, and following the curvature produced by the currents.

The result of the supposed circumstances will be briefly thus: water dissolved by the lower air exposed to the sun; a motion of ascent in this part; descending divergent currents on all sides, spreading over the earth. These currents, moreover, communicate their water to the heated columns, which rise and diverge laterally; and this water is precipitated, because the air of the currents proceeding from the upper regions is too cold to keep it in solution, or because the pressure is less from the diminished weight of the columns, as their distance from the line immediately beneath the sun is greater, as well as because they may mix with other cold air near the surface; and, lastly, the ground, and all other bodies in the direction of this precipitated water, will be wetted therewith.

A few more remarks are necessary to complete the description. We must first observe that the descending currents are prolonged till the resistance of the air, through which they pass, has entirely destroyed their motion. Again, immediately beneath the sun there will be a circular space, considerably heated, which does not present to the inhabitants the phænomenon we have been describing. As we depart from this space, and in proportion as the sun appears in a more oblique direction, we arrive at a region less heated, where the wind, from the direction of the sun, and the precipitation of moisture, begins to be perceived. This region forms a crown round the circular space before mentioned. And, lastly, by departing still more from the inner border of this crown, the wind is found to be stronger, the cold more perceptible, and the precipitation more abundant; which effects afterwards diminish to a certain distance, and entirely cease at the surface of the earth, diametrically opposite to the sun. In this manner, on the hypothesis of the immobility of the earth with regard to the sun, there would be beneath that luminary a very extended region, eternally and uninterruptedly subjected to the phænomenon of the morning and evening dew, according as the observer was placed to the east or the west.

But let us now assume the real state of things, and restore to the earth its diurnal rotation. The preceding phænomena will then take place on successive parts of its surface. Those places from which the sun is descending, and ready to set beneath the horizon, will soon perceive the appearance of the evening dew with a west wind springing up, which phænomena will increase gradually till after the setting of the sun, and then the effect will diminish and entirely cease. During the night the humidity will evaporate, and entirely disappear, provided the air be not already too much loaded with moisture. Towards the next morning just before day-break, the phænomenon will again present itself on the eastern side with the same circumstances and gradations, the maximum of effect being also when the sun is yet beneath the horizon; but with this remarkable difference, that the effects will be much stronger than those of the evening; that is, there will be more wind, more moisture deposited, and a more sensible degree of cold. The reason of this is, that in the evening the precipitation of water, the wind, and the cold which accompany it, ought to be diminished, because the whole takes place in the vicinity, and by the mixture of air which the sun has heated during the day; whereas, in the morning, the coldness of the night air permits, or gives a much greater effect to, the phænomenon.

We see, likewise, that in the two temperate zones, where the winter and summer have a great difference of temperature, where the length of days and nights vary much, the effects of the evening and morning dews are varied and irregular. In summer, if on the one hand the air dissolves more water in the day, on the other hand, the precipitation of the evening dew is made in the air very much heated, and that of the morning dew in air which the shortness of the night has cooled only to a certain point. In this case the solution of moisture is considerable, and the precipitation little. In winter, on the contrary, the cause of solution is less, but that of precipitation more effectual. Local circumstances, more especially the vicinity of water, must also influence the effects. Fine weather increases and renders them more sensible. Close weather weakens or destroys them.

Under the torrid zone, the days and nights are more nearly equal, and at the equator they are equal at all times. The difference between the summer and winter temperatures is less considerable than in our latitude, and the sky is almost constantly clear. It must follow that the morning and evening dews will be heavier under this burning climate, than elsewhere on the earth. And this agrees with the testimony of travellers. In Egypt, in Asiatic Turkey, at the Antilles, at Mexico, in vessels sailing between the tropics, the morning and evening dews fall so abundantly, that they produce the same effect as showers of rain.

But there is a very important consequence, which it seems allowable to draw from these phænomena; namely, that they must influence the production and permanence of the trade winds. For every day, almost regularly, the air of the torrid zone being solicited to move in two opposite directions by forces very different in quantity, it must tend, in fact, to acquire and preserve a motion or current, in the direction of that strongest power, which, in this case, is from the east, being the wind which brings the morning dew. This cause must be the more effectual, as it acts in the lower part of the atmosphere, where we feel the trade winds, and because it affects the densest portion, and consequently must the more readily move the whole.

Under the glacial zone, where, particularly during the winter, the sun scarcely skims the horizon through the whole day, the precipitation of water will be very considerable, by reason of the coldness of the climate, and a thick fog will prevail, which will scarcely be dissipated in summer; but in winter will extend far into the temperate zones. Thus we see, during the winter season, in our country, very considerable fogs, which have only a feeble light even in the middle of the day. (*Nicholson's Journal*, vol. iv. p. 90. 4to.)

Signor Beccaria made several experiments to demonstrate the existence of the electricity that is produced by dew. He observes in general, that such electricity took place in clear and dry weather, during which no strong wind prevailed; and that it depends on the quantity of the dew, as the electricity of the rain depends on the quantity of the rain. He sometimes found that it began before sun-set; at other times not till eleven o'clock at night. See his Artificial Electricity: Appendix, letter 3.

To DEW. *v. a.* (from the noun.) To wet as with dew; to moisten (*Spenser*).

DEWBERRY BUSH. In botany. See RUBUS.

DEWBESPRE'NT. *part.* (*dew* and *besprent.*) Sprinkled with dew (*Milton*).

DE'WDROP. *s.* (*dew* and *drop.*) A drop of dew which sparkles at sunrise (*Tickel*).

DE WITT (John), the celebrated Dutch pensionary, born in 1625 at Dort, where he received his education. At the age of twenty-three, he published his Elementa Curvarum Linearum, a mathematical book of considerable merit. In 1650 he became pensionary of Dort, and soon distinguished himself as an able politician. He was very strenuous in opposing the war between the English and Dutch, and he afterwards laboured to bring about a peace with Cromwell, which was effected. In this treaty a secret article was inserted, for excluding the house of Orange, which brought considerable odium upon de Witt. However he was re-elected pensionary of Holland in 1663. In the war with England, that soon after followed, he was appointed one of the commissioners to direct the navy; and when Opdam was defeated, he was chosen one of the three to command the fleet, in which service he behaved so well as to receive the thanks of the States General. In 1667 he procured an edict to be passed for abolishing the office of stadtholder, which occasioned violent commotions, and laid the foundation of his ruin. He resigned his place of pensionary, and had the thanks of the States for his faithful services. The invasion of the French gave occasion to his enemies to represent him as a traitor to the country. Cornelius, the pensionary's brother was imprisoned and condemned to exile; and a report being raised that he would be rescued, the mob armed, and surrounded the prison where the two brothers then were together, dragged them out, barbarously murdered them, hung their bodies on a gallows, and cut them to pieces, which many of them even broiled, and ate with savage fury. Such was the end of one of the greatest geniuses of his age; of whom sir William Temple, who was well acquainted with him, writes with the greatest esteem and admiration. He observes, that when he was at the head of the government, he differed nothing in his manner of living from an ordinary citizen. His office, for the first ten years, brought him in little more than 300*l.* and in the latter part of his life, not above 700*l.* per annum. He refused a gift of 10,000*l.* from the States General, because he thought it a bad precedent in the government. With great reason, therefore, sir William Temple, speaking of his death, observes, "He was a person that deserved another fate, and a better return from his country; after eighteen years spent in their ministry, without any care of his entertainments or ease, and little of his fortune. A man of unwearied industry, inflexible constancy, sound, clear, and deep understanding, and untainted integrity; so that whenever he was blinded, it was by the passion he had for that which he esteemed the good and interest of his state. This testimony is justly due to him from all that were well acquainted with him; and is the more willingly paid, since there can be as little interest to flatter, as honour to reproach the dead." Besides the work already mentioned, he wrote a book containing those maxims of government upon which he acted; which will be a never-fading monument to his immortal memory. A translation of it from the original Dutch, intituled, The true Interest and Political Maxims of the Republic of Holland, has been printed in London; to the last edition of which, in 1646, are prefixed Historical Memoirs of the illustrious brothers Cornelius and John de Witt, by John Campbell, esq.

DE'WLAP. *s.* (from *lapping* or *licking* the dew.) 1. The flesh that hangs down from the throat of oxen (*Addison*). 2. The lip flaccid with age (*Shakspeare*).

DE'WLAPT. *a.* (from *dewlap.*) Furnished with dewlaps (*Shakspeare*).

DE'W-WORM. *s.* (from *dew* and *worm.*) A worm found in dew. See Lumbricus.

DE'WY. *a.* (from *dew.*) 1. Resembling dew; partaking of dew (*Milton*). 2. Moist with dew; roscid (*Dryden*).

DEXTANS. In antiquity. See As.

DE'XTER. *a.* (Lat.) The right; not the left. A term in heraldry (*Shakspeare*).

DEXTE'RITY. *s.* (*dexteritas*, Latin.) 1. Readiness of limbs; activity; readiness to attain skill; expertness. 2. Readiness of contrivance (*Bacon*).

DE'XTEROUS. *a.* (*dexter*, Latin.) 1. Expert at any manual employment; active; ready (*Pope*). 2. Expert in management; subtle; full of expedients (*Locke*).

DE'XTEROUSLY. *ad.* Expertly; skilfully; artfully (*South*).

DEXTRÆ: the ancient Roman flute-players, who possessed the art of playing on two flutes at once, gave this name to the instruments fingered by the right hand: those which were fingered by the left hand were called *sinistræ.*

DEXTRAL. *a.* (*dexter*, Lat.) On the right side.

DEXTROCHERE, or Destrochere, in heraldry, is applied to the right arm, painted in a shield, sometimes naked, sometimes clothed, or adorned with a bracelet, and sometimes armed, or holding some moveable, or member used in the arms.

DEY, the title of the sovereign of Algiers, under the protection of the grand seignors. A prince under this title was appointed by the sultan, at the request of the Turkish soldiers, in the year 1710.

DIA, Δια, the beginning of various terms in medicine, surgery, pharmacy, &c. Where these three letters commence the name of a remedy, unguent, plaster, cataplasm, &c. they signify composition and mixture; as in diapasma, diachylon, &c.

Dia is likewise the beginning of many terms in the other arts; as, diameter, dialogue, &c. on all which occasions, dia, which is an inseparable particle, or preposition, is borrowed from the Greek δια, *ex*, or *cum*; which begins the same words in the Greek.

Indeed we have words wherein dia is no preposition borrowed from a foreign language; though it is possible, the words themselves may: as in diamant, dial, &c.

Dia, in mythology, a goddess among the Romans, probably the same with Cybele.

DIABE'TES. (*diabetes*, διαϐητης, from δια, through, and βαινω, to pass.) An immoderate flow of urine. It is a genus of diseases in the class neuroses, and order spasmi of Cullen. There are two species of this complaint: 1. diabetes serosus, in which there is a superabundant discharge of limpid urine, of its usual urinary taste: 2. diabetes mellitus, in which the urine is very sweet, and contains a great quantity of sugar. The diabetes is a disease which has of late years attracted a considerable degree of attention, and concerning which we shall treat more copiously under the article Medicine. We should, however, be wanting in that respect which is always due to real talents and merit, if we were not to notice under this head, that we are indebted for the most scientific and successful practice in this dangerous disease to the valuable experiments and ingenious suggestions of the late Dr. Rollo.

The doctor supposes, that in this complaint the vegetable matter taken into the stomach has not, from some defect in this organ, undergone a sufficient change to form proper chyle; that in consequence of this, much saccharine matter is evolved, which, when carried into the circulation, proves a general stimulus, producing head-achs and quickness of pulse, but that it acts more remarkably on the kidneys, occasioning a constant and copious secretion of sweet urine. From this hypothesis, he was naturally led to adopt a plan of cure, which in many cases has proved completely successful. The indications he lays down are: 1. To prevent the formation of saccharine matter in the stomach; and, 2. to remove the morbidly increased actions of this organ, and restore it to a healthful condition. These indications are to be answered by a complete diet of animal food, and by the use of such medicines as shall diminish the action of the stomach, and at the same time counteract the formation of saccharine matter. The remedies employed for this purpose have been emetics, kali sulphuratum, lime-water, hepatized ammonia, and vegetable narcotics. But the principal dependence is to be placed on a total abstinence from all vegetable matter, which alone can supply the saccharine principle. By a regular perseverance in this plan, several patients have experienced a complete cure.

DIABO'LIC, or Diabo'lical. *a.* (*diabolicus*, Lat.) Partaking of the qualities of the devil; extremely impious and wicked.

DIACAUSTIC CURVE, or the Caustic

BY REFRACTION, is a species of caustic curves, the genesis of which is in the following manner. Imagine an infinite number of rays BA, BM, BD, &c. issuing from the same luminous point B, refracted to or from the perpendicular MC, by the given curve AMD; and so, that CE the sines of the angles of incidence CME, be always to CG the sines of the refracted angles CMG, in a given ratio: then the curve HFN that touches all the refracted rays AH, MF, DN, &c. is called the diacaustic, or caustic by refraction. See Plate 7, fig. 7.

DIACENTROS, in astronomy, the conjugate diameter of a planet's orbit.

DIACHYLON, in pharmacy, an emollient digestive plaster, composed of the mucilages or juices of certain herbs, litharge, and oil.

DIACODIUM, in pharmacy, a syrup prepared from the heads of poppies.

DIACOUSTICS, or DIAPHONICS, the consideration of the properties of sound refracted in passing through different mediums; that is, out of a denser into a more subtile, or out of a more subtile into a denser medium.

DIACRII, in antiquity, the name given to that faction or party at Athens who favoured an oligarchy, or would only have a few persons employed in the government. See PEDIACI.

DIADELPHIA. In botany. (from δις, twice, and αδελφος, a brother.) Two brotherhoods. The name of the seventeenth class, in Linnéus's Artificial System; comprehending those plants which bear hermaphrodite flowers, with two sets of united stamens. This is a natural class, with papilionaceous or pea flowers, and leguminous fruits. It is nearly the same with the papilionacei of Tournefort; the irregulares tetrapetalæ of Rivinus, and the leguminosæ of Ray. The orders are founded on the number of the stamens; and ten being the predominating number in this class, the order decandria is much the largest. The regular disposition of the stamens in this order is, nine united in one brotherhood, the lower broad part of the filament sheathing the germ; and the tenth single; but in almost twenty genera the ten stamens are connected into one body at bottom.

DIADELPHOUS STAMENS. Stamens forming two brotherhoods. The filaments united in each of the two sets at bottom, but separate at top.

DIADEM, in antiquity, a head-band or fillet, worn by kings as a badge of their royalty. It was made of silk, thread, or wool, and tied round the temples and forehead, the ends being tied behind, and let fall on the neck. It was usually white, and quite plain; though sometimes embroidered with gold, and set with pearls and precious stones. In latter times it came to be twisted round crowns, laurels, &c. and even appears to have been worn on various parts of the body.

DIADE'MED. *a.* (from *diadem.*) Adorned with a diadem; crowned (*Pope*).

DI'ADROM. *s.* (διαδρομεω.) The time in which any motion is performed (*Locke*).

DIÆ'RESIS. (διαιρεσις.) The separation or disjunction of syllables; as, aër.

DIÆ'RESIS. (*diæresis*, διαιρεσι; from διαιρεω, to divide or separate.) A solution of continuity of the soft parts of the human body.

DIÆTETÆ, in Grecian antiquity, from διαιταω, I arbitrate. Arbitrators; of which there were two sorts. The one, called cleroti, were public arbitrators chosen by lot, and from whose sentence appeal might be made: the other, called dialecterii, were private arbitrators, in smaller matters, and from whose sentence there was no appeal.

DIAGNOSIS. (*diagnosis*, διαγνωσιος; from διαγινωσκα, to discern or distinguish.) The science which delivers the signs by which one disease may be distinguished from another disease; hence those symptoms which distinguish such affections are termed diagnostic.

DIAGNOSIS, in botany, implies the affinity of the genus, and the difference or distinction of the species.

DIAGNO'STIC. *s.* (διαγινωσκω.) A symptom by which a disease is distinguished from others (*Collier*).

DIA'GONAL. *a.* (διαγωνιος.) Reaching from one angle to another (*Brown*).

DIAGONAL, in geometry, a right line drawn across a quadrilateral or other figure, whether plain or solid, from the vertex or summit of one angle to that of another.

It is demonstrable, 1. That every diagonal divides a parallelogram into two equal parts. 2. That two diagonals drawn in any parallelogram bisect each other. 3. A line passing through the middle point of the diagonal of a parallelogram, divides the figure into two equal parts. 4. The diagonal of a square is incommensurable with one of its sides. 5. The sum of the squares of the two diagonals of every parallelogram is equal to the sum of the squares of the four sides. 6. In any trapezium, the sum of the squares of the four sides is equal to the sum of the squares of the two diagonals together with four times the squares of the distance between the middle points of the diagonals. 7. In any trapezium, the sum of the squares of the two diagonals is double the sum of the squares of two lines bisecting the two pairs of opposite sides. 8. In any quadrilateral inscribed in a circle, the rectangle of the two diagonals is equal to the sum of the two rectangles under the two pairs of opposite sides. 9. In every parallelopiped the sum of the squares of the four diagonals of the solid, is equal to the sum of the squares of its twelve edges. 10. In every hexaëdron, regular or not, the sum of the squares of the twelve edges, plus the sum of the squares of the twelve diagonals of the faces, is equal to three times the sum of the squares of the four diagonals which cross the solid, plus four times the sum of the squares of the six right lines which join, two by two, the middle points of those four latter diagonals. 11. In every polygon, and in every polyëdron, the sum of the squares of the lines which join, two by two, the middle points both of sides and diagonals, is the quarter of the sum of the squares of those sides and diagonals; multiplied by the number of summits of the polygon or polyëdron, diminished by two units. 12. A farther generalization of the latter property leads to the most celebrated property of the centre of gravity. See CENTRE OF GRAVITY; also *Geometrie de position*, par M. Carnot, p. 332—337.

DIAGONAL SCALE. See SCALE.

DIA′GONALLY. *ad.* (from *diagonal.*) In a diagonal direction (*Brown*).

DI′AGRAM. *s.* (διαγραμμα.) A delineation of geometrical figures; a mathematical scheme (*Dryden. Bentley*).

DIAGRAM, or DIAGRAMMA, in the ancient music, was what we call the scale, or gammut, in the modern.

The extent of the diagramma, which they also called systema perfectum, was a disdiapason, or two octaves in the ratio 1 : 4. In that space they had eighteen chords, though these had not all different sounds.

Guido Aretine improved this scale, or diagram, very greatly: finding it of too small extent, he added five more chords, or notes, to it; laid them all down on a staff of five lines; and, instead of the long Greek names, named all his notes by Gregory's seven letters. See NOTATION.

The first, or lowest note of his scale, he marked Γ, and called gamma; whence the whole scale came to be denominated.

Dr. Pepusch observes, that the ancients considered a descending as well as an ascending scale; the former proceeding from acute to grave, precisely by the same intervals as the latter did from grave to acute, and the same name served for both. But the proslambanomenos, and the rest of the names, correspond to different notes of our scale. An example of one octave will explain the learned author's meaning.

Ascending		*Descending*
A	— Proslambanomenos	g
B	— Hypate hypaton	f
C	— Parypate hypaton	e
D	— Lichanos hypaton	d
E	— Hypate meson	c
F	— Parypate meson	b
G	— Lichanos meson	a
a	— Mese	G

The intervals here, both ascending and descending, are the same, and in the same order, viz. tone, semi-tone, tone, tone, semi-tone, tone, tone. So that the one scale is precisely the reverse of the other. This distinction of an ascending and a descending scale, is said to be conducive to the variety and perfection of melody, though little understood by modern composers. Phil. Trans. N°. 481. p. 369.

DIAGRY′DIATES. *s.* (from *diagrydium.*) Strong purgatives made with diagrydium. (*Floyer*).

DIAGRYDIUM, in pharmacy, is scammony prepared for medicinal use. See PHARMACY and SCAMMONY.

DIAL, or SUN-DIAL, an instrument serving to measure time, by means of the shadow of the sun. The word is formed from *dies*, day, because indicating the hour of the day. (See HOUR.) The ancients also call it sciathericum, from its doing it by the shadow.

DIAL is more accurately defined, a draught, or description, of certain lines on a plane, or surface, of a body given, so contrived, as that the shadow of a style, or ray, of the sun, passed through a hole therein, shall touch certain points at certain hours.

The antiquity of dials is beyond doubt. Some attribute their invention to Anaximenes Milesius; and others to Thales. Vitruvius mentions one made by the ancient Chaldee historian Berosus, on a reclining plane, almost parallel to the equinoctial. Aristarchus Samius invented the hemispherical dial. And there were some spherical ones, with a needle for a gnomon. The discus of Aristarchus was an horizontal dial, with its limb raised up all round, to prevent the shadows stretching too far.

It was late ere the Romans became acquainted with dials. The first sun-dial at Rome was set up by Papirius Cursor, about the year of the city 460; before which time, says Pliny, there is no mention of any account of time but by the sun's rising and setting: it was set up at or near the temple of Quirinus; but being inaccurate, about 30 years after, another was brought out of Sicily by the consul M. Valerius Messala, which he placed on a pillar near the Rostrum; but neither did this shew time truly, because not made for that latitude; and, after using it 99 years, Martius Philippus set up another more exact.

The diversity of sun-dials arises from the different situation of the planes, and from the different figure of the surfaces upon which they are described; whence they become denominated equinoctial, horizontal, vertical, polar, direct, erect, declining, inclining, reclining, cylindrical, &c. For the general principles of their construction, See DIALLING.

DIAL-PLATE, the plate on which hours, or hour lines are marked.

DI′ALECT. *s.* (διαλεκτος.) 1. The subdivision of a language. 2. Style; manner of expression (*Hooker*). 3. Language; speech (*South*).

DIALECT. (Διαλεκτος, from διαγελεσθαι, to discourse.) The peculiar language of some province, or part, of a nation, formed by corruption of the general or national language.

Homer could speak five different languages in one verse, i. e. five dialects; viz. the Attic, Ionic, Æolic, the Doric, and the common dialect of the Greeks.

The Attic dialect is more particularly used by Xenophon and Thucydides; the Ionic by Herodotus and Hippocrates; the Doric by Pindar and Theocritus; the Æolic by Sappho and Alcea, and often by the two former writers.

The Bolognese, Bergamasque, Tuscan, &c. are the dialects of the Italian; the Gascon, and Picard, are dialects of the French.

In Great Britain almost every county has a dialect of its own; all differing considerably in pronunciation, accent, and tone, though the language be the same.

There is an essential difference with regard to the use of the modern and of the Greek dialects. Thus, all England being subject to one government, the dialect of the court and of the metropolis is the only one usually committed to writing: but it was otherwise among the Greeks; for, as they were divided into a number of distinct sovereign states, the authors who flourished under these several governments wrote in the dialect of the country wherein they lived.

The inspired writers of the New Testament chiefly used the Attic dialect, which is remarkable for being elegantly simple, neat, and compact: on this account, the Biblical student will do well to acquaint himself thoroughly with the principal peculiarities of this dialect; for a description of which, we refer him to pp. 71, 72, of the Introduction to Parkhurst's Greek Lexicon.

DIALECTICS, in the literary history of the ancients, that branch of logic which taught the rules and modes of reasoning. (See LOGIC.) Zeno Eleates was the first who discovered the natural series of principles and conclusions observed in reasoning, and formed an art thereof in form of a dialogue; which, for this reason, was called dialectica.

The dialectica of the ancients is usually divided into several kinds; the first was the eleatica, that of Zeno Eleates, which was threefold; viz. consecutionem, colloqutionum, and contentionum. The first consisted of rules for deducing or drawing conclusions. The second was the art of dialogue; which became of such universal use in philosophy, that all reasoning was called interrogation: then, syllogism being laid aside, the philosophers did all by dialogue; it lying on the respondent to conclude and argue from the several concessions made. The last part of Zeno's dialectics, Εριϛικη, was contentious, or the art of disputing and contradicting; though some, particularly Laertius, ascribe this part to Protagoras, a disciple of Zeno.

The second is the dialectica megarica, whose author is Euclid, not the mathematician, but another, of Megara. He gave much into the method of Zeno and Protagoras: though there are two things appropriated to him: the first, that he impugned the demonstrations of others, not by assumptions, but conclusions; continually making illations, and proceeding from consequence to consequence: the second, that he set aside all arguments drawn from comparisons of similitude as invalid. He was succeeded by Eubulides, from whom the sophistic way of reasoning is said to be derived. In his time the art is described as manifold: mentiens, fallens, electra, obvelata, acervalis, cornuta, and calva. See SOPHISM.

The third is the dialectics of Plato, which he proposes as a kind of analysis to direct the human mind, by dividing, defining, and bringing things to the first truth; where being arrived, and stopped there a little, it applies itself to explain sensible things, but with a view to return to the first truth, where alone it can rest. Such is the idea of Plato's analysis.

The fourth is Aristotle's dialectics; containing the doctrine of simple words, delivered in his book of Prædicaments; the doctrine of propositions, in his book De Interpretatione; and that of the several kinds of syllogism, in his books of Analytics, Topics, and Elenchuses.

The fifth is the dialectics of the Stoics; which they call a part of philosophy, and divide into rhetoric and dialectic; to which some add the definitive, whereby things are justly defined; comprehending likewise the canons or criterions of truth. The Stoics, before they come to treat of syllogisms, have two principal places: the one about the signification of words, the other about the things signified. On occasion of the first, they consider abundance of things belonging to the grammarian's province: what, and how many letters; what is a word, diction, speech, &c. On occasion of the latter, they consider things themselves, not as without the mind, but as in it, received in it by means of the senses. Accordingly, they first teach, that nil sit in intellectu, quod non prius fuerit in sensu; "whatever is in the mind came thither by the senses;" and that aut incursione sui, as Plato, who meets the sight; aut similitudine, as Cæsar by his effigy; aut proportione, either by enlarging as a giant, or by diminishing as a pigmy; aut translatione, as a Cyclops; aut compositione, as a Centaur; aut contrario, as death; aut privatione, as a blind man.

The sixth is Epicurus's dialectics; for though he seems to have despised dialectic, he cultivated it with vigour. He was only averse to that of the Stoics, who, he thought, attributed too much to it, as pronouncing him alone wise who was well versed in dialectics. For this reason, Epicurus, seeming to set aside the common dialectics, had recourse to another way; viz. to certain canons which he substituted in their stead, the collection whereof he called canonica; and as all questions in philosophy are either de re or de voce, he gave separate rules for each. See EPICUREANS.

DIALE'CTICAL. *a.* (from *dialectick.*) Logical; argumental (*Boyle*).

DIALIA, ancient sacrifices to Jupiter.

DIALIS, something relating to Jupiter.

DIALITHA, in the writings of the ancients, is used to express the elegant ornaments of the Greeks and Romans composed of gold and gems.

DI'ALIST. *s.* (from *dial.*) A constructor of dials (*Moxon*).

DI'ALIUM, in botany, a genus of the class diandria, order monogynia. Calyxless: corol five-petalled; stamens seated at the upper side of the receptacle. Two species: one an In-

dian tree, with alternate pinnate leaves, and panicled flowers; the other a Guinea shrub, with round branches; leaves alternate, pinnate, with an odd one; yellow flowers; and one-celled, one-seeded capsule, of the size of a cherry.

DIALLING, the art of drawing dials on the surface of any given body, whether plane or curved.

Dialling is wholly founded on the first motion of the heavenly bodies, and chiefly the sun; or rather on the diurnal motion of the earth: so that the elements of spherics, and spherical trigonometry, should be understood before a person advances to the doctrine of dialling. The doctrine or theory of dialling, we say; for, as to the practice, or the operations themselves, independent of the demonstrations, nothing is more easy and obvious.

The edge of the plane by which the time of the day is found is called the stile of the dial, which must be parallel to the earth's axis; and the line on which this plane is erected is called the substile. The angle included between the substile and stile is called the elevation or height of the stile.

The principles of dialling may be aptly illustrated by the phenomena of a hollow or transparent sphere, as of glass. Thus suppose *a*PB*p* (fig. 1. Pl. 56.) to represent the earth as transparent; and its equator as divided into 24 equal parts by so many meridian semicircles *a*, *b*, *c*, *d*, *e*, &c. one of which is the geographical meridian of any given place, as London, which it is supposed is at the point *a*; and if the hour of 12 were marked at the equator, both upon that meridian and the opposite one, and all the rest of the hours in order on the other meridians, those meridians would be the hour circles of London: because, as the sun appears to move round the earth, which is in the centre of the visible heavens, in 24 hours, he will pass from one meridian to another in an hour. Then, if the sphere had an opake axis, as PE*p*, terminating in the poles P and *p*, the shadow of the axis, which is in the same plane with the sun and with each meridian, would fall upon every particular meridian and hour, when the sun came to the plane of the opposite meridian, and would consequently shew the time at London, and at all other places on the same meridian. If this sphere were cut through the middle by a solid plane ABCD in the rational horizon of London, one half of the axis EP would be above the plane, and the other half below it; and if straight lines were drawn from the centre of the plane to those points where its circumference is cut by the hour circles of the sphere, those lines would be the hour lines of an horizontal dial for London; for the shadow of the axis would fall upon each particular hour line of the dial, when it fell upon the like hour circle of the sphere.

If the plane which cuts the sphere be upright, as, AFCG, touching the given place, for ex. London, at F, (fig. 2.) and directly facing the meridian of London, it will then become the plane of an erect direct south dial; and if right lines be drawn from its centre E, to those points of its circumference where the hour circles of the sphere cut it, these will be the hour lines of a vertical or direct south dial for London, to which the hours are to be set in the figure, contrary to those on an horizontal dial; and the lower half E*p* of the axis will cast a shadow on the hour of the day in this dial, at the same time that it would fall upon the like hour circle of the sphere, if the dial plane was not in the way.

If the plane still facing the meridian, be made to incline, or recline any number of degrees, the hour circles of the sphere will still cut the edge of the plane in those points to which the hour lines must be drawn straight from the centre; and the axis of the sphere will cast a shadow on these lines at the respective hours. The like will still hold, if the plane be made to decline by any number of degrees from the meridian towards the east or west; provided the declination be less than 90 degrees, or the reclination be less than the co-latitude of the place; and the axis of the sphere will be the gnomon: otherwise, the axis will have no elevation above the plane of the dial, and cannot be a gnomon.

Thus it appears that the plane of every dial represents the plane of some great circle on the earth, and the gnomon of the earth's axis; the vertex of a right gnomon the centre of the earth or visible heavens; and the plane of the dial is just as far from this centre as from the vertex of this stile. The earth itself, compared with its distance from the sun, is considered as a point; and therefore, if a small sphere of glass be placed upon any part of the earth's surface, so that its axis be parallel to the axis of the earth, and the sphere have such lines upon it, and such planes within it, as above described; it will shew the hours of the day as truly as if it were placed at the earth's centre and the shell of the earth were as transparent as glass. (Ferguson, lect. 10).

There are several kinds of dials called universal, because they serve for all latitudes. One of a very ingenious construction has lately been invented by Mr. G. Wright of London. The hour circle, or arch E, and latitude arch C, (fig. 3.) are the portions of two meridian circles; one fixed, and the other moveable. The hour or dial-plate SEI at top is fixed to the arch C, and has an index that moves with the hour circle E; therefore the construction of this dial is perfectly similar to the construction of the meridians and hour-circles upon a common globe. The peculiar problems to be performed by this instrument are, 1. To find the latitude of any place. 2. The latitude of the place being known, to find the time by the sun and stars. 3. To find the sun or stars altitude and azimuth.

Previous to use, this instrument should be in a well-adjusted state: to perform which, try the levels of the horizontal plates A*a*, by first turning the screws BBBB till the bubbles of air in the glass tubes of the spirit levels (which are at right angles to each other) are central, or in the middle, and remain so when the upper plate A is turned half round its centre; but if they should not keep so, there are small screws at the end of each level, which admit of being turned one way or the other, as may be requisite, till they are so. The plates A*a* being thus made horizontal, set the latitude arch or meridian C steadily between the two grooved sides that hold it (one of which is seen at D) by the screw behind. On this side D is divided the nonius or vernier, corresponding with the divisions on the latitude arch C, and which may be subdivided into 5′ of a degree, and even less, if required. The latitude arch C is to be so placed in D, that the pole M may be in a vertical position, which is done by making 90° on the arch at the bottom coincide with *o* of the nonius. The arch is then fixed by the tightening screws at the back of D. Hang a silken plumb-line on the hook at G: which line is to coincide with a mark at the bottom of the latitude arch at H, all the while the upper plate A is moved round its centre. If it does not so, there are four screws to regulate this adjustment, two of which pass through the base I into the plate A: the other two screws fasten the nonius piece D together; which, when unscrewed a thread or two, the nonius piece may be easily moved to the right or left of 90°, as may be found requisite.

Prob. 1. *To find the latitude of the place.* Fasten the latitude and hour circles together, by placing the pin K into the holes; slide the nonius piece E on the hour-circle to the sun's declination for the given day. The nonius piece E must be set on that portion of the hour-circle marked ND or SD, according as the sun has north or south declination. About 20 minutes or a quarter of an hour before noon, observe the sun's shadow or spot that passes through the hole at the axis O, and gently move the latitude arch C down in its groove at D, till you observe the spot exactly fall on the cross line on the centre of the nonius piece at L; and by the falling of this spot so long as you observe the sun to increase in altitude, you depress the arch C: but at the instant of its stationary appearance the spot will appear to go no lower; then fix the arch by the screw at the back of D, and the degrees thereby cut by the nonius on the arch will be the latitude of the place required: if great exactness is wanted, allowance should be made for the refraction of the atmosphere, taken from some nautical or astronomical treatise.

Prob. 2. *The latitude of the place being given, to find the time by the sun or stars.* From an ephemeris as before, you find the sun's declination for the day north or south, and set the nonius piece E on the arch accordingly. Set the latitude arch C, by the nonius at D, to the latitude of the place; and place the magnifying glass at M, by which you will very correctly set the index carrying a nonius to the upper XII at S. Take out the pin K, slacken the horizontal screw N, and gently move, either to the right or left as you see necessary, the hour circle E, at the same time with the other hand moving the horizontal plate A round its axis to the right and left, till the latitude-arch C falls into the meridian; which you will know by the sun's spot falling exactly in the centre of the nonius piece, or where the lines intersect each other. The time may be now read off exactly to a minute by the nonius on the dial plate at top, and which will be the time required. The horizontal line drawn on the nonius piece L, is not seen in the figure, being the parallel of declination, or path that the sundial makes, it therefore can fall on the centre of that line at no other time but when the latitude arch C is in the meridian, or due north and south. Hence the hour-circle, on moving round with the pole, must give the true time on the dial-plate at top. There is a hole to the right, and cross hairs to the left, of the centre axis hole O, where the sun's rays pass through; whence the sun's shadow or spot will also appear on the right and left of the centre on the nonius piece L, the holes of which are occasionally used as sights to observe through. If the sun's rays are too weak for a shadow, a dark glass to screen the eye is occasionally placed over the hole. The most proper time to find a true meridian is three or four hours before or after noon; and take the difference of the sun's declination from noon at the time you observe. If it be the morning, the difference is from noon of the preceding day; if afternoon, from noon of the following day: and the meridian being once found exact, the hour-circle E, is to be brought into this meridian, a fixed place made for the dial, and an object to observe by it also fixed for it at a great distance. The sights L, O, must at all times be directed against this fixed object, to place the dial truly in the meridian, proper for observing the planets, moon, or bright stars by night.

Prob. 3. *To find the sun's azimuth and altitude.* The latitude arch C being in the meridian, bring the pole M into the zenith, by setting the latitude-arch to 90°. Fasten the hour-circle E in the meridian by putting in the pin K; fix the horizontal plates by the screw N; and set the index of the dial-plate to XII, which is the south point: Now take out the pin K, and gently move the hour-circle E; leaving the latitude-arch fixed, till the sun's rays or spot passing through the centre hole in the axis O fall on the centre line of the hour-circle E, made for that purpose. The azimuth in time may be then read off on the dial-plate at top by the magnifying glass. This time may be converted into degrees, by allowing at the rate of 15 for every hour. By sliding the nonius piece E, so that the spot shall fall on the cross line thereon, the altitude may be taken at the same time, if it does not exceed 45 degrees. Or the altitude may be taken more universally, by fixing the nonius piece E to the 0 on the divisions, and sliding down the latitude-arch in such a manner in the groove at D, till the spot falls exactly on the centre of the nonius E. The degrees and minutes then shewn by the nonius at D, taken from 90, will be the altitude required. By looking through the sight holes L, O, the altitude of the moon, planets, and stars, may be easily taken. Upon this principle it is somewhat adapted for levelling also: by lowering the nonius piece E, equal altitudes of the sun may be had; and by raising it higher, equal depressions.

A dial better fitted for the performance of problems than the above, though in some particulars not so convenient and accurate, is made by Jones and other instrument-makers in London. It consists of the common equatorial circles reduced to a portable size, and instead of a telescope carrying a plain sight. Its principal parts consist of the sight-piece O P, fig. 4, moveable over the declination's semicircle D. It has a nonius Q to the semicircle. A dark glass to screen the eye applies occasionally over either of the holes at O: these holes on the inner side of the piece are intersected by cross lines; and to the sight P two pieces are fixed by a proper number of screws, the lower piece having a small hole for the sun's rays or shadow, and the upper two cross hairs or wires.

The declination circle or arch D is divided into two, 90° each; and is fixed perpendicularly on a circle with a chamfered edge, containing a nonius division that subdivides into single minutes the under equatorial circle MN, which in all cases represents the equator, and is divided into twice twelve hours, and each hour into five minutes. At right angles below this equatorial circle is fixed the semicircle of altitude AB, divided into two quadrants of 90° each. This arch serves principally to measure angles of altitude and depression; and it moves centrally on an upright pillar fixed in the horizontal circle EF. This circle EF is divided into four quadrants of 90° each, and against it there is fixed a small nonius plate at N. The horizontal circle may be turned round its centre or axis; and two spirit levels LL are fixed on it at right angles to one another.

We have not room to detail the great variety of astronomical and trigonometrical problems that may be solved by this general instrument; we therefore refer the reader to Jones's Instrumental Dialling.

The construction of sun-dials on all planes whatever may be included in one general rule, which will be quite intelligible, if that of a horizontal dial for any given latitude be well understood. For there is no plane, however obliquely situated with respect to any given place, but what is parallel to the horizon of some other place; and therefore, if we can find that other place by a problem on the terrestrial globe, or by a trigonometrical calculation, and construct a horizontal dial for it, that dial applied to the plane where it is to serve will be a true dial for that place.—Thus, an erect direct south dial in 51½° N. lat. would be a horizontal dial on the same meridian, 90° southward, which falls in with 38½° S. lat.; but if the upright plane declines from facing the south at the given place, it would be a horizontal plane 90° from that place; but for a different longitude, which would alter the reckoning of the hours accordingly.

Case I. Let us suppose that an upright plane at London declines 36° westward from facing the south, and that it is required to find a place to whose horizon the said plane is parallel; and also the difference of longitude between London and that place.

Let NESW (fig. 5.) be the horizon of London, whose zenith is Z, and P the north pole of the sphere; and let *Zh* be the position of a vertical plane at Z, declining westward from S (the south) by 36°; on which plane an erect dial for London at Z is to be described. Make the semi-diameter ZD perpendicular to *Zh*; and it will cut the horizon in D, 36° west of S. Then a plane, in the tangent HD, touching the sphere in D, will be parallel to the plane *Zh*: and the axis of the sphere will be equally inclined to both these planes.

Let WQE be the equinoctial, whose elevation above the horizon of Z (London) is 38½°; and PRD the meridian of the place D, cutting the equinoctial in R. Then, it is evident that the arc RD is the latitude of the place D, (where the plane *Zh* would be horizontal) and the arc RQ is the difference of longitude of the planes *Zh* and DH.

In the spherical triangle WDR, the arc WD is given, for it is the complement of the plane's declination from S to south; which complement is 54° (viz. 90°−36°:) the angle at R, in which the meridian of the place D cuts the equator, is a right angle; and the angle RWD measures the elevation of the equinoctial above the horizon or Z, namely, 38½ degrees. Say therefore, As radius is to the cosine of the plane's declination from the south, so is the cosine of the latitude of Z to the sine of RD the latitude of D: which is of a different denomination from the latitude of Z, because Z and D are of different sides of the equator.

As radius to cosine, 36° 0′=RQ, so cosine 51° 30′=QZ to sine 30° 14′=DR=the lat. of D, whose horizon is parallel to the vertical plane *Zh* at Z.

N. B. When radius is made the first term, it may be omitted; and then by subtracting it mentally from the sum of the other two, the operation will be shortened. Thus, in the present case,

To the logarithmic sine of WR=54° 0′ add the logarithmic sine of RD=38° 30′ their sum—radius gives the same solution as above. And we shall keep to this method in the following part of this article.

To find the difference of longitude of the places D and Z, say, As radius is to the cosine of 38½ degrees, the height of the equinoctial at Z, so is the co-tangent of 36 degrees, the plane's declination, to the co-tangent of the difference of longitudes. Thus,

To the logarithmic sine of 51° 30′ add the logarithmic tang. of 54° 0′ their sum—radius is the nearest tangent of 47° 8′=WR: which is the co-tangent of 42° 52′=RQ, the difference of longitude sought. Which difference, being reduced to time, is 2 hours 51½ minutes.

And thus having found the exact latitude and longitude of the place D, to whose horizon the vertical plane at Z is parallel, we shall proceed to the construction of a horizontal dial for the place D, whose latitude is 30° 14′ south; but anticipating the time at D by 2 hours 51 minutes (neglecting the ½ minute in practice), because D is so far westward in longitude from the meridian of London; and this will be a true vertical dial at London, declining westward 36 degrees.

Assume any right line CSL, fig. 6. for the substile of the dial, and make the angle KCP equal to the latitude of the place (viz. 30° 14′), to whose horizon the plane of the dial is parallel; then CRP will be the axis of the stile or edge that casts the shadow on the hours of the day, in the dial. This done, draw the contingent line EQ cutting the substilar line at right angles in K; and from K make KR perpendicular to the axis CRP. Then KG (=KR) being made radius, that is, equal to the chord of 60° or tangent of 45° on a good sector, take 42° 52′ (the difference of longitude of the places Z and D) from the tangents, and having set it from K to M, draw CM for the hour-line of XII. Take KN, equal to the tangent of an angle, less by 15 degrees than KM; that is, the tangent of 27° 52′: and through the point N draw CN for the hour-line of I. The tangent of 12° 52′ (which is 15° less than 27° 42′), set off the same way, will give a point between K and N, through which the hour-line of II is to be drawn. The tangent of 2° 8′ (the difference between 45° and 50° 52′) placed on the other side of CL, will determine the point through which the hour-line of III is to be drawn: to which 2° 8′ if the tangent of 15° be added, it will make 17° 8′; and this set off from K towards Q on the line EQ, will give the point for the hour line of IV: and so of the rest.—The forenoon hour-lines are drawn the same way, by the continual addition of the tangents 15°, 30°, 45°, &c. to 42° 52′ (=the tangent of KM) for the hours of XI, X, IX, &c. as far as necessary: that is, until there be five hours on each side of the substile. The sixth hour, accounted from that hour or part of the hour on which the substile falls, will be always in a line perpendicular to the substile, and drawn through the centre C.

In all erect dials, CM, the hour-line of XII, is perpendicular to the horizon of the place for which the dial is to serve; for that line is the intersection of a vertical plane with the plane of the meridian of the place, both which are perpendicular to the plane of the horizon: and any line HO or *ho*, perpendicular to CM, will be a horizontal line on the plane of the dial, along which line the hours may be numbered; and CM being set perpendicular to the horizon, the dial will have its true position.

If the plane of the dial had declined by an equal angle towards the east, its description would have differed only in this, that the hour-line of XII would have fallen on the other side of the substile CL, and the line HO would have a subcontrary position to what it has in this figure.

And these two dials, with the upper points of their stiles turned towards the north pole, will serve for other two planes parallel to them; the one declining from the north toward the east, and the other from the north toward the west, by the same quantity of angle. The like holds true of all dials in general, whatever be their declination, and obliquity of their planes to the horizon.

Case II. If the plane of the dial not only declines, but also reclines, or inclines. Suppose its declination from fronting the south S, fig. 7, be equal to the arc SD on the horizon; and its reclination be equal to the arc D*d* of the vertical circle DZ: then it is plain, that if the quadrant of altitude Z*d*D on the globe cuts the point D in the horizon, and the reclination is counted upon the quadrant from D to *d*: the intersection of the hour-circle PR*d*, with the equinoctial WQE, will determine R*d*, the latitude of the place *d*, whose horizon is parallel to the given plane Z*h* at Z; and RQ will be the difference in longitude to the places at *d* and Z.

Trigonometrically thus; Let a great circle pass through the three points, W, *d*, E; and in the triangle WD*d*, right-angled at D, the sides WD, and D*d* are given; and thence the angle DW*d* is found, and so is the hypothenuse W*d*. Again, the difference, or the sum, of DW*d* and DWR, the elevation of the equinoctial above the horizon of Z, gives the angle *d*WR; and the hypothenuse of the triangle WR*d* was just now found; whence the sides R*d* and WR are found, the former being the latitude of the place *d*, and the latter the complement of RQ, the difference of longitude sought.

Thus, if the latitude of the place Z be 52° 10′ north; the declination SD of the plane Z*h* (which would be horizontal at *d*) be 36°, and the reclination be 15°, or equal to the arc D*d*; the south latitude of the place *d*, that is the arc R*d*, will be 15° 9′; and RQ, the difference of the longitude, 36° 2′. From these data, therefore, let the dial (fig. 8.) be described, as in the former example; only it is to be observed, that in the reclining or inclining dials, the horizontal line will not stand at right angles to the hour-line of XII, as in erect dials; but its position may be thus found:—To the common substilar line CKL on which the dial for the place *d* was described, draw the dial C*rpm* for the place D, whose declination is the same as that of *d*, viz. the arc SD; and HO, perpendicular to C*m*, the hour-line of XII on this dial, will be a horizontal line on the dial CPRM XII. For the declination of both dials being the same, the horizontal line remains parallel to itself, while the erect position of one dial is reclined or inclined with respect to the position of the other. Or the position of the dial may be found by applying it to its plane, so as to mark the true hour of the day by the sun, as shewn by another dial; or by a clock regulated by a true meridian line and equation table.

The other chief requisites in the practice of dialling we shall give either in the form of arithmetical rules, or algebraical theorems; as follows:

Rule I. To find the angles which the hour-lines on any dial make with the substile. To the logarithmic sine of the given latitude, or of the stiles of elevation above the plane of the dial, add the logarithmic tangent of the hour distance from the meridian, or from the substile (at the rate of 15° to an hour); and the sum minus radius will be the logarithmic tangent of the angle sought, N. B. In all horizontal dials, and erect north or south dials, the substile and the meridian are the same; but in all declining dials, the substilar line makes an angle with the meridian.

In fig. 6, KC is to KM, in the ratio compounded of KC to KG (=KR) and of KG to KM; which, making CK the radius, 10000000, or 1, are the ratio of 10000000, or 1, to KG × KM. Thus, in a horizontal dial for latitude 51½°, to find the angular distance of XI in the morning, or of I in the afternoon, from XII. To the logarithmic sine of 51° 30′, add the logarithmic tang. of 15°, the sum—radius, is the logarithmic tangent of 11° 50′, or of the angle which the hour-line of XI or I, makes with the meridian. And, by computing in a similar manner, with the sine of the latitude, and the tangs. of 30°, 45°, &c. the angular distances of X or II, of IX or III, &c. from the meridian may be found; and may be easily laid down.

Rule II. The latitude of the place, the sun's declination, and his hour distance from the meridian, being given; to find (1.) *his altitude*; (2.) *his azimuth.*

1. Let *d* (fig. 7.) be the sun's place, *d*R his declination; and, in the triangle PZ*d*, P*d* the sum or the difference of *d*R, and the quadrant PR, being given by the supposition, as also the complement of the latitude PZ, and the angle *d*PZ, which measures the horary distance of *d* from the meridian; we shall (by Case 4. of Keill's Oblique Spheric Trigonometry) find the base Z*d*, which is the sun's distance from the zenith, or the complement of his altitude.

And (2.) as sine Z*d* : sine P*d* : : sine *d*PZ : *d*ZP, or of its supplement DZS, the azimuthal distance from the south.

Or the practical rule may be as follows:

Write A for the sine of the sun's altitude, L and *l* for the sine and cosine of the latitude, D and *d* for the sine and cosine of the sun's declination, and H for the sine of the horary distance from VI.

Then the relation of H to A will have three varieties.

1. When the declination is toward the elevated pole, and the hour of the day is between XII and VI; it is

$$A = LD + Hld, \text{ and } H = \frac{A - LD}{ld}$$

2. When the hour is after VI. it is $A = LD - Hld$, and $H = \dfrac{LD + A}{ld}$

3. When the declination is towards the depressed pole, we have $A = Hld - LD$, and $H = \dfrac{A + LD}{ld}$

Which theorems will be found useful, and expeditious enough for solving those problems in geography and dialling which depend on the relation of the sun's altitude to the hour of the day. (Ferguson's Lect. 11.)

The chief writers on dials and dialling are the following: Vitruvius, in his Architecture, cap. 4. and 7. lib. 9: Sebastian Munster, in his Horolographia: John Dryander de Horologiorum varia Compositione: Conrade Gesner's Pandectæ: Andrew Schoner's Gnomonicæ: Fred. Commandine de Horologiorum Descriptione: Joan. Bapt. Benedictus de Gnomonum Umbrarumque Solarium Usu: Joannes Georgius Schomberg, Exegesis Fundamentorum Gnomonicorum: Solomon de Caus, Traité des Horologes Solaires: Joan. Bapt. Trolta, Praxis Horologiorum: Desargues, Maniere Universelle pour poser l'Essieu et placer les Heures et autres Choses aux Cadrans Solaires: Ath. Kircher, Ars magna Lucis et Umbræ: Hallum, Explicatio Horologii in Horto Regio Londoni: Tractatus Horologiorum Joannis Mark: Clavius, Gnomonices de Horologiis; in which he demonstrates both the theory and the operations after the rigid manner of the ancient mathematicians: Dechales, Ozanam, and Schottus, gave much easier treatises on this subject; as did also Wolfius in his Elementa: M. Picard gave a new method of making large dials, by calculating the hour lines; and M. de la Hire, in his Dialling, printed in 1683, gave a geometrical method of drawing hour lines from certain points, determined by observation. Everhard Walper, in 1625, published his Dialling, in which he lays down a method of drawing the primary dials on a very easy foundation; and the same foundation is also described at length by Sebastian Munster, in his Rudimenta Mathematica, published in 1651. In 1672, Sturmius published a new edition of Walper's Dialling, with the addition of a whole second part concerning inclining and declining dials, &c. In 1708, the same work, with Sturmius's additions, was re-published, with the addition of a fourth part, containing Picard's and De la Hire's method of drawing large dials, which makes much the best and fullest book on the subject. Paterson, Michael, and Muller, have each written on Dialling, in the German language: Coetsius, in his Horologiographia Plana, printed in 1689: Gauppen, in his Gnomonica Mechanica: Leybourn, in his Dialling: Bion, in his use of Mathematical Instruments: Wells, in his Art of Shadows. There is also a treatise by M. Deparceux, 1740. Mr. Ferguson has also written on the same subject in his Lectures on Mechanics, above quoted: besides, Emerson, in his Dialling; Leadbetter, in his Mechanic Dialling; Mr. W. Jones, in his Instrumental Dialling; and the learned bishop Horsley, in his Mathematical Tracts. Dr. Brewster has described in the appendix to his valuable edition of Ferguson's Lectures, an analemmatic dial which sets itself; and many ingenious constructions of dials are given in Dr. Hutton's translation of Montucla's Recreations.

Dialling lines, or scales, are graduated lines, placed on rules, or the edges of quadrants, and other instruments, to expedite the construction of dials.

DIALOGISM, Διαλογισμος, in rhetoric, is used for the soliloquy of persons deliberating with themselves; in which sense it is distinguished from dialogue.

DIA'LOGIST. *s.* (from *dialogue.*) A speaker in a dialogue; a writer of dialogues.

DI'ALOGUE. *s.* (διαλογος.) A conference; a conversation between two or more, either real or feigned (*Shakspeare*).

Dialogue, a vocal or instrumental composition of two parts, in which the performers, for the most part, sing or play alternately, but occasionally unite. Opera scenes, especially those of the Italian drama, are frequently conducted upon this plan; and in situations of either humour or passion are found capable of the most striking effects.

DIA'LYSIS. (*dialysis*, διαλυσις; from διαλυω, to dissolve.) A solution of continuity, or a destruction of parts. An order in the class locales of Cullen's nosology is termed dialyses.

Dialysis, in grammar, a mark or character, consisting of two points, ¨, placed over two vowels of a word, to separate them, otherwise they would make a diphthong, as Mosäic, &c. See Diæresis.

DIAMASTIGOSIS,, a festival at Sparta in honour of Diana Orthia, which received that name απο του μαςιγουν, from whipping, because boys were whipped before the altar of the goddess. These boys, called bomonicæ, were originally free-born Spartans, but in the more delicate ages they were generally of a slavish origin. The parents of the children commonly attended the solemnity, and exhorted them not to give the least sign of pain or concern; though some of them were so severely lashed as to die upon the spot.

DIA'METER. *s.* (δια and μετρον.) The line which, passing through the centre of a circle, or other curvilinear figure, divides it or its respective ordinates into equal parts. See Curve.

Diameter (Transverse), of a conic section, is a line drawn through the foci to the curve, or which bisects parallel right lines between the curves.

Diameter (Conjugate), when used in the singular, denotes what is more properly called the conjugate axis: when used in the plural, conjugate diameters, are such diameters as are each parallel to the tangent at the vertex of the other.

Diameter of gravity, is a right line passing through the centre of gravity.

Diameter of a column, in architecture, its thickness just above the base. Half of this is generally reckoned the module, and commonly, though not always divided into 30 parts called minutes. See Module.

Diameter, in astronomy. The diameters of the heavenly bodies are either apparent, i. e. such as they appear to the eye; or real, i. e. such as they are in themselves.

The apparent diameters measured with a micrometer are found different, in different circumstances and parts of their orbits. These are the angles under which the diameters of the planets are seen from the earth; and they are equal to the real diameters divided by the distance from the earth; or, as these angles are very small, the diameters may be taken for arcs of a circle described on the eye as a center, with a radius equal to the distance of the planets; and they are said to consist of as many minutes and seconds as those angles consist of: therefore the apparent diameters of a planet are in the inverse ratio of their real distances. The sun's vertical diameter is found by taking the height of the upper and lower edge of his disk, when he is in or near the meridian; the height of each edge must be corrected by proper allowances for parallax and refraction, and the difference between the true height of the upper and lower edge is the true apparent diameter. This apparent diameter is found to vary from 32′ 38″6, in January, to 31′ 33″8, in July.... The apparent diameter of the moon varies from about 29′ 28″ to 33′ 36″. Her real diameter is about 0180 miles. The apparent diameters of the planets when at their respective mean distances from the earth are as follow: Mercury, 11″; Venus, 58″; Mars, 27″; Jupiter, 39″; Saturn, 18″; Georgium Sidus, 3″ 54‴. And from these apparent diameters, and the respective distances from the earth, the diameters of the sun and planets have been determined in English miles as here stated: Mercury, 3224; Venus, 7687; Mars, 4189; Jupiter, 89,170; Saturn, 79,042; Georgium Sidus, 35,112; the Sun, 883,246. Observations upon the planets Herschel, Saturn, Jupiter, and Mars, prove that there is a sensible difference between their equatoreal and polar diameters; and it probable that there is a like difference between the diameters of the other planets, but this has not yet been determined by observation. The mean apparent diameters of the planets, as seen from the sun, have been thus given: Mercury, 20″; Venus, 30″; Earth, 17″; Mars, 10″; Jupiter, 37″; Saturn, 26″; Georgium Sidus, 4″. See ASTRONOMY.

DIA′METRAL. *a.* (from *diameter.*) Describing the diameter; relating to the diameter.

DIA′METRALLY. *ad.* According to the direction of a diameter (*Hammond*).

DIAME′TRICAL. *a.* (from *diameter.*) 1. Describing a diameter. 2. Observing the direction of a diameter (*Govern. of the Tongue*).

DIAME′TRICALLY. *ad.* (from *diametrical.*) In a diametrical direction (*Clarendon*).

DIAMOND, a precious stone of most costly value, for the mineralogical character of which see ADAMAS.

The art of cutting and polishing diamonds appears to have been known at a very early period to the inhabitants of Hindostan and China; the only material, however, that is used for this purpose in the east being corundum (*adamantinus*), and the apparatus being of extreme simplicity, the jewellers of these countries are incapable of bringing out the peculiar beauty of the diamond in a degree at all comparable to what is readily effected by European artists. The extreme hardness of this gem had baffled the attempts of the jewellers of Europe till the year 1456, when a young man named Lewis de Berguin, a native of Bruges, endeavoured to polish two diamonds by rubbing them against each other. He found that by this mean a facet was produced on the surface of the diamond, and in consequence of this hint constructed a polishing wheel, on which, by means of diamond powder, he was enabled to cut and polish this substance in the same manner as other gems are wrought by emery. Previous to this discovery diamonds were set in jewellery precisely in the state in which they arrived from India; and hence the regular octohedrons were much more esteemed than the rest, both on account of the regularity of the figure, and the superiority of its natural polish.

Diamonds are cut and manufactured by jewellers into brilliants and rose diamonds: the former being for the most part made out of the octohedral crystals, and the latter from the spheroidal varieties. To fashion a rough diamond into a brilliant the first step is to modify the faces of the original octohedron, so that the plane formed by a junction of the two pyramids shall be an exact square, and the axis of the crystal, or a line connecting the apices of the pyramids, and perpendicular to this common base, shall be precisely twice the length of one of the sides of the square. The octohedron being thus rectified, a section is to be made parallel to the common base or girdle, so as to cut off $\frac{5}{18}$ of the whole height from the upper pyramid, and $\frac{1}{18}$ from the lower one. The superior and larger plane thus produced is called the table, and the inferior and smaller one the collet: in this state it is called a complete square table diamond. To convert it into a brilliant two triangular facets are placed on each side of the table, thus converting from a square to an octagon; a lozenge-shaped facet is also placed at each of the four corners of the table, and another lozenge extending lengthways along the whole of each side of the original square of the table, which with two triangular facets set on the base of each lozenge, completes the whole number of facets on the table side of the diamond, viz. eight lozenges and twenty-four triangles: on the collet side are formed four irregular pentagons alternating with as many irregular lozenges, radiating from the collet as a centre, and bordered by sixteen triangular facets adjoining the girdle. The brilliant being thus completed is set with the table side upwards, and the collet side implanted in the cavity made to receive the diamond. The regular rose diamond is formed by inscribing a regular octagon in the centre of the table side of the stone, and bordering it by eight right-angled triangles, the bases of which correspond with the sides of the octagon; beyond these is a chain of eight trapeziums, and another of sixteen triangles. The collet side consists also of a minute central octagon, from every angle of which proceeds a ray to the edge of the girdle, forming the whole surface into eight trapeziums, each of which is again subdivided by a saliant angle, the apex of which touches the girdle, into one irregular pentagon and two triangles In the formation of either a brilliant or rose diamond of regular proportions, so much is cut away that the weight of the polished gem is no more than half that of the rough crystal out of which it was formed, whence the value of a cut diamond is esteemed equal to that of a similar rough diamond of twice the weight, exclusive of the value of the workmanship. The weight, and consequently the value of diamonds, is estimated in carats, 150 of which are equivalent to 240 grains or 1 oz. Troy, and the difference between the cost of one diamond and another, ceteris paribus, is as the squares of their respective weights. Thus the value of three diamonds of one, two, and three carats weight respectively, is as one, four, and nine. The average price of rough diamonds, that are worth working, is about 2 pounds sterling for the first carat, and consequently in wrought diamonds, exclusive of the cost of workmanship, the cost of the first carat is = 8l. hence a wrought diamond of

5 carats is worth	£ 200
10 ditto - -	800
20 ditto - -	3,200
30 ditto - -	7,200
40 ditto - -	12,800
50 ditto - -	20,000
60 ditto - -	28,800
70 ditto - -	39,200
80 ditto - -	51,200
90 ditto - -	64,800
100 ditto - -	80,000

This rule, however, actually holds good only in the smaller diamonds of twenty carats and under, the larger ones, in consequence of the scarcity of purchasers, being disposed of at prices greatly inferior to their estimated worth. The largest diamond at present known is in the possession of the emperor of Russia; it weighs 779 carats. The Pitt or Regent Diamond, the finest of the crown jewels of France, weighs 136 carats, and was purchased for 2,500,000 livres.

The mineralogical situation of the diamond is not well ascertained: it occurs in India in detached crystals, in a kind of induriated ochery gravel, but whether or not this is its native bed is unknown. The diamond mines of India are dispersed throughout the whole chain of the Ghauts from Bengal to Cape Comorin; many of these are however at present abandoned, the chief that are now worked being situated between Golconda and Mazulipatam. The earth which affords them being dug up and broken to pieces is carefully washed till the water comes off colourless, and the residue is spread thin on mats in the sun, where the diamonds are discovered by their superior brilliancy. This valuable gem is also procured from Borneo and from Brazil, in the mountainous district called Serro Dofrio, contained in alluvial beds of ferruginous sand.

The principal use of diamond is in ornamental jewellery; it is also employed by glaziers and lapidaries to cut glass, and engrave upon the harder gems; and in the finer kinds of clockwork.

Newton conjectured the diamond to be a combustible body. Guyton in 1785 inferred its similarity to charcoal, from its leaving an effervescent alkali, after combustion in fused nitre. Lavoisier found that on burning it in closed vessels it yielded carbonic acid. This has also been proved by Mr. Tennant, who performed the combustion in a crucible of gold. Berthollet considered it as crystallized charcoal.

Since this, Guyton having burnt the diamond in oxygen gass, by the solar rays, and thereby having obtained carbonic acid without residue, he presumed that he had ascertained the diamond to be pure carbon, or the pure combustible matter of the carbonic genus, yielding the pure acidifiable basis of the carbonic acid. But it was Clouet who proposed the conclusive experiment of making soft iron pass to the state of steel, by cementation with the diamond. He therefore secured a diamond with some filings of iron, in a cavity bored in a block of soft iron, filling up the cavity with a stopper of iron. The whole properly inclosed in a crucible was exposed to the heat of a blast furnace, by which the diamond disappeared, and the metal was fused, and converted into a button of cast steel.

DIAMOND SPAR. See ADAMANTINUS.

DIANA, in mythology, the goddess of hunting. According to Cicero, there were three of this name: a daughter of Jupiter and Proserpine, who became mother of Cupid; a daughter of Jupiter and Latona; and a daughter of Upis and Glauce. The second is the most celebrated, and to her all the ancients allude. She was born, at the same birth as Apollo, in the island of Delos; and the pains which she saw her mother suffer during her labour gave her such an aversion to marriage, that she obtained leave of her father to live in perpetual celibacy, and to preside over the travails of women. To shun the society of men, she devoted herself to hunting, and was always accompanied by a number of chosen virgins, who, like herself, abjured marriage. She is represented with a quiver, and attended with dogs, and sometimes drawn in a chariot by two white stags. She was called Lucina, Ilythia, or Juno Pronuba, when invoked by women in childbed, and Trivia when worshipped in the crossways where her statues were generally erected. She was supposed to be the same as the moon, or Phœbe, and Proserpine or Hecate; and from that circumstance she was called Triformis; and some of her statues represented her with three heads, that of a horse, a dog, and a boar. She was also called Agrotera, Orthia, Taurica, Delia, Cynthia, Aricia, &c. She was supposed to be the same as the Isis of the Egyptians, whose worship was introduced into Greece with that of Osiris, under the name of Apollo. The most famous of her temples was that of Ephesus, which was one of the seven wonders of the world. (See EPHESUS.) Though she was the patroness of chastity, yet she forgot her dignity to enjoy the company of Endymion; and the very familiar favours which she granted to Pan and Orion are well known. (See ENDYMION, PAN, ORION.) The Athenians generally offered her goats, and others a white kid, and sometimes a boar pig, or an ox, Among plants, the poppy and the dittany were sacred to her.

This goddess had also a temple at Rome upon mount Aventine, in the reign of Servius Tullius, which was built by the Romans and Latins, at both their charges; and there they met every year to offer a sacrifice, in commemoration of the league made between both nations. This temple was adorned with cows-horns. Plutarch and Livy tell us the reason of it, when they relate that Autro Coratius, a Sabine, who had a very fine cow, was advised by a soothsayer to offer it in a sacrifice to Diana of mount Aventine; promising him if he offered that sacrifice that he should never want any thing, and that the city whereof he should be a citizen should subdue all other towns of Italy. To that purpose Autro came to Rome; but a slave of king Servius having acquainted his master with Autro's design, who being gone to purify himself in the Tiber, before he offered his sacrifice, Servius made use of that opportunity, sacrificed the cow to Diana, and hung the horns in her temple.

Strabo, l. 14. de descriptione Mundi, relates, that in the isle of Icarus there was a temple of Diana, called ταυροπολον or Taurica; Livy, l. 4. Dec. 4. calls it Tauropolum, and the sacrifices that were offered in that temple Tauropolia. However Dionysius in his book De situ Orbis says, that Diana was not called Tauropola from the people, but from the bulls that abound in that country.

DIANELLA, in botany. See DRACÆNA.

DIANDRIA. (δις, and ανηρ, a husband.) The second class of Linnéus's Artificial System, comprehending all hermaphrodite flowers, which have two stamens. Also the name of an order, in the classes gynandria, monœcia, diœcia. Haller calls such plants distemones.

DIANTHERA, in botany. See JUSTICIA.

DIANTHUS. Pink. In botany, a genus of the class decandria, order digynia. Calyx cylindrical, one leafed, with scales at the base; petals five, with claws; capsule cylindrical, superior, one-celled. Thirty-two species; chiefly European plants, and five or six indigenous to our own country. They may be subtribuated as follows:

A. with aggregate flowers.
B. with solitary flowers, several on the same stem.
C. with a one flowered herbaceous stem.
D. with shrubby stem.

The following are those chiefly cultivated for ornament:

1. D. barbatus. Sweet-William: with flowers in clustered heads; scales of the calyx ovate-subulate, as long as the tube; leaves lanceolate. A native of Germany. The mode of cultivation is too well known to need enlarging upon.

2. D. caryophyllus. Clove-gilly-flower: found wild on old walls in our own country, with solitary flowers; scales of the calyx ovate, acute, very short; petals crenate, beardless.

There are two other varieties, one with its calyx-scales imbricate: the other with flowers double and variegated. This last is the real carnation, assuming in the different individuals an infinite and most playful diversity of hues and stains.

3. D. deltoides. Common pink: with flowers solitary; scales of the calyx ovate, lanceolate, acute, generally only two; leaves rather obtuse, somewhat pubescent; petals crenate. It is found wild in our own pastures, where there is also another variety to be met with, with four scales and white petals.

4. D. Chinensis. Chinese or Indian pink: with solitary flowers; scales of the calyx tubulate, spreading, foliaceous, as long as the tube; petals crenate; leaves lanceolate. A native of China. It rises about fifteen inches high, and, among us, flowers from July to November.

DI'APASE. *s.* (δια παζων.) A chord including all tones: the old word for *diapason* (*Spenser*).

DIAPASON, from δια, by, and πας, all, in music, a musical interval, otherwise called octave: so called, because it contains all the possible diversities of sound.

The diapason is the first and most perfect of the concords: if considered simply, it is but one harmonical interval; though if considered diatonically, by tones, and semi-tones, it contains seven degrees, viz. three greater tones, two lesser tones, and two greater semi-tones.

The interval of a diapason, that is, the proportion of its grave sound to its acute, is as 2 to 1.

The ancients had seven variations, or species of the diapason, arising from the various positions of the tones and semi-tones in the scale.

DIAPASON, is also an appellation given to certain stops in an organ. See STOPS.

DIAPASON, among musical instrument-makers, is a kind of rule, by which they determine the measure of the pipes or other parts of their instruments. A square being divided into eight equal parallelograms; the points wherein a diagonal intersects all these parallelograms, express all the usual intervals in music: and on this principle it is that the diapason is founded. Thus, there is a diapason for trumpets and serpents: bell-founders have likewise a diapason, for the regulation of the size, thickness, &c. of their bells.

DIAPASON, is also compounded with other words; as *diapuson diaex*, of which there are two kinds, the greater expressed by the ratio of 10÷3, the less by 16: 5. *Diapason diapente*, a twelfth; the ratio is 9 : 3. *Diapason diatessaron*, an eleventh; founded on the ratio of 8 : 3. *Diapason ditone*, a tenth; a concord whose terms are 10 : 4. *Diapason semiditone*, a minor or imperfect tenth; the ratio of which is 12 : 5.

DIAPENSIA, in botany, a genus of the class pentandria, order monogynia. Corol salver-shaped; calyx five-leaved, imbricate, with three additional leaflets; stamens placed on the tube of the coral; capsule three-celled. One species; a native of Lapland, with linear leaves, imbricate at the base; peduncles one-flowered from the top of the branch; petals white.

DIAPENTE, in ancient music, an interval which we now call a perfect fifth.

DI'APER. *s.* (*diapre*, French.) 1. Linen cloth woven in flowers, and other figures (*Spenser*). 2. A napkin; a towel (*Shak.*).

To DI'APER. *v. a.* (from the noun.) 1. To variegate; to diversify (*Howel*). 2. To draw flowers upon clothes (*Peacham*).

DIAPERIS, in entomology, a tribe of the genus chrysomela; thus named by Fabricius in his system. See CHRYSOMELA.

DIAPHANE'ITY. *s.* (from διαφανεια.) Transparency; pellucidness (*Ray*).

DIAPHA'NIC. *a.* (δια and φαινος.) Transparent; pellucid (*Raleigh*).

DIA'PHANOUS. *a.* (δια and φαινω.) Transparent; clear; translucent (*Raleigh*).

DIAPHONICS, from δια, through, and φωνη, sound, is sometimes used for the science of refracted sound, as it passes through different mediums.

DIAPHORESIS. (*diaphoresis*, διαφορησις; from διαφορεω, to carry through.) Perspiration or increased cutaneous secretion.

DIAPHORE'TIC. *a.* (διαφορητικος.) Sudorific; promoting perspiration (*Arbuthnot*).

DIAPHORE'TICS. (*diaphoretica, medicamenta*, διαφορητικα; from διαφορεω, to carry through.) Sudorifics. Medicines which, from being taken internally, increase the discharge by the skin. This class of medicines comprehends five orders: 1. Pungent diaphoretics, as the volatile salts and essential oils, which are well adapted for the aged; those in whose system there is little sensibility; those who are difficultly affected by other diaphoretics; and those whose stomachs will not bear large doses of medicines. 2. Calefacient diaphoretics, such as serpentaria, contrayerva, and guaiacum; these are given in cases where the circulation is low and languid. 3. Stimulant diaphoretics, as antimonial and mercurial preparations, which are best fitted for the vigorous and plethoric. 4. Antispasmodic diaphoretics, as opium, musk, and camphor, which are given to produce a diaphoresis, when the momentum of the blood is increased. 5. Diluent diaphoretics, as water, whey, &c. which are best calculated for that habit in which a predisposition to sweating is wanted; and in which no diaphoresis takes place, although there be evident causes to produce it.

DIAPHORICA, a term given by the Greek musicians to every dissonant interval.

DIAPHRAGM. (*diaphragma*, διαφραγμα; from δια, and φραττω, to divide.) Septum transversum. The midrif. A muscle that divides the cavity of the thorax from that of the abdomen. It is composed of two muscles; the first and superior of these arises from the sternum, and the ends of the last ribs on each side. Its fibres, from this semicircular origination, tend towards their centre, and terminate in a tendon, or aponeurosis, which is termed the centrum tendinosum. The second and inferior muscle proceeds from the vertebræ of the loins by two productions, of which that on the right side comes from the first, second, and third vertebræ of the loins; that on the left side is somewhat shorter, and both these productions join and make the lower part of the diaphragm, which joins its tendons with the tendon of the other, so that they make but one muscular partition. It is covered by the pleura on its upper side, and by the peritonæum on the lower side. It is pierced in the middle, for the passage of the vena cava; in its lower part for the œsophagus, and the nerves which go to the upper orifice of the stomach, and betwixt the productions of the inferior muscle, passes the aorta, the thoracic duct, and the vena azygos. It receives arteries and veins called phrenic or diaphragmatic, from the cava and aorta; and sometimes on its lower part two branches from the vena adiposa, and two arteries from the lumbares. It has two nerves which come from the third vertebra of the neck, which pass through the cavity of the thorax, and are lost in its substance. In its natural situation the diaphragm is convex on the upper side towards the breast, and concave on its lower side towards the belly: therefore, when its fibres swell and contract, it must become plain on each side, and consequently the cavity of the breast is enlarged to give liberty to the lungs to receive air in inspiration; and the stomach and intestines are pressed for the distribution of their contents; hence the use of this muscle is very considerable; it is the principal agent in respiration, particularly in inspiration; for when it is in action the cavity of the thorax is enlarged, particularly at the sides, where the lungs are chiefly situated; and as the lungs must always be contiguous to the inside of the thorax and upper side of the diaphragm, the air rushes into them, in order to fill up the increased space. In expiration it is relaxed and pushed up by the pressure of the abdominal muscles upon the viscera of the abdomen; and at the same time that they press it upwards, they pull down the ribs, by which the cavity of the thorax is diminished, and the air suddenly pushed out of the lungs.

DIAPHRAGM, is also a general name given to all partitions, or separations between two parts of a thing; as the little perforated partitions in the tubes of long telescopes.

DIAPHRAGMITIS. (*diaphragmitis*, διαφραγμιτις; from διαφραγμα, the diaphragm.) Paraphrenitis. An inflammation of the diaphragm. See PARAPHRENITIS.

DIAPORESIS, in rhetoric, is used to express the hesitation or uncertainty of the speaker; and is most naturally placed in the exordium or introduction to a discourse.

DIARBECK, or DIARBEKR, a province of Turkey, in Asia, lying between the rivers Euphrates and Tigris. It has Turcomania on the N. Persia on the E. Irac Arabi on the S. and Syria on the W. This was the ancient Mesopotamia.

DIARBEKR, the capital of the above province, is a large and ancient town. It is called by the Turks Karamed: and is seated in a delightful plain, on the banks of the Tigris, near its source. The trade of this town consists chiefly in red leather, and cotton cloth of the same colour. Here are about 20,000 Christians, to whom the Turks behave remarkably well. Lat. 37. 28 N. Lon. 39. 40 E.

DIARRHŒA. (*diarrhœa*, διαῤῥοια; from διαῤῥεω, to flow through). A purging. It is distinguished by frequent stools with the natural excrement, not contagious, and seldom attended with pyrexia. It is a genus of diseases in the class neuroses, and order spasmi of Cullen, containing the following species: 1. Diarrhœa crapulosa. The feculent diarrhœa, from crapulus, or a surfeit which overloads the stomach. 2 Diarrhœa biliosa. The bilious, from an increased secretion of bile. 3. Diarrhœa mucosa. The mucous, from a quantity of slime being voided. 4. Diarrhœa hepatirrhœa. The hepatic, in which there is a quantity of serous matter, somewhat resembling flesh, voided; the liver being primarily affected. 5. Diarrhœa lienterica. The lientery; when the food passes unchanged. 6. Diarrhœa cœliaca. The cœliac passion: the food passes off in this affection in a white liquid state like chyle. 7. Diarrhœa verminosa. Arising from worms.

DIARRHOE'TIC. *a.* (from *diarrhœa.*) Promoting the flux of the belly; solutive; purgative (*Arbuthnot*).

DIARTHROSIS. (*diarthrosis*, from διαρθροω, to articulate.) A moveable connexion of bones. This genus has five species, viz. enarthrosis, arthrodia, ginglymus, trochoides, and amphyarthrosis.

DIARY. (*diarium*, Latin.) A term sometimes used for a journal, or day-book, containing an account of every day's proceeding. This may be, either by way of history of what is past, as diaries of the weather for a preceding year; or by way of anticipation, as in almanacs, such as the Ladies' Diary, the Gentleman's Diary, &c.

DIARY FEVER, an ephemera, or fever of a day.

DIASCHISMA, in music, the difference between the comma and the enharmonic diesis: the ratio expressing it is $\frac{2048}{2025}$.

DIASCORDIUM, in pharmacy, a once celebrated composition, so called from *scordium*, which was one of its ingredients. It is now expunged from the dispensatories.

DIASTALTIC, a term applied by the ancient musicians to the major third, major sixth, and major seventh.

DIASTASIS. (*diastasis*, from διστημι, to separate.) A separation of the ends of bones.

DIASTEM, a name the ancient musicians gave to a simple interval, in contradistinction to a compound interval, which they called a system.

DIASTOLE. (*diastole*, from διά, and στελλω, to stretch.) The dilation of the heart and arteries. See CIRCULATION OF THE BLOOD.

DIASTOLE, in grammar, a figure whereby a syllable naturally short is made long.

DIA'STYLE. *s.* (δια and ϛυλος, a pillar.) A sort of edifice, where the pillars stand at such a distance from one another, that three diameters of their thickness are allowed for intercolumniation.

DIATESSARON, in ancient music, an interval comprehending a major tone, a minor tone, and a major semitone: the terms of its ratio are 4 : 3; and it is now called a fourth.

DIATHESIS. (*diathesis*, διαθεσις; from διαθεμι, to dispose.) In medicine, any particular state of the body: thus, in inflammatory fever there is an inflammatory diathesis, and, during putrid fever, a putrid diathesis.

DIATONIC. (from δια, and τονος, tone.) An epithet given to that of the three ancient musical genera, which allowed only three degrees, the greater and less tone, and the greater semitone. The diatonic genus has long been considered as more natural than either the chromatic or enharmonic. Aristoxenus asserts it to have been the first, and informs us, that the other two were formed from the division of its intervals.

DIATONUM INTENSUM, or SHARP DIATONIC; the name given by musical theorists to those famous proportions of the intervals proposed by Ptolemy, in his system of that name. A system which, long after the time of this ancient speculative musician, was received in our counterpoint, and is pronounced by Dr. Wallis, Dr. Smith, and the most learned writers on harmonics, to be the best division of the scale. The numbers by which Didymus expresses these proportions are $\frac{9}{8} \times \frac{10}{9} \times \frac{16}{15} = \frac{4}{3}$: Ptolemy expressed them in the same way, merely transposing the first two terms.

DIATRÆTA, a word used by Pliny and other ancient Romans, to express a sort of cups and vases, which were of much value, and only seen at the tables of the great. They were, at first, made of pure rock crystal.

DIAULION. (from δια, and αυλος, a flute.) A performance on the ancient stage with a flute alone.

DIAULODROMI, in antiquity, those racers who turned the meta or goal, and finished their course at the place of starting. This kind of race was called diaulos.

DIAZEUCTIC, (from διαζευγνυμι, I disjoin, or sesqui-octave tone), in the ancient Greek music, was that which disjoined two fourths, one on each side of it, and which, being joined to either, made a fifth.

DIB, in ichthyology. See SCIÆNA RAMAH.

DIBBLE, or DIBBER, a simple but useful implement in gardening, used for planting out not only young plants but some kinds of grain also. Dibbling of wheat has now become very general, and is a most important improvement in agriculture. See HUSBANDRY.

DI'BSTONE. *s.* A little stone which children throw at another stone (*Locke*).

DICA'CITY. *s.* (*dicacitas*, Lat.) Pertness; sauciness.

DICE, among gamesters, certain cubical pieces of bone or ivory, marked with dots on each of their faces, from one to six, according to the number of their sides.

Dice are said to have been invented by Palamedes at the siege of Troy, for the amusement of the officers and soldiers.

Sharpers have several ways of falsifying dice: 1. By sticking a hog's bristle in them, so as to make them run high or low as they please. 2. By drilling and loading them with quicksilver; which trick is discovered by holding them gently between two diagonal corners; when if false, the heavy side will turn always downward. 3. By filing and rounding them. But all these methods fall far short of the arts of the dice-makers, some of whom are so dextrous, that sharping gamesters will give any money for such dice.

Dice pay a large stamp-duty, and are prohibited from importation.

To Dice. *v. n.* (from the noun.) To game with dice (*Shakspeare*).

Dice-box. *s.* (*dice* and *box.*) The box from which the dice are thrown (*Addison*).

DI'CER. *s.* (from *dice.*) A player at dice; a gamester (*Shakspeare*).

DICHONDRA, in botany, a genus of the class pentandria, order digynia. Calyx five-parted; corol wheel-shaped, five-parted; inferior; capsules two, one seeded. Two species; one a native of New Grenada, the other of India.

DICHORD, in music, the name given to the two-stringed lyre, said to have been invented by the Egyptian Mercury. Apollodorus accounts for its invention in the following manner: "Mercury," says he, "walking on the banks of the river Nile, happened to strike his foot against the shell of a tortoise, the flesh of which had been dried away by the heat of the sun, and nothing left of its contents but the nerves and cartilages; he was so pleased with the sound it produced, that he thence conceived the idea of a lyre, which he afterwards constructed in the form of a tortoise, and strung it with the dried sinews of animals." (*Busby*.)

This relation of Apollodorus will serve to explain a passage in the third ode of the fourth book of Horace: namely,

O Testudinis aureæ
Dulcem quæ strepitum, Pieri, temperas!
O mutis quoque piscibus
Donaturi cycni, si libeat, sonum!

This passage has been often looked upon as an extravagant whim of the poet. But, allowing that he was acquainted with the writings of the Athenian mythologist, the thought exhibited in the above lines is as natural as it is beautiful; and the muse might give even to mute fishes (or the shells of the Testudines Aquaticæ) the melodious voice of the swan. See Lyre.

DICHOTOMOUS STEM, in botany, applied to a forked stem; whence the term might be rendered furcate or forked: but neither of these terms express the full meaning of dichotomous, excepting perhaps when applied to melissa calamintha, which seldom proceeds to a second subdivision. Continually and regularly dividing by pairs from top to bottom. As in viscum or misselto, valeriana locusta.

When applied to a peduncle, as in melissa calamintha, this term may with more propriety be rendered by forked; because it seldom proceeds to a second subdivision.

Dichotomous-corymbed. Composed of corymbs, in which the pedicles divide and subdivide in pairs. As in achyranthes corymbosa.

DICHOTOMY. *s.* (διχοτομια.) Distribution or ideas by pairs (*Watts*).

Dichotomy. Bisection. A term used by astronomers for that phasis, or appearance of the moon, wherein she is bisected, or shews just half her disk, or circle; or when she is in the beginning of her first and last quarter.

DICK, in agriculture, a term provincially employed to signify the mound or back of a ditch.

DICKER, in old writers, ten hides of skins. Also ten pairs of gloves, ten bars of iron, &c. are sometimes denoted by the term dicker.

DICKINSON (Edmund), an English physician, born at Appleton in Berkshire, 1624, and educated at Merton college, Oxford, where he took his degrees. In 1655 he published a curious book called Delphi Phœnicizantes, &c. to which were added some other tracts. His chief design in this work is to prove that the heathen mythological stories were corruptions of the scripture histories of the Old Testament. In 1684 Dr. Dickinson removed to London, and soon after was appointed physician to the king. In 1702 he published his physica Vetus et Vera, sive tractarus de Naturali veritate hexæmeri Mosaici, &c. in which it is proved that the method of the creation of the universe, according to the principles of true philosophy, is, in a concise and general way, laid down by Moses. He died in 1707, and was buried in the church of St. Martin-in-the-fields (*Watkins*).

DICKSONIA, in botany, a genus of the class cryptogamia, order filices. Fructification, in roundish, distinct marginal dots; involucre double: one from the surface opening outwards; the other from the inflated margin of the front, often embracing the former, opening inwards. Thirteen species; all exotics.

DICOCCOUS, or Two-grained capsule, (*capsula dicocca.*) In botany, consisting of two cohering grains or cells, with one seed in each.

DICOTYLEDONOUS, in botany, applied to those plants which have seeds that split into two lobes in germinating.

DICRANUM, in botany, a genus of the class cryptogamia, order musci. Capsule ovate, oblong; fringe simple, of sixteen broadish, inflected, cloven teeth. Sixty-one species; mostly natives of our own country; which may be subarranged into

A. Plants with leaves two-rowed, and compressed.

B. Plants with leaves pointing.

The dicranium or dicranum is, in all its species, exquisitely beautiful and elegant. We have selected two of the species in the botanical plate LXX, which are as follow:

D. osmundioides. Close-leaved, fern fork-moss, with erect stem; leaves imbricate, in two ranks, sheathing, elliptic; lanceolate, flattened laterally; fruit stalk terminal. A native of the Down and Wicklow mountains in Ireland; and occasionally found in Scotland and Carnarvonshire. Perennial; produces fruit in the spring.

D. fuscescens. Brown forkmoss. Stem branched; leaves subulate, carinate, curvilateral; peduncle solitary, from a small sheath; capsule obovate, curved, furrowed. First discovered by Dr. Smith in 1782, in Rivelston wood near Edinburgh.

DICROTIC. (*dicroticus, pulsus*, from δις, twice, and κρουω, to strike.) A term given to a pulse in which the artery rebounds after striking, so as to convey the sensation of a double pulsation.

DICTAMNUS. (*dictamnus*, from *Dictamnus*, a city in Crete, on whose mountains it grows.) Fraxinella; bastard or white dittany. In botany, a genus of the class decandria, order monogynia. Calyx five-leaved; petals five, spreading; filaments sprinkled with glandular dots: capsules five, united. One species only, D. albus; a native of Germany and France, with large white flowers, emitting inflammable odorous effluvia. The root of the plant was formerly in medicinal use; when fresh, it has a moderately strong, not disagreeable, smell. Formerly it was much used as a stomachic, tonic, &c. but is now fallen into disuse.

DICTAMNUS CRETICUS. Dittany of Crete. The leaves of this plant, origanum dictamnus; foliis inferioribus tomentosis, spicis nutantibus, of Linnéus, are now rarely used; they have been recommended as emmenagogue and alexipharmic. See ORIGANUM.

To DI'CTATE. *v. a.* (*dicto*, Latin.) To deliver to another with authority; to declare with confidence (*Pope*).

DI'CTATE. *s.* (*dictatum*, Latin.) Rule or maxim delivered with authority; prescription; prescript (*Prior*).

DICTA'TION. *s.* (from *dictate*.) The act or practice of dictating or prescribing.

DICTATOR, a magistrate in ancient Rome, invested with regal authority. He was chosen only when the state was in imminent danger; as from foreign enemies, inward seditions, the plague, &c. The origin of this office was somewhat uncertain even in Livy's time. The dictator remained in office for six months, after which he was again elected if the affairs of the state seemed to be desperate; but if tranquillity was re-established, he generally laid down his power before the time was expired. He knew no superior in the republic, and even the laws were subjected to him. He was called dictator, because *dictas*, named by the consul, or *quoniam dictis ejus parebat populus*, because the people implicitly obeyed his command. He was named by the consul in the night *viva voce*, and his election was confirmed by the auguries. As his power was absolute, he could proclaim war, levy forces, conduct them against an enemy, and disband them at his pleasure. He punished as he pleased, and from his decision there lay no appeal, at least till later times. This office, so respectable and illustrious in the earlier ages of the republic, became odious by the perpetual usurpations of Sylla and J. Cæsar; and after the death of the latter the Roman senate passed a decree which for ever forbade the election of another dictator in Rome.

DICTATOR, is now used to signify one invested with absolute authority; or one whose credit or authority enables him to direct the conduct of others.

DICTATO'RIAL. *a.* (from *dictator.*) Authoritative; confident; dogmatical (*Watts*).

DICTA'TORSHIP. *s.* (from *dictator.*) 1. The office of a dictator (*Wotton*). 2. Authority; insolent confidence (*Dryden*).

DICTA'TURE. *s.* (*dictatura*, Latin.) The office of a dictator; dictatorship.

DI'CTION. *s.* (*diction*, French.) Style; language; expression (*Dryden*).

DICTIONARY, a collection, or catalogue of all the words of a language, or art, with their significations: ranged in the order of the alphabet.

What the Latins, and we after them, call dictionary, the Greeks called lexicon.

There are two principal manners of writing: in the one, which we may call scientific, we proceed from ideas, and things, to words; that is, we first lay down the thing, then the name it is called by. This is the way of discovery, or invention; because the thing ought to be first found, before it is named. In this way we come from simple and common ideas, to complex ones.

The other is didactic, just the reverse of the former; in which we go from words and sounds, to ideas and things; that is, begin with the term and end with the explanation. This is the historical way, or the way of teaching and narration; of resolving the extraordinary knowledge of one person into the ordinary of another; of distributing artificial complications into their simple ideas; and thus rasing and levelling again what art had erected.

The dictionary comes under the latter kind. It supposes the advances and discoveries made, and proceeds to explain or relate them. The lexicographer, like a historian, comes after the affair; and gives a description of what passed. The several terms are so many subjects, supposed to be known to him; and which he imparts to others, by a detail of the particulars thereof. Indeed, the analogy between a dictionary and a history is closer than people may, at first thought, imagine: the dictionary relates what has passed, with regard to each of our ideas, in the coalitions or combinations that have been made of them: its business is, to deliver the progresses made in the several parts of knowledge under consideration, by an orderly retrospect, and deduction of the terms, from their present complex to their original simple state. The dictionary of an art, is the proper history of such art, the dictionary of a language, the history of that language. The one relates that such an art, or such and such parts thereof, stand so and so; are managed so and so; and the result so and so: the other, that such and such a word is used as synonymous to such and such others. The dictionary-writer is not supposed to have any hand in the thing he relates; he is no more concerned to make the improvements, or establish the significations, than is the historian to achieve the actions he relates.

The difference between what we commonly call the history of an art, and a dictionary of it, is only circumstantial; arising from the different views of the two sorts of authors: the one chiefly regards the time and order, when each step, each advance, was first made; i. e. how it stood with respect to such and such æras, or periods of time; and might more properly be called the chronology of the art: the other, regarding chiefly the object or intention of the art, relates its present constitution, and how it proceeds to attain the end proposed. You may add, that the former primarily considers what is passed, or already advanced; the other also, what is present, or remains to be done. And if you will likewise add this, that the history intermixes divers foreign and accidental circumstances with the discovery, which the dictionary abstracts and sets aside, and so reduces it nearer to science, you will have the full and adequate difference between them. Thus, the making of the first lyre (see Dichord) is related with some circumstances which have no place in the proper structure of the instrument, and may therefore, without impropriety, be omitted in the dictionary, which only takes in (necessarily) what belongs to the art, or artists in general, not what belongs to some one of them.

The whole, in effect, amounts to this, that the first time of doing a thing is related by the historian with the several particulars, which in any way, though occasionally only, and remotely, affected it: whereas, the lexicographer coming afterwards, keeps more closely and severely to the point, and relates nothing but what is essential; i. e. the first time the thing is considered as now arising; a new production or phenomenon, from some analogous principle; and therefore we attend to the foreign causes that brought it forth: whereas, afterwards, we consider it as arising from a pre-existent theory, or the prescription of an artist, and thus resolve the cause into the art itself.

Any other difference which may seem to be between the two, is only as to more or less particular; which, indeed, is a thing that embarrasses and amuses us on many occasions: thus, in mere civil histories, if one relate the series of a campaign, another the bombardment of a town, and a third the wounding and death of a general officer; though the latter subjects be only part of the former, yet the first will be said to have composed a piece of history, the second a piece of fortification, and the third a piece of surgery. And yet there is no other difference between them, than between the geography of a country, and the topography of a village or a hillock; the history of a nation, and the life of a single person.

To say no more, the dictionary of an art stands in much the same relation to the history thereof, that the history of a people does to the lives of all the considerable and active persons composing it. Their difference is only as to the point of sight; the eye being supposed so near in the one case, as to see the parts distinctly; and in the other so far off, as to take in the whole completely: whence the one gives you all the incidents; the other only the greater. In effect, the one is all concerted to one point of view, most favourable to the whole, and the greater parts; the other to many; the eye being shifted for each part, to furnish an adequate representation of each.

Our readers will not, we trust, judge of our work, by the description we have here given of a dictionary. Let it be recollected that ours is meant to be something more; and that we have taken all the advantages the nature of the subject would afford us: we have frequently made ourselves delinquents against strict rule, for our reader's benefit. A dictionary, by our own confession, is to be a history; and yet we have not kept so close to that form as to abandon the benefit of all others. In the business of mathematics, for instance, the regular way would be to relate or enumerate the several matters belonging thereto, without investigating or demonstrating their truth: demonstrations, strictly speaking, have nothing to do in a dictionary, no more than authentic instruments, declarations, &c. in a history. To demonstrate the several properties and relations, e. gr. of lines, angles, numbers, &c. in a dictionary, were an indiscretion as great as for a historian to produce certificates and copies of parish-registers, of the births, burials, marriages, &c. of the several persons whose actions he relates. And yet, on some extraordinary occasions, we would not, even in a mere dictionary, omit to give demonstrations; where, for instance, there was any thing very interesting, novel, not easily effected, or very important: a practice like which historians themselves frequently give into; though it be a confessed irregularity, as it breaks in upon the unity of the narration. But we are far from the views of certain dictionary-writers, who seem to think it incumbent on them to demonstrate every thing that is capable of demonstration. This is directly to forget the nature of their work; and to dispense with the rules, both to their own and the reader's cost. How dear, for example, must a competent demonstration of most of Euclid's propositions be, purchased in this way. The reader must be at the pains of picking it piece-meal out of twenty several parts of the book, where the alphabet has happened to cast it. And for what is all this? Why, to make the dictionary do the business of Euclid's elements; for which it is the most unfit in the world. You might with equal propriety make an ozier basket supply the office of a pleasure boat; or a sword-pummel that of a portmanteau; as Paracelsus is said to have done. Modern times and tastes, however, have required a union of the method of the dictionary-writers, with those of the historian of art, and the author of systems: this general plan carries with it many advantages, with comparatively few and small disadvantages: it has, therefore, been adopted in the present work. See ENCYCLOPÆDIA and PANTOLOGIA.

DICTIONARY OF THE ENGLISH LANGUAGE. The design of every dictionary of language is to explain, in the most accurate manner, the meaning of every word; and to shew the various ways in which it can be combined with others, in as far as this tends to alter its meaning. The dictionary which does this in the most accurate manner is the most complete. Therefore the principal study of a lexicographer ought to be, to discover a method which will be best adapted for that purpose. Dr. Johnson, with great labour, has collected the various meanings of every word, and quoted the authorities: but, would it not have been an improvement if he had given an accurate definition of the precise meaning of every word; pointed out the way in which it ought to be employed with the greatest propriety; shewed the various deviations from that original meaning, which custom had so far established as to render allowable; and fixed the precise limits beyond which it could not be employed without becoming a vicious expression? With this view, it would have been necessary to exhibit the nice distinctions that take place between words which are nearly synonymous. Without this, many words can only be defined in such a manner as that they must be considered exactly synonymous. We might point out these defects in many instances; but shall content ourselves with giving the following example, to show how a dictionary of the English language might be more advantageously compiled.

FORM. *subst.* The external appearance of any object, when considered only with respect to shape or figure. This term therefore, in the literal sense, can only be applied to the objects of the sight and touch; and is nearly synonymous with figure: but they differ in some respects. Form may be employed to denote more rude and unfinished shapes: figure, those which are more perfect and regular. Form can never be employed without denoting matter; whereas figure may be employed in the abstract: thus we say, a square or a triangular figure; but not a square or triangular form. And in the same manner we say, the figure of a house; but we must denote the substance which forms that figure, if we use the word form; as, a cloud of the form of a house, &c. See FIGURE.

2. In contrast to irregularity or confusion. As beauty cannot exist without form, it is by a figure of speech employed to denote beauty, order, &c.

3. As form respects only the external appearance of bodies, without regard to their internal qualities, it is, by a figure of speech, employed in contrast to these qualities, to denote empty show, without essential qualities. In this sense it is often taken when applied to religious ceremonies, &c.

4. As form is employed to denote the external appearance of bodies; so, in a figurative sense, it is applied to reasoning, denoting the particular mode or manner in which this is conducted; as, the form of a syllogism, &c.

5. In the same manner it is employed to denote the particular mode of procedure established in courts of law; as, the forms of law, religion, &c.

6. Form is sometimes, although improperly, used to denote the different circumstances of the same body; as, water in a fluid or a solid form. But as this phrase regards the internal qualities rather than the external figure, it is improper; and ought to be, water in a fluid or solid state.

7. But when bodies of different kinds are compared with one another, this term may be employed to denote other circumstances than shape or figure; for we may say, a juice exuding from a tree in the form of wax or rosin; although, in this case, the consistence, colour, &c. and not the external arrangement of parts, constitute the resemblance.

8. From the regular appearance of a number of persons arranged in one long seat, such persons so arranged are sometimes called a form; as a form of students, &c. And,

9. By an easy transition, the seat itself has also acquired the name of form.

This may perhaps serve to give some idea of the plan of an English Dictionary composed upon philosophical principles: but, besides the circumstances we have enumerated, there are many others which would require particular attention in the execution of a work of this kind. In the English language, a great variety of terms occur, which denote matter under certain general forms or circumstances, without regarding the minute diversities that may take place; as the word cloth, which denotes matter as manufactured into a particular form, including under it all the variety of stuffs manufactured in that particular way, of whatever materials, colours, texture, or fineness they may be. The same may be said of wood, iron, yarn, and a great variety of terms of the same nature, some of which cannot assume any plural; while others admit of it in all cases, and others admit or refuse it according to the different circumstances in which they are considered. In a dictionary, therefore, all this variety of cases ought to be clearly and distinctly pointed out under each particular article: this is the more necessary, as some of these words have others formed from them, which might be readily mistaken for their plurals, although they have a very different signification; as clothes, which does not denote any number of pieces or different kinds of cloth, but wearing apparel. The following example will illustrate this head.

WOOD. *subst.* A solid substance, of which the trunks and branches of trees consist.

1. This term is employed to denote the solid parts of vegetables of all kinds, in whatever

form or circumstances they are found. Nor does this term admit of a plural with propriety, unless in the circumstances after-mentioned: for we say, many different kinds of wood, in preference to many kinds of woods; or, we say, oak, ash, or elm wood, not woods.

2. But where we want to contrast wood of one quality or country with that of another, it admits of a plural: for we say, white woods are in general softer than red; or West Indian woods are in general of greater specific gravity than the European woods: but unless where the colour, or some quality which distinguishes it from growing wood, is mentioned, this plural ought as much as possible to be avoided, as it always suggests an idea of growing wood.

3. Wood likewise denotes a number of trees growing near one another; being nearly synonymous with forest. (See FOREST). In this sense it always admits of a plural; as, "Ye woods and wilds whose solitary gloom, &c."

Farther, it is evident that a dictionary cannot be reckoned complete without explaining obsolete words; and if the terms of the several provincial dialects were likewise given, it would be of great utility: nor would this take much time; because a number of these words need no other explanation than to mark along with them the words which had come in their place, when there happened to be one perfectly synonymous: and in those cases where the same idea could not be expressed in modern language without a periphrasis, it would be of use to explain them distinctly: so that, when a writer found himself at a loss for a term, and obliged to search for one beyond the bounds of our own language, he might take one of these, when he found that it was expressive and energetic, in preference to another drawn from a foreign language. This would at least have one good effect: it would make our language more fixed and stable, not to say more accurate and precise, than by borrowing from foreign languages.

DICTUM, is used for an arbitrament or award.

DICTYS CRETENSIS, an ancient historian, who served under Idomeneus, king of Crete, at the siege of Troy; of which expedition he wrote an account. This work is said to have been the foundation of Homer's Iliad. The book which is extant under his name is generally admitted to be a forgery of the fifteenth century.

DID of *do*. (ꝺıꝺ, Saxon.) 1. The preterit of *do*. 2. The sign of the preter-imperfect tense. 3. It is sometimes used emphatically; as, I *did* really love him.

DIDACTIC, in the schools, signifies the manner of speaking, or writing, adapted to teach or explain the nature of things. The word is formed from the Greek *διδασκω*, *doceo*, I teach.

There are many words that are only used in the didactic and dogmatic way; and there are many works, ancient and modern, both in prose and verse, written after this method: such are the Georgics of Virgil, Lucretius's poem De Rerum Natura, Pope's Essays on Criticism and on Man, Akenside's Pleasures of the Imagination, &c.

DIDAPPER, in ornithology, the little grebe, or colymbus minor.

DIDASCA'LIC. *a.* (διδασκαλικος.) Preceptive; didactic (*Prior*).

To DI'DDER. *v. a.* (*diddern*, Teut.) To quake with cold; to shiver (*Skinner*).

DIDE'LPHIS. Opossum. In zoology, a genus of the class mammalia, order feræ. Fore-teeth minute, rounded; upper, ten; intermediate two longer; lower eight; intermediate two broader, very short: tusks long; grinders crenate: tongue fringed with papillæ; a pouch (in many) abdominal, covering the teats. This tribe is chiefly found in America; living in holes in woody places, burrowing in the earth, and climbing trees by means of their prehensile tail; they move slowly, and feed on birds, especially poultry, insects, worms, and vegetables. Feet usually five-toed, divided; the great toe remote: penis mostly concealed, glans divided. Females have one, two, or three abdominal pouches, which can be opened or shut at pleasure; in which the young are hid in time of danger, and which are sometimes found in the males. Nineteen species; omitting the two species of kanguroo which are united under the same genus in the Linnéan system of Gmellin, but are separated and formed into a distinct genus by Dr. Shaw, who denominates the kanguroo genus macropus: and the two species into which he has divided it, m. major, and m. minor or kanguroo, and kanguroo-rat.

The following are the species chiefly entitled to notice:

1. D. opossum. Virginian opossum. Two varieties.

α. Tail hairy near the base; region of the eye-brows paler: head acute; ears longish oval.

β. Back dark-brown, belly yellowish: ears short, round. Both have from five to seven teats. General size rather smaller than a common cat: general measure from sixteen to twenty inches from the tip of the nose to the tail: which in the first variety is longer than the body, in the second shorter; has a disagreeable smell; and a grunting squeak in its voice.

The generation of this species of didelphis, and of those species in general which are possessed of pouches or marsupia, has, till very lately, remained a matter of great doubt, and even to the present moment is not cleared up satisfactorily. From observations made on the d. gigantea, macropus major, or kanguroo, in our own country, it has been long ascertained that the young fetus (for it can be hardly called otherwise) receives its birth, and is admitted in a very diminutive and unformed state, into the pouch of the mother, and adheres to the teat appropriated to it with peculiar and almost intractable resistance. All that we are acquainted with beyond this has been privately noticed by professor Barton of Philadelphia, and will soon be, but never has been yet, communicated to the public, in a series of memoirs upon this interesting subject. He divides the gestation of d. Virginia, which he calls d. woopink, into uterine and marsupial; the first occupies a period of from twenty-two to twenty-six days: the animal is then discharged from the uterus, and weighs not more than a single grain in common; by some means we are not yet acquainted with, it is almost immediately introduced into the marsupium, and adheres to its appropriate teat: here it continues about fifty days before it becomes of the size of a house mouse, and is able to quit occasionally its new domicilium, acquiring upon the average about nine grains a day: and while the marsupial gestation is advancing, a second uterine gestation is proceeding at the same time.

2. D. philander. Brazil opossum. Tail bushy at the base; ears pendulous; teats four: whiskers six rows; margin of the orbits dusky; feet whitish; naked part of the tail whitish with brown spots. Inhabits South America; length nine inches; of the tail fourteen.

3. D. marsupialis. Amboyna opossum. Teats eight, within the pouch. Tail length of the body. Inhabits Amboyna: size of a cat: its flesh is said to be pleasant.

4. D. marina. Marmose. Tail hairy at the base; a fold including the teats, which are from ten to fourteen; claws acute: teeth fourteen, cylindrical. Inhabits South America; eats fruits, grain, roots, and fishes: slow and stupid: six inches long; tail same length. Pouchless.

5. D. cayopollin. Mexican opossum. This is another of the few pouchless species of this genus. Tail larger than the body; margin of the orbits black: length of the body six inches; of the tail generally eleven, whitish spotted with chesnut, hairy at the base: grinders upper, five on each side. Inhabits the mountains of New Spain; lives in trees, in which it brings forth its young, who cling close to the dam when alarmed.

6. D. dorsigera. Merian opossum. So named from madame Merian, who has introduced a figure of it into her splendid work on the insects of Surinam. Tail hairy at the base; longer than the body, whitish; of the male spotted, brownish, naked; ears naked, sharp; claws of the fore feet obtuse, of the hind feet sharp. Inhabits Surinam; burrows in the ground; is without pouch, but has five or six teats; brings five or six young, which when in danger adhere to the back of the mother, by twisting their tails round her: size of a rat. See Nat. Hist. Plate XLV.

7. D. cancrivora. Cayenne opossum. Tail scaly, almost naked, nearly as long as the body: thumb of the hind feet flat: hair curled like wool. Inhabits marshy places in Cayenne; feeds on crabs, which it hooks out from their holes with its prensile tail; grunts like a pig; grows flat; easily tamed; brings forth from four to five in hollow trees; flesh good, resembling that of a hare.

8. D. orientalis. Phalanger. Tail hairy from the base to the middle, prensile, longer than the body: two middle toes of the hind feet united. Inhabits the Molucca islands; supposed also to inhabit Australasia; is timid, and resembles the squirrel in voice and manner of eating; teats from two to four; as many young.

9. D. volans. Pentaurus, or flying opossum. A broad, hairy membrane, extending from the middle of the fore-legs to the first joint of the hind-legs, not including the tail. Inhabits Australasia; body twenty inches long: tail twenty-two: its general appearance is that of a flying squirrel; and its size, colours, and form, conspire to render it one of the most beautiful of quadrupeds.

10. D. sciurea. Squirrel opossum. A lateral flying membrane; body grey above; snowy beneath; tail prehensile, very hairy, black towards the tip. Size of a squirrel; eyes black and full; pouch large; a black stripe down the head and back. Inhabits Australasia; is torpid by day, but extremely active by night: a very elegant quadruped.

DIDE'LTA, in botany, a genus of the class syngenesia, order polygamia frustranea. Receptacle bristly; seeds crowned with many-leaved chaff; calyx double; the outer about three-leaved, inner many-leaved. Two species: both natives of the Cape, and annual plants.

DIDEROT (Dionysius), a French writer, born at Langres in 1713. He settled early at Paris, where he soon procured friends by his wit and talents. In 1740, he published Pensées Philosophiques, which was afterwards reprinted under the title of Etrennes aux Esprits forts. In 1746, he was concerned in a Medical Dictionary, which suggested to him the idea of a Dictionnaire Encyclopédique; which, with the assistance of powerful associates, he at length completed. His share in this great work was very large, and the whole of the articles on arts and trade were furnished by him. While he was engaged in the Encyclopédie, he wrote some other works; as a licentious novel, called Bijoux Indiscrets, and two comedies, the Fils Natural, and the Père de Famille. In 1749, appeared his Letters to the Blind, the free sentiments in which occasioned his being imprisoned for six months at Vincennes. On recovering his liberty he wrote a letter on the Deaf and Dumb, in which he throws out a variety of reflections on miscellaneous subjects. His other works are: 1. Principles of Moral Philosophy. 2. Reflections on the Interpretation of Nature. 3. The Code of Nature. 4. The sixth Sense. 5. Of Public Education. 6. Panegyric on Richardson. 7. Life of Seneca. In the major part of the works of Diderot he kept one great object in view, which was the propagation of deistical principles and sophisms. Indeed he was during most of his life a decided atheist, and he was pretty active in disseminating his notions: he was assisted by D'Alembert and others, who when the intention of Diderot was too plain and open, threw a mist over it, that the design might not be so palpable as to defeat itself.

Notwithstanding his numerous publications, Diderot was never rich. Soon after the publitation of the last volumes of the Encyclopédie, upon which he had been employed for upwards of twenty years, his circumstances were so straitened, that an expedient was to be devised for their improvement. He had long corresponded with the late empress of Russia, whom he persuaded to consider him as the greatest, or one of the greatest economists of France. In the course of the correspondence he had mentioned his own library as one of the most valuable in Europe; and when Catharine wanted to purchase it and make him librarian, he said that his constitution could not support the cold climate of St. Petersburgh. She offered to let him keep it during his lifetime in Paris; and the library was sold for an immense price. When her ambassador wanted to see it, after a year or two's payments, and the visitation could be no longer put off, Diderot was obliged to run in a hurry through all the booksellers' shops in Germany to fill his empty shelves with old volumes. He had the good fortune to save appearances; but the trick took air, because he had been niggardly in his attention to the ambassador's secretary. This, however, did not hinder him from visiting his imperial pupil; to whom he told a poor story, in hopes of getting his daughter married with parade, and patronised by her majesty; but the scheme was seen through, and he was disappointed.

In the year 1784, Diderot's health began visibly to decline; and one of his domestics, perceiving that his death was at no great distance, acquainted him with his apprehensions, and addressed him on the importance of preparing for another world. He heard the man with attention, thanked him kindly, acknowledged that his situation required seriousness, and promised to weigh well what he had said. Some time after this conversation he desired that a priest might be brought; and the same domestic introduced to him M. de Farsac, Curé de St. Sulpice. Diderot saw this ecclesiastic several times, and was preparing to make a public recantation of his errors. Condorcet and the other adepts now crowded about him, persuaded him that he was cheated, that his case was not so dangerous as it was said to be, and that he only wanted the country air to restore him to health. For some time he resisted their attempts to bring him back to atheism, but was at last prevailed upon to try the effect of the country air. His departure was kept secret, and he was concealed in the country till the 2d of July, when he died. His dead body was secretly brought back to Paris, and a report was spread and believed that he died suddenly on rising from the table, without remorse, and with his atheism unshaken.

As to the character of Diderot, it has been variously given by different writers. It should seem, however, that he had a considerable knowledge of mathematics, metaphysics, and the belles lettres. He has been extolled for frankness; but unless his frank avowal of atheism, we see not what claim he has to the character. M. Bauze coming one day into Diderot's house, found him explaining to his daughter a chapter of the Gospel history. When he expressed some surprise at this conduct, Diderot said, "J'entends ce que vous voulez dire; mais au fond, quelles meilleures leçons pourrois je lui donner ou trouverai je mieux?" It was a common assertion of Diderot's, that between him and his dog "il n'y avoit de difference que habit." In uttering this sentiment, he did not resemble Pope's Indian with untutored mind,

> "Who thinks, admitted to that equal sky,
> His faithful dog shall bear him company."

The Indian hopes to carry his dog with him to heaven; but Diderot hoped to die like a dog, and to be as if he had not been.

DIDO, called also Elisa, in dubious history, a daughter of Belus, king of Tyre, who married Sichæus, or Sicharbas, her uncle, who was priest of Hercules. Pygmalion, who succeeded to the throne of Tyre, after Belus, murdered Sichæus, to get possession of the immense riches which he had; and Dido, disconsolate for the loss of her husband, set sail in quest of a settlement, with a number of Tyrians, to whom the cruelty of the tyrant became odious. During her voyage, she visited the coast of Cyprus. Afterwards a storm drove her fleet on the African coast, and she bought of the inhabitants as much land as could be covered by a bull's hide cut into thongs. Upon this piece of land she built a citadel, called Byrsa (see Byrsa), and the increase of population, and the rising commerce among her subjects, soon obliged her to enlarge her city, and the boundaries of her dominions. Her beauty, as well as the fame of her enterprise, gained her many admirers; and her subjects wished to compel her to marry Iarbas, king of Mauritania, who threatened them with a dreadful war. Dido begged three months to give her decisive answer; and during that time, she erected a funeral pile, as if wishing, by a solemn sacrifice, to appease the manes of Sichæus, to which she had promised eternal fidelity. When all was prepared, she stabbed herself on the pile in presence of her people, and by this uncommon action obtained the name of Dido, valiant woman, instead of Elisa. According to Virgil and Ovid, the death of Dido was caused by the sudden departure of Æneas, of whom she was deeply enamoured, and whom she could not obtain as a husband. This poetical fiction represents Æneas as living in the age of Dido, and introduces an anachronism of near 300 years. Dido left Phœnicia 247 years after the Trojan war, or the age of Æneas, that is, about 953 years B.C. (*Justin. Virg.* &c.)

DIDST. The second person of the preter tense of *do.* I *did*, thou *didst.*

DIDU'CTION. *s.* (*diductio*, Lat.) Separation by withdrawing one part from the other (*Boyle*).

DIDUS. Dodo. In zoology, a genus of the class aves, order gallinæ. Bill narrowed in the middle, with two transverse wrinkles; each mandible bent in at the tip; nostrils oblique, near the edge of the middle of the bill; face naked beyond the eyes; legs short, thick; feet cleft; wings unfit for flight; tailless. Three species. See Nat. Hist. Plate II.

1. D. ineptus. Dronte, or hooded dodo. Black, waved whitish; head hooded; feet four-toed. Bill strong, large, blueish, with a red spot; the upper mandible reddish at the tip, the lower bulging near the tip; gape very large; irids whitish, head large, black, as covered with a cap; feathers of the rump curled; inclining to yellow; clawless. Inhabits the isles of France and Bourbon. Three feet long.

2. D. solitarius. Solitary dodo. Varied with grey and brown; feet four-toed; eyes black; spurious wings terminating in a round protuberance. Female with a white protuberance each side the breast, resembling a teat. Inhabits the island Rodrigue. Size of a turkey; never in flocks; whence its specific name; rarely more than a pair being ever found together. Makes its nest in retired places of palm-leaves; and lays one egg rather larger than that of a goose. The sitting extends to seven weeks, and the male takes his turn with the female. The young are stupid, and will not readily fly at the approach of strangers; they are chased between March and September; the young affording delicious food.

3. D. nazarenus. Nazarene dodo. Black; downy; feet three-toed. Bill large; feathers of the rump erect, curled, on the body downy: legs long, scaly. Inhabits the isle of France; larger than a swan; builds on the ground with leaves and dry grass, and lays one large egg.

DI'DYMI. (*didymi*, from διδυμος, double.) Twins. An old name of the testicles, and two eminences of the brain, from their double protuberance.

DI'DYMOUS. (διδυμος, twin.) In botany; anther, capsule, berry. Duobus nodis extus protuberantes. See TWIN.

DIDYMUS, of Alexandria, an ecclesiastical writer of the 4th century. Though he became blind at the age of five years, yet he made so great a progress in his studies, as to have acquired a most extensive knowledge of the sciences and the scripture. His reputation was so high that he was appointed divinity professor, and had St. Jerom and other great men for his disciples. Nothing of his remains but a Latin translation of his Treatise on the Holy Spirit, some remarks on the Canonical Epistles, and a book against the Manichees. He died in 395, aged 85.

DIDYNA'MIA. (δις, twice, and δυναμις, power.) The name of the fourteenth class in Linnéus's Artificial System, comprehending those plants which have hermaphrodite flowers, with four stamens in two pairs of different lengths; the outer pair longer, the middle pair shorter and converging. The flowers have one pistil; and the corol is irregular; either ringent or personate.

It is a natural class, containing the labiati and personati of Tournefort, and the monopetali irregulares of Rivinus.

Linnéus has divided it into two orders: 1. Gymnospermia, or such as have naked seeds. 2. Angiospermia; such as have the seeds enclosed in a vessel.

To DIE. *v. a.* (ꝺeaᵹ, Saxon, a colour.) To tinge; to colour; to stain (*Milton*).

DIE. *s.* (from the verb.) Colour; tincture; stain; hue acquired. See DYE and DYING.

To DIE. *v. n.* (ꝺeaꞇian, Saxon.) 1. To lose life; to expire; to pass into another state of existence (*Sidney*). 2. To perish by violence or disease (*Dryden*). 3. To be punished with death (*Hammond*). 4. To be lost; to perish (*Spectator*). 5. To sink; to faint (*Samuel*). 6. (In theology.) To perish everlastingly (*Hakewill*). 7. To languish with pleasure (*Pope*). 8. To vanish (*Addison*). 9. To languish with affection (*Tatler*). 10. To wither, as a vegetable (*John*). 11. To grow vapid, as liquor.

DIE. *s. pl. dice*, (*dé*, Fr. *dis*, Welsh.) 1. A small cube, marked on its faces with numbers from one to six, which gamesters throw in play (*South*). 2. Hazard; chance (*Spenser*). 3. Any cubick body.

DIE. *s. pl. dies.* The stamp used in coinage (*Swift*).

DIEMEN'S LAND, the southern coast or point of New Holland. Lat. 43. 21. 20 S. Lon. 147. 29 E. This coast was discovered in November 1642, by Tasman, who gave it the name of Van Diemen's Land. Captain Furneaux touched at it in March 1773, and the country has been since further explored by our late navigators. Here is a very safe road, named by captain Cook Adventure Bay. The parts adjoining to the bay are mostly hilly, and form an entire forest of tall trees, rendered almost impassable by brakes of fern, shrubs, &c. The soil on the flat land, and on the lower part of the hills, is sandy, or consists of a yellowish earth, and in some parts of a reddish clay; but further up the hills it is of a tough grey sort.

DIEMERES, in the ancient music, a word used sometimes alone, and sometimes joined with the word phorbeia. It expressed a sort of bandage, used by the ancients, to tie up the lower lip in playing on the pipe.

DIEPPE, a town of France, in the department of Lower Seine, and late province of Normandy. It has a good harbour. Packet-boats pass from this port to Brighton in times of peace. Lat. 49. 55 N. Lon. 1. 9 E.

DIER, or DYER, one that follows the trade of dying; one that dies clothes.

DIE'RVILLA. (*diervilla*, named in honour of Mr. Dierville, who first brought it from Arcadia.) The young branches of this species of honeysuckle, lonicera diervilla; racemis terminalibus, foliis serratis, of Linnéus, are employed in North America as a certain remedy in gonorrhœa and suppression of urine. It has not yet been exhibited in Europe.

DIES. See DAY.

DIES MARCHIÆ, was the day of congress or meeting of the English and Scots, annually appointed to be held on the marches or borders, in order to adjust all differences between them.

DIESIS, in music, is the division of a tone less than a semitone; or an interval consisting of a less or imperfect semitone. Diesis is the smallest and softest change or inflection of the voice imaginable: it is called a faint, expressed thus X, by a St. Andrew's cross or saltier. Diesis, in modern music, is the name given to the elevation of a note above its natural pitch. This raising of the sound is, however, only a kind of insensible gliding through the interval of a semi-tone, and does not produce any change in the denomination of the note upon which it operates. With some authors, diesis is only another name for the quarter of a tone.

DIESPITER, in antiquity, a name given to Jupiter.

DIESSENHOFFEN, a considerable town of Swisserland, in Thurgau, seated on the Rhine. Lat. 47. 35 N. Lon. 8. 42 E.

DIET. (*diæta*, διαιτα.) The dietetic part of medicine is no inconsiderable branch, and seems to require a much greater share of regard than it commonly meets with. A great variety of diseases might be removed by the observance of a proper diet and regimen, without the assistance of medicine, were it not for the impatience of the sufferers. However, it may on all occasions come in as a proper assistant to the cure, which sometimes cannot be performed without a due observance of the non-naturals. Yet in various instances it must be confest, that many physicians appear to be too strict and particular in the rules of diet and regimen, which they deliver as proper to be regarded by all who are solicitous either to preserve or recover their health. The too anxious attention to these rules hath often hurt those who are well, and added unnecessarily to the distresses of the sick. The common experience of mankind will sufficiently acquaint any one with the sorts of food which are wholesome to the generality of men; and his own experience will teach him which of these agrees best with his particular constitution. Scarcely any other directions beside these are wanted, except that, as variety of food at the same meal, and poignant sauces, will tempt most persons to eat more than they can well digest, they ought, therefore, to be avoided by all who are afflicted with any chronical disorder, or wish to keep free from them. Small beer, where it agrees, or water alone, are the properest liquors at meals. Wine or spirits mixed with water have gradually led on several to be sots, and have ruined more constitutions than ever were hurt by small beer from its first invention.

In fevers a little more restraint is necessary, but not so much as is often enjoined. The stronger sorts of meat and fish are most usually loathed by the sick themselves, nor could they be eaten without offending the stomach, and increasing the distemper, while it is at all considerable; but in its decline, the sick are often desirous of some of the milder sorts of meat, and no harm follows from indulging their desire. The English nation are said to eat more meat when they are well than most others; but were remarkable, so long ago as the time of Erasmus, for avoiding it more scrupulously when they are sick than any other people. How high soever the fever be, the sick may safely be nourished with weak broths and gellies, and with any vegetable substances, if we except the acrid and aromatic, or with the infusions or decoctions prepared from them; and we know no reason for preferring any of these to the rest. Eggs and milk have been, we know not by what authority, forbidden in all fevers; but, as far as our experience goes, they both afford innocent food in the worst, where they are grateful to the patients.

The feverish thirst is best allayed by pure water, which may be drunk either warm, or cold, at the option of the sick person, and he may drink as much as he pleases; but we see no advantage in persuading him to gorge himself with liquids, as is often done, against his inclination and stomach. If water be deemed too insipid, currant gelly, and a variety of syrups, may be dissolved in it; or apples sliced or roasted, tamarinds, sage, or balm, or toasted bread, may be infused in it; or decoctions may be made of oatmeal, barley, or rice; or the water may be made into an emulsion with the oily seeds; all which, with a variety of similar substances, merely correct its insipidness, but in other respects leave it just what it was.

There is scarcely any distemper, in every stage of which it may not be safely left to the patient's own choice, if he be perfectly in his senses, whether he will sit up or keep his bed. His strength and his ease are chiefly to be attended to in settling this point; and who can tell so well as himself, what his ease requires, and what his strength will bear!

Doubts are often raised about the propriety of changing the linen in sickness, just as there have been about changing the foul air of the sick chamber by any of the means which could refresh and purify it. There can be very little reason to fear any mischief from the cold which the sick may feel while their clean linen is putting on; for their attendants, with common care, will do this as safely as many other things which must necessarily be done for them. But some have a strange opinion of harm from the smell of the soap perceivable in linen after it has been washed, and therefore allow not their patients, when they change their linen, ever to put on fresh, but such only as has been worn, or lain in, by other persons. By this contrivance, indeed, the smell of the soap might be taken off, but few cleanly people would think they gained any advantage by the change. Now if a faint smell of soap were noxious, then soapmakers and laundry-servants must be remarkably unhealthy, which is contrary to experience: nor is it less so that the sick are injured by the cleanliness of what they wear: on the contrary, the removal of their foul linen generally diffuses over them a sense of ease and comfort, and occasionally lulls them into a quiet and refreshing sleep.

The dread of producing mischief by a change of linen, however, like that of producing mischief by a change of air, has of late years been yielding to the dictates of common sense: and the pleasurable and instinctive feeling which has largely concurred to obtain these advantages for the invalid, should chiefly regulate him in the choice of his regimen.

Some authors have thought it right to indulge in long disquisitions upon the subject of diet: but excepting the few general observations which we have now advanced, whatever else is necessary to be remarked, will fall with more pertinency under the articles of the different constitutions and diseases that require a particular attention to this subject.

Diet, or Dyet, in matters of policy, signifies the general assembly of the states or circles of an empire, to deliberate and concert measures proper to be taken for the good of the public. The general diet of the empire of Germany is usually held at Ratisbon. It consists of the emperor, the nine electors, and the ecclesiastical princes; viz. the archbishops, bishops, abbots, and abbesses; the secular princes, who are dukes, marquisses, counts, viscounts, or barons; and the representatives of imperial cities. It meets on the emperor's summons, and any of the princes may send their deputies thither in their stead. The diet makes laws, raises taxes, determines differences between the several princes and states, and can relieve the subjects from the oppressions of their sovereigns.

To Di′et. *v. a.* (from the noun.) 1. To feed by the rules of medicine (*Shakspeare*). 2. To give food to (*Shakspeare*). 3. To board; to supply with diet.

To Di′et. *v. n.* 1. To eat by rules of physic. 2. To eat; to feed (*Milton*).

DI′ET-DRINK. *s.* (*diet* and *drink.*) Medicated liquors (*Locke*).

DI′ETARY. *a.* (from *diet.*) Pertaining to the rules of diet.

DI′ETER. *s.* (from *diet.*) One who prescribes rules for eating (*Shakspeare*).

DIETE′TICAL. Diete′tick. *a.* (διαιτητικη.) Relating to diet; belonging to the medical cautions about the use of food (*Arbuthnot*).

DIETE′TICS, that part of medical physiology which contemplates the nature and properties of particular foods in reference to particular constitutions or temperaments, or the diversified digestive organs of particular animals. See Diet, Physiology, and Digestion.

DIETZ, a town of Weteravia, capital of a county of the same name, with a strong castle. Lat. 50. 12 N. Lon. 7. 35 E.

DIEU ET MON DROIT, i. e. God and my right, the motto of the royal arms of England, first assumed by king Richard I. to intimate that he did not hold his empire in vassalage of any mortal. It was afterwards taken up by Edward III. and was continued without interruption to the time of the late king William, who used the motto *Je maintiendray*, though the former was still retained upon the great seal. After him queen Anne used the motto *Semper eadem*, which had been before used by queen Elizabeth; but ever since queen Anne, *Dieu et mon droit* continues to be the royal motto.

DIFF, an Arabian musical instrument: it is a hoop over which a parchment is distended, and pieces of brass are fixed to it, to make a jingling when it is struck or rubbed. This is the tympanum of the ancients.

DIFFANEATION, among the Romans, a ceremony whereby the divorces of the priests were completed.

To DI′FFER. *v. n.* (*differo*, Latin.) 1. To be distinguished from; to have properties and qualities not the same with those of another (*Addison*). 2. To contend; to be at variance (*Rowe*). 3. To be of a contrary opinion (*Burnet*).

DI′FFERENCE. *s.* (*differentia*, Latin.) 1. State of being distinct from something; contrariety to identity (*Hooker*). 2. The quality by which one differs from another (*Raleigh*). 3. The disproportion between one thing and another (*Hayward*). 4. Dispute; debate; quarrel (*Tillotson*). 5. Distinction (*Addison*). 6. Point in question; ground of controversy (*Shakspeare*). 7. A logical distinction (*Bacon*). 8. Evidences of distinction; differential marks (*Davies*).

Difference, in logic, an essential attribute belonging to any species that is not found in the genus, and is the universal idea of that species: thus body and spirit are two species of substance, which contain in their ideas something more than is in that of substance. In a body, we find impenetrability and extension; in a spirit, a power of thinking and reasoning: so that the difference of body is impenetrable extension, and the difference of a spirit is cogitation.

Difference, in mathematics, is the remainder, when one number or quantity is subtracted from another.

Difference of latitude, in geography, is an arch of the meridian, included between the parallels of latitude on which any two places lie. If the latitudes be both north, or both south, the less latitude taken from the greater will leave the difference of latitude; but if the latitudes be one north, the other south, their sum will shew the difference of latitude.

Difference of longitude, in geography, is an arch of the equator included between the meridians of any two given places. If the two places lie both on the same side of the first meridian, the less longitude taken from the greater will be the difference of longitude; but, if they lie on different sides of the first meridian, their longitudes must be added for the difference of longitude sought.

To Di′fference. *v. a.* (from the noun.) To cause a difference; to make one thing not the same as another (*Holder*).

DI′FFERENT. *a.* (from *differ.*) 1. Distinct; not the same (*Addison*). 2. Of contrary qualities (*Philips*). 3. Unlike; dissimilar (*Locke*).

DIFFERENTIAL, Differentiale, in the higher geometry, an infinitely small quantity, or a particle of quantity so small as to be less than any assignable one. It is called a differential, or differential quantity, because frequently considered as the difference of two quantities; and, as such, is the foundation of the differential calculus. Sir Isaac Newton, and the English, call it a moment, as being considered as the momentary increase of quantity.

Differential equation, an equation involving differential quantities.

Differential calculus. See Calculus.

Differential method, in mathematics, a method of finding quantities by means of their successive differences: these differences, in the ordinates of parabolic curves, becoming ultimately equal, and the required ordinate of the curve being determinable by them, led to the adoption of the name differential method.

This method teaches, having a certain number of the ordinates of any unknown curve given, with the points of the absciss on which they stand, to find out such a general law for this curve, viz. such an equation expressing the relation of the ordinate and absciss, as will suit the ordinates and abscissæ in any points of the absciss given, in the unknown curve under consideration. If many ordinates be given; if the distances of the points of the absciss, on which they stand, be equal and small; if the ordinate required lie amongst them, or near them; and if there be reason to think that the curve itself is formed according to some simple, though unknown law; then may we conclude, that the new ordinate determined by the equation does not vary far from the truth. And, if the resulting equation be simple, and always the same, from whatever given ordinates it be extracted, there is the greatest reason to think that this is the real law or equation of the curve; and consequently that all its points and properties may be determined with perfect exactness by means of such equation: whereas, if the given ordinates be few, their distances great or unequal, the ordinate required considerably distant from many or most of them, the unknown curve a line drawn at hazard, and the resulting equation very different where different ordinates are given, though their number be the same, there will be little probability of determining the new ordinate with exactness; still, however, the differential method affords us the greatest probability which the data permit in such cases.

This method may be applied to the construction of tables, and the summation of series: also when some terms of a series are given, and conceived as placed at given intervals, any intermediate term may be found nearly. By it, likewise, may any curvilinear figure be squared nearly, having some of its ordinates given. We will illustrate the mode of operation, by a problem, as below:

A series of numbers, placed at equal intervals, being given, to find any intermediate number of that series, when its distance from the first term of the series is given. Subtract each term of the series from the next following term, and call the remainders first differences, then subtract in like manner each of the differences from the next following one, calling these remainders 2d differences; again, subtract each 2d difference from the next following, for the 3d differences; and so on; then if A be the 1st term of the series,

d' the first of the 1st differences,

d'' the first of the 2d differences,

d''' the first of the 3d differences, &c.;

and if x be the interval or distance between the first term of the series and any term sought, T, that is, let the number of terms from A to T, both included, be $= x + 1$; then will the term sought, T, be =

$$A + \frac{x}{1} d' + \frac{x}{1} \cdot \frac{x-1}{2} d'' + \frac{x}{1} \cdot \frac{x-1}{2} \cdot \frac{x-2}{3} d''' \text{ \&c.}$$

Hence, if the differences of any order become equal, that is, if any of the diffs. d'', d''', &c. become = 0, the above series will give a finite expression for T the term sought; it being evident, that the series must terminate when any of the diffs. d'', d''', &c. become = 0.

It is also evident that the co-efficients $\frac{x}{1}, \frac{x}{1} \cdot \frac{x-1}{2}$, &c. of the differences are the same as the terms of the binomial theorem.

For ex. Suppose it were required to find the log. tangent of 5′ 1″ 12‴ 24⁗, or 5′ 1″ $\frac{62}{300}$, or 5′ 1″·2066, &c.

Take out the log. tangents to several minutes and seconds, and take their first and second differences, as below:

	Tang.	d′	d″	
5′ 0″ . .	7·1626964			
		14453		
5 1 . .	7·1641417		—49	
		14404		—48
5 2 . .	7·1655821		—47	
		14357		
5 3 . .	7·1670178			

Here $A = 7{\cdot}1641417$; $x = \frac{62}{300}$; $d' = 14404$; and the mean 2d difference $d'' = -48$. Hence

A . . .	7·1641417
xd' . . .	2977
$\frac{x}{1} \cdot \frac{x-1}{1} d''$.	4

Theref. the tang. of 5′ 1″ 12‴ 24⁗ is 7·1644398

Differential scale, in algebra, the scale of relation subtracted from unity. See Scale.

DI′FFERENTLY. *ad.* (from *different.*) In a different manner (*Boyle*).

DIFFI′CIL. *a.* (*difficilis*, Latin.) 1. Difficult; hard; not easy (*Hudibras*). 2. Scrupulous; hard to be persuaded (*Bacon*).

DIFFI′CILNESS. *s.* (from *difficil.*) Difficulty to be persuaded; incompliance (*Bacon*).

DI′FFICULT. *a.* (*difficilis*, Latin.) 1. Hard; not easy; not facil (*Zachariah*). 2.

Troublesome; vexatious. 3. Hard to please; peevish; morose.

DI′FFICULTLY. *ad.* (from *difficult.*) Hardly; with difficulty; not easily (*Rogers*).

DI′FFICULTY. *s.* (*difficulté*, French.) 1. Hardness; contrariety to easiness (*Rogers*). 2. Something hard to accomplish (*South*). 3. Distress; opposition (*Dryden*). 4. Perplexity in affairs (*Addison*). 5. Objection; cavil (*Swift*).

To **DIFFI′DE.** *v. n.* (*diffido*, Latin.) To distrust; to have no confidence in (*Dryden*).

DI′FFIDENCE. *s.* (from *diffide.*) 1. Distrust; want of confidence in others (*Bacon*). 2. Doubt; want of confidence in ourselves (*Bentley*).

DI′FFIDENT. *a.* (from *diffide.*) 1. Distrustful; doubting others (*Milton*). 2. Doubtful of an event; uncertain (*Pope*). 3. Doubtful of himself; not confident (*Clarissa*).

To **DIFFI′ND.** *v. a.* (*diffindo*, Latin.) To cleave in two; to split.

DIFFI′SSION. *s.* (*diffissio*, Lat.) The act of cleaving or splitting.

DIFFLA′TION. *s.* (*difflare*, Lat.) The act of scattering with a blast of wind.

DI′FFLUENCE, Di′ffluency. *s.* (from *diffluo*, Latin.) The quality of falling away on all sides (*Brown*).

DI′FFLUENT. *a.* (*diffluens*, Lat.) Flowing every way; not consistent; not fixed.

DI′FFORM. *a.* (from *forma*, Lat.) Contrary to uniform; dissimilar; unlike (*Newton*).

Difform. (*difformis.*) In botany, a term applied to the flower by Jungius and Knaut. The parts of which do not correspond either in size or proportion.

Difform leaves. In botany. Diversæ figuræ in eadem planta, Of different shapes on the same plant. As in ranunculus aquatilis, rudbeckia triloba, euphorbia heterophylla. lepidium perfoliatum, hibiscus virginicus, pentacarpos, sabdariffa.

It is observable, that aquatic plants sometimes have the leaves under water finely cut, whilst those above water are not so. On the contrary, in mountain plants, the upper leaves are usually most cut.

DIFFO′RMITY. *s.* (from *difform.*) Diversity of form; irregularity; dissimilitude (*Brown*).

DIFFRACTION OF LIGHT. See Inflection.

DIFFRA′NCHISEMENT. *s.* (*franchise*, Fr.) The act of taking away privileges.

To **DIFFU′SE.** *v. a.* (*diffusus*, Latin.) 1. To pour out upon a plane (*Burnet*). 2. To spread; to scatter; to disperse (*Milton*).

Diffu′se. *a.* (*diffusus*, Lat.) 1. Scattered; widely spread. 2. Copious; not concise.

DIFFU′SED. *part. a.* (from *diffuse.*) Wild; uncouth; irregular (*Shakspeare*).

Diffu′sed stem, in botany, having spreading branches; diffused panicle; panicle hanging loose; opposed to close or compact. When the pedicles are spread about loosely, at right or obtuse angles with the main peduncle.

DIFFU′SEDLY. *ad.* (from *diffused.*) Widely; dispersedly.

DIFFU′SEDNESS. *s.* (from *diffused.*) The state of being diffused; dispersion.

DIFFU′SELY. *ad.* (from *diffuse.*) 1. Widely; extensively. 2. Copiously; not concisely.

DIFFU′SION. *s.* (from *diffuse.*) 1. Dispersion; the state of being scattered every way (*Boyle*). 2. Copiousness; exuberance of style.

DIFFU′SIVE. *a.* (from *diffuse.*) 1. Having the quality of scattering any thing every way (*Dryden*). 2. Scattered; dispersed (*South*). 3. Extended (*Tillotson*).

DIFFU′SIVELY. *ad.* Widely; extensively; every way.

DIFFU′SIVENESS. *s.* (from *diffusive.*) 1 Extension; dispersion. 2. Want of conciseness (*Addison*).

To **DIG.** *v. a.* preter. *dug* or *digged*; part. pass. *dug* or *digged* (*dyger*, Danish.) 1. To pierce with a spade (*Ezekiel*). 2. To form by digging (*Whitgift*). 3. To cultivate the ground by turning it with a spade (*Temple*). 4. To pierce with a sharp point (*Dryden*). 5. To gain by digging (*Woodward*).

To **Dig.** *v. n.* To work with a spade (*Job*).

To **Dig** *up. v. a.* To throw up that which is covered with earth (*Shakspeare*).

DI′GAMY. *s.* (διγαμια.) A second marriage (*Bishop Ferne*).

DIGA′STRICUS. (*digastricus*, from δις, twice, and γαστηρ, a belly.) Biventer maxillæ inferioris. A muscle so called from its having two bellies, situated externally between the lower jaw and os hyoides. It arises, by a fleshy belly, from the upper part of the processus mastoidæus, and descending, contracts into a round tendon, which passes through the stylohyoidæus, and an annular ligament which is fastened to the os hyoides, then it grows fleshy again, and ascends towards the middle of the edge of the lower jaw, where it is inserted. Its use is to open the mouth by pulling the lower jaw downwards and backwards; and when the jaws are shut, to raise the larynx, and consequently the pharynx upwards, as in deglutition.

DIGBY (Sir Kenelm), became very illustrious in the seventeenth century for his virtue and learning. He was descended of an ancient family in England. His great-grandfather, accompanied by six of his brothers, fought valiantly at Bosworth-field on the side of Henry VII. against the usurper Richard III. His father, Everard, suffered himself to be engaged in the gun-powder plot against king James I. and for that crime was beheaded. His son wiped off that stain, and was restored to his estate. King Charles I. made him gentleman of the bedchamber, commissioner of the navy, and governor of the Trinity-house. He granted him letters of reprisal against the Venetians, by virtue whereof he took several prizes with a small fleet which he commanded. He fought the Venetians near the port of Scanderoon, and bravely made his way through them with his booty. He was a great lover of learning, and translated several authors into English; and his

Treatise of the Nature of Bodies and the Immortality of the Soul, discovers great penetration and extensive knowledge. He applied to chemistry; and found out several useful medicines, which he gave freely away to people of all sorts, especially to the poor. He degraded himself, however, by his sympathetic powder for the cure of wounds at a distance; his discourse concerning which made a great noise for a while. He had conferences with Des Cartes about the nature of the soul. In the beginning of the civil wars, he exerted himself very vigorously in the king's cause; but he was afterwards imprisoned, by the parliament's order, in Winchester house, and had leave to depart thence in 1643. He afterwards compounded for his estate, but was ordered to leave the nation; when he went to France, and was sent on two embassies to pope Innocent X. from the queen, widow to Charles I. whose chancellor he then was. On the restoration of Charles II. he returned to London; where he died in 1665, aged 60.

DI'GERENT. *a.* (*digerens*, Latin.) That has the power of digestion, or causing digestion.

DIGEST, DIGESTUM, a collection of the Roman laws, ranged and digested under proper titles, by order of the emperor Justinian. The digest makes the first part of the Roman law, and the first vol. of the corpus, or body of the civil law, contained in fifty books. It was translated into Greek under the same emperor, and called Pandecta. See PANDECTS.

Cujus says, that digest is a common name for all books disposed in a good order and œconomy; and hence it is, that Tertullian calls the Gospel of St. Luke a Digest.

Hence, also, abridgements of the common law are denominated digests of the numerous cases, arguments, readings, pleadings, &c. dispersed in the year-books, and other reports and books of law, reduced under proper heads, or common places. The first was that of Statham, which comes as low as Henry VI.

To DIGE'ST. *v. a.* (*digero, digestum*, Lat.) 1. To distribute into various classes, or repositories; to range methodically. 2. To concoct in the stomach (*Prior*). 3. To soften by heat, as in a boiler. 4. To range methodically in the mind (*Thomson*). 5. To reduce to any plan or method (*Shakspeare*). 6. To receive without loathing or repugnance; not to reject (*Peacham*). 7. To receive and enjoy (*Shakspeare*). 8. To dispose a wound to generate pus in order to a cure.

To DIGE'ST. *v. n.* To generate matter as a wound, and tend to a cure.

DIGE'STER. *s.* (from *digest.*) 1. He that digests or disposes. 2. He that digests or concocts his food (*Arbuthnot*). 3. A strong vessel, wherein to boil, with a very strong heat, any hard substances, so as to reduce them into a fluid state (*Quincy*). 4. That which causes or strengthens the concoctive power (*Temple*).

DIGE'STIBLE. *a.* (from *digest.*) Capable of being digested or concocted (*Bacon*).

DIGESTION, in physiology, the change that the food undergoes in the stomach, by which it is converted into a soft, equable, pultaceous mass called chyme, which, after it has passed through the pylorus, or lower orifice of the stomach, is converted by an additional process, into another substance, of a more fluid and milky character, denominated chyle.

The circumstances necessary to effect a healthy digestion of food, are, 1st, a certain degree of heat in the stomach. 2d. A free mixture of saliva with the food in the mouth. 3d. The secretion of a certain quantity of healthy gastric juice as well as of the juice of the other chylopoietic viscera, as the liver, spleen, and pancreas, either thrown into the stomach or the smaller intestines. 4th. The natural peristaltic motion of the stomach. 5th. The pressure of the contraction and relaxation of the abdominal muscles and diaphragm. From these circumstances, the particles of the food are softened, dissolved, diluted, and intimately mixed into the soft pap, called chyme, which passes through the pylorus of the stomach into the duodenum.

In the process of digestion the two substances chiefly noticeable and of chief importance are the *gastric juice*, as the grand operating cause, and the *chyle*, the direct effect produced, and which constitutes the prima pabulum of the blood.

The *gastric juice* is separated by the minute arteries that open into the cavity of the stomach. It is, indeed, a most powerful solvent, but it does not act indiscriminately on all substances. To prove the truth of this observation, it is sufficient to observe, that if grains of corn are put into a perforated tube, and a granivorous bird is made to swallow it, the corn will remain the usual time in the stomach without alteration: whereas, if the husk of the grain is previously taken off, the whole of it will be converted into chyme. It is well known, too, that many substances pass unaltered through the intestines of animals, and consequently are not acted upon by the gastric juice. This is the case frequently with grains of oats when they have been swallowed by horses entire with their husks on. This is the case also with the seeds of apples, &c. when swallowed entire by man; yet these very substances, if they have been previously ground sufficiently by the teeth, are digested. It appears, therefore, that it is chiefly the husk or outside of these substances which resists the action of the gastric juice. We see also, that trituration greatly facilitates the conversion of food into chyme.

The gastric juice is not the same in all animals; for many animals cannot digest the food on which others live. The conium maculatum (hemlock), for instance, is a poison to man instead of food, yet the goat often feeds upon it. Many animals, as sheep, live wholly upon vegetables; and if they be made to feed on animals, their stomachs will not digest them: others again, as the eagle, feed wholly on animal substances, and cannot digest vegetables.

The gastric juice does not continue always of the same nature, even in the same animal; it changes gradually according to circumstances. Graminivorous animals may be brought to live on animal food; and after they have been accustomed to this for some time, their stomachs become incapable of digesting vegetables. On the other hand, those animals which naturally digest nothing but animal food may be brought to digest vegetables.

What is the nature of the gastric juice, which possesses these singular properties? It is evidently different in different animals; but it is a very difficult task, if not an impossible one, to obtain it in a state of purity. Various attempts have indeed been made by very ingenious philosophers to procure it; but their analysis of it is sufficient to shew us, that they have never obtained it in a state of purity.

The methods which have been used to procure gastric juice are, first, to kill the animal whose gastric juice is to be examined, after it has fasted for some time. By this method Spallanzani collected 37 spoonfuls from the first two stomachs of a sheep. It was of a green colour, undoubtedly owing to the grass which the animal had eaten. He found also half a spoonful in the stomach of some young crows which he killed before they had left their nest.

Small tubes of metal pierced with holes, and containing a dry sponge, have been swallowed by animals; and when vomited up, the liquid imbibed by the sponge is squeezed out. By this method, Spallanzani collected 481 grains of gastric juice from the stomachs of five crows.

A third method consists in exciting vomiting in the morning, when the stomach is without food. Spallanzani tried this method twice upon himself, and collected one of the times, 1 oz. 32 gr. of liquid; but the pain was so great, that he did not think proper to try the experiment a third time. Mr. Gosse, however, who could excite vomiting whenever he thought proper, by swallowing air, has employed that method to collect gastric juice.

Spallanzani has observed that eagles throw up every morning a quantity of liquid, which he considers as gastric juice; and he has availed himself of this to collect it in considerable quantities.

It is almost unnecessary to remark how imperfect these different methods are, and how far every conclusion drawn from the examination of such juices must deviate from the truth. It is impossible that the gastric juice obtained by any one of these processes can be pure; because in the stomach it must be constantly mixed with large quantities of saliva, mucus, bile, food, &c. It may be questioned, indeed, whether any gastric juice at all can be obtained by these methods; for as the intention of the gastric juice is to convert the food into chyme, in all probability it is only secreted, or at least thrown into the stomach, when food is present.

We need not be surprised, then, at the contradictory accounts concerning its nature given us by those philosophers who have attempted to examine it; as these relate not so much to the gastric juice, as to the different substances found in the stomach. The idea that the gastric juice can be obtained by vomiting, or that it is thrown up spontaneously by some animals, is, to say the least of it, very far from being probable.

According to Brugnatelli, the gastric juice of carnivorous animals, as hawks, kites, &c. has an acid and resinous odour, is very bitter, and not at all watery; and is composed of an uncombined acid, a resin, an animal substance, and a small quantity of muriat of soda. The gastric juice of herbivorous animals, on the contrary, as goats, sheep, &c. is very watery, a little muddy, has a bitter saltish taste, and contains ammonia, an animal extract, and a pretty large quantity of muriat of soda. Mr. Carminati found the same ingredients; but he supposes that the ammonia had been formed by the putrefaction of a part of their food, and that in reality the gastric juice of these animals is of an acid nature.

The accounts which have been given of the gastric juice of man are so various, that it is not worth while to transcribe them. Sometimes it has been found of an acid nature, at other times not. The experiments of Spallanzani are sufficient to shew, that this acidity is not owing to the gastric juice but to the food. He never found any acidity in the gastric juice of birds of prey, nor of serpents, frogs, and fishes. Crows gave an acidulous gastric juice only when fed on grain; and he found that the same observation holds with respect to dogs, herbivorous animals, and domestic fowls. Carnivorous birds threw up pieces of shells and coral without alteration; but these substances were sensibly diminished in the stomachs of hens, even when inclosed in perforated tubes. Spallanzani himself swallowed calcareous substances inclosed in tubes; and when he fed on vegetables and fruits, they were sometimes altered and a little diminished in weight, just as if they had been put into weak vinegar; but when he used only animal food, they came out untouched. According to this philosopher, whose experiments have been by far the most numerous, the gastric juice is naturally neither acid nor alkaline. When poured on the carbonat of potass, it causes no effervescence.

Such are the results of the experiments on the juices taken from the stomach of animals. No conclusion can be drawn from them respecting the nature of the gastric juice. But from the experiments which have been made on the digestion of the stomach, especially by Spallanzani, the following facts are established.

The gastric juice attacks the surface of bodies, unites to the particles of them, which it carries off, and cannot be separated from them by filtration. It operates with more energy and rapidity the more the food is divided, and its action is increased by a warm temperature.

The food is not merely reduced to very minute parts; its taste and smell are quite changed; its sensible properties are destroyed, and it acquires new and very different ones. This juice does not act as a ferment; so far from it that it is a powerful antiseptic, and even restores flesh already putrefied. There is not the smallest appearance of such a process; indeed, when the juice is renewed frequently, as in the stomach, substances dissolve in it with a rapidity which excludes all idea of fermentation. Only a few air-bubbles make their escape, which adhere to the alimentary matter, and buoy it up to the top, and which are probably extricated by the heat of the solution.

The properties of human *chyle* have not been investigated: but according to Dr. Fordyce, as far as experiments have been carried, the chyle of quadrupeds, a class of animals in which man is to be ranked as far as he is not improved by culture, is so similar as not to be distinguished, not even in natural classes the most opposite to each other in their food, structure, and habits of life. The chyle of a dog or of a wolf differs in nothing, as far as experiment has gone, from that of a sheep or of an ox.

The chyle consists of three parts, one part which is fluid and contained in the lacteals, but coagulate on extravasation. The second part consists of a fluid, which is coagulable by heat, and in all its properties hitherto observed, it is consonant to the serum of the blood.

The third part consists of globules, which render the whole white and opake. These globules have been supposed by many to be an expressed oil, but this has not been proved. Neither has it been perfectly demonstrated that sugar is contained in the chyle, although it has been made very probable. The difficulty of determining these points is, the small quantity that can be collected, the largest animals not supplying more than one ounce, or two, at the most. However, the part coagulating on extravasation, the part agreeing with serum in its qualities, the globular part, which in some animals, but not in quadrupeds, exists without giving whiteness to the chyle, alone, or along with sugar, form the essential parts of the chyle. A great many substances may enter the lacteals along with the chyle; even solids reduced to a fine powder. When indigo has been thrown into the intestine of a sheep, Dr. Fordyce has seen the chyle rendered quite blue; yet indigo is not soluble in water, but is a solid reduced to a very fine powder. Musk likewise gets into the chyle, giving it a strong smell, and a great variety of other substances of various colours, various tastes, and various smells; each of them giving colour, or taste, or smell to the chyle. The lacteals, however, reject some substances in whatever manner they are applied; amongst these are green vitriol and infusion of galls, for the chyle gives no colour when either is given with food to the animal, or thrown into the intestine, and it is afterward tried by them as tests of each other.

According to Dr. Fordyce, the chyle is not formed in the stomach. Milk is that food which comes nearest the chyle in its external appearance, and as it is formed for the nourishment of young animals whose digestive organs are weak, and necessity for nourishment great, it is obvious that chyle is ready prepared, or nearly so, in the vessels of the mother, to save the powers of digestion in the infant. Yet, on this entering the stomach, there is a juice which coagulates it in a few minutes after, retards it in the stomach, and retains it there for a considerable length of time. The same is produced on the white of egg, and serum of the blood. This of itself would sufficiently prove that there is a process which it must go through previous to its being formed into chyle. It further appears, that food dissolved in water so as to form a solution not capable of being coagulated and not detained in the stomach, gives very little nourishment in proportion to the same quantity of the same food given in a solid form, or a coagulable one. Hence a decomposition and recombination take place, but these do not appear to be the formation of chyle. Another circumstance is, that if it were chyle, the absorbents, which are numerous in the stomach, would take it up as fast as it is produced, and would have the appearance of, and actually be, lacteals, and be perceived; but if a living animal be opened at any time during digestion, there is no appearance of any chyle absorbed from the stomach, and hence there is none to be absorbed. If we throw milk into a portion of the jejunum, it will be absorbed by the lacteals, but if thrown into the stomach of the same animal, the milk will not be absorbed by the lymphatics; hence it may be said that the absorbents of the stomach refuse what those of the jejunum readily take up; but the case is, that the milk is instantly coagulated in the stomach, and not in the jejunum, which coagulation will perfectly prevent it from being absorbed; but all those substances which are not changed by the coagulating juice of the stomach are equally taken up by the lymphatics in the stomach and lacteals.

It therefore appears, that the use of the stomach is only to change the food into a new substance, the chyme, which is the only substance that can be converted into chyle. When this chyme is propelled into the duodenum, it is then converted into chyle, and not before; but the duodenum cannot have this action upon it, unless it has previously undergone the action of the stomach. There is nothing, therefore, in the whole doctrine of different species of food which can have any respect to any part of the body, excepting the stomach itself; for only those parts of it that are converted into chyme will pass into the duodenum and be converted into chyle; the other parts that have not undergone this change in the stomach will pass through the duodenum unchanged, and be evacuated. So that, according to Dr. Fordyce, it is perfectly immaterial what is the species of food, farinaceous matter, animal mucilage, apples, chicken, salmon or goose. So long as it has undergone the process of the stomach, and is converted into the matter formed by that process, it gives equally good nourishment, and is equally innoxious, because it becomes exactly the same. Sometimes a little whitish matter is seen about the pylorus, but this is not perfect chyle, for it is not seen in the absorbents of the stomach, even although in the middle of digestion the pylorus be tied round by introducing a piece of tape, forming a ligature round it, and retaining the remaining food in the stomach. The matter, therefore, formed in the stomach is converted into chyle in the duodenum, and continues to be converted in the jejunum. As the coagulating juice of the stomach, as far as can be judged, does not enter into the matter or chyme formed in the stomach from the food, nor the other juices of the stomach, only in so far as they supply water; so neither do the juices of the duodenum, the bile, pancreatic juice, or fluids secreted in the glands of the duodenum, or which may pass through the exhalents, at all appear to enter into any part of the chyle. For, according to Dr. Fordyce, if the ductus communis choledochus be obstructed by a stone, or if the body of an animal be opened when food has been thrown into the stomach, and the duct be tied up, by which the bile is prevented from getting into the duodenum; in either case the chyle is formed without any particle of bile being admitted; and the same may be said of the pancreatic juice: so that chyle is solely the product of the matter formed by the digestive process of the stomach. The chyle is always the same, but not always in the same proportion to the quantity of food. Scarcely any digestible matter is ever found in the duodenum, in the form it was thrown into the stomach; hence all of it seems to undergo some change or other.

Digestion (Chemical). An operation in which such matters as are intended to act tardily on each other are exposed to a low heat, continued for some time.

Digestion (Chirurgical). The disposition of a wound, abscess, or ulcer to a bland and healthy suppuration.

Digestion, also denotes farther; 1. reduction to a plan (*Temple*). 2. The act of disposing a wound to generate matter.

DIGE′STIVE. *a.* (from *digest.*) 1. Having the power to cause digestion (*Brown*). 2. Capable by heat to soften and subdue (*Hale*). 3. Disposing; methodising (*Dryden*).

Dige′stive. *s.* An application which disposes a wound to generate matter (*Wiseman*).

DIGESTIVES. (*digestiva, medicamenta*: from *digero*, to dissolve.) A term applied by surgeons to those substances which when applied to an ulcer or wound, promote suppuration: such are the unguentum resinæ flavæ, unguentum elemi, warm poultices, fomentations, &c.

DIGESTOR, in chemistry, a thick iron boiler furnished with a strong lid perfectly tight, that may be screwed down with force sufficient to resist the expansive power of the inclosed steam, whereby the water or other liquid which it contains may be heated considerably higher than the natural boiling point of water when unconfined. But as the strength of the vessel diminishes, and the force of the expansion increases as the heat is raised, there is a point at which the vessel would burst, and a dangerous explosion would take place, if it were not prevented by a safety-valve, with which all these vessels are furnished, and which will open and let part of the confined air escape when the expansion has reached a certain extent. There are some cases in which a digestor proves a useful part of chemical apparatus, but it is not often employed.

DI′GGER. *s.* (from *dig.*) One that opens the ground with a spade (*Boyle*).

DIGGES (Leonard), an English mathematician, born at Barham, in Kent, and educated at University college, Oxford. He wrote a treatise on Surveying, another on Geometry, and one entitled, Prognostication everlasting of right good Effect; or, Choice Rules to judge the Weather by Sun, Moon, and Stars, &c. He died about 1574. (*Watkins*).

Digges (Thomas), son of the preceding. He was educated at Oxford, after which he became muster-general of the forces sent by queen Elizabeth to the Netherlands. He wrote some military pieces, and some on astronomy, and other subjects of mathematics. He died in 1595. (*Watkins*).

Digges (Sir Dudley), the eldest son of the above, born in 1583, and educated at University college, Oxford. He received the honour of knighthood from James I. who sent him ambassador to Russia; but in the parliament of 1621 he resisted the court measures with great spirit, and continued to do so in the following reign, for which he was sent to the Tower, where, however, he did not remain long. In 1636 he was bought over by the grant of the mastership of the rolls, which he held but a short time, for he died in 1639. He wrote, 1. A Defence of Trade, 1615, 4to.; 2. A Discourse concerning the Rights and Privileges of the Subject, in a Conference desired by the Lords, and had by a Committee of both Houses, April 3, 1628, 4to.; 3. Sundry Speeches in Rushworth's Collections. His son Dudley, who died in 1643, was a loyal and learned man, and wrote some tracts against rebellion. (*Watkins*).

To DIGHT. *v. a.* (ꝺihtan, to prepare, Saxon.) 1. To dress; to deck; to adorn (*Milton*). 2. To put on (*Spenser*).

DIGIT. *s.* (*digitus*, Latin.) 1. The measure of length containing three-fourths of an inch (*Boyle*). 2. The twelfth part of the diameter of the sun or moon; as noticed in eclipses. 3. Any of the numbers expressed by single figures; any number to ten (*Brown*).

DI′GITATED. *a.* (from *digitus*, Latin.) Branched out into divisions like fingers (*Brown*).

DIGITALIS. (*digitalis*, from *digitus*, a finger; because its flower represents a finger.) Foxglove. In botany, a genus of the class and order didynamia, angiospermia. Calyx five-parted; coral campanulate, five-cleft, swelling; capsule ovate, two-celled, many-seeded. Four species; chiefly of the south of Europe: one, however, d. purpurea, purple foxglove, is a plant common to our own hedges, and well known to every one; the leaves of which have a bitter nauseous taste, but no remarkable smell; they have been long used externally to ulcers and scrophulous tumours with considerable advantage. Respecting the internal use of this plant, we are told of its good effects in epilepsy, scrophula, and phthisis; and Dr. Withering and others have established its reputation as a diuretic in dropsies. It is, however, necessary to observe, that this remedy must be cautiously administered; for the plant is of so deleterious a nature, that three grains of the dried leaf have been known to produce the most dreadful tormina.

From its effects on the animal system it appears to have a power of diminishing arterial action, and stimulating that of the lymphatics: and hence, if circumspectly employed, may be used advantageously in all cases in which such antagonism of action is indicated.

DIGITATE, in botany, applied to the leaf of a plant. Fingered leaf. When a simple or undivided petiole connects several distinct leaflets at the end of it. This is a sort of compound leaf; whilst the palmate, which in some measure resembles it, is a simple leaf. The digitate leaf, to correspond with the name, should have five leaflets spreading out like the open fingers: but Linnéus makes binate, ternate and quinate leaves to be species of the digitate; and the leaves of horse-chesnut, though they have more leaflets than five, are nevertheless called digitate.

DIGITUS. (*digitus.*) In anatomy, a finger or toe.

Digitus manus. A finger. The fingers and thumb in each hand consist of fourteen bones, there being three to each finger; they are denominated according to their order the first, second, and third phalanx. The first is longer than the second, and the second longer than the third. What has been said of the fingers applies to the toes also.

Digitus pedis. A toe. See Digitus manus.

DIGLADIA'TION. *s.* (*digladiatio*, Lat.) A combat with swords; any quarrel (*Glan.*).

DIGLYPH, in architecture, a kind of imperfect triglyph, console, &c. having two channels.

DIGNE, a town of France, in the department of the Lower Alps, with a bishop's see. It is famous for its hot-baths. Lat. 44. 10 N. Lon. 6. 12 E.

DI'GNIFIED. *a.* (from *dignify.*) Invested with some dignity (*Ayliffe*).

DIGNIFICA'TION. *s.* (from *dignify.*) Exaltation (*Walton*).

To DI'GNIFY. *v. a.* (from *dignus*, and *facio*, Latin.) 1. To advance; to prefer; to exalt. 2. To honour; to adorn; to improve by some adventitious excellence, or honourable distinction (*Ben Jonson*).

DI'GNITARY. *s.* (from *dignus*, Latin.) A clergyman advanced to some dignity, to some rank above that of a parochial priest (*Swift*).

DI'GNITY. *s.* (*dignitas*, Latin.) 1. Rank of elevation (*Hooker*). 2. Grandeur of mien (*Clarissa*). 3. Advancement; preferment; high place (*Shakspeare*). 4. (Among ecclesiastics.) That promotion or preferment to which any jurisdiction is annexed (*Ayliffe*). 5. Maxim; general principle (*Brown*).

Dignity, in the human character, the opposite of meanness. Man is endued with a sense of the worth and excellence of his nature: he deems it more perfect than that of the other beings around him; and he perceives that the perfection of his nature consists in virtue, particularly in virtues of the highest rank. To express that sense, the term dignity is appropriated. Further, to behave with dignity, and to refrain from all mean actions, is felt to be, not a virtue only, but a duty: it is a duty every man owes to himself. By acting in that manner, he attracts love and esteem: by acting meanly, or below himself, he is disapproved and contemned. This sense of the dignity of human nature reaches even our pleasures and amusements. If they enlarge the mind by raising grand or elevated emotions, or if they humanize the mind by exercising our sympathy, they are approved as suited to the dignity of our nature: if they contract the mind by fixing it on trivial objects, they are contemned as not suited to the dignity of our nature. Hence, in general, every occupation, whether of use or amusement, that corresponds to the dignity of man, is termed manly; and every occupation below his nature is termed childish.

To those who study human nature the question has always appeared intricate how it comes that generosity and courage are more esteemed, and bestow more dignity, than good nature, or even justice; though the latter contribute more than the former to private as well as to public happiness? The answer seems to be this. Human virtues, like other objects, obtain a rank in our estimation, not from their utility, which is a subject of reflection, but from the direct impression they make on us. Justice and good-nature are, according to this mode of estimation, a sort of negative virtues, that scarcely make any impression, but when they are transgressed: courage and generosity, on the contrary, producing elevated emotions, enliven greatly the sense of a man's dignity, both in himself and others; and hence courage and generosity are in more regard, and considered as of greater dignity, than the other virtues mentioned.

This leads us to examine more directly emotions and passions with respect to the present subject: and it will not be difficult to form a scale of them, beginning with the meanest, and ascending gradually to those of the highest rank and dignity. Pleasure felt as at the organ of sense, named corporeal pleasure, is perceived to be low; and when indulged to excess, is perceived also to be mean: for that reason persons of any delicacy dissemble the pleasure they take in eating and drinking. The pleasures of the eye and ear, having no organic feeling, and being free from any sense of meanness, are indulged without any shame: they even rise to a certain degree of dignity when their objects are grand or elevated. The same is the case of the sympathetic passions: a virtuous person behaving with fortitude and dignity under cruel misfortunes, makes a capital figure; and the sympathizing spectator feels in himself the same dignity. Sympathetic distress at the same time never is mean: on the contrary, it is agreeable to the nature of a social being, and has general approbation. The rank that love possesses in the scale depends in a great measure on its object: it possesses a low place when founded on external properties merely; and is mean when bestowed on a person of inferior rank without any extraordinary qualification: but when founded on the more elevated internal properties, it assumes a considerable degree of dignity. The same is the case of friendship. When gratitude is warm, it animates the mind; but it scarce rises to dignity. Joy bestows dignity when it proceeds from an elevated cause. If we can depend upon induction, dignity is not a property of any disagreeable passion: one is slight, another severe; one depresses the mind, another animates it; but there is no elevation, far less dignity, in any of them. Revenge, in particular, though it inflame and swell the mind, is not accompanied with dignity, not even with elevation: it is not however felt as mean or groveling, unless when it takes indirect measures for gratification. Shame and remorse, though they sink the spirits, are not mean. Pride, a disagreeable passion, bestows no dignity in the eye of a spectator. Vanity always appears mean, and extremely so where founded, as commonly happens, on trivial qualifications.

We proceed to the pleasures of the understanding, which possess a high rank in point of dignity. Of this every one will be sensible, when he considers the important truths that have been laid open by science: such as general theorems, and the general laws that govern the material and moral worlds. The pleasures of the understanding are suited to a man as a rational and contemplative being, and they tend not a little to ennoble his nature; even to the Deity he stretcheth his contemplations, which, in the discovery of infinite power, wisdom, and benevolence, afford delight of the most exalted kind. Hence, it appears, that the fine arts, studied as a rational science, afford entertainment of great dignity; superior far to what they afford as a subject of taste merely.

But contemplation, however in itself valuable, is chiefly respected as subservient to action; for man is intended to be more an active than a contemplative being. He accordingly shews more dignity in action than in contemplation: generosity, magnanimity, heroism, raise his character to the highest pitch: these best express the dignity of his nature, and advance him nearer to divinity than any other of his attributes.

Having endeavoured to assign the efficient cause of dignity and meanness by unfolding the principle on which they are founded, we proceed to explain the final cause of the dignity or meanness bestowed upon the several particulars above mentioned, beginning with corporeal pleasures. These, as far as useful, are, like justice, fenced with sufficient sanctions to prevent their being neglected. Hunger and thirst are painful sensations; and we are incited to animal love by a vigorous propensity: were corporeal pleasures dignified over and above with a place in a high class, they would infallibly overturn the balance of the mind, by outweighing the social affections. This is a satisfactory final cause for refusing to these pleasures any degree of dignity: and the final cause is not less evident of their meanness, when they are indulged to excess. The more refined pleasures of external sense, conveyed by the eye and the ear from natural objects and from the fine arts, deserve a high place in our esteem, because of their singular and extensive utility: in some cases they rise to a considerable dignity: and the very lowest pleasures of the kind are never esteemed mean or groveling. The pleasure arising from wit, humour, ridicule, or from what is simply ludicrous, is useful by relaxing the mind after the fatigue of more manly occupation: but the mind when it surrenders itself to pleasure of that kind, loses its vigour, and sinks gradually into sloth. The place this pleasure occupies in point of dignity is adjusted to these views: to make it useful as a relaxation, it is not branded with meanness; to prevent its usurpation, it is removed from that place but a single degree: no man values himself for that pleasure, even during gratification; and if it have engrossed more of his time than is requisite for relaxation, he looks back with some degree of shame.

In point of dignity, the social emotions rise above the selfish, and much above those of the eye and ear: man is by his nature a social being; and to qualify him for society, it is wisely contrived that he should value himself more for being social than selfish.

The excellency of man is chiefly discernible in the great improvements he is susceptible of in society: these, by perseverance, may be carried on progressively, above any assignable limits; and even abstracting from revelation, there is great probability that the progress begun here will be completed in some future state. Now, as all valuable improvements proceed from the exercise of our rational faculties, the author of our nature, in order to excite us to a due sense of these faculties, hath assigned a high rank to the pleasures of the understanding: their utility, with respect to this life as well as a future, entitles them to that rank.

But as action is the aim of all our improvements, virtuous actions justly possess the highest of all the ranks. These, we find, are by nature distributed into different classes, and the first in point of dignity assigned to actions that appear not the first in point of use: generosity, for example, in the sense of mankind is more respected than justice, though the latter is undoubtedly more essential to society; and magnanimity, heroism, undaunted courage, rise still higher in our esteem: the reason of which is explained above.

DIGNO′TION. *s.* (from *dignosco*, Latin.) Distinction; distinguishing mark (*Brown*).

To DIGRE′SS. *v. n.* (*digressus*, Latin.) 1. To turn aside out of the road. 2. To depart from the main design (*Locke*). 3. To wander; to expatiate (*Brerewood*). 4. To transgress; to deviate: not in use (*Shakspeare*).

DIGRE′SSION. *s.* (*digressio*, Latin.) 1. A passage deviating from the main tenour or design of a discourse (*Denham*). 2. Deviation (*Brown*).

DIGY′NIA (δις and γυνη.) The name of an order in Linnéus's Artificial System, comprehending those plants which have two pistils to a flower. This order is the second in the first thirteen classes, except the ninth.

DIHELIOS, the name given by Kepler to the transverse diameter of a planet's elliptic orbit.

DII, in the ancient mythology, a train of divinities which imagination arrayed in different forms, and armed with different powers. They were endowed with understanding, and were actuated by the same passions which daily afflict the human race. The Romans, generally speaking, reckoned two classes of the gods, the dii majorum gentium, or dii consulentes, and the dii minorum gentium. The former were twelve in number, six males and six females; their names are, Juno, Vesta, Minerva, Ceres, Diana, Venus, Mars, Mercurius, Jupiter, Neptunus, Vulcan, Apollo. (See CONSENTES.) In the class of the latter, were ranked all the gods which were worshipped in different parts of the earth. Besides these, there were some called dii selecti, sometimes classed with the twelve greater gods. There were also some called demi-gods, that is, who deserved immortality by the greatness of their exploits, and for their uncommon services to mankind. Besides these, all the passions, and the moral virtues, were reckoned as powerful deities, and temples were raised to the goddess of concord, peace, &c. According to Hesiod, there were no less than 30,000 gods that inhabited the earth, and were guardians of men, all subservient to the power of Jupiter, and in succeeding ages we find temples erected, and sacrifices offered to unknown gods. In process of time not only good and virtuous men, who had been the patrons of learning and the supporters of liberty, but also thieves, and pirates, were admitted among the gods; and the Roman senate courteously granted immortality to the most cruel and abandoned of their emperors.

DIJON, an ancient city of France, lately an archbishopric, but now the episcopal town of the department of Cote d'Or. It contains about 20,000 inhabitants, and has an academy of sciences and belles-lettres. The public structures, and particularly the churches, are very fine. Lat. 47. 19 N. Lon. 5. 7 E.

DIJUDICA′TION. *s.* (*dijudicatio*, Latin.) Judicial distinction.

DIKE. *s.* (ꝺıc, Sax. *dyk*, Erse.) 1. A channel to receive water (*Pope*). 2. A mound to hinder inundations (*Cowley*).

To DILA′CERATE. *v. a.* (*dilacero*, Lat.) To tear; to rend; to force in two (*Brown*).

DILACERA′TION. *s.* (from *dilaceratio*, Lat.) The act of rending in two (*Arbuthnot*).

To DILA′NIATE. *v. a.* (*dilanio*, Latin.) To tear; to rend in pieces.

To DILA′PIDATE. *v. n.* To go to ruin.

DILAPIDATION, in ecclesiastical law, is where an incumbent of a church living suffers the parsonage-house or out-houses to fall down, or be in decay for want of necessary reparations; or it is the pulling down or destroying any of the houses or buildings belonging to a spiritual living, or destroying of the woods, trees, &c. appertaining to the same; for it is said to extend to committing or suffering any wilful waste, in or upon the inheritance of the church. By 13 Eliz. c. 10. if any ecclesiastical persons, who are bound to repair the buildings whereof they are seised in right of their place or function, suffer them to fall into decay for want of repair, and make fraudulent gifts of their personal estate, with intent to hinder their successors from recovering dilapidations against their executors or administrators, in such case the successor shall have like remedy in the ecclesiastical court, against the grantee of such personal estate, as he might have against the executor or administrator of the predecessor. By 14 Eliz. c. 11. all moneys recovered by dilapidations shall within two years be employed upon the buildings for which they were paid, on pain of forfeiting double so much as shall not be employed, to the queen.

DILATABI′LITY. *s.* (from *dilatable*.) The quality of admitting extension (*Ray*).

DILA′TABLE. *a.* (from *dilate*.) Capable of extension (*Arbuthnot*).

DILATA′TION. *s.* (from *dilatatio*, Lat.) 1. The act of extending into greater space: opposed to *contraction* (*Holder*). (See EXPANSION.) 2. The state of being extended (*Newton*).

To DILA′TE. *v. a.* (*dilato*, Latin.) 1. To extend; to spread out (*Waller*). 2. To relate at large; to tell diffusely and copiously (*Sh.*).

To DILA′TE. *v. n.* 1. To widen; to grow wide (*Addison*). 2. To speak largely and copiously (*Clarendon*).

DILA′TOR. *s.* (from *dilate*.) That which widens or extends (*Arbuthnot*).

DI′LATORINESS. *s.* (from *dilatory*.) Slowness; sluggishness.

DI′LATORY. *a.* (*dilatoire*, Fr.) Tardy; slow; sluggish (*Otway*).

DILATORY PLEAS, in law, are such as are put in merely for delay, and are of three kinds: 1. To the jurisdiction of the court, alleging, that it ought not to hold plea of the matter in hand, as belonging to some other court. 2. To the disability of the plaintiff, by reason whereof he is unable to commence or continue the suit, as that he is outlawed, attainted, an infant, or the like. 3. In abatement, as for some defect in the writ, as a misnomer of the defendant, or other want of form in any material respect. These pleas were formerly used as merely dilatory, without any foundation of truth, and calculated only for delay; but now by stat. 4 and 5 Anne, c. 16, no dilatory plea shall be admitted, without affidavit made of the truth thereof, or some probable matter shewn to the court to induce them to believe it true. 3 Black. 301.

DILATRIS, in botany, a genus of the class triandria, order monogynia. Coral six-petalled, hairy; third filament less than the others; stigma simple; capsule globular, inferior, three-celled. Three species, all natives of the Cape. D. corymbosa, the most elegant, is a villous-plant except in the inside of the flowers; with leaves lanceolate, smooth; umbel fastigiate; flowers dark-purple.

DILE'CTION. *s.* (*dilectio*, Latin.) The act of loving; kindness (*Boyle*).

DILEMMA, Διλημμα, in logic, an argument consisting of two or more propositions, so disposed, that grant which you will of them you will be pressed by the conclusion.

The word is formed from the Greek δις, *bis*, twice, and λημμα, *sumptio*.

A dilemma is an argument consisting of two contrary parts, or sides, either of which catches the adversary. And hence it is also called syllogismus cornutus, a horned syllogism, its horns being so disposed, that if you avoid the one, you run upon the other.

It is also called crocodilinus, by reason that as the crocodile leads such as follow it into the water, and pursues such as fly it, to destroy them; so, whatever the adversary either affirms, or denies, in this kind of syllogism, is turned to his disadvantage.

Cicero uses this fine dilemma, to prove, that all pain is to be borne with patience: "Omnis dolor aut est vehemens, aut levis; si levis, facile feretur; si vehemens, certe brevis futurus est."

Nor must we here omit that beautiful dilemma of Tertullian, whereby he clears the Christians, and accuses Trajan, who had forbad the seeking them out, and yet ordered them to be punished when found: "O sententiam necessitate confusam! negat inquirendos, ut innocentes; et mandat puniendos, ut nocentes: parcit et sævit, dissimulat et animadvertit! quid temetipsum censura circumvenis? si damnas, cur non et inquiris? si non inquiris, cur non et absolvis?"

For a dilemma to be legitimate, there are two things required: 1. A full enumeration of parts; thus that of Aristippus, whereby he dissuades from marriage, is invalid, as being defective in the enumeration; there being a middle degree, or form, between handsome and ugly.

2. That the dilemma press the adversary alone, and that the person who makes it be not liable to have it retorted upon him. This was the case in that celebrated dilemma of the sophist Protagoras, which the areopagites, with all their wisdom, were not able to resolve.

A youth named Evathlus, engaged with Protagoras to learn dialectics upon condition that he should pay him a large sum of money, the first cause he pleaded, in case he gained the same. Evathlus, when fully instructed, refusing to pay the condition, Protagoras brings his action, arguing thus: "You must pay the money, however the cause go; for if I gain, you must pay in consequence of the sentence, as being cast in the cause; and if you gain it, you must pay in pursuance of our covenant." "Nay," retorts Evathlus, "which way soever the cause go, you will have nothing: for if I prevail, the sentence gives it, that nothing is due to you; and if I lose, then there is nothing due by the covenant."

DILETTANTE. (Ital.; equivalent with *amateur*, French. The word is formed from *dilettare*, of *dilectator*, Lat.) One who gives and receives delight from the succession and combinations of sounds in music.

DILI. See Delos.

DI'LIGENCE. *s.* (*diligentia*, Latin.) Industry; assiduity; constancy in business (*Peter*).

Dr. Barrow has five fine sermons, on diligence or industry in general; on industry in our general calling, as Christians; in our particular calling, as gentlemen; and in our particular calling, as scholars.

Diligence, in Scots law, signifies either that care and attention which parties are bound to give, in implementing certain contracts or trusts, and which varies according to the nature of the contract: or it signifies certain forms of law, whereby the creditor endeavours to operate his payment, either by affecting the person or estate of the debtor.

DI'LIGENT. *a.* (*diligens*, Latin.) 1. Constant in application; persevering in endeavour; assiduous; not idle (*Proverbs*). 2. Constantly applied; prosecuted with activity and perseverance (*Deuteronomy*).

DI'LIGENTLY. *ad.* With assiduity; with heed and perseverance (*Dryden*).

DILL, in botany. See Anethum.

DILLA (Mount), a remarkable promontory of the coast of Malabar, 20 miles N. by W. of Tillicherry. Lon. 75. 2 E. Lat. 12. 1 N.

DILLENIA, in botany, a genus of the class polyandria, order polygynia. Calyx five-leaved; petals five; capsules many-seeded, united, filled with pulp. Eight species; all Indian plants; some trees, and some shrubs.

DILLENIUS (John James), an eminent botanist, born at Darmstadt in Germany, in 1681, and educated at the university of Giessen. He contributed several curious papers to the Miscellanea Curiosa, and, in 1721, accompanied Dr. Sherard to England, where he spent the remainder of his days. Soon after his arrival he undertook a new edition of Ray's Synopsis

Stirpium Britannicarum. He was appointed the first botanical professor at Oxford on Dr. Sherard's foundation, and there he continued to reside till his death. In 1735 the university admitted him to the degree of M.D. and the year following he was visited by Linnéus. He died in 1747. He published an elaborate work entitled, Hortus Elthamensis, and a History of Mosses.

DILLWYNIA, in botany, a genus of the class decandria, order monogynia. Perianth bell-shaped, two-lipped; the upper, of two oblique divaricated segments, lower, of three direct, nearly equal ones; corol papilionaceous, five-petalled; standard broad, almost kidney-shaped, with a linear claw of its own length; style short and thick, bent upwards; stigma obtuse, downy; legume ovate, inflated, of one cell; seeds two. Five species; bushy shrubs of New Holland.

DILU′CID. *a.* (*dilucidus*, Latin.) 1. Clear; not opaque. 2. Clear; plain; not obscure.

To DILU′CIDATE. *v. a.* (*dilucidare*, Latin.) To make clear or plain; to explain; to free from obscurity (*Brown*).

DILUCIDA′TION. *s.* (*dilucidatio*, Lat.) The act of making clear; explanation.

DI′LUENT. *a.* (*diluens*, Latin.) Having the power to thin other matter.

Diluents, in medicine, Attenuants, which see.

To DILU′TE. *v. a.* (*diluo*, Latin.) 1. To make thin (*Locke*). 2. To make weak (*Newton*).

DILU′TER. *s.* (from *dilute.*) That which makes any thing else thin (*Arbuthnot*).

DILU′TION. *s.* (*dilutio*, Latin.) The act of making any thing thin or weak (*Arbuthnot*).

DILU′VIAN. *a.* (from *diluvium*, Latin.) Relating to the deluge (*Burnet*).

DIM. *a.* (ꝺimme, Saxon.) 1. Not having a quick sight (*Davies*). 2. Dull of apprehension (*Rogers*). 3. Not clearly seen (*Locke*). 4. Obstructing the act of vision; not luminous; somewhat dark (*Spenser*).

To Dim. *v. a.* (from the adjective.) 1. To cloud; to darken (*Locke*). 2. To make less bright; to obscure (*Spenser*).

DIMACHÆRUS, in antiquity, a gladiator who fought with two swords.

DIMENSION, in geometry, is either length, breath, or thickness; hence a line has one dimension, viz. length; a superficies two, viz. length and breadth; and a body or solid has three, viz. length, breadth, and thickness.

Dimension, in algebra, a term applied to the powers of quantities in equations. Thus, in a simple equation, the unknown quantity is said to be of one dimension; in a quadratic, of two dimensions; in a cubic, of three; and so on.

DIME′NSIONLESS. *a.* (from *dimension.*) Without any definite bulk (*Milton*).

DIME′NSIVE. *a.* (*dimensus*, Latin.) That marks the boundaries or outlines (*Davies*).

DIMICA′TION. *s.* (*dimicatio*, Latin.) A battle; the act of fighting; contest.

DIMIDIA′TION. *s.* (*dimidiatio*, Latin.) The act of halving; division into two equal parts.

To DIMI′NISH. *v. a.* (*diminuo*, Latin.) 1. To make less by abscission or destruction of any part: the opposite to *increase* (*Locke*). 2. To impair; to lessen; to degrade (*Milton*). 3. To take any thing from that to which it belongs: the contrary to *add* (*Deuteronomy*).

To Dimi′nish. *v. n.* To grow less; to be impaired (*Dryden*).

DIMINISHED INTERVAL, in music, is such as, by the application of a sharp or a natural, to the lower tone, or of a flat or a natural, to the upper tone, becomes contracted within its natural compass. Thus, a *diminished second*, is a major semitone lessened by a minor semitone. A *diminished third*, is a third minor lessened by a semitone minor. A *diminished fifth*, is a perfect fifth lessened by a minor semitone. And a *diminished octave*, is an octave lessened by a minor semitone. In every diminished interval, the alteration is that of a minor semitone.

DIMI′NISHINGLY. *ad.* (from *diminish.*) In a manner tending to vilify, or lessen (*Locke*).

DIMINU′TION. *s.* (*diminutio*, Latin.) 1. The act of making less (*Hooker*). 2. The state of growing less (*Newton*). 3. Discredit; loss of dignity (*Philips*). 4. Deprivation of dignity; injury of reputation (*K. Charles*).

Diminution, in architecture, a contraction of the upper part of a column, whereby its diameter is made less than that of the lower part.

To attain those two important points in architecture, strength, and the appearance of strength, all architects have made their columns less above than below, which is called their diminution. Some have likewise made them a little bigger towards the middle than at the bottom, which is called their swelling. The Gothic architects, indeed, observe neither diminution nor swelling; their columns are perfectly cylindrical; for which reason they are properly called pillars, in contradistinction to columns.

The first architects probably made their columns in straight lines, in imitation of trees; so that their shaft was a conic frustum: but finding this form abrupt and disagreeable, they made use of some curve, which springing from the extremities of the upper and lower diameters of the column, swelled beyond the sides of the cone, and by that means gave a more pleasing figure to the contour.

For the best methods of diminution, see Architecture, sect. ii.

DIMI′NUTIVE. *a.* (*diminutivus*, Latin.) Small; little; narrow; contracted (*South*).

Dimi′nutive. *s.* (from the adjective.) 1. A word formed to express littleness; as, *manikin*, a *little man* (*Cotton*). 2. A small thing: not in use (*Shakspeare*).

In Latin, Italian, English, and most other tongues, diminutives are formed from primitives, by the addition of a few letters, or syllables; in French, the case is frequently otherwise, the diminutive being sometimes shorter than the primitive, sometimes of the same length.

They have a pleasing effect in that celebrated address of Adrian to his departing soul, which begins,

Animula, vagula, blandula
Hospes comesque corporis, &c.

DIMI′NUTIVELY. *ad.* (from *diminutive.*) In a diminutive manner.

DIMI′NUTIVENESS. *s.* (from *diminutive.*) Smallness; littleness; pettyness.

DI′MISH. *a.* (from *dim.*) Somewhat dim (*Swift*).

DI′MISSORY. *a.* (*dimissorius*, Lat.) That by which a man is dismissed to another jurisdiction (*Ayliffe*).

DIMITY, a kind of cotton cloth originally imported from India, and now manufactured in great quantities in various parts of Britain, especially Lancashire. Dimity is in its fabric similar to fustian; but is ornamented in the loom, either with stripes or fanciful figures, and when woven is seldom dyed, but commonly bleached of a pure white.

DI′MLY. *ad.* (from *dim.*) 1. Not with a quick sight; not with a clear perception (*Milton*). 2. Not brightly; not luminously (*Boyle*).

DI′MNESS. *s.* (from *dim.*) 1. Dulness of sight. 2. Want of apprehension; stupidity (*Decay of Piety*). 3. Obscurity; not brightness.

DIMOCARPUS. In botany, a genus of the class octandria, order monogynia. Calyx five-cleft; corol five-petalled; berries two, one-seeded; seed large. One species: a Chinese plant, the litchi of Du Halde.

DI-MOLTO, in music, *very*, as *Di-molto largo*, very slow.

DIMORPHA. In botany, a genus of the class diadelphia, order decandria. Calyx three or four-cleft; banner very large; crenulate; wingless and heelless; legume one-seeded; compressed, large. Two species; both Guiana trees, from twenty to thirty feet high

DI′MPLE. *s.* (*dint*, a hole; *dintle*, a little hole; by a careless pronunciation *dimple*, *Skinner.*) A small cavity or depression in the cheek, chin, or other part (*Grew*).

To DI′MPLE. *v. n.* (from the noun.) To sink in small cavities (*Dryden*).

DI′MPLED. *a.* (from *dimple.*) Set with dimples (*Shakspeare*).

DI′MPLY. *a.* (from *dimple.*) Full of dimples; sinking in little inequalities (*Warton*).

DIN. *s.* (ꝺyn, Sax.) A loud noise; a violent and continued sound (*Smith*).

To DIN. *v. a.* (from the noun.) 1. To stun with noise (*Otway*). 2. To impress with violent and continued noise (*Swift*).

D-IN-ALT, that musical note, which is a twelfth above G, or the treble cliff note.

DINANT, a town in France, in the department of the North Coast, seated on a craggy mountain, at the foot of which is the river Rance, 20 miles S. of St. Malo. Lon. 1, 58 W. Lat. 48. 20 N.

To DINE. *v. n.* (*diner*, French.) To eat the chief meal about the middle of the day (*Clarendon*).

To DINE. *v. a.* To give a dinner to; to feed (*Dryden*).

DINE′TICAL. *a.* (δινητικος.) Whirling round; vertiginous (*Ray*).

To DING. *v. a.* pret. *dung.* (*dringen*, Dutch.) 1. To dash with violence. 2. To impress with force.

To DING. *v. n.* To bluster; to bounce; to huff: a low word (*Arbuthnot*).

DING-DONG. *s.* A word by which the sound of bells is imitated (*Shakspeare*).

DI′NGLE. *s.* (from ꝺen, or ꝺın, a hollow, Sax.) A hollow between hills; a dale (*Milt.*).

DINGWALL, a royal borough in Ross-shire, seated at the head of the Frith of Cromarty. Lat. 57. 45 N. Lon. 4. 23 W.

DINICS. (*dinica*, from δινος, a giddiness.) Medicines which relieve a vertigo or giddiness of the head.

DI′NING-ROOM. *s.* (*dine*, and *room.*) The principal apartment of the house; the room where entertainments are made (*Taylor*).

DINNER, the meal taken about the middle of the day. The word is derived from the French *disner*, which Du Cange derives from the barbarous Latin *disnare*. Henry Stephens derives it from the Greek, δειπνειν; and will have it written *dipner*. Menage deduces it from the Italian *desinare*, to dine; and that from the Latin *desinere*, to leave off work. It is generally agreed to be the most salutary to make a sufficient dinner, and to eat sparingly at supper. This is the usual practice among us. The French, however, in imitation of the ancient Romans, defer their good cheer till the evening; and people of fashion in England seldom dine till 5 or 6 o'clock in the afternoon.

DINNER-TIME. *s.* The time of dining.

DINOCRATES, an architect of Macedonia, who proposed to Alexander to cut mount Athos in the form of a statue, holding a city in one hand, and in the other a bason, into which all the waters of the mountain should empty themselves. This project Alexander rejected as chimerical, but he employed the talents of the artist in building and beautifying Alexandria. He began to build a temple in honour of Arsinoe, by order of Ptolemy Philadelphus, in which he intended to suspend a statue of the queen, by means of loadstones. His death, and that of his royal patron, prevented the execution of a work which would have been the admiration of every age.

DINOSTRATES, in biography, a famous mathematician of the Platonic school, the brother of Menechmus, and disciple of Plato. Pursuing the steps of his brother, who applied the theory of the conic sections, Dinostrates is said to have made many geometrical discoveries; but he is particularly distinguished as the inventor of the QUADRATRIX, which see. Montucla, however, observes (Hist. Mathem.

v. i. p. 181.) that there is some reason for ascribing the original invention of this curve to Hippias of Elœa, an ingenious philosopher and geometer, contemporary with Socrates.

DINT. *s.* (ꝺynꞇ, Saxon.) 1. A blow; a stroke (*Milton*). 2. The mark made by a blow; the cavity remaining after a violent pressure (*Dryden*). 3. Violence; force; power (*Addison*).

To DINT. *v. a.* To mark with a cavity by a blow, or violent impression (*Donne*).

DINUMERATION. *s.* (*dinumeratio*, Lat.) The act of numbering out singly.

DIO (Chrysostom), a celebrated Grecian orator, was the son of one Pasicrates, and was born at Prusa in Bithynia. He was familiarly acquainted with Apollonius of Tyana, and Euphrates of Tyre, during the reigns of Nero and Vespasian. When he arrived at manhood, he travelled into Egypt and other countries for the improvement of his understanding by a survey of their curiosities, and by conversation with their inhabitants. On his return to Rome, his freedom of speech, in conjunction with his friendship for a man of honour, whom Domitian had put to death, endangered his life with that despotic monster, and drove him into banishment, about the year ninety-four of the Christian æra, with no other companions of his exile besides Plato's dialogue on the Immortality of the Soul, and a single oration of Demosthenes. From the manner in which he mentions the Getæ, Mysians, and Thracians, in several passages of his works, he seems to have penetrated, during his pilgrimage, to the very extremities of the Roman empire. He was recalled from banishment by Nerva, and was caressed by that emperor, but more particularly by Trajan, who conspicuously displayed his esteem and affection, by admitting our philosopher to accompany him on extraordinary occasions, when he rode in his triumphal chariot through the city. That magnanimous prince, the sovereign of the world, did not think himself disgraced by being seen in the procession of imperial Rome with a man of letters sitting by his side. Dio's character, as a moral preceptor, an eloquent writer, and a graceful speaker, was in high estimation with his contemporaries and his successors in the same rhetorical department. He acquired the additional name of Cocceianus from his patron Cocceius, and of Chrysostom, or golden mouthed, from the elegance and purity of his compositions: a name which has occasioned a frequent confusion of our Dio Chrysostom, the heathen philosopher, with John Chrysostom, the Christian preacher, so denominated for the same solid and splendid excellences of his style. In person our author is reasonably presumed, from various circumstances of praise and censure on these topics in his orations, to have been slender, and of inferior stature. He was married, brought up children, and lived to a good old age.

There are still extant 80 of Dio's orations, and some other of his works; the best edition of which is that of Hermand Samuel Raimarus, in 1750, in folio. Some Select Essays of this author were lately translated from the Greek by Mr. Gilbert Wakefield, and published with notes. The above account of Dio is taken from the preface of that ingenious and learned translator.

DIOCE'SAN. *s.* (from *diocess.*) A bishop, as he stands related to his own clergy or flock (*Tatler*).

DIOCESE, or DIOCESS, the circuit or extent of the jurisdiction of a bishop. The word is formed from the Greek διοικησις, government, administration; formed of διοικεω, which the ancient glossaries render *administro*, *moderor*, *ordino*: hence διοικησις της ϖολεως, the administration or government of a city. In England, the provinces are two, Canterbury and York; whereof Canterbury includes twenty-one dioceses, or sees of suffragan bishops; and York three, besides the bishopric of the Isle of Man, which was annexed to the province of York by king Henry the VIII.

DIOCESE is also used in ancient authors, &c. for the province of a metropolitan. *Diocæsis*, διοικησις, was originally a civil government, or prefecture, composed of different provinces. The first division of the empire into dioceses is ordinarily ascribed to Constantine; who distributed the whole Roman state into four, viz. the diocese of Italy, the diocese of Illyria, that of the East, and that of Africa. And yet, long before Constantine, Strabo, who wrote under Tiberius, takes notice, that the Romans had divided Asia into dioceses; and complains of the confusion such a division occasioned in geography, Asia being no longer divided by people, but by dioceses, each whereof had a tribunal or court, where justice was administered. Constantine, then, was only the institutor of those large dioceses, which comprehended several metropoles and governments; the former dioceses only comprehending one jurisdiction or district, or the country that had resort to one judge, as appears from this passage in Strabo, and (before Strabo) from Cicero himself, lib. iii. epist. ad famil. 9. and lib. xiii. ep. 67.

Thus, at first, a province included many dioceses; and afterwards a diocese came to comprise several provinces. In after times the Roman empire became divided into 13 dioceses or prefectures; though including Rome and the suburbicary regions, there were 14. These 14 dioceses comprehended 120 provinces: each province had a proconsul, who resided in the capital or metropolis; and each diocese of the empire had a consul, who resided in the principal city of the district. On this civil constitution, the ecclesiastical one was afterwards regulated: each diocese had an ecclesiastical vicar or primate, who judged finally of all the concerns of the church within his territory. At present there is some further alteration: for diocese does not now signify an assemblage of provinces; but is limited to a single province under a metropolitan, or more commonly to the single jurisdiction of a bishop. Gul. Brito affirms diocese to be properly the territory and extent of a baptismal or parochial church, whence some authors use the word to signify a simple parish. See Parish.

DIOCLEIA, an ancient Athenian festival.

DIOCLETIANUS (Caius Valerius Jovius), *Diocletian*, a celebrated Roman emperor, was born of an obscure family in Dalmatia. He was first a common soldier, and by merit he gradually rose to the office of a general, and at the death of Numerian, he was invested with imperial power. In this high station he rewarded the virtues of Maximilian, by making him his colleague on the throne. He created two subordinate emperors, Constantius and Galerius, whom he called Cæsars. Diocletian has been celebrated for his military virtues; and though naturally unpolished by education, yet he was the friend and patron of learning and genius. He was resolute, active, and well acquainted with the arts, which will endear a sovereign to his people, and make him respectable even in the eyes of his enemies. His cruelty, however, against the followers of Christianity, has been deservedly branded; he raised a most violent persecution against the Christians. After he had reigned 21 years in the greatest prosperity, he publicly abdicated the crown at Nicomedia, on the first of May, A. D. 304, and retired to a private station at Salona. Maximilian, his colleague, followed his example; but not from choice. He lived nine years after his abdication at Salona, and died in the 68th year of his age. Some time previous to his death he was seized with an agitation of body and mind, which allowed him no rest either day or night; he kept rolling himself on the ground, and spent his whole time in sighs, groans, and tears. His body became putrid, and the flesh fell away from his bones in small portions, with so horrible a stench that none were able to go near him, for some days before he died. Yet after his death Licinius placed him among the gods, after the usual manner.

DIODIA, in botany, a genus of the class tetrandria; order monogynia. Corol one-petalled, funnel-form, capsule two-celled, two-seeded. Six species; all West Indian and American plants.

DIODON, in zoology, a genus of the class pisces, order branchiostega. Jaws bony, extended, undivided; aperture of the gills linear; body armed on all sides with long, strong, moveable spines, varied with white and black, hollowed within, and covered with the common skin; no ventral fin. Three species, as follow:

1. D. trystrix: of which there are four varieties.

α. Nearly spherical; spines triangular.

β. Somewhat round; spines shorter, triangular.

γ. Roundish; spines triangular at the base.

δ. Conic-oblong, spines long, a little rounded.

Inhabits the Indian and American seas; grows to two feet in length; body oblong, pale brown; head small, eyes large, irids yellow; has the power of erecting and depressing its spines; and of inflating and contracting its body. The flesh is hard and rank.

2. D. atinga; of which there are two varieties.

α. Oblong; spines round.

β. Spines of the neck and head longer.

Inhabits the American seas, and round the Cape of Good Hope. From twelve to fifteen inches long; body compressed at the sides, blueish, back broad, round, and blackish; belly white, broad, spotted with black; head small, eyes small, irids yellow. Has the same compressive and expansile power as d. trystrix.

3. D. mola. Vertically semi-oval, nearly truncate behind; belly carinate; dorsal, anal, and caudal fins united. Inhabits the Atlantic and Ethiopian seas; body compressed, thicker at the head, truncate behind, and terminating in a longitudinal thin fin, silvery white, growing gradually darker towards the back. The name of sun-fish is given by some naturalists to this genus, but improperly. The real sun-fish is a species of Setrodon, which see.

DIODORUS, an historian, surnamed Siculus, because he was born at Argira in Sicily. He wrote an history of Egypt, Persia, Syria, Media, Greece, Rome, and Carthage, which was divided into 40 books, of which only 15 are extant, with some few fragments. This valuable composition was the work of an accurate enquirer, and it is said that he visited all the places of which he has made mention in his history. It was the labour of 30 years. He often wanders far from the truth. His style is neither elegant, nor too laboured; but it manifests great simplicity, and unaffected correctness. The historian flourished about 44 years B.C. The last edition of his works is that of Amsterdam, 1746, in 2 vols. folio.

DIŒCIA. The name of the twenty-second class in Linnéus's artificial system, comprehending those plants which have no hermaphrodite flowers; but male and female flowers on distinct individuals. Mares et fœminæ habitant in diversis thalamis et domiciliis.

DIOGENES, a celebrated Cynic philosopher of Sinope, banished from his country for coining false money. From Sinope he retired to Athens, where he became the disciple of Antisthenes, the head of the Cynics. Antisthenes at first refused to admit him into his house, and even struck him with a stick. Diogenes calmly said, Strike me, Antisthenes, but never shall you find a stick sufficiently hard to remove me from your presence, whilst there is any thing to be gained from your conversation and acquaintance. Such firmness recommended him to Antisthenes, and he became his most devoted pupil. He dressed himself in the Cynical garment, and walked about the streets with a tub on his head, which served him as a house and a place of repose. Such singularity, joined to the greatest contempt for riches, soon gained him reputation, and Alexander the Great condescended to visit the philosopher in his tub. He asked Diogenes if there was any thing in which he could gratify or oblige him? "Get out of my sun-shine," was the only answer from the philosopher. Such an independence of mind so pleased the monarch, that he turned to his courtiers, and said, "Were I not Alexander, I would wish to be Diogenes." In reply to one who asked Diogenes at what time he ought to dine, he said, "If you are a rich man, when you *will*; if you are poor, when you *can*." "How happy," said one, "is Calisthenes in living with Alexander." "No," said Diogenes, "he is not happy; for he must dine and sup when Alexander pleases." "Would you be revenged upon your enemy," said Diogenes, "be virtuous, that he may have nothing to say against you." One day, on meeting Plato, he trod upon his robe, exclaiming, "I trample under foot the pride of Plato:" the reply of Plato, though cited a thousand times, must be once more transcribed: it was, "Yes, with far greater pride." Diogenes was once sold as a slave, but his magnanimity so pleased his master, that he made him the preceptor of his children, and the guardian of his estates. After a life spent in the greatest misery and indigence, he died B. C. 324, in the 96th year of his age. The inhabitants of Sinope raised statues to his memory, and the marble figure of a dog was placed on a high column erected on his tomb.

Diogenes (Laertius), so called from Laerta in Cilicia, where he was born, an ancient Greek author, who wrote ten books of the Lives of the Philosophers, still extant. In what age he flourished is not easy to determine. The oldest writers who mention him are Sopater Alexandrinus, who lived in the time of Constantine the Great, and Hesychius Milesius, who lived under Justinian. There have been several editions of his Lives of the Philosophers; but the best is that printed in two volumes 4to. at Amsterdam, in 1693.

DIOGMUS. (διωγμος, from διωκω, to persecute.) A distressing palpitation of the heart.

DIOICOUS. (δις, and οικôς, a house.) A diœcous plant. Having male and female flowers on distinct individuals.

DIOMEDEA. Albatross. In zoology, a genus of the class aves, order anseres. Bill straight; upper mandible hooked at the point, lower truncate; nostrils oval, wide, prominent, lateral, tongue very small; feet four-toed, all placed forward. Four species; as follow:

1. D. exulans. Wandering albatross; man of war bird. White; back and wings with white lines; bill pale yellow; legs flesh colour; quill feathers black; tail rounded, lead colour. There are two other varieties from slight differences of colour. Inhabits most seas; but chiefly within the tropics: from three and a half to four feet long; feeds on fishes and molluscæ; is gregarious and migrates; lays numerous white eggs on shore as large as those of a goose; whose white is not to be hardened by boiling. The flesh is tough. Tail-feathers thirteen: wings when extended from ten to thirteen feet. Sometimes swallows a salmon of such length that the whole cannot enter into the stomach, and the tail part hangs out at the mouth; at which period it is easily knocked down and killed; yet otherwise sternly resists with its bill. The male watches the female while sitting, and supplies her with food. The cry is harsh and braying. The large intestine is used as a floating bladder to buoy up fishing nets; the bones are employed by the natives for tobacco pipes, needle-cases and other trinkets.

2. D. spadicea. Chocolate albatross. Bill whitish; body deep chesnut brown; belly pale; face and wings beneath, whitish. Another variety entirely grey-brown. The first inhabits the Pacific ocean; three feet long. The second, China; two feet and a half long.

3. D. chlororhyncos. Yellow-nosed albatross. White: bill black; heel of the upper mandible and base of the lower yellow; body above black-blue, beneath white. Inhabits the Pacific ocean; about three feet long.

4. D. fuliginosa. Sooty albatross. Brown; head, bill, tail, quill-feathers, and claws sooty brown; area of the eyes white. Inhabits the seas within the arctic circle; three feet long.

DIOMEDES, in biography, son of Tydeus and Deiphyle, was king of Ætolia, and one of the bravest of the Grecian chiefs in the Trojan war. He often engaged Hector and Æneas, and wounded Mars and Venus in battle. He went with Ulysses to steal the Palladium from the temple of Minerva, in Troy, and assisted in murdering Rhesus, king of Thrace, and carrying away his horses. During his long absence, his wife Ægiale forgot her marriage vows, and prostituted herself to Cometes, one of her servants. This infidelity was highly displeasing to Diomedes. He resolved to abandon his native country, which was the seat of his disgrace. He came to that part of Italy which has been called Magna Græcia, where he built a city, which he called Argyrippa, and married the daughter of Daunus, the king of the country. He died there in extreme old age, or according to a certain tradition, he perished by the hand of his father-in-law. His death was greatly lamented by his companions, who, in the excess of their grief, were changed into birds resembling swans. Altars were raised to Diomedes, as to a god, one of which Strabo mentions at Timavus. (*Virg. Ovid.* &c.) 2. A king of Thrace, son of Mars and Cyrene, who fed his horses with human flesh. It was one of the labours of Hercules to destroy them, and accordingly the hero, attended with some of his friends, attacked Diomedes, and gave him to be devoured by his own horses which he had fed so barbarously.

DION, in biography, a Syracusan, son of Hipparinus, famous for his power and abilities. He was related to Dionysius, and often advised him, together with the philosopher Plato, to lay aside the supreme power. His great popularity rendered him odious in the eyes of the tyrant, who banished him to Greece. There he collected a numerous force, and resolved to free his country from tyranny. This he easily effected on account of his uncommon popularity. He entered the port of Syracuse only in two ships, and in three days reduced an empire, which had already subsisted for fifty years, and which was guarded by 500 ships of war, and 100,000 foot, and 10,000 horse. The tyrant fled to Corinth, and Dion kept the power in his own hands, fearful of the aspiring ambition of some of the friends of Dionysius. He was shamefully murdered by one of his familiar friends, called Callicrates, or Callipus, 354 years before the Christian era, in the 55th year of his age, and 4 years after his return from Peloponnesus. His death was universally lamented by the Syracusans, who raised a monument to his memory.

DIONÆA. Venus's fly-trap. In botany, a genus of the class decandria, order monogynia. Calyx five-leaved; petals five; capsule one-celled, gibbous, many-seeded. One species only; d. muscipula; a native of Carolina, and in many respects a very extraordinary vegetable. Scape naked; leaves radical, roundish, two-lobed, fringed with stiff bristles, and so irritable as to fold together like a rat-trap, and crush insects which crawl or settle on them; petioles winged and not fringed; corymb terminal, peduncle one-flowered. The upper surface of the lobes of the leaves are covered with a great number of small red glands; each of which resembles, when highly magnified, a compressed arbutus-berry. Insects are often attracted by the appearance or perhaps the sweet secretion of these glands, but the moment they touch them, the two lobes rise up, grasp them fast, lock the two rows of spines together, and squeeze them to death. Nor do the lobes ever open again while the insect remains there. Other substances, however, as a needle, or piece of straw, excite the same irritable power as insects. We have here therefore the power of a pair of muscles existing without the fibres; and acting with a force superior to many animal sphincters. If the foreign substance can be pushed out so as not to strain the lobes, they will expand again; but if force be employed, so strong is the spring of their fibres, that one of the lobes will generally snap off rather than yield. The stalk is about six feet high, and the flowers are milk white. They require much attention to the degree of heat and exposure to air which may seem best to agree with the plant; and, after all, we are seldom able to ripen the seeds in the gardens of our own country.

DIONYSIA, in Grecian antiquity, solemnities in honour of Bacchus; sometimes called Orgia: and by the Romans Bacchanalia, and Liberalia.

DIONYSIACA, in antiquity, a designation given to plays and other stage amusements.

DIONYSIUS I. or the elder, was son of Hermocrates. He signalized himself in the wars which the Syracusans carried on against the Carthaginians, and taking advantage of the power lodged in his hands, he made himself absolute at Syracuse. To strengthen himself in his usurpation, and acquire popularity, he increased the pay of his soldiers, and recalled those that had been banished. He vowed eternal enmity against Carthage, and experienced various successes in his wars against that republic. He was highly ambitious of being thought a poet, and he set higher value on a prize adjudged to a composition of his at Athens, than all the victories he had obtained. His tyranny and cruelty at home rendered him odious in the eyes of his subjects, and he became so suspicious that he never admitted his wife or children to his private apartments without a previous examination of their garments. He never trusted his head to a barber, but always burnt his beard. He made a subterranean cave in a rock, said to be still extant, in the form of a human ear, in order to hear whatever was said by those whom his suspicion and cruelty had confined in the apartments above, and then put the artists to death lest they should disclose the purpose for which it was constructed. His impiety and sacrilege were as conspicuous as his suspicious credulity. He died, as some say, of an indigestion, in the 63d year of his age, B. C. 368, after a reign of 38 years. Others are of opinion that he died a violent death. The invention of the catapulta is attributed to him. (*Diod. Justin.* &c.) The second of that name, sirnamed the younger, was son of Dionysius the First by Doris. He succeeded his father as tyrant of Sicily, and by the advice of Dion, his brother-in-law, he invited the philosopher Plato to his court, under whom he studied for a while. The philosopher advised him to lay aside the supreme power, and in his admonitions he was warmly seconded by Dion, who afterwards expelled the tyrant from Syracuse, B. C. 357. Dionysius retired to Locri, and recovered Syracuse ten years after his expulsion. His triumph was short. The Corinthians, under the conduct of Timoleon, obliged him to retire from the city. He fled to Corinth, where to support himself, he kept a school, as Cicero observes, that he might still continue to be tyrant; and, as he could not command over men, he might still continue his power over boys. It is said that he died from an excess of joy when he heard that a tragedy of his own composition had been rewarded with a poetical prize. Dionysius was as cruel as his father, but he did not, like him, possess the art of retaining his power.

DIONYSIUS (Halicarnassensis), an historian and critic of Halicarnassus, in Caria, who came to Rome about 30 years B. C. and there wrote his Roman Antiquities, or a History of Rome, upon which he was employed 24 years. Only eleven books, out of twenty, are now extant. He is a very faithful historian, and remarkably exact in his chronology. Besides his Antiquities, we have some other writings by Dionysius, the most esteemed of which is, De Structura Orationes. The best edition of all his works is that of Oxford, in 1704, 2 vols. folio.

DIONYSIUS (Periegetes), a poet and geographer, who was sent by Augustus to survey the eastern part of the world. This is the account given by Pliny the elder, but critics differ as to the Augustus here meant, though the most respectable understand him to be the first Augustus Cæsar. His Periegesis, or Survey of the World, is the only piece of his extant. It is in Greek hexameters, and was printed by Henry Stephens, 4to. 1577, and at Oxford in 1697.

DIOPHANTINE PROBLEMS, in algebra, certain questions relating to square and cubic numbers, right angled triangles, &c. the nature of which was first discussed by Diophantus in his Algebra.

In these questions, it is chiefly intended to find commensurable numbers to answer indeterminate problems; which often bring out an infinite number of incommensurable quantities. For example, let it be proposed to find a right-angled triangle, whose three sides x, y, z, are expressed by rational numbers; from the nature of the figure it is known that $x^2+y^2=z^2$, where z denotes the hypothenuse. It is plain that x and y may also be so taken, that z shall be irrational; for if $x=1$, and $y=2$, then is $z=\sqrt{5}$. Now the art of resolving such problems consists in ordering the unknown quantity or quantities, in such a manner, that the square or higher power may vanish out of the equation, and then by means of the unknown quantity in its first dimension, the equation may be resolved without having recourse to incommensurables.

This kind of problems is well handled by many authors; but particularly by Fermat, de Billy, Ozanam, Kersey, Saunderson, and Euler. Professor Leslie of Edinburgh has an ingenious paper on diophantine algebra and indeterminate problems, in the 2d. vol. of the Edinburgh Philosophical Transactions, where, by means of a simple principle of very extensive application, he solves various problems falling under these classes.

Let $A\times B$ be any compound quantity equal to another $C\times D$, and let m be any rational number assumed at pleasure; it is manifest that, taking equimultiples, $A\times mB=C\times mD$. If, therefore, we suppose that $A=mD$, it must follow that $mB=C$, or $B=C\div m$. Thus, two equations of a lower dimension are obtained. If these be capable of a farther decomposition, we may assume the multiples n and p, and form four equations, still more simple. By the repeated application of this principle, an higher equation, if it admits of divisors, will be resolved into those of the first order, the number of which will be one greater than that of the multiples assumed. Hence the number of simple equations into which a compound expression can be resolved, is equal to the sum of the exponents of the unknown quantities in the highest term. Wherefore a problem can be solved by the application of this principle only, when the aggregate sum, formed by the addition of the exponents in the highest terms of the several equations proposed, is at least equal to the number of the unknown quantities, together with that of the assumed multiples.

Let it be required to find two numbers, the sum of the squares of which shall be equal to the sum of two given squares.

By hypothesis, $x^2+y^2=a^2+b^2$; and transposing, $x^2-a^2=b^2-y^2$; and by resolving into factors, $(x+a)\ (x-a)=(b+y)\ (b-y)$; whence, by substitution, $x+a=mb-my$, and $x-u=(b+y)\div m$. Transposing a in the first equation, gives $x=mb-my-a$; reducing the second, $mx-ma=b+y$; and transposing, $mx=ma+b+y$: whence $(ma+b+y)\div m=mb-my-a$; and $ma+b+y=m^2b-m^2y-ma$; then transposing, $m^2y+y=m^2b-2ma-b$; that is $y=(m^2b-2ma-b)\div(m^2+1)$. But, $x=mb-my-a$; whence, by substitution, $x=(m^2a+2mb-a)\div(m^2-1)$. Thus, if $x=5$, and $b=10$, and $m=2$: then $y=(4\cdot10-4\cdot5-10)\ 5\ 2$, and $x=(4\cdot5+4\cdot10-5)\div5=11$: But $11^2+2^2=125=10^2+5^2$.

Corol. If $b=o$, we shall obtain two squares, the sum of which shall be a given square: for $y=-2ma\div(m^2+1)$, or $+2ma\div(m2+1)$, and $x=(m^2a-a)\div(m^2+1)$. Thus, if $a=10$, and $m=2$, then $y=4\cdot10\div5=8$, and $x=(4\cdot10-10)\div5=6$: but $8^2+6^2=100=10^2$.

Again, to find a cube which shall be equal to the product of a square by a given number.

By hypothesis, $a^3=ay^2$, and, resolving, $x\times x^2=a\times y^2$; whence $x=ma$, and $y^2=mx^2$: but $x^2=(ma^2)$, consequently $y^2=m^3a^2$, and $y\times y=ma\times m^2a$: and, by a second assumption, $y=pma$, and $m^2a=py$. But $x=ma$; whence $y=px$, and since $y=m^2a\div p$, $y=x^2\div ap$; wherefore $x^2\div ap=px$, and $x=ap^2$; but $y=px$, whence $y=ap^3$.

Suppose $a=3$, and $p=2$; then $x=3\times2^2=12$, and $y=3=2^3=24$. For, $12^3=1728=3\times(24)^2$.

For the solution of various other problems, agreeably to this simple method, the reader may consult Mr. Leslie's memoir referred to above.

Diophantine algebra has generally been thought far more curious than useful: but it has been lately shewn, that it is capable of being employed with success in the calculation of fluents, one of the most important parts of the modern analysis. See an ingenious paper on this subject, by Mr. Cunliffe, in the Math. Repository, vol. ii. p. 394.

DIOPHANTUS, a celebrated mathematician of Alexandria, has been reputed to be the inventor of algebra; at least his is the earliest work extant on that science. It is not certain when Diophantus lived. Some have placed him before Christ, and some after, in the reigns of Nero and the Antonines; but all with equal uncertainty. It seems he is the same Diophantus who wrote the Canon Astronomicus, which Suidas says was commented on by the celebrated Hypatia, daughter of Theon of Alexandria. His reputation must have been very high among the ancients, since they ranked him with Pythagoras and Euclid in mathematical learning. Bachet, in his notes upon the 5th book De Arithmetica, has collected, from Diophantus's epitaph in the Anthologia, the following circumstances of his life; namely, that he was married when he was 33 years old, and had a son born five years after; that this son died when he was 42 years of age, and that his father did not survive him above four years; from which it appears that Diophantus was 84 years old when he died.

DIOPSIDE. See Diopsidum.

DIOPSIDUM; Diopside; in mineralogy, a genus of the class earth, order siliceous. Specific gravity is 3·2374; does not scratch glass, or very slightly; but scratches fluate of lime. Before the blow-pipe fuses into a glass of the same greenish colour as the mass itself. Its primitive form is a right-angled quadrangular prism, with oblique bases; the angle of incidence between the diagonal and the edge is 107° 8′. The prism is subdivisible by very clean sections in the direction of the diagonals of its bases. The divisions parallel to the bases are in general very clean; those that answer to the sides are less easy to obtain. Two species.

1. D. mussitum, mussite: of which there are five varieties, from a variety in the compactness of its structure, or in the form of its pyramids. Found in the commune of la Balmede-Mussa, in the department of the Po, toward the north of the valley of Lans, in the interstices of a vein one or two yards thick, that traverses, at the height of four or five yards, a rock called the Black Rock, which is twelve or fifteen yards high. The crystals have sometimes a translucid granular carbonate of lime for their gangue.

2. D. alalitum, alalite: discovered in a vein in the mountain of Ciarmetta, situate beyond that of Testa-Ciarva, at the Alp of la Mussa, near the village of Ala. It is commonly accompanied with green or pale yellow primitive garnets, and emarginated garnets of a hyacinth red, which have nothing in common with the topaz. It was these last that Mr. Bonvosin designated by the name of topazolites, because he thought them of a pleasing colour, which he compared with the yellow of the topaz.

The colours of the diopside are green, greenish gray, greenish white, and yellowish white. It is sometimes translucid, sometimes opake.

The crystals of mussite are small, elongated, and commonly opake. Several are twisted, and exhibit the primitive form very undecidedly. The crystals of alalite are in general larger, translucid, and of a greenish white.

DIO′PSIS, in zoology, a genus of the class insecta, order deptera. Head with two inarticulate filiform horns much longer than the head, at the top of which are placed the eyes. One species. Inhabits South America and Guinea, and resembles an ichneumon. See Nat. Hist. Pl. LXXII.

DIOPTRATE, a term in natural history, applied to the orellate spots of the wings of insects, where the pupil is divided by a transverse line.

DIOPTRICS, (from δια, *per, through*, and οπτομαι, *I see*,) or Anaclastics, the doctrine of refracted vision. The office of this branch of optics is to consider and explain the effects of light refracted by passing through different mediums, as air, water, glass, &c. and especially lenses.

Dioptrics is one of the most useful and pleasant of the human sciences; bringing the remotest objects near hand, enlarging the smallest objects so as to shew their minute parts, and even giving sight to the blind; and all this by the simple means of the attractive power in glass and water, causing the rays of light in their passage through them to alter their course according to the different substances of the medium; whence it happens, that the objects seen through them do, in appearance, alter their magnitude, distance, and situation.

The ancients have treated of direct and reflected vision; but what we have of refracted vision is very imperfect. J. Baptista Porta wrote a treatise on refraction, in nine books, but without any great improvement. Kepler was the first who succeeded in any great degree, on this subject; having demonstrated the properties of spherical lenses very accurately, in a treatise first published anno 1611. After Kepler, Galileo gave somewhat of this doctrine in his Letters; as also an Examination of the Preface of Johannes Pena upon Euclid's Optics, concerning the use of optics in astronomy. Des Cartes also wrote a treatise on Dioptrics, commonly annexed to his Principles of Philosophy, which is one of his best works: in which the true manner of vision is more distinctly explained than by any former writer, and in which is contained the true law of refraction, which was found out by Snell, though the name of the inventor is suppressed: here are also laid down the properties of elliptical and hyperbolical lenses, with the practice of grinding glasses. Dr. Barrow has treated on dioptrics in a very elegant manner, though rather too briefly, in his Optical Lectures, read at Cambridge. There are also Huygens's Dioptrics, an excellent work of its kind. Molyneux's Dioptrics, a work rather heavy and dull. Hartsoeker's Essai de Dioptrique. Cherubin's Dioptrique Oculaire, et Da Vision Parfaite. David Gregory's Elements of Dioptrics. Traber's Nervus Opticus. Zahn's Oculus Artificialis Teledioptricus. Dr. Smith's Optics, a complete work of its kind. Wolfius's Dioptrics, contained in his Elementa Matheseos Universalis. Harris's Optics, Bouguer's Optics, and the 2d volume of Haüy's Natural Philosophy, may also be advantageously consulted. The Treatise on Optics, and the Optical Lectures of Newton, contain an account of experiments and reasonings, of inestimable value, in this branch of science: and Dollond's discovery of achromatic glasses, by which colours are obviated in refracting telescopes, is of especial importance.

The following may be laid down as the principal definitions. 1. When a ray of light passing out of one medium into another of a different density, is turned from that straight line in which it would otherwise proceed into one of a different direction, it is said to be refracted. Thus the rays AB, AC, &c. Pl. 57. fig. 3. by passing out of air into the glass BGC, are turned from their natural course into that of BF, CF, &c. and are therefore said to be refracted by the lens BGC. 2. Any spherical transparent glass, that converges or diverges the rays of light as they pass through it, is called a *lens*. 3. Of lenses there are five sorts: 1. A plane or single convex lens, which is plane on one side and convex on the

other; as AZ, fig. 4. 2. A double convex lens, as B. 3. A plano-concave lens, that is, plane on one side and concave on the other, as C. 4. A double concave, as D. And, 5. A meniscus, which is convex on one side and concave on the other, as E. 4. The point C, round which the spherical surface of a lens, as AZ, is described, is called its *centre*: the line XY, drawn from that centre perpendicular to its two surfaces, is the axis; and the point V, to which the axis is drawn, is the vertex of that lens. 5. When the rays of light that pass through a single or double convex lens are brought into their smallest compass, that point is the focus of the lens. 6. In optical instruments, that lens which is next the object is called the *object-glass;* and that next the eye, the *eye-glass.* 7. The angle ABE between the ray AB fig. 5. pl. 57, and the perpendicular BE to the refracting surface, is called the *angle of incidence:* and the angle DBF between the refracted ray and the same perpendicular, the *angle of refraction.*

The chief propositions in the doctrine of dioptrics are these: 1. A ray of light passing obliquely out of one medium into another that is denser, will be refracted toward the perpendicular; as the ray AB, by passing out of air into glass, is refracted into BD, inclined to the perpendicular EF. On the contrary, a ray passing out of a denser into a rarer medium, will be refracted from the perpendicular; as the ray BD, passing out of the glass GH into air, is refracted into D I. 2. The sines of the angles of incidence and refraction, when the lines that contain them are all equal, will have a determinate proportion to each other, in the same mediums: which between air and water will be as 4 to 3; between air and glass, as 3 to 2, nearly; and in other mediums in proportion to their densities. 3. Any object viewed through a glass, whose two surfaces are parallel, will appear of its natural shape and dimensions, provided it be only of the size of the pupil of the eye, and the light proceeding from it be received directly through the glass by one eye only. In all other situations an alteration will be perceived not only in its apparent situation, but its dimensions also. This alteration will be greater in proportion to the thickness of the glass, and the obliquity of the rays; in general, it is so small as to be overlooked. 4. All the rays of light which fall upon a convex lens, whether parallel, converging, or diverging to a certain degee, will be made to meet in a focus on the other side; but if they diverge excessively, they will not do so. Thus if rays diverge from a point placed before the glass, at the focal distance from it, they will become parallel after passing through it; and if the point from which they proceed be nearer the glass than its focal distance, they will still continue to diverge, though in a less degree than before. 5. When parallel rays fall upon a concave lens, they will be made to diverge after passing through it. If they are diverging already before they fall upon the glass, they will diverge more after passing through it; or even if they are converging to a certain degree, they will diverge upon passing through a concave lens; but if the convergence is very great, they will converge after passing through the glass, though to a more distant point than that at which they would otherwise have met. 6. When an object is viewed through two convex lenses, its apparent diameter ought to be to its real one as the distance of the focus of the object-glass is to that of the eye-glass; but by reason of the aberration of the rays of light, the magnifying power will be somewhat greater or less in proportion to the diameter of the object. By these we are enabled to account for the various effects of dioptric machines, as refracting telescopes, microscopes, the camera obscura, &c. See the articles LENS, MIRROR, REFRACTION, CAMERA OBSCURA, TELESCOPE, &c.

The principal dioptric problem is that of finding the focus of any sort of lens exposed either to converging, diverging, or parallel rays of light, proceeding from, or tending to a given point, in the axis of the lens, be the ratio of refraction what it will, according to the nature of the transparent material the lens is formed of, and also with allowance for the thickness of the lens between the vertices of the two spherical segments. This problem being solved in one case, mutatis mutandis, will exhibit theorems for all the possible cases, whether the lens be double-convex or double-concave, plano-convex or plano-concave, or a meniscus. But this is only to be understood of those rays which are nearest to the axis of the lens, so as to occasion no sensible difference by their inclination to it; and the focus here formed is by dioptric writers commonly called the principal focus, being that of use in telescopes and microscopes.

Let then, in fig. 6, Pl. 57, BE*b* be a double convex lens, C the centre of the segment EB, and K the centre of the segment E*b*, B*b* the thickness of the lens, D a point in the axis of the lens; and it is required to find the point F, where the beams, proceeding from the point D, are collected, the ratio of refraction being as m to n. Let the distance of the object DB=DA=d, (the point A being supposed the same with B, but taken at a distance from it to prevent the coincidence of so many lines,) the radius of the segment towards the object CB or CA=r, and the radius of the segment from the object K*b* or K*a* =ϱ, and let B*b* the thickness of the lens be =t; then let the sine of the angle of incidence DAG be to the sine of the refracted angle HAG, or CAf, as m to n; and in very small angles the angles themselves will be in the same proportion. Whence it will follow that, as d to r, so the angle at C to the angle at D, and hence $d+r$ will be as the angle of incidence GAD: again, as m to n, so $d+r$ to $\frac{dn+rn}{m}$, which will be as the angle GAH=CAf; this being taken from ACD, which is as d, will leave $\frac{m-n.\,d.-nr}{m}$ analogous to the angle AfD; and the sides being in this case proportional to the angles they subtend, it will follow, that as the angle AfD is to the angle ADf, so is the side AD or BD, to Af or Bf: that is, Bf will be $=\frac{mdr}{m-n.d-nr}$, which shows in what point the beams proceeding from D would be collected by means of the first refraction. But if nr cannot be subtracted from $m-n.d$, it follows that the beams after refraction do still pass on diverging, and the point f is on the same side of the lens beyond D: or if nr be equal to $m-n.d$, then they proceed parallel to the axis, and the point f is infinitely distant.

The point f being found as before, and Bf—B*b* being given, which we call δ; it follows, by a process like the former, that *b*F, or the focal distance sought, is equal to $\frac{\delta\varrho n}{m-n.\delta+m\varrho}=f$. And instead of δ substituting $Bf - Bb = \frac{mdr}{m-n.d-nr} - t$, putting p for $\frac{n}{m-n}$, after due reduction this following equation will arise, $\frac{mpdr\varrho - nd\varrho t + npr\varrho t}{mdr + md\varrho - mpr\varrho - m-n.dt + nrt} = f$. Which theorem, however it may seem operose, is not so, considering the great number of data that enter the question, and that one half of the terms arise from our taking in the thickness of the lens, which in most cases can produce no great effect, however it was necessary to consider it, to make our rule perfect. If, therefore, the lens consist of glass, whose refraction is as 3 to 2, it will be $\frac{6dr\varrho - 2d\varrho t + 4r\varrho t}{3dr + 3d\varrho - 6r\varrho - dt + 2rt} = f$. If of water, whose refraction is as 4 to 3, the theorem will stand thus $\frac{12dr\varrho - 3d\varrho t + 9r\varrho t}{4dr + 4d\varrho - 12r\varrho - dt + 3rt} = f$. If it could be made of diamond, whose refraction is as 5 to 2, it would be $\frac{\frac{10}{3}dr\varrho - 2d\varrho t + \frac{4}{3}r\varrho t}{5dr + 5d\varrho - \frac{10}{3}r\varrho - 3dt + 2rt} = f$. And this is the universal rule for the foci of double convex glasses exposed to diverging rays. But if the thickness of the lens be rejected as not sensible, the rule will be much shorter, viz. $\frac{pdr\varrho}{dr + d\varrho - pr\varrho} = f$, or in glass $\frac{2dr\varrho}{dr + d\varrho - 2r\varrho} = f$; all the terms wherein t is found being omitted as equal to nothing. In this case, if d be so small, as that $2r\varrho$ exceed $dr + d\varrho$, then will it be $-f$, or the focus will be negative, which shows that the beams after both refractions still proceed diverging.

To bring this to the other cases, as of converging beams, or of concave glasses, the rule is ever composed of the same terms, only changing the signs of + and −; for the distance of the point of concourse of converging beams, from the point B, or the first surface of the lens, we call a negative distance or $-d$; and the radius of a concave lens we call a negative radius or $-r$, if it be the first surface, and $-\varrho$, if it be the second surface. Let then converging beams fall on a double convex of glass, and the theorem will stand thus $\frac{-2dr\varrho}{-dr - d\varrho - 2r\varrho} = +f$; which shows that in this case the focus is always affirmative.

If the lens were a meniscus of glass, exposed to diverging beams, the rule is $\frac{-2dr\varrho}{-dr + d\varrho + 2r\varrho} = f$; which is affirmative when $2r\varrho$ is less than $dr - d\varrho$, otherwise negative; but in the case of converging beams falling on the same meniscus, it will be $\frac{+2dr\varrho}{+dr - d\varrho + 2r\varrho} = f$; and it will be $+f$, while $d\varrho - dr$ is less than $2r\varrho$, but if it be greater than $2r\varrho$, it will always be found negative or $-f$. If the lens be double concave, the focus of converging beams is negative, where it was affirmative in the case of diverging beams on a double convex, viz. $\frac{-2dr\varrho}{+dr + d\varrho - 2r\varrho} = f$, which is affirmative only when $2r\varrho$ exceeds $dr + d\varrho$: but diverging beams passing a double concave have always a negative focus, viz. $\frac{-2dr\varrho}{+dr + d\varrho + 2r\varrho} = -f$.

The theorems for converging beams are principally of use to determine the focus resulting from any sort of lens placed in a telescope, between the focus of the object-glass and the glass itself; the distance between the said focus of the object-glass and the interposed lens being made $= -d$.

We here suppose the reader acquainted with the rules of analytical multiplication and division, as that + multiplied by + makes the product +, + by − makes −, and − by − makes +; so dividing + by + makes the quote +, + by − makes −, and − by − makes +; which will be necessary to be understood in the preceding examples.

In case the beams are parallel, as coming from an infinite distance, which is supposed in the case of telescopes; then will d be supposed infinite, and in the theorem $\frac{pd\varrho r}{dr + d\varrho - pr\varrho}$ the term $pr\varrho$ vanishes, as being finite, which is no part of the other infinite terms, and dividing the remainder by the infinite part d, the theorem will stand thus, $\frac{pr\varrho}{r + \varrho} = f$, or in glass, $\frac{2r\varrho}{r + \varrho} = f$.

In case the lens were plano-convex exposed to diverging beams, instead of $\frac{pd\varrho r}{dr + d\varrho = pr\varrho}$, r being infinite, it will be $\frac{pd\varrho}{d - p\varrho} = f$, or $\frac{2d\varrho}{d - 2\varrho} = f$ if the lens be glass.

If the lens be double convex, and r be equal to ϱ, as being formed of segments of equal spheres, then will $\frac{pd\varrho r}{dr + dr - pr\varrho}$ be reduced to $\frac{pdr}{2d - pr} = f$; and in case d be infinite, then it will be yet farther contracted to $\frac{1}{2}pr$, and p being $= \frac{n}{m-n}$ the focal distance in glass will be $= r$, in water $1\frac{1}{2}r$, but in diamond $\frac{1}{3}r$.

This may suffice to show the extent of our theorem, and how easy a reduction adapts any one case to all the rest. Nor is this only useful to discover the focus from the other proposed data, but from the focus given, we may thereby determine the distance of the object, or from the focus and distance given, we may find of what sphere it is requisite to take another segment, to make any given segment of another sphere cast the beams from the distance d to the focus f; as likewise from the lens, focus, and distance given, to find the ratio of refraction, or of m to n, requisite to answer those data. All which, it is obvious, are fully determined from the equation we have hitherto used, viz. $pd\varrho r = drf + d\varrho f = pr\varrho f$; for to find d, the theorem is $\frac{pr\varrho f}{rf + \varrho f - p\varrho r} = d$, the distance of the object.

For ϱ, the rule is $\frac{drf}{pdr + df + prf} = \varrho$.

But for p, it is $\frac{drf + d\varrho f}{d\varrho r + f\varrho r} = p$, which latter determines the ratio of refraction, m being to n as $1 + p$ to p.

We shall not expatiate on these particulars, but leave them for the exercise of those who are desirous to be informed in optical matters, which are comprehended in these three rules, as fully as the most inquisitive can desire them, and in all possible cases; regard being had to the signs + and −, as in the former cases of finding the focus. We shall only show two considerable uses of them; the one to find the distance whereat an object being placed, it shall by a given lens be represented in a species as large as the object itself, which may be of singular use in drawing faces, and other things in their true magnitude, by transmitting the species by a glass into a dark room, which will not only give the true figure and shades, but even the colours themselves, almost as vivid as the life. In this case d is equal to f, and substituting d for f in the equation, we shall have $pdr\varrho = ddr + dd\varrho - dp\varrho r$, and dividing all by d, then $pr\varrho = dr + d\varrho - pr\varrho$, that is, $\frac{2pr\varrho}{r+\varrho} = d$; but if the two convexities be of the same sphere; so as $r = \varrho$, then will the distance be $= pr$; that is, if the lens be glass $= 2r$; so that if an object be placed at the diameter of the sphere distant, in this case the focus will be as far within as the object is without, and the species represented will be as large as the life; but if it were a plano-convex, the same distance will be $= 2pr$, or in glass equal to 4 times the radius of the convexity.

A second use is to find what convexity or concavity is required, to make a vastly distant object be represented at a given focus, after the one surface of the lens is formed; which is but a corollary of our theorem for finding ϱ, having p, d, r and f given; for d being infinite, that rule becomes $\frac{rf}{pr-f} = \varrho$, that is, in glass $\frac{rf}{2r-f} = \varrho$; whence, if f be greater than $2r$, ϱ becomes negative, and $\frac{rf}{f-2r}$ is the radius of the concave sought.

But to return to our first theorem, which accounting for the thickness of the lens, we will here again resume, viz.

$$\frac{mpdr\varrho - nd\varrho t + npr\varrho t}{mdr + md\varrho - mpr\varrho - \overline{m-n}.dt + nrt} = f.$$

And let it be required to find the focus, where a whole sphere will collect the beams proceeding from an object at the distance d: here t is equal to $2r$, and $r = \varrho$: and, after due reduction, the theorem will stand thus, $\frac{mpdr - 2ndr + 2nprr}{2nd + 2nr - mpr} = f$, but if d be infinite, it is contracted to $\frac{mpr}{2n} - r = \frac{2n-m}{2m-2n} r = f$; wherefore a sphere of glass collects the sun's beams at half the semidiameter of the sphere without it, and a sphere of water at a whole semidiameter. But if the ratio of refraction m to n, be as 2 to 1, the focus falls on the opposite surface of the sphere, and if it be of greater inequality it falls within.

Another example shall be, when a hemisphere is exposed to parallel rays, that is d and ϱ being infinite, and $t = r$; then after due reduction the theorem results $\frac{nn}{mm-mn} r = f$. That is, in glass it is at $\frac{4}{3}r$, in water at $\frac{9}{4}r$; but if the hemisphere were diamond, it would collect the beams at $\frac{4}{15}$ of the radius beyond the centre.

Lastly, as to the effect of turning the two sides of a lens towards an object; it is evident, that if the thickness of the lens be very small, so as that you neglect it, or account $t = 0$; then in all cases the focus of the same lens, to whatever beams, will be the same, without any difference on the turning the lens: but if you are so nice as to consider the thickness, (which is seldom worth accounting for) in the case of parallel rays falling on a plano-convex of glass, if the plain side be towards the object, t occasions no difference, but the focal distance $f = 2r$: but when the convex side is towards the object, it is contracted to $2r - \frac{2}{3}t$, so that the focus is nearer by $\frac{2}{3}t$. If the lens be double convex, the difference is less: if a meniscus, greater. If the convexity on both sides be equal, the focal length is about $\frac{1}{6}t$ shorter than when $t = 0$. In a meniscus, the concave side towards the object increases the focal length, but the convex towards the object diminishes it. A general rule for the difference arising on turning the lens, where the focus is affirmative, is this, $\frac{2rt - 2\varrho t}{3r + 3\varrho - t}$, for double convexes of differing spheres. But for a meniscus, the same difference becomes $\frac{2rt + 2\varrho t}{3r - 3\varrho + t}$; of which we need give no other demonstration, but that by a due reduction it will so follow from what is premised, as will the theorems for all sorts of problems relating to the foci of optic glasses.

Dioptric. *a.* Relating to dioptrics.

Dioptric telescope. See Telescope.

DIORTHRO'SIS. *s.* (διορθρωσις.) An operation by which crooked or distorted members are restored to their regular shape (*Harris*).

DIOSCOREA. In botany, a genus of the class diœcia, order hexandria. Calyx six-parted; corolless. Fem. styles three; capsule three-celled, compressed; seeds two, membranaceous. Fifteen species, all Indian plants; of which the only one particularly worthy of notice is,

D. sativa. Common yam, with heart-shaped, alternate leaves; round, wingless stem. It is a creeping plant: its stalks trailing on the ground to a considerable distance, and putting out roots from their joints, by which it becomes very considerably multiplied. The roots are used as an esculent in both Indies; and is the common food of the slaves in the West Indies. The plant is propagated exactly as we propagate potatoes in this country, by cutting the roots in pieces and preserving an eye in each piece; the common proportion of roots is three or four to every plant. The skin of the root is thick, rough and unequal, covered with many strong fibres or filaments, and of a violet colour, approaching to black. In the inside it partakes of the consistency of the red beet, but in colour is white, and in mealiness it resembles the potatoe. If kept from moisture the roots may be preserved many years without deterioration. The common weight of a root is two or three pounds, though they have sometimes been known to weigh upwards of twenty. In our own gardens the yam-plant can only be cultivated in a hot-house. There is great variety in the colour, size, and shape of yams; they are generally blue or brown, round or oblong. They are esteemed when dressed, as being nutritious and easy of digestion, and are preferred to wheaten bread. Their taste is somewhat like the potatoe, but more luscious. The negroes, whose common food is yams, boil and mash them. They are also ground into flour, and made into bread and puddings. When they are to be kept for some time, they are exposed upon the ground to the sun as we do onions, and when sufficiently withered they are put into dry sand in casks, and placed in a dry garret, where they remain often for many seasons without losing any of their primitive goodness.

DIOSCURIA, (διοσκουρια, *sons of Jupiter*), in antiquity, a festival observed by the Cyreneans and Spartans, in honour of Castor and Pollux. The solemnity was full of mirth, and attended with lively sports.

DIO'SMA, in botany, a genus of the class pentandria, order monogynia. Corol five petalled, nectaries five, above the germ; capsules three or five, united; seeds veiled. Thirty-one species, all Cape-plants, of which the following are the most esteemed, and in culture among ourselves.

1. D. oppositifolia, or cross-leaved diosma. It rises to the height of three or four feet, the branches are slender and produced irregularly from the stem; the leaves are three-sided, obtuse, ciliate; the flowers are terminal.

2. D. hirsuta, with leaves three-sided, mucronate, rough-haired; flowers terminal, mostly solitary: a very handsome shrub, growing to the height of five or six feet; the stalks of which are of a fine coral colour; the whole plant, leaves, flowers, and seeds, possesses an agreeable fragrance. Both species may be propagated by cuttings, which should be plunged into a moderate hot-bed during any part of the summer. In about two months the cuttings will take root, and should be then transplanted into small pots, in which they are to remain. But in the winter they require the shelter of the green-house.

DIOSPY'ROS. Date-palm: or Date-plum. In botany, a genus of the class polygamia, order diœcia. Calyx four-cleft; corol cup-shaped, four-cleft; stamens eight; style four-cleft; berry eight-celled; seeds solitary. Eight species; chiefly of the East Indies. The two following are the chief.

1. D. lotus; having the surface of its leaves of different colours. Found in Africa and Italy, and said to be the fruit referred to by Homer, in his account of the oblivion into which Ulysses and his companions were thrown by the fruit that was given for the purpose of enchanting them in this manner. Yet it does not seem to produce any such affection of the brain in modern days. In Italy, this plant is a tree of thirty feet high.

2. D. Virginiana. Pitchumen, Pishoman or Persimen-plum; with the surface of its leaves of the same colour. A native of Virginia, rising to twelve or fourteen feet, but generally dividing into many trunk branches near the ground. Both species may be cultivated from their seeds in our own gardens, though most successfully in our green-houses, or in moderate hot-beds; and if gradually inured to the climate when young plants, will be found sufficiently strong at length to endure all its variations.

DIOXIA, in music. See DIAPENTE.

To DIP. *v. a.* pret. *dipped*; part. *dipped* or *dipt*. (dippan, Saxon; *doopen*, Dutch.) 1. To immerge; to put into any liquor (*Ayl.*). 2. To moisten; to wet (*Milton*). 3. To be engaged in any affair (*Dryden*). 4. To engage as a pledge (*Dryden*).

To DIP. *v. n.* 1. To sink; to immerge (*L'Estrange*). 2. To enter; to pierce (*Granville*). 3. To enter slightly into any thing (*Pope*). 4. To take that which comes first; to choose by chance (*Dryden*).

DIP OF THE HORIZON. See DEPRESSION.

DIPETALUS. (*dipetala.*) Corolla, or two-petalled; having two petals only: as circæa, commelina.

DIPHTHERA, a garment made of skins worn by the ancient shepherds and labourers.

DIPHTHONG. (διφθογγος.) In grammar, a double vowel, or the union, or mixture, of two vowels pronounced together, so as only to make one syllable: as 1. The Latin *ae*, or *æ*; *oe*, or *œ*. 2. The Greek αι, ει. 3. The English *ai*, *au*, &c. (See VOWEL, SYLLABLE, and GRAMMAR). The word is Greek, and is compounded of δις, twice; and φθογγος, sound.

The Latins pronounced the two vowels in their diphthongs much as we do, with this exception, that the two were not heard equally, but the one was somewhat weaker than the other; though the division was made with all the delicacy imaginable; among us most of the Latin diphthongs are lost in the pronunciation; their *æ* and *œ* are only spoken as *e's*; so also the English *ea*, *oa*, &c. though wrote with two characters, are pronounced as simple sounds. In English, French, and divers other languages, one may distinguish diphthongs with regard to the eye, from diphthongs with regard to the ear. A diphthong with regard to the eye, is formed of two vowels, meeting in the same syllable, whether the particular sound of each of them be heard in the pronunciation, or whether the sound of one of them be drowned; or, lastly, whether a new sound, different from either of them, result from both. In the two latter cases, it is with some impropriety that we call them diphthongs: the first only are real diphthongs, as being such both to the eye and ear. Diphthongs with regard to the ear, are either formed of two vowels, meeting in the same syllable, whose sounds are severally heard; or of three vowels, in the same syllable, which only afford two sounds in the pronunciation. On this last occasion, diphthongs with regard to the ear, are triphthongs with regard to the eye.

DIPHYLLOUS. (δις, and φυλλον, a leaf.) in botany, a two-leaved calyx: as in papaver and fumaria. Applied also to the cirrus or tendril, as in lathyrus; and to the peduncle, as in gomphrena.

DIPHYSA, in botany, a genus of the class diadelphia, order decandria. Calyx five-cleft, unequal; legume one-celled, many seeded; compressed; surrounded on each side with a large, inflated, longitudinal bladder. One species; a native shrub of Carthagena, with pinnate leaves; leaflets oblong, emarginate; peduncles axillary, two or three-flowered; flowers yellow.

DIPLA'ZIUM, in botany, a genus of the class cryptogamia, order filices. Fructification in scattered, double, decussate lines, near the vein of the frond; involucres double, originating from a vein opening towards the margin on both sides. Two species, both exotics.

DI'PLOE. (*diploe*, from διπλοω, to double.) In anatomy. Meditullium. The spongy substance between the two tables of the skull.

DIPLOMA. (διπλωμα, from διπλοω, to fold or double up), was originally a letter or writing of a sovereign conferring a title or dignity, or granting some immunity or privilege. The oldest is that of the emperor Galba dismissing some veteran soldiers. These instruments were originally written on waxed tables folded together; whence their name.

Latterly, the term diploma is restricted to the instrument by which a legalized incorporation, as a university or college, confers a title of dignity, or a privilege to practise in a learned profession.

DIPLOMACY, is the knowledge of the relations of independent states to each other. This knowledge is supposed to be best understood by those who are authorized by sovereigns (formerly by diploma) to be ambassadors from the government of one state to that of another.

DIPLOMATICS, the science of diplomas, or of ancient literary monuments, public documents, &c. It does not, however, nor can it, absolutely extend its researches to antiquity; but is chiefly confined to the middle age, and the first centuries of modern times. For though the ancients were accustomed to reduce their contracts and treaties into writing; yet they graved them on tables, or covered them over with wax, or brass, copper, stone, or wood, &c. And all that in the first ages were not traced on brass or marble, have perished by the length of time, and the number of destructive events. The word diploma signifies, properly, a letter or epistle, that is folded in the middle, and that is not open. But, in more modern times, the title has been given to all ancient epistles, letters, literary monuments, and public documents, and to all those pieces of writing which the ancients called syngrapha, chirographa, codicilli, &c. In the middle age, and in the diplomas themselves, these writings are called litteræ, præcepta, placita, chartæ indiculæ, sigilla, and bullæ; as also panchartæ, pantochartæ, tractoriæ, descriptiones, &c. The originals of these pieces are named exemplaria, or autographa, chartæ, authenticæ, originalia, &c. and the copies, apographa, copiæ, particulæ, and so forth. The collections that have been made of them, are called chartaria and chartulia. The place where these papers and documents were kept the ancients named scrinia, tabularium, or ærarium; words that were derived from the tables of brass, and, according to the Greek idiom, archeium, or archivum. On this subject there are two works which furnish the clearest lights on this matter, and which may serve as sure guides in the judgment we may have occasion to make on what are called ancient diplomas. The one is the celebrated Treatise on the Diplomatic, by F. Mabillon; and the other, the first volume of the Chronicon Gotvicense. We there find specimens of all the characters, the flourishes, and different methods of writing, of every age.

Diplomatics, is now more commonly used to denote that branch of knowledge which ought to be possessed by an ambassador to a foreign court. The art of diplomatics has been cultivated with great assiduity by every nation in Europe for many years past, and men experienced in political history, of engaging manners, and possessing a considerable share of general knowledge, and especially of international relationships, have always been selected by each to practise it. The principal aim of the *corps diplomatique* (as the French term ambassadors) is to discover the movements and intentions of their brethren, and to conceal their own.

DIPLO'PIA. (*diplopia*, διπλωπια, from διπλοος, double, and οπτομια, to see.) Visus duplicatus. A defect of vision in which the person sees an object doubly or trebly. It is rather a symptom of a disease than a disease itself.

DI'PPER. *s.* (from *dip.*) One that dips in the water.

Dipper. In ornithology. See Columbus.

DIPPING, among miners, signifies the interruption, or breaking off, of the veins of ore; an accident that gives them a great deal of trouble before they can discover the ore again.

Dipping-needle, or Inclinatory needle, a magnetical needle, so hung, as that, instead of playing horizontally, and pointing out north and south, one end dips, or inclines to the horizon, and the other points to a certain degree or elevation above it.

The inventor of the dipping-needle was Robert Norman, a compass-maker at Ratcliffe, about the year 1580. This is not only testified by his own account, in his New Attractive, but also by Dr. Gilbert, Mr. William Burrowes, Mr. Henry Bond, and other writers of that time, or soon after it. The occasion of the discovery he himself relates, viz. that it being his custom to finish, and hang the needles of his compasses, before he touched them, he always found that, immediately after the touch, the north point would dip or decline downward, pointing in a direction under the horizon; so that, to balance the needle again, he was always forced to put a piece of wax on the south end, as a counterpoise. The constancy of this effect led him at length to observe the precise quantity of the dip, or to measure the greatest angle which the needle would make with the horizon. This, in the year 1576, he found at London was 71° 50'. It is not quite certain whether the dip varies, as well as the horizontal direction, in the same place. Mr. Graham made a great many experiments with the dipping-needle in 1723, and found the dip between 74 and 75 degrees. Mr. Nairne, in 1772, found it somewhat above 72°.

Mr. Whiston, whose needle there is reason to suppose was more to be relied upon than Norman's or Bond's, determined the dip in 1720, to be 75° 10'; this compared with Mr.

Cavendish's accurate observations in 1775, when he found the dip to be 72° 30′, makes the decrease in this period of 55 years, on a mean 2′·9 per annum. And from a comparison of Mr. Gilpin's observations of the dip in August 1805, when he found it 70° 20′, with those of Mr. Cavendish in 1775, its annual decrease on a mean, appears to have been 4′·3; and its progressive annual decrease, on a mean in the above-mentioned period of 30 years, to have been 1′·4.

It is certain, however, from many experiments and observations, that the dip is different in different latitudes, and that it increases in going northward. It appears from a table of observations made with a marine dipping-needle of Mr. Nairne's, in a voyage towards the north pole, in 1773, that

in latitude 60° 18′ the dip was 75° 0′,
in latitude 70 45 the dip was 77 52,
in latitude 80 12 the dip was 81 52, and
in latitude 80 27 the dip was 82 2½.

See Phipps's Voyage, p. 122. See also the Observations of Mr. Hutchins, made in Hudson's bay and straits, Philos. Trans. vol. 65, p. 129.

Burrowes, Gilbert, Ridley, Bond, &c. endeavoured to apply this discovery of the dip to the finding of the latitude; and Bond, going still farther, first of any proposed finding the longitude by it; but for want of observations and experiments, he could not go any length. Mr. Whiston, being furnished with the farther observations of colonel Windham, Dr. Halley, Mr. Pound, Mr. Cunningham, M. Noel, M. Feuille, and his own, made great improvements in the doctrine and use of the dipping-needle, brought it to more certain rules, and endeavoured in good earnest to find the longitude by it. But all the rules which have been hitherto proposed for this purpose have been gratuitous, uncertain, and unsatisfactory.

In order to determine the law that regulates the inclination or dip of the needle, Biot, in a Memoir delivered by himself and Humboldt to the French National Institute, On the Variations of the Terrestrial Magnetism in different Latitudes, supposed in the axis of the magnetic equator, and at equal distances from the centre of the earth, two centres of attractive forces, the one austral and the other boreal, so as to represent the two opposite magnetic poles of the earth: he then calculated the effect which ought to result from the action of these centres upon any point of the earth's surface, assuming the attractive force in the reciprocal ratio of the squares of the distances; he found that his results approximated more and more to the truth in proportion as the distance between the magnetic poles was assumed less; and, indeed, by supposing those two poles or centres to coincide, or the inclination of the magnetic needle to be produced by an indefinitely small magnet placed in the centre of the earth, his theorem gave the same numbers as had been observed by Humboldt both in Europe and in America, as well as what had been observed in Russia, Lapland, and various other places in both hemispheres: the results of theory being classed with those of observations in a comparative table, which clearly evinces their near coincidence. Let u be the angle included between a radius drawn from the earth's centre to any assumed point on its surface and the magnetic axis, β the angle comprehended between the line coinciding with the real position of the needle and the said magnetic axis, and I the inclination of the needle with the horizon of the place; then we have

$$\text{I.} \qquad \tan.\ \beta = \frac{\sin.\ 2u}{\cos.\ 2u + 3}:$$

whence β is readily determined; and then we shall have the inclination by means of the following:

$$\text{II.} \qquad I = 90° + u - \beta.$$

Still it must be observed, that though these formulæ given by Biot, furnished in general results very near the truth; yet when he attempted to represent the inclinations in different latitudes by the supposition of a magnet infinitely small, very near the centre of the earth and perpendicular to the magnetic equator, he did not pretend to consider the hypothesis as any thing real, but solely as a mathematical abstraction useful in connecting the results, and tending to ascertain in future whether any changes exist.

DI′PSACUS. Teazel. In botany, a genus of the class tetrandria, order monogynia. Common calyx many-leaved; proper superior one-leafed; receptacle chaffy; crown of the seed cup-shaped. Four species: of which two are common to the hedges, and one to the moist wastes of our own country. The only species we need notice is d. fullonum, which is still cultivated in the west of England, as being, at least till lately, of general use in raising the knap upon woollen cloths, but which for some years has been gradually sinking into disuse.

DIPSAS, in zoology, the green coluber.

DIPTERA, in zoology, an order of the class insecta, characterised by having two wings, under each of which is a clavate poise with its appropriate scale. Of these some possess both proboscis and sucker; others have a sucker, but no proboscis. See ENTOMOLOGY and ZOOLOGY.

DIPTERE, in ancient architecture, a temple surrounded by a double row of columns, forming wings.

DI′PTERIX, in botany, a genus of the class diadelphia, order decandria. Calyx with the two upper divisions wing-shaped; legume one-celled, one-seeded, coriaceous, two-valved. Two species; both natives of South America, and both trees sixty feet high.

1. D. odorata, called by the inhabitants tonca bean, with alternate leaves and terminal racemes: legume fleshy, and yellowish; seed highly fragrant, covered with a thin brittle shell.

2. D. oppositifolia; leaves opposite; flowers panicled; legume coriaceous, greenish.

DI′PTOTE. *s.* (διπτωτα.) A noun consisting of two cases only (*Clarke*)

DIPTYCHA, in antiquity, a public register, wherein were written the names of the consuls, and other magistrates, among the heathens; and of bishops, and defunct as well as surviving brethren among the Christians. The word is formed from the Greek διπτυχων, or διπτυχα, and that from διπτυξ, a masculine noun derived from πτυσσω, a fold or plait. From its future ϖτυξω, is formed ϖτυξ, a fold or plait, to which adding δις, twice, we have διπτυξ, in the genitive διπτυχος, whence the nominative neuter διπτυχον, q. d. a book folded in two leaves; though there were some in three, and others in four or five leaves. An ingenious author imagines this name to have been first given them to distinguish them from the books that were rolled, called volumina.

DI′PUS. Jerboa. In zoology, a genus of the class mammalia, order glires. Fore-teeth two in each jaw; fore-legs very short, hind-legs very long; tail long, tufted at the tip. These animals in their habits very much resemble dormice. By means of their long hind-legs they make prodigious bounds; and use the fore-paws to carry food to the mouth. The genus was probably known to the ancients under the name of μυς διπους, two-footed mouse, a figure that occurs on various coins of Cyrene, where the animal is still to be found. It is said by Bochart to be the שפן (saphan) of the Hebrew Scriptures, which in our common version is generally translated conies: see Ps. civ. 18. Prov. xxx. 26: but the characters ascribed to it in these passages do not apply very accurately either to the cony (rabbit) or jerboa: and Dr. Shaw and Mr. Bruce, are probably right in referring the Hebrew saphan to another animal, which they denominate daman Israel.

There are ten species of the jerboa, of which the following are the chief:

1. D. jaculus. Alagtago, or common jerboa. Feet fore-toed; fore-feet with a claw, instead of the thumb; hind-legs three times as long as the fore, and used after the manner of the kanguroo; teats eight, and distant from each other; hair above pale-brown, beneath whitish; ears and feet flesh-coloured: body seven inches long; tail ten. Inhabits Egypt, Arabia, and South Siberia, in firm ground, and fields covered with herbage; is not easily tamed; rests with the hind-legs under the belly, and fore-legs near the throat, so as not easily to be seen: forms long winding burrows with a chamber at the end, half a yard below the surface of the soil; feeds on roots, grain, and grass: cuts grass, which, when dry, it carries into its retreats for winter provision. The flesh is eaten by the Calmucs and Arabians. See Nat. Hist. Plate LXXIII.

2. D. cafer. Cape jerboa. Toes five before, four behind: body above bright chesnut, beneath yellowish white; tail very hairy, black at the tip. Inhabits the Cape; is fourteen inches long, the tail fifteen, ears three: burrows with the fore-feet; sleeps sitting on its haunches, the head between the legs, and the fore-paws over the ears; is driven out of its hole by water poured in; grunts with a shrill voice; the flesh is eaten by the natives.

3. D. meridianus. Torrid jerboa. Fore-feet three-toed, with the rudiment of a fourth; hind feet five-toed; tail colour of the body, which is above pale tawny, sometimes greyish, beneath white. Inhabits the sandy deserts of the torrid region, near the Caspian sea: feeds on a few farinaceous seeds: forms burrows with three apertures, about a yard under the surface. Body five inches long; tail three inches.

4. D. tamaricinus. Tamarisk jerboa. Fore-feet three-toed, with the rudiment of a fourth; hind-feet five-toed; tail obscurely annulate, hairy, a little tufted at the tip. Body above yellowish-grey, beneath white. Inhabits the salt marshes of the Caspian sea; feeds on the fruit of the tamarisk, whence its specific name, and burrows under it with two entrances into its chamber. A very elegant animal; body five and a half inches long; tail the same length.

5. D. Canadensis. Canada jerboa. Toes four before, five behind; tail covered with bristles, longer than the body, the colour of which is ferruginous. Inhabits the coldest parts of Canada; size of a small mouse; frequents shrubby places; active; caught with difficulty.

DIPYRE, a species of siliceous earth, found at Manleon in the Pyrennees, imbedded in steatite. Colour greyish, or reddish-white, passing into pale rose colour. It occurs either disseminated in small fascicular masses, or in minute prismatic crystals. It has a brilliant vitreous lustre, a lamellar fracture, parallel to the sides of a regular hexahedron. It is moderately hard, easily frangible; and when pulverised and thrown on hot coals, gives a pale phosphoric light. It is fusible with ebullition before the blow-pipe, and yields, according to Vauquelin,

60 silex.
24 alumine.
10 lime.
2 water.
———
96
4 loss.

100

DIRÆ, in mythology. See Furies.

DIREA, in botany, a genus of the class octandria, order monogynia. Calyxless; coral tubular, with the border obsolete; stamens longer than the tube; drupe one-seeded. One species; a Virginian shrub, with oval, pale, yellowish leaves; flowers axillary, two or three on each peduncle, greenish white.

DIRE. *a.* (*dirus*, Latin.) Dreadful; dismal; mournful; horrible; terrible (*Milton*)

DIRE′CT. *a.* (*directus*, Latin.) 1. Straight; not crooked. 2. Not oblique (*Bentley*). 3. Not collateral. 4. Apparently tending to some end (*Sidney*). 5. Open; not ambiguous (*Bacon*). 6. Plain; express (*Locke*).

Direct, in astronomy, is applied to a planet when it appears to move according to the order of the signs. When a planet is direct, its motion and other phenomena are designated by the term direction.

Direct, a character used in music, at the end of a staff, especially at the foot of a page, to shew the place of the first note in the next staff: it is this, W.

To Dire'ct. *v. a.* (*directum*, Latin.) 1. To aim in a straight line (*Pope*). 2. To point against; as a mark (*Dryden*). 3. To regulate; to adjust (*Ecclus.*). 4. To prescribe certain measures; to mark out a certain course (*Job*). 5. To order; to command.

DIRE'CTION. *s.* (*directio*, Latin.) 1. Aim at a certain point (*Smalridge*). 2. Tendency of motion impressed by a certain impulse (*Locke*). 3. Order; command; prescription (*Hooker*). 4. Regularity; adjustment (*Pope*).

Direction, is also a kind of calculus whereby astrologers pretend to find when any notable accident shall befal the person whose horoscope is drawn. In their own language, the direction is the calculation of the time when the significator shall meet the portender.

Direction of motion, in mechanics, the situation of the straight line along which any motion is performed, or which is a tangent to that part of the curve in which a moving body is at any time.

Direction (Line of), in mechanics, is a straight line supposed to be drawn from the centre of gravity of any body directly towards the centre of the earth.

DIRE'CTIVE. *a.* (from *direct.*) 1. Having the power of direction (*Bramhall*). 2. Informing; shewing the way (*Thomson*).

DIRE'CTLY. *ad.* (from *direct.*) 1. In a straight line; rectilineally (*Dryden*). 2. Immediately; apparently (*Hooker*).

DIRE'CTNESS. *s.* (from *direct.*) Straightness; tendency to any point; the nearest way (*Bentley*).

DIRE'CTOR. *s.* (*director*, Latin.) 1. One that has authority over others; a superintendent (*Swift*). 2. A rule; an ordinance (*Swift*). 3. An instructor (*Hooker*). 4. One who is consulted in cases of conscience (*Dryden*).

Dire'ctor, *s.* (*director*, Latin.) 1. One that directs; one that prescribes. 2. An instrument that serves to guide any manual operation.

Director, in surgery, a grooved instrument for guiding an incision-knife, as used in lithotomy, or operating for the stone, and in some other cases.

Director, in commercial polity, a person who has the management of the affairs of a trading company: thus we say, the directors of the India company, South sea company, &c.

DIRE'CTORY. *s.* (from *director.*) The books which the factious preachers published in the rebellion, for the direction of their sect in acts of worship (*Oxford Reasons*).

DIRECTRIX. See Dirigent.

Directrix, a particular right line, perpendicular to the axis of a conic section, and frequently referred to by those authors who demonstrate the properties of those curves from the description of them in plano. The indefinite right line DX (fig. 7, Plate 57.) is the directrix, and it is such that if any point S be assumed without it, and, whilst the line SP revolves about S as a centre, a point P moves in it in such a manner that its distance from S shall always be to PE its distance from the line DX, in a given ratio; then the curve described by the point P is a conic section; it is an ellipse, a parabola, or an hyperbola, according as SP is less than, equal to, or greater than, PE. The ratio of SP to PE is called the determining ratio. In the ellipse AD, the distance of the directrix from the vertex, is greater than AS the distance from the vertex to the focus; in the parabola AD is equal to AS, in the hyperbola it is less.

DI'REFUL. *a.* Dire; dreadful (*Pope*).

DI'RENESS. *a.* (from *dire.*) Dismalness; horrour; hideousness (*Shakspeare*).

DIRE'PTION. *s.* (*direptio*, Lat.) The act of plundering.

DIRGE, a solemn and mournful composition performed at funeral processions. The dirge was in very general use with the ancient Greeks and Romans, and was numerously filled, both by voices and instruments (*Busby*).

DIRIBITORES, officers appointed to distribute tablets to the people at the Roman comitia.

DIRITTA, in the Italian music, a term intimating that the piece is to be played or sung by conjoint degrees.

DIRK. *s.* (Earse.) A kind of dagger (*Tickel*).

To DIRKE. *v. a.* To spoil; to ruin (*Spenser*).

DIRT. *s.* (*dryt*, Dutch.) 1. Mud; filth; mire (*Wake*). 2. Meanness: sordidness.

To Dirt. *v. a.* (from the noun.) To foul; to bemire; to soil (*Swift*).

Dirt-pie. *s.* (*dirt* and *pie.*) Forms moulded by children of clay (*Suckling*).

DI'RTILY. *ad.* (from *dirty.*) 1. Nastily; foully; filthily. 2. Meanly; sordidly; shamefully (*Donne*).

DI'RTINESS. *s.* (from *dirty.*) 1. Nastiness; filthiness; foulness. 2. Meanness; baseness; sordidness.

DI'RTY. *a.* (from *dirt.*) 1. Foul; nasty; filthy (*Shakspeare*). 2. Sullied; cloudy; not elegant (*Locke*). 3. Mean; base; despicable (*Taylor*).

To Di'rty. *v. a.* (from the noun.) 1. To foul; to soil (*Arbuthnot*). 2. To disgrace; to scandalize.

DIRU'PTION. *s.* (*diruptio*, Latin.) 1. The act of bursting, or breaking. 2. The state of bursting, or breaking.

DIS, an inseparable particle, implying commonly a privative or negative signification: as, to *arm*, to *disarm*; to *join*, to *disjoin*.

DISA, in botany, a genus of the class gynandria, order diandria. Spathe one-valved; petals three: the third less than the others; two-parted, gibbous at the base. Four species; all natives of the Cape; herbaceous plants, with elegant blue flowers.

DISABI'LITY. *s.* (from *disable.*) 1. Want of power to do any thing; weakness; impotence (*Raleigh*).

Disability, in law, is when a man is disabled, or made incapable to inherit any lands, or take that benefit which otherwise he might have done: and this may happen four ways; by the act of an ancestor, or of the party himself; by the act of God, or of the law. 1. Disability by the act of the ancestor, is where the ancestor is attainted of high treason, &c. which corrupts the blood of his children, so that they may not inherit his estate. 2. Disability by the act of the party, is where a man binds himself by obligation, that upon surrender of a lease, he will grant a new estate to a lessee; and afterwards he grants over the reversion to another, which puts it out of his power to perform it. 3. Disability by the act of God, is where a man is *non sanæ memoriæ*, whereby he is incapable to make any grant, &c. So that, if he passeth an estate out of him, it may after his death be made void; but it is a maxim in law, "That a man of full age shall never be received to disable his own person." 4. Disability by the act of the law, is where a man, by the sole act of the law, without any thing by him done, is rendered incapable of the benefit of the law; as an alien born, &c.

To DISA'BLE. *v. a.* (*dis* and *able.*) 1. To deprive of force; to weaken (*Davies*). 2. To hinder from action (*Temple*). 3. To impair; to diminish (*Shakspeare*). 4. To deprive of usefulness or efficacy (*Dryden*). 5. To exclude, as wanting proper qualifications (*Wotton*).

To DISABU'SE. *v. a.* (*dis* and *abuse.*) To set free from mistake; to undeceive (*Waller*).

DISACCOMMODA'TION. *s.* (*dis* and *accommodation.*) The state of being unfit or unprepared (*Hale*).

To DISACCU'STOM. *v. a.* (*dis* and *accustom.*) To destroy the force of habit by disuse, or contrary practice.

DISACQUA'INTANCE. *s.* (*dis* and *acquaintance.*) Disuse of familiarity (*South*).

DISADVA'NTAGE. *s.* (*dis* and *advantage.*) 1. Loss; injury to interest: as, he sold to *disadvantage*. 2. Diminution of any thing desirable, as, credit, fame, honour (*Dryden.*) 3. A state not prepared for defence (*Spenser*).

To Disadva'ntage. *v. a.* To injure an interest of any kind (*Decay of Piety.*)

DISADVA'NTAGEABLE. *a.* Contrary to profit; producing loss: not used (*Bacon*).

DISADVANTA'GEOUS. *a.* Contrary to interest; contrary to convenience; unfavourable (*Addison*).

DISADVANTA'GEOUSLY. *ad.* In a manner contrary to interest or profit (*Government of the Tongue*).

DISADVANTA'GEOUSNESS. *s.* Contrariety to profit; inconvenience.

DISADVE'NTUROUS *a.* Unhappy; unprosperous (*Spenser*).

To DISAFFE'CT. *v. a.* (*dis* and *affect.*) To fill with discontent; to discontent (*Clarendon*).

DISAFFE'CTED. *part. a.* Not disposed to zeal or affection (*Stillingfleet*).

DISAFFE'CTEDLY. *ad.* After a disaffected manner.

DISAFFE'CTEDNESS. *s.* The quality of being disaffected.

DISAFFE'CTION. *s.* (from *disaffect.*) 1. Dislike; ill-will (*Taylor*). 2. Want of zeal for the government (*Swift*). 3. Disorder; bad constitution (*Wiseman*).

DISAFFI'RMANCE. *s.* (*dis* and *affirm.*) Confutation; negation (*Hale*).

To DISAFFO'REST. *v. a.* (*dis* and *forest.*) To throw open to common purposes, by putting away the privileges of a forest (*Bacon*).

To DISAGRE'E. *v. n.* (*dis* and *agree.*) 1. To differ; not to be the same (*Locke*). 2. To differ; not to be of the same opinion (*Dryden*). 3. To be in a state of opposition (*Brown*).

DISAGREE'ABLE. *a.* (from *disagree.*) 1. Contrary; unsuitable (*Pope*). 2. Unpleasing; offensive (*Locke*).

DISAGREE'ABLENESS. *s.* 1. Unsuitableness; contrariety. 2. Unpleasantness; offensiveness (*South*).

DISAGREE'MENT. *s.* (from *disagree.*) 1. Difference; dissimilitude; diversity; not identity; not likeness (*Woodward*). 2. Difference of opinion; contrariety of sentiments (*Hooker*).

To DISALLO'W. *v. a.* (*dis* and *allow.*) 1. To deny authority to any (*Dryden*). 2. To consider as unlawful (*Hooker*). 3. To censure by some posterior act (*Swift*). 4. To censure; not to justify (*South*).

To Disallo'w. *v. n.* To refuse permission; not to grant (*Hooker*).

DISALLO'WABLE. *a.* Not allowable; not to be suffered.

DISALLO'WANCE. *s.* Prohibition (*South*).

To DISA'NCHOR. *v. a.* (from *dis* and *anchor.*) To drive a ship from its anchor.

DISA'NDRA, in botany, a genus of the class heptandria, order monogynia. Calyx seven-parted; corol wheel-shaped, seven-parted; capsule two-celled, many-seeded. One species only; a native of Madeira, affording two varieties.

To DISA'NIMATE. *v. a.* (*dis* and *animate.*) 1. To deprive of life. 2. To discourage; to deject (*Boyle*).

DISANIMA'TION. *s.* (from *disanimate.*) Privation of life (*Brown*).

To DISANNU'L. *v. a.* To annul; to deprive of authority: a barbarous word (*Herbert*).

DISANNU'LMENT. *s.* (from *disannul.*) The act of making void.

To DISAPPE'AR. *v. n.* (*disparoitre*, Fr.) To be lost to view; to vanish out of sight; to fly; to go away (*Milton*).

To DISAPPO′INT. *v. a.* (*dis* and *appoint.*) To defeat of expectation; to balk (*Tillotson*).

DISAPPO′INTMENT. *s.* Defeat of hopes; miscarriage of expectations (*Spectator*).

Disappointment (Isles of), two or more small islands, discovered by commodore Byron, in the S. Pacific ocean. Lat. 10. to 14. 5 S. Lon. 141. 5. to 141. 16 W.

DISAPPROBA′TION. *s.* (*dis* and *approbation.*) Censure; condemnation (*Pope*).

To DISAPPRO′VE. *v. n.* (*disapprouver*, Fr.) 1. To dislike; to censure (*Pope*). 2. To reject as disliked (*Swift*).

DI′SARD. *s.* (ꝺıſıᵹ, Saxon.) A prattler; a boasting talker (*Skinner*).

To DISA′RM. *v. a.* (*disarmer*, French.) To spoil or divest of arms; to deprive of arms (*Dryden*).

To DISARRA′Y. *v. a.* (*dis* and *array.*) To undress any one; to divest of clothes (*Spenser*).

Disarra′y. *s.* (from the verb.) 1. Disorder; confusion (*Hayward*). 2. Undress.

DISASSIDU′ITY. *s.* Absence of care or attention (*Wotton*).

DISA′STER. *s.* (*desastre*, French.) 1. The blast or stroke of an unfavourable planet (*Shakspeare*). 2. Misfortune; grief; mishap; misery (*Pope*).

To Disa′ster. *v. a.* (from the noun.) 1. To blast by an unfavourable star (*Sidney*). 2. To afflict; to mischief (*Shakspeare*).

DISA′STROUS. *a.* (from *disaster.*) 1. Unlucky; not fortunate (*Hayward*). 2. Gloomy; threatening misfortune (*Milton*). 3. Unhappy; calamitous; miserable (*Denham*).

DISA′STROUSLY. *ad.* In a dismal manner.

DISA′STROUSNESS. *s.* Unluckiness.

To DISAVOU′CH. *v. a.* (*dis* and *avouch.*) To retract profession; to disown (*Daniel*).

To DISAVO′W. *v. a.* (*dis* and *avow.*) To disown; to deny knowledge of (*Hayward*).

DISAVO′WAL. *s.* Denial (*Clarissa*).

DISAVO′WMENT. *s.* Denial (*Wotton*).

To DISAU′THORIZE. *v. a.* (*dis* and *authorize.*) To deprive of credit or authority (*Wotton*).

To DISBA′ND. *v. a.* (*dis* and *band.*) 1. To dismiss from military service; to break up an army (*Knolles*). 2. To spread abroad; to scatter (*Woodward*).

To Disba′nd. *v. n.* 1. To retire from military service; to separate; to break up (*Tillotson*). 2. To be dissolved (*Herbert*).

To DISBA′RK. *v. a.* (*debarquer*, Fr.) To land from a ship; to put on shore (*Fairfax*).

DISBELIE′F. *s.* (from *disbelieve.*) Refusal of credit; denial of belief (*Tillotson*).

To DISBELIE′VE. *v. a.* (*dis* and *believe.*) Not to credit; not to hold true (*Hammond*).

DISBELIE′VER. *s.* One who refuses belief; one who denies a position to be true (*Watts*).

To DISBE′NCH. *v. a.* (*dis* and *bench.*) To drive from a seat (*Shakspeare*).

To DISBRA′NCH. *v. n.* (*dis* and *branch.*) To separate, or break off, as a branch from a tree (*Evelyn*).

To DISBU′D. *v. a.* (with gardeners.) To take away the sprigs newly put forth.

To DISBU′RDEN. *v. a.* (*dis* and *burden.*) 1. To ease of a burden; to unload (*Milton*). 2. To disencumber, discharge, or clear (*Hale*). 3. To throw off a burden (*Addison*).

To Disbu′rden. *v. n.* To ease the mind.

To DISBU′RSE. *v. a.* (*debourser*, Fr.) To spend or lay out money (*Spenser*).

DISBU′RSEMENT. *s.* (*deboursement*, Fr.) 1. Act of disbursing or laying out (*Spenser*). 2. Sum spent.

DISBU′RSER. *s.* One that disburses.

DISC, in antiquity. See Discus.

Disc, in astronomy. See Disk.

DISCA′LCEATED. *a.* (*discalceatus*, Lat.) Stripped of shoes.

DISCALCEA′TION. *s.* (from *discalceated.*) The act of pulling off the shoes (*Brown*).

To DISCA′NDY. *v. n.* (*dis* and *candy.*) To dissolve; to melt (*Shakspeare*).

DISCANT, in music. See Descant.

To DISCA′RD. *v. a.* (*dis* and *card.*) 1. To throw out of the hand such cards as are useless. 2. To dismiss or eject from service or employment (*Swift*).

DISCA′RNATE. *a.* (*dis* and *caro*, flesh; *scarnato*, Italian.) Stripped of flesh (*Glanville*).

To DISCA′SE. *v. a.* To strip; to undress (*Shakspeare*).

To DISCE′RN. *v. a.* (*discerno*, Latin.) 1. To descry; to see (*Proverbs*). 2. To judge; to have knowledge of (*Sidney*). 3. To distinguish (*Boyle*). 4. To make the difference between (*Ben Jonson*).

To Disce′rn. *v. n.* To make distinction (*Hayward*).

DISCE′RNER. *s.* (from *discern.*) 1. Discoverer; he that descries (*Shakspeare*). 2. Judge; one that has the power of distinguishing (*Clarendon*).

DISCE′RNIBLE. *a.* (from *discern.*) Discoverable; perceptible; apparent (*South*).

DISCE′RNIBLENESS. *s.* Visibleness.

DISCE′RNIBLY. *ad.* (from *discernible.*) Perceptibly; apparently (*Hammond*).

DISCE′RNING. *part. a.* (from *discern.*) Judicious; knowing (*Atterbury*).

DISCE′RNINGLY. *ad.* Judiciously; rationally; acutely (*Garth*).

DISCE′RNMENT. *s.* (from *discern.*) Judgment; power of distinguishing (*Freeholder*).

To DISCE′RP. (from *discerpo*, Lat.) To tear in pieces; to break.

DISCE′RPTIBLE. *s.* (from *discerp.*) Frangible; separable (*More*).

DISCERPTIBI′LITY. *s.* (from *discerptible.*) Liableness to be destroyed by disunion of parts.

DISCE′RPTION. *s.* (from *discerp.*) The act of pulling to pieces.

To DISCHA′RGE. *v. a.* (*decharger*, Fr.) 1. To disburden; to exonerate (*Dryden*). 2. To unload; to disembark (*Kings*). 3. To give vent to any thing; to let fly (*Dryden*). 4. To let off a gun (*Knolles*). 5. To clear a debt by payment (*Locke*). 6. To set free from obligation (*L'Estrange*). 7. To clear from an accusation or crime; to absolve (*Locke*). 8. To perform; to execute (*Dryden*). 9. To put away; to obliterate (*Bacon*). 10. To divest of any office or employment. 11. To dismiss; to release (*Bacon*). 12. To emit (*Wiseman*).

To Discha'rge. *v. n.* To dismiss itself; to break up (*Bacon*).

Discha'rge. *s.* (from the verb.) 1. Vent; explosion; emission (*Woodward*). 2. Matter vented (*Sharp*). 3. Disruption; evanescence (*Bacon.*) 4. Dismission from an office. 5. Release from an obligation or penalty (*Milton*). 6. Absolution from a crime (*South*). 7. Ransom; price of ransom (*Milton*). 8. Performance; execution (*L'Estrange*). 9. An acquittance from a debt. 10. Exemption; privilege (*Ecclus*).

Discharge of fluids through apertures. See Hydraulics.

DISCHA'RGER. *s.* (from *discharge.*) 1. He that discharges in any manner. 2. He that fires a gun (*Brown*).

Discharger, or Discharging rod, in electricity, an instrument invented for the purpose of discharging electric jars, &c. The common discharging rod is nothing more than a semicircular brass wire, furnished with two brass balls, one at each end of the wire. The other, which is of very extensive use in electric experiments, is called the jointed discharging rod. It is furnished with a handle of glass, or baked wood; the legs are moveable, and may be set to any convenient distance. By bringing one of these knobs or points to one coated side of a charged electric, and the other to the other side, or to any conductor connected with it, the communication is completed between the two sides, and the electric is discharged.

Discharger (Universal), contrived by Mr. Henley, consists of a flat board at bottom, about fifteen inches long, four broad, and one thick, into two holes of which are cemented two glass pillars, eight or nine inches asunder; each of these has a turning joint, so composed of caps and pivots, that wire may not only be slided through each joint, but turned, either horizontally or vertically. Each of the wires is furnished with an open ring at one end, and at the other end with a brass ball, which by a short spring socket may be slipt on the pointed extremity, or removed at pleasure. On a cylindrical foot about the midway between the two glass pillars, is a strong circular piece of wood about five inches in diameter, in the surface of which a plate of ivory is inlaid; this board and plate may, by means of screws, be fixed at any required height. The instrument is used in a variety of experiments. Thus, *to reduce thick pieces of glass to powder.* Place a thick piece of glass on the ivory plate of the universal discharger, and a thick piece of ivory on the glass, on which a weight from one to seven pounds is to be placed; take off the balls, bring the points of the wires against the edge of the glass, and pass the discharge through the wires, by connecting one of the wires with the hook of the battery, and forming a communication, when the battery is charged, from the other wire to the ball. By this operation the glass will be broken, and some part of it shivered to an impalpable powder. When the piece of glass is strong enough to resist the shock, the glass is often marked by the explosion with the most lively and beautiful colours that can be imagined.

Fix some very dry white wood between the balls of the universal discharger, the fibres of the wood running in the same direction with the wires: then pass the shock through them, and the wood will be torn to pieces; or run the points into the wood, and then pass the shock, which will answer as well.

DISCI'NCT. *a.* (*discinctus*, Lat.) Ungirded; loosely dressed.

To DISCI'ND. *v. a.* (*discindo*, Lat.) To divide; to cut in pieces (*Boyle*).

DISCIPLE. (from *disco*, I learn.) One who learns any thing from another: thus, the followers of any teacher, philosopher, &c. are called disciples. In the Christian sense, they were followers of Jesus Christ, in general; but in a more restrained sense, the disciples denote those alone who were the immediate followers and attendants on his person, of which there were seventy or seventy-two. The names disciple and apostle are often synonymously used in the Gospel history; but sometimes the apostles are distinguished from disciples, as persons selected out of the number of disciples, to be the principal ministers of his religion: of these there were only twelve. The Latins kept the festival of the seventy or seventy-two disciples on July 15th, and the Greeks on January 4th.

To Disci'ple. *v. a.* Not in use. 1. To train; to bring up (*Shakspeare*). 2. To punish; to discipline (*Spenser*).

DISCI'PLESHIP. *s.* (from *disciple.*) The state or function of a disciple (*Hammond*).

DI'SCIPLINABLE. *a.* (*disciplinabilis*, Lat.) Capable of instruction.

DI'SCIPLINABLENESS. *s.* (from *disciplinable.*) Capacity of instruction (*Hale*).

DISCIPLINA'RIAN. *a.* (from *discipline.*) Pertaining to discipline (*Glanville*).

Disciplina'rian. *s.* (*disciplina*, Lat.) 1. One who rules or teaches with great strictness. 2. A follower of the Presbyterian sect, so called from their perpetual urgency about discipline (*Saunderson*).

DI'SCIPLINARY. *a.* (*disciplina*, Lat.) 1. Pertaining to discipline. 2. Relating to government (*Ferne*). 3. Relating to education (*Milton*).

DI'SCIPLINE. *s.* (*disciplina*, Latin.) 1. Education; instruction; the act of cultivating the mind (*Bacon*). 2. Rule of government; order (*Hooker*). 3. Military regulation (*Shakspeare*). 4. A state of subjection (*Rogers*). 5. Any thing taught; art; science (*Wilkins*)

6. Punishment; chastisement (*Addison*). 7. External mortification (*Taylor*).

To Di′scipline. *v. a.* 1. To educate; to instruct; to bring up (*Addison*). 2. To regulate; to keep in order (*Derham*). 3. To punish; to correct; to chastise.

To DISCLA′IM. *v. a.* (*dis* and *claim.*) To disown; to deny any knowledge of (*Rogers*).

DISCLA′IMER. *s.* (from *disclaim.*) One that disclaims, disowns, or renounces.

To DISCLO′SE. *v. a.* (*dis* and *close.*) 1. To uncover; to produce from a state of latitancy to open view (*Woodward*). 2. To hatch; to open (*Bacon*). 3. To reveal; to tell (*Addison*).

DISCLO′SER. *s.* (from *disclose.*) One that reveals or discovers.

DISCLO′SURE. *s.* (from *disclose.*) 1. Discovery; production into view (*Bacon*). 2. Act of revealing any secret (*Bacon*).

DISCOBOLI, in antiquity (from δισκος, and βαλλω, I throw;) throwers of the discus.

DISCOLORA′TION. *s.* (from *discolour.*) 1. The act of changing the colour; the act of staining. 2. Change of colour; stain; die (*Arbuthnot*).

To DISCO′LOUR. *v. a.* (*decoloro*, Latin.) To change from the natural hue; to stain (*Temple*).

To DISCO′MFIT. *v. a.* (*desconfire*, Fr.) To defeat; to conquer; to vanquish (*Philips*).

Disco′mfit. *s.* (from the verb.) Defeat; rout; overthrow (*Milton*).

DISCO′MFITURE. *s.* (from *discomfit.*) Defeat; loss of battle; rout; overthrow (*Atterbury*).

DISCO′MFORT. *s.* (*dis* and *comfort.*) Uneasiness; sorrow; melancholy; gloom (*Shakspeare*).

To Disco′mfort. *v. a.* To grieve; to sadden; to deject (*Sidney*).

DISCO′MFORTABLE. *a.* (from *discomfort.*) I. That is melancholy and refuses comfort (*Shakspeare*). 2. That causes sadness (*Sidney*).

To DISCOMME′ND. *v. a.* (*dis* and *commend.*) To blame; to censure (*Denham*).

DISCOMME′NDABLE. *a.* Blamable; censurable; deserving blame (*Ayliffe*).

DISCOMME′NDABLENESS. *s.* Blamableness; liableness to censure.

DISCOMMENDA′TION. *s.* Blame; reproach; censure (*Ayliffe*).

DISCOMME′NDER. *s.* One that discommends; a dispraiser.

To DISCOMMO′DE. *v. a.* (*dis* and *commode*, Fr.) To put to inconvenience; to molest.

DISCOMMO′DIOUS. *a.* Inconvenient; troublesome; unpleasing (*Spenser*).

DISCOMMO′DITY. *s.* Inconvenience; disadvantage; hurt; mischief (*Bacon*).

To DISCOMPO′SE. *v. a.* (*decomposer*, Fr.) 1. To disorder; to unsettle (*Clarendon*). 2. To ruffle; to disorder (*Swift*). 3. To disturb the temper (*Dryden*). 4. To offend; to fret; to vex (*Swift*). 5. To displace; to discard not in use (*Bacon*).

DISCOMPO′SURE. *s.* (from *discompose.*) Disorder; perturbation (*Clarendon*).

To DISCONCE′RT. *v. a.* (*dis* and *concert.*) To unsettle the mind; to discompose (*Collier*).

DISCONFO′RMITY. *s.* Want of agreement; inconsistency (*Hakewill*).

DISCONGRU′ITY. *s.* Disagreement; inconsistency (*Hale*).

DISCO′NSOLATE. *a.* Void of comfort; hopeless; sorrowful; melancholy (*Milton*).

DISCO′NSOLATELY. *ad.* In a disconsolate manner; comfortlesly.

DISCO′NSOLATENESS. *s.* The state of being disconsolate.

DISCONTE′NT. *s.* Want of content; uneasiness at the present state. See Contentment.

Disconte′nt. *a.* Uneasy at the present state; dissatisfied (*Hayward*).

To Disconte′nt. *v. a.* To dissatisfy; to make uneasy at the present state (*Dryden*).

DISCONTE′NTED. *participial a.* Uneasy; cheerless; malevolent (*Tillotson*).

DISCONTE′NTEDNESS. *s.* Uneasiness; want of ease; dissatisfaction (*Addison*).

DISCONTE′NTMENT. *s.* The state of being discontented; uneasiness (*Bacon*).

DISCONTI′NUANCE. *s.* (from *discontinue.*) 1. Want of cohesion of parts; disruption (*Bacon*). 2. Cessation; intermission (*Atterbury*).

DISCONTINUA′TION. *s.* (from *discontinue.*) Disruption of continuity; breach of union of parts; disruption; separation (*Newton*).

To DISCONTI′NUE. *v. n.* (*discontinuer*, Fr.) 1. To lose the cohesion of parts (*Bacon*). 2. To lose an established or prescriptive custom or right (*Jeremiah*).

To Disconti′nue. *v. a.* 1. To leave off; to cease any practice or habit (*Bacon*). 2. To break off; to interrupt (*Holder*).

DISCONTINU′ITY. *s.* Disunion of parts; want of cohesion (*Newton*).

DISCONVE′NIENCE. *s.* Incongruity; disagreement (*Bramhall*).

DI′SCORD. *s.* (*discordia*, Latin.) 1. Disagreement; opposition; mutual anger; reciprocal oppugnancy (*Shakspeare*). 2. Difference or contrariety of qualities, particularly of sounds (*Dryden*).

Discord, in music, the relation of two sounds which are, of themselves, always disagreeable, whether applied in succession, or consonance: thus the second, fourth, and seventh, with their octaves, and in general, all intervals, except those few which precisely terminate the concords, are called discords. Discords are divided into concinnous and inconcinnous intervals. Concinnous discords are such as are fit for music, next to and in combination with concords. These are relations which in themselves are neither very disagreeable nor agreeable, and have only a good effect in music, as by their mixture and combination with the more natural and essential principles, they produce a variety necessary to our being pleased.

Inconcinnous discords are such as are never chosen in music, as having too great a harshness in them; though even the greatest discord is not without its use. The harmony of discords is that wherein the discords are made use of as the solid and substantial part of harmony: for by a proper interposition of a discord, the succeeding concords receive an additional lustre. Thus discords are in music what strong shades are in painting; and without discords not only the variety, which is the life of music, would be soon exhausted, but the very perfection of such relation of sounds would clog the ear in like manner as sweet and luscious things do the stomach. Besides the concinnous discords used designedly in music, there are several other discord relations which happen unavoidably in an accidental and indirect manner. Discords may transiently pass upon the unaccented part of the measure without much offence to the ear. The discords are, the fifth when joined with the sixth, the fourth with the fifth; and the ninth and seventh, of their own nature, are discords. Discords are introduced into harmony with due preparations, and must be succeeded or resolved by concords. A discord is prepared by substituting it first in the harmony in quality of a concord; that is, the same note is first a concord to the bass note immediately preceding that to which it is a discord. Again, a discord is resolved by being immediately succeeded by a concord, descending from it only by the distance of a major or minor second. Discords must be brought off so as to render them delightful, which they will always be when used by a skilful composer, who will take care, by striking the ear with a disproportionate sound, to awaken a greater attention to that which follows. See Dissonance.

To Di′scord. *v. n.* (*discordo*, Latin.) To disagree; not to suit with (*Bacon.*)

DISCO′RDANCE. Disco′rdancy. *s.* (from *discord.*) Disagreement; opposition; inconsistency.

DISCO′RDANT. *a.* (*discordans*, Lat.) 1. Inconsistent; at variance with itself (*Dryden*). 2. Opposite; contrarious (*Cheyne.*) 3. Incongruous; not conformable (*Hale*).

DISDO′RDANTLY. *ad.* 1. Inconsistently; in disagreement with itself. 2. In disagreement with another (*Boyle*). 3. Peevishly; in a contradictious manner.

DISCORDIA, in mythology, a malevolent deity, daughter of Nox, and sister to Nemesis, the Parcæ and Death. She was driven from heaven by Jupiter, because she was the cause of continual quarrels. When the nuptials of Peleus and Thetis were celebrated, this goddess was not invited, and the neglect so irritated her that she threw an apple into the midst of the gods, with the inscription of *detur pulchriori.* This apple was the cause of the ruin of Troy, and of infinite misfortunes to the Greeks. (See Paris.) She is represented with a pale ghastly look, and her garment is torn. Her head is generally entwined with serpents, and she is attended by Bellona. She is supposed to be the cause of all the dissensions which arise upon earth, public as well as private. (*Virgil. Hesiod*).

To DISCO′VER. *v. a.* (*decouvrir*, Fr.) 1. To show; to disclose; to bring to light. 2. To expose to view (*Shakspeare*). 3. To make known; to reveal (*Isaiah*). 4. To ken; to espy (*Acts*). 5. To find out; to obtain information (*Pope*). 6. To detect; to find though concealed (*Milton*). 7. To find things or places not known before (*Shakspeare*).

DISCO′VERABLE. *a.* (from *discover.*) 1. That may be found out (*Watts*). 2. Apparent; exposed to view (*Bentley*).

DISCO′VERER. *s.* (from *discover.*) 1. One that finds any thing not known before; a finder out (*Arbuthnot*). 2. A scout; one who is put to descry the enemy (*Shakspeare*).

DISCO′VERY. *s.* (from *discover.*) 1. The act of finding any thing hidden (*Dryden*). 2. The act of revealing or disclosing any secret (*South*).

In philosophical disquisitions, it is proper to discriminate carefully between invention and discovery. The object of the former is to produce something which had no existence before; that of the latter, to bring to light something which did exist, but which was concealed from common observation. Thus we say, Otto Guerricke invented the air-pump; Sanctorius invented the thermometer; Newton and Gregory invented the reflecting telescope; Galileo discovered the solar spots; and Harvey discovered the circulation of the blood. It appears, therefore, that improvements in the arts are properly called inventions; and that facts brought to light by means of observation are properly called discoveries.

Agreeably to this analogy, is the use which we make of these words, when we apply them to subjects purely intellectual. As truth is eternal and immutable, and has no dependence on our belief or disbelief of it, a person who brings to light a truth formerly unknown is said to make a discovery. A person, on the other hand, who contrives a new method of discovering truth, is called an inventor. Pythagoras, we say, discovered the forty-seventh proposition of Euclid's first book; Newton discovered the binomial theorem: but he invented the method of prime and ultimate ratios; and he invented the method of fluxions. In general, every advancement of knowledge is considered as a discovery; every contrivance by which we produce an effect, or accomplish an end, is considered as an invention.

To DISCOU′NSEL. *v. a.* To dissuade; to give contrary advice: obsolete (*Spenser*).

DISCOUNT, or Rebate, is used for an allowance made on a bill, or any other debt not yet become due, in consideration of making present payment of the bill or debt.

Among merchants and traders, it is usual to allow a sum for discount that is equal to the interest of the debt, calculated for the time till it becomes due: but this is not just; for as the true value of the discount is equal to the difference between the debt and its present worth, it is equal only to the interest of that present worth, instead of the interest on the whole debt. And therefore the rule for finding the true discount is this:

As the amount of 100l. for the given rate and time:

Is to the given sum or debt: :

So is the interest of 100l. for the given rate and time:

To the discount of the debt.

So that, if p be the principal or debt, r the rate of interest per cent, and t the time; then as $100+rt : p : : rt : \frac{prt}{100+rt}$, which is the true discount. Hence also $p-\frac{prt}{100+rt}=\frac{100p}{100+rt}$ is the present worth, or sum to be received.

For ex. Suppose it be required to find the discount of 250l. for five months, at the rate of 5 per cent. per annum interest. Here $p=250$, $r=5$, and $t=\frac{5}{12}$ or 5 months; then $\frac{prt}{100+rt}=\frac{250\times5\times\frac{5}{12}}{100+5\times\frac{5}{12}}=\frac{250\times25}{1200\times25}=\frac{250}{49}=$ *5l. 2s.* $\frac{2}{49}$ the discount sought.

A Table of Discounts may be seen in Smart's Tables of Interest, the use of which makes calculations of discount very easy.

To Discou′nt. *v. a.* To make an abatement on a bill or debt, in consideration of prompt payment.

To Discount. *v. a.* To count back; to pay back again (*Swift.*)

To DISCOU′NTENANCE. *v. a.* 1. To discourage by cold treatment (*Clarendon*). 2. To abash; to put to shame (*Milton*).

Discou′ntenance. *s.* Cold treatment; unfriendly regard (*Clarendon*).

DISCOU′NTENANCER. *s.* One that discourages by cold treatment (*Bacon*).

To DISCOU′RAGE. *v. a.* (*decourager*, Fr.) 1. To depress: to deprive of confidence; to deject; to dastardise (*King Charles*). 2. To deter; to fright from any attempt.

DISCOU′RAGER. *s.* (from *discourage.*) One that impresses diffidence and terrour (*Pope*).

DISCOU′RAGEMENT. *s.* (from *discourage.*) 1. The act of deterring, or depressing hope. 2. Determent; that which deters (*Wilkins*). 3. The cause of depression, or fear (*Locke*).

DISCOU′RSE. *s.* (*discours*, French.) 1. The act of the understanding, by which it passes from premises to consequences (*Hooker.*) 2. Conversation; mutual intercourse of language; talk (*Herbert.*) 3. Effusion of language; speech (*Locke.*) 4. A treatise; a dissertation either written or uttered (*Pope*).

To Discou′rse. *v. n.* (from the noun.) 1. To converse; to talk; to relate (*Shakspeare*). 2. To treat upon in a solemn or set manner (*Locke*). 3. To reason; to pass from premises to consequences (*Davies*).

To Discou′rse. *v. a.* To treat of; to talk over; to discuss (*Shakspeare*).

DISCOU′RSER. *s.* (from *discourse.*) 1. A speaker; a haranguer (*Shakspeare*). 2. A writer on any subject (*Brown*).

DISCOU′RSIVE. *a.* (from *discourse.*) 1. Passing by intermediate steps from premises to consequences (*Milton*). 2. Containing dialogue; interlocutory (*Dryden*).

DISCOU′RTEOUS. *a.* (*dis* and *courteous.*) Uncivil; uncomplaisant (*Motteux*).

DISCOU′RTEOUSLY. *ad.* Uncivilly; rudely.

DISCOU′RTESY. *s.* Incivility; rudeness (*Sidney*).

DI′SCOUS. *a.* (from *discus*, Lat.) Broad; flat; wide (*Quincy*).

DISCRE′DIT. *s.* (*decrediter*, Fr.) Ignominy; reproach; disgrace (*Rogers*).

To Discre′dit. *v. a.* (*decrediter*, French.) 1. To destroy the reputation of a person or thing. 2. To render a thing suspicious which is believed to be true. 3. To hinder a rumour from spreading by shewing it to be false.

DISCRE′ET. *a.* (*discret*, French.) 1. Prudent; circumspect; cautious (*Whitgift*). 2. Modest; not forward (*Thomson*).

DISCRE′ETLY. *ad.* Prudently; cautiously; circumspectly (*Waller*).

DISCRE′ETNESS. *s.* The quality of being discreet; discretion.

DI′SCREPANCE. *s.* (*discrepantia*, Lat.) Difference; contrariety; disagreement.

DI′SCREPANT. *a.* (*discrepans*, Lat.) Different; disagreeing; contrary.

DISCRE′TE. *a.* (*discretus*, Latin.) 1. Distinct; disjointed; not continuous (*Hale*). 2. Disjunctive.

Discrete, or disjunct, proportion, is that in which the ratio between two or more pairs of numbers is the same, and yet the proportion is not continued, so as that the ratio may be the same between the consequent of one pair and the antecedent of the next pair.

Discrete quantity, is such as is not continued and joined together. Such for instance is any number; for its parts, being distinct units, cannot be united into one continuum.

DISCRE′TION. *s.* (from *discretio*, Lat.) 1. Prudence; knowledge to govern or direct one's self; skill; wise management (*Tillotson*). 2. Liberty of acting at pleasure; uncontrolled and unconditional power.

DISCRE′TIONARY, *a.* (from *discretion.*) Left at large; unlimited; unrestrained (*Tatler*).

DISCRETIONE, a musical term, requiring great care and judgment in the performer.

DISCRE′TIVE. *a.* (*discretus*, Latin.) 1. (In logic.) Discretive propositions are such wherein various, and seemingly opposite, judgments are made, whose variety or distinction is noted by the particles, *but*, *though*, *yet*, &c. as, *travellers may change their climate*, but *not their temper*. 2. (In grammar.) Discretive distinctions are such as imply opposition: as, *not a man*, but *a beast*.

DISCRI′MINABLE. *a.* (from *discriminate.*) Distinguishable by outward marks or tokens.

To DISCRI′MINATE. *v. a.* (*discrimino,* Lat.) 1. To mark with notes of difference (*South*). 2. To select or separate from others (*Boyle*).

DISCRI′MINATENESS. *s.* Distinctness.

DISCRIMINA′TION. *s.* (*discriminatio,* Lat.) The state of being distinguished from other persons or things (*Stillingfleet*). 2. The act of distinguishing one from another; distinction (*Addison*). 3. The mark of distinction (*Holder*).

DISCRI′MINATIVE. *a.* (from *discriminate.*) 1. That makes the mark of distinction; characteristical (*Woodward*). 2. That observes distinction (*More*).

DISCRI′MINOUS. *a.* (from *discrimen,* Lat.) Dangerous; hazardous: not usual (*Harvey*).

DISCU′BITORY. *a.* (*discubitorius,* Lat.) Fitted to the posture of leaning (*Brown*).

DISCU′MBENCY. *s.* (*discumbens,* Lat.) The act of leaning at meat (*Brown*).

To DISCU′MBER. *v. a.* (*dis* and *cumber.*) To disengage from any troublesome weight (*Pope*).

To DISCU′RE. *v. a.* (*decouvrir,* Fr.) To discover; to reveal: not used (*Spenser*).

DISCU′RSIVE. *a.* (*discursif,* French.) 1. Moving here and there; roving (*Bacon*). 2. Proceeding by gradation from premises to consequences; argumentative (*More*).

DISCU′RSIVELY. *ad.* By due gradation of argument (*Hale*).

DISCU′RSORY. *a.* (*discursor,* Lat.) Argumental; rational.

DISCUS, in antiquity, a quoit made of stone, iron, or copper, nearly a foot long, inclining to an oval figure, which was hurled in form of a bowl, to a vast distance, by the help of a leather thong tied round the person's hand who threw it, and put through a hole in the middle. Homer has made Ajax and Ulysses great adepts at this sport.

Discus, among the ancients, also signified a round shield consecrated to the memory of some hero, and hung up in the temple of some god.

Discus, in astronomy, is derived from the above. See Disk.

To DISCU′SS. *v. a.* (*discussum,* Latin.) 1. To examine; to ventilate (*Pope*). 2. To disperse (*Wotton*). 3. To break to pieces (*Brown*).

DISCU′SSER. *s.* (from *discuss.*) He that discusses; an examiner.

DISCU′SSION. *s.* (from *discuss.*) 1. Disquisition; examination; ventilation of a question (*Prior*). 2. (In surgery.) A breathing out the humours by insensible transpiration (*Wiseman*).

DISCU′SSIVE. *a.* (from *discuss.*) Having the power to discuss or disperse.

DISCUTIENTS. (*discutientia,* from *discutio,* to shake in pieces). A term in surgery applied to those substances which possess a power of repelling or resolving tumours.

To DISDA′IN. *v. a.* (*dedaigner,* French.) To scorn; to consider as unworthy of one's character (*Addison*).

Disda′in. *s.* (*sdegno,* Italian.) Contempt; scorn; indignation (*Ecclus.*)

Disdain is such a degree of contempt as precludes any commerce with the party despised. It considers him as totally unworthy of our notice; even of our reprehension, which always supposes a possibility of being reclaimed.

DISDA′INFUL. *a.* (*disdain* and *full.*) Contemptuous; haughtily scornful; indignant (*Hooker*).

DISDA′INFULLY. *ad.* Contemptuously; with haughty scorn; with indignation (*South*).

DISDA′INFULNESS. *s.* Contempt; contemptuousness; haughty scorn (*Ascham*).

DISDIAPASON, in music, a double octave, or fifteenth. The extremes of the disdiapason limited the ancient scale, or diagramma: and in practice, they are generally found to limit the voice; for there are very few singers who can stretch their voice beyond a double octave, without disfiguring it by the effort, and thus making what is called a false voice.

DISEA′SE. *s.* (*dis* and *ease.*) Distemper; malady; sickness; morbid state (*Swift*).

Disease. (*morbus.*) An alteration of any kind from a state of perfect health. It is termed general when it pervades the entire system, and does not depend upon any partial or local affection: and partial or local when confined to an individual organ.

Diseases are also distributed into original, or idiopathic, and secondary or symptomatic: both of which may be either general or partial. They are also denominated from the causes that produce them, as Endemic, Epidemic, Sporadic, &c. all which see, as also Medicine.

To Disea′se. *v. a.* (from the noun.) 1. To afflict with disease; to torment with sickness; to make morbid (*Shakspeare*). 2. To put to pain; to make uneasy (*Locke*).

DISEA′SEDNESS. *s.* (from *diseased.*) Sickness; morbidness (*Burnet*).

DISE′DGED. *a* Blunted; obtunded (*Shakspeare*).

To DISEMBA′RK. *v. a.* To carry to land (*Shakspeare*).

To Disemba′rk. *v. n.* To go on land (*Pope*).

To DISEMBI′TTER. *v. a.* (*dis* and *embitter.*) To sweeten; to free from bitterness (*Addison*).

DISEMBO′DIED. *a.* Divested of the body.

To DISEMBO′GUE. *v. a.* (*disemboucher,* old Fr.) To pour out at the mouth of a river; to vent (*Addison*).

To Disembo′gue. *v. n.* To gain a vent; to flow (*Cheyne*).

DISEMBO′WELLED. *part. a.* (*dis* and *embowel.*) Taken from out the bowels (*Philips*).

To DISEMBRO′IL. *v. a.* (*debouiller*, Fr.) To disentangle; to free from perplexity (*Dryden*).

To DISENA′BLE. *v. a.* To deprive of power; to sink into weakness (*Dryden*).

To DISENCHA′NT. *v. a.* To free from the force of an enchantment (*Denham*).

To DISENCU′MBER. *v. a.* (*dis* and *encumber.*) 1. To discharge from encumbrances; to disburden; to exonerate (*Spratt*). 2. To free from obstruction of any kind (*Addison*).

DISENCU′MBRANCE. *s.* Freedom from encumbrance and obstruction (*Spectator*).

To DISENGA′GE. *v. a.* (*dis* and *engage.*) 1. To separate from any thing with which it is in union (*Burnet*). 2. To disentangle; to clear from impediments or difficulties (*Waller*). 3. To withdraw the affection; to wean; to abstract the mind (*Atterbury*). 4. To free from any powerful detention (*Denham*). 5. To release from an obligation.

To Disenga′ge. *v. a.* To set one's self free from (*Collier*).

DISENGA′GED. *participial a.* 1. Disjoined; disentangled. 2. Vacant; at leisure. 3. Released from obligation.

DISENGA′GEDNESS. *s.* The quality of being disengaged; vacuity of attention.

DISENGA′GEMENT. *s.* (from *disengage.*) 1. Release from any engagement, or obligation. 2. Freedom of attention; vacancy.

To DISENTA′NGLE. *v. a.* 1. To unfold or loose the parts of any thing interwoven with one another (*Boyle*). 2. To set free from impediments; to clear from perplexity or difficulty (*Clarendon*). 3. To disengage; to separate (*Stillingfleet*).

To DISENTE′RRE. *v. a.* To unbury (*Brown*).

To DISENTHRA′L. *v. a.* To set free; to restore to liberty; to rescue from slavery (*Sandys*).

To DISENTHRO′NE. *v. a.* To depose from sovereignty; to dethrone (*Milton*).

To DISENTRA′NCE. *v. a.* To awaken from a trance or deep sleep (*Hudibras*).

To DISESPOU′SE. *v. a.* To separate after faith plighted (*Milton*).

DISESTE′EM. *s.* (*dis* and *esteem.*) Slight regard (*Locke*).

To Disesteʹem. *v. a.* (from the noun.) To regard slightly (*Chapman*).

DISESTIMA′TION. *s.* Disrespect; disesteem.

DISFA′VOUR. *s.* (*dis* and *favour.*) 1. Discountenance; unpropitious regard (*Bacon*). 2. A state of ungraciousness or unacceptableness (*Spelman*). 3. Want of beauty.

To Disfa′vour. *v. a.* (from the noun.) To discountenance; to withhold or withdraw kindness (*Swift*).

DISFIGURA′TION. *s.* (from *disfigure.*) 1. The act of disfiguring. 2. The state of being disfigured. 3. Deformity.

To DISFI′GURE. *v. a.* (*dis* and *figure.*) To change any thing to a worse form; to deform; to mangle (*Locke*).

DISFI′GUREMENT. *s.* (from *disfigure.*) Defacement of beauty; change of a better form to a worse (*Suckling*).

To DISFO′REST. *v. a.* To reduce land from the privileges of a forest to the state of common land.

To DISFRA′NCHISE. *v. a.* To deprive of privileges or immunities.

DISFRA′NCHISEMENT. *s.* The act of depriving of privileges.

To DISFU′RNISH. *v. a.* To deprive; to unfurnish; to strip (*Knowles*.

To DISGA′RNISH. *v. a.* 1. To strip of ornaments. 2. To take guns from a fortress.

To DISGLO′RIFY. *v. a.* To deprive of glory; to treat with indignity (*Milton*).

To DISGO′RGE. *v. a.* (*degorger*, Fr.) 1. To discharge by the mouth (*Dryden*). 2. To pour out with violence (*Derham*).

DISGRA′CE. *s.* (*disgrace*, French.) 1. State of being out of favour. 2. State of ignominy; dishonour (*Shakspeare*). 3. Act of unkindness: obsolete (*Sidney*). 4. Cause of shame (*Brown*).

To Disgra′ce. *v. a.* 1. To bring a reproach upon; to dishonour, as an agent (*Hooker*). 2. To bring to shame, as a cause. 3. To put out of favour.

DISGRA′CEFUL. *a.* (*disgrace* and *full.*) Shameful; ignominious; reproachful (*Taylor*).

DISGRA′CEFULLY. *ad.* In disgrace; with indignity; ignominiously (*Ben Jonson*).

DISGRA′CEFULNESS. *s.* Ignominy.

DISGRA′CER. *s.* One that exposes to shame; one that causes ignominy (*Swift*).

DISGRA′CIOUS. *a.* Unpleasing (*Shakspeare*).

To DISGUI′SE. *v. a.* (*deguiser*, French.) 1. To conceal by a unusual dress (*Shakspeare*). 2. To hide by a counterfeit appearance. 3. To disfigure; to change the form (*Dryden*). 4. To deform by liquor (*Spectator*).

Disgui′se. *s.* (from the verb.) 1. A dress contrived to conceal the person that wears it (*Addison.*) 2. A false appearance (*Pope*). 3. Disorder by drink (*Shakspeare*).

DISGUI′SEMENT. *s.* (from *disguise.*) Dress of concealment (*Sidney*).

DISGUI′SER. *s.* (from *disguise.*) 1. One that puts on a disguise (*Swift*). 2. One that conceals another by a disguise; one that disfigures (*Shakspeare*).

DISGU′ST. *s.* (*degout*, French.) 1. Aversion of the palate from any thing. 2. Ill humour; malevolence; offence conceived (*Locke*).

To Disgu′st. *v. a.* (*degouter*, French.) 1. To raise aversion in the stomach; to distaste. 2. To strike with dislike; to offend (*Watts*). 3. To produce aversion (*Swift*).

DISGU′STFUL. *a.* Nauseous (*Swift*).

DISH. *s.* (ꝺiꝛc, Saxon; *discus*, Latin.) 1. A broad wide vessel, in which food is served up at the table (*Dryden*). 2. A deep hollow vessel for liquid food (*Milton*). 3. The meat served in a dish; any particular kind of food (*Shakspeare.*)

To Dish. *v. a.* To serve in a dish (*Shakspeare.*)

DISH-CLOUT. *s.* (*dish* and *clout.*) The cloth with which the maids rub their dishes (*Swift*).

DISH-WASHER. *s.* The name of a bird.

DISHABI′LLE. *a.* (*dishabille*, Fr.) Undressed; loosely or negligently dressed (*Dryden*).

Dishabi′lle. *s.* Undress; loose dress (*Clarissa*).

To DISHA′BIT. *v. a.* To throw out of place; to drive from their habitation (*Shakspeare*).

DISHA′RMONY. *s.* Contrariety to harmony.

To DISHEA′RTEN. *v. a.* To discourage; to deject; to terrify; to depress (*Milton*).

DISHE′RISON. *s.* The act of debarring from inheritance.

To DISHE′RIT. *v. a.* (*dis* and *inherit.*) To cut off from hereditary succession (*Spenser*).

To DISHE′VEL. *v. a.* (*decheveler*, Fr.) To spread the hair disorderly (*Knolles*).

DI′SHING. *a.* Concave (*Mortimer*).

DISHO′NEST. *a.* (*dis* and *honest.*) 1. Void of probity; void of faith; faithless; fraudulent (*South*). 2. Unchaste; lewd (*Shakspeare*). 3. Disgraced; dishononred (*Dryden*). 4. Disgraceful; ignominious (*Pope*).

DISHO′NESTLY. *ad.* 1. Without faith; without probity; faithlessly; wickedly (*Shakspeare*). 2. Lewdly; wantonly; unchastely (*Eccles*).

DISHO′NESTY. *s.* 1. Want of probity; faithlessness (*Swift*). 2. Unchastity; incontinence (*Shakspeare*).

DISHO′NOUR. *s.* (*dis* and *honour.*) 1. Reproach; disgrace; ignominy (*Boyle*). 2. Reproach uttered; censure (*Shakspeare.*)

To Disho′nour. *v. a.* 1. To disgrace; to bring shame upon; to blast with infamy (*Shakspeare*). 2. To violate chastity. 3. To treat with indignity (*Dryden*).

DISHO′NOURABLE. *a.* 1. Shameful; reproachful; ignominious (*Daniel*). 2. Being in a state of neglect or disesteem.

DISHO′NOURER. *s.* (from *dishonour.*) 1. One that treats another with indignity (*Milton*). 2. A violator of chastity.

To DISHO′RN. *v. a.* To strip of horns (*Shakspeare*).

DISHU′MOUR. *s.* Peevishness; ill humour; uneasy state of mind (*Spectator*).

DISIMPRO′VEMENT. *s.* Reduction from a better to a worse state (*Norris*).

To DISINCA′RCERATE. *v. a.* To set at liberty; to free from prison (*Harvey.*)

DISINCLINA′TION. *s.* Want of affection; slight; dislike (*Arbuthnot*).

To DISINCLI′NE. *v. a.* (*dis* and *incline.*) To produce dislike to; to make disaffected; to alienate affection from (*Clarendon*).

DISINGENU′ITY. *s.* Meanness of artifice; unfairness (*Clarendon*).

DISINGE′NUOUS. *a.* Unfair; meanly artful; viciously subtle; sly; crafty; illiberal.

DISINGE′NUOUSLY. *ad.* In a disingenuous manner.

DISINGE′NUOUSNESS. *s.* Mean subtilty; low craft (*Government of the Tongue*).

DISINHE′RISON. *s.* (*dis* and *inherit.*) 1. The act of cutting off from any hereditary succession (*Clarendon*). 2. The state of being cut off from an hereditary right (*Taylor*).

To DISINHE′RIT. *v. a.* To cut off from an hereditary right (*Davies*).

To DISINTE′R. *v. a.* To unbury; to take as out of the grave (*Addison*).

DISINTERE′SSED. *a.* (*dis* and *interesse*, Fr.) Void of regard to private advantage; impartial (*Dryden*).

DISENTERE′SSMENT. *s.* (*dis* and *interessement*, Fr.) Disregard to private advantage; disinterest; disinterestedness (*Prior*).

DISI′NTEREST. *s.* (*dis* and *interest.*) 1. What is contrary to one's wish or prosperity (*Glanville*). 2. Indifference to profit.

DISI′NTERESTED. *a.* (from *disinterest.*) 1. Superiour to regard of private advantage; not influenced by private profit (*Swift*). 2. Without any concern in an affair.

DISINTERE′STEDLY. *ad.* In a disinterested manner.

DISINTERE′STEDNESS. *s.* (from *disinterested.*) Contempt of private interest (*Brown*).

To DISI′NTRICATE. *v. a.* To disentangle.

To DISINVI′TE. *v. a.* (*dis* and *invite.*) To retract an invitation.

To DISJO′IN. *v. a.* (*dejoindre*, Fr.) To separate; to part from each other (*Milton*).

To DISJO′INT. *v. a.* (*dis* and *joint.*) 1. To put out of joint (*Sandys*). 2. To break at junctures; to separate at the part where there is a cement (*Irene*). 3. To break in pieces (*Blackmore*). 4. To carve a fowl. 5. To make incoherent (*Sidney*).

To Disjoi′nt. *v. n.* To fall in pieces (*Shakspeare*).

Disjoi′nt. *particip.* (from the verb.) Separated; divided (*Shakspeare*).

DISJU′NCT. *a.* (*disjunctus*, Lat.) Disjoined; separate.

DISJU′NCTION. *s.* (from *disjunctio*, Lat.) Disunion; separation; parting (*South*).

DISJU′NCTIVE. *a.* (*disjunctivus*, Latin.) 1. Incapable of union (*Grew.*) 2. That marks separation or opposition: as, *I love him*, or *fear him* (*Watts*). 3. (In logic.) A disjunctive proposition is when the parts are opposed to one another by disjunctive particles: as, *It is either day* or *night*.

DISJU′NCTIVELY. *ad.* Distinctly; separately (*Decay of Piety.*)

DISK, or Disc. (δισκος, Gr) In astronomy, the body or face of the sun or moon, such as it appears to us. Though each of these bodies is nearly spherical, it appears as a circular plane, and this is the disk.

Disk of a leaf, in botany, the whole

surface; *supine*, the upper; *prone*, the under surface. *Disk* of a flower, is the central part in radiate compound flowers, consisting generally of regular corollules or florets: it is applied to other aggregate flowers, when the florets towards the middle differ from those in the circumference; as in umbels.

DISKI′NDNESS. *s.* 1. Want of kindness; want of affection. 2. Ill turn; injury; detriment (*Woodward*).

DISLI′KE. *s.* 1. Disinclination; absence of affection. (*Spenser*). 2. Discord; dissension: not in use (*Fairfax*).

To Disli′ke. *v. a.* (*dis* and *like.*) To disapprove; to regard without affection (*Temple*).

DISLI′KEFUL. *a.* (*dislike* and *full.*) Disaffected; malign: not in use (*Spenser*).

To DISLI′KEN. *v. a.* (*dis* and *like.*) To make unlike: not usual (*Shakspeare*).

DISLI′KENESS. *s.* Dissimilitude; not resemblance; unlikeness (*Locke*).

DISLI′KER. *s.* A disapprover; one that is not pleased (*Swift*).

To DISLI′MB. *v. a.* (*dis* and *limb.*) To dilaniate; to tear limb from limb.

To DISLI′MN. *v. a.* (*dis* and *limn.*) To unpaint; to strike out of a picture (*Shaks.*).

To DI′SLOCATE. *v. a.* (*dis* and *locus*, Latin.) 1. To put out of the proper place (*Woodward*). 2. To put out of joint (*Shakspeare*).

DISLOCA′TION. *s.* (from *dislocate.*) 1. The act of shifting the places of things. 2. The state of being displaced (*Burnet*). 3. A luxation; a joint put out. See Luxation.

To DISLO′DGE. *v. a.* (*dis* and *lodge.*) 1. To remove from a place (*Woodward*). 2. To remove from a habitation (*Dryden*). 3. To drive an enemy from a station (*Dryden*). 4. To remove an army to other quarters (*Shakspeare*).

To Dislo′dge. *v. n.* To go away to another place (*Milton*).

DISLO′YAL. *a.* (*desloyal*, French.) 1. Not true to allegiance; faithless; false to a sovereign; disobedient (*Milton*). 2. Dishonest; perfidious: obsolete (*Shakspeare*). 3. Not true to the marriage bed: obsolete (*Shakspeare*). 4. False in love; not constant: obsolete.

DISLO′YALLY. *ad.* Not faithfully; treacherously; disobediently.

DISLO′YALTY. *s.* (from *disloyal.*) 1. Want of fidelity to the sovereign (*K. Charles*). 2. Want of fidelity in love: obsolete (*Shakspeare*).

DISMA′L. *a.* (*dies malus*, Latin, an evil day.) Sorrowful; dire; horrid; melancholy; uncomfortable; unhappy; dark (*Decay of Piety*).

DI′SMALLY. *ad.* Horribly; sorrowfully.

DI′SMALNESS. *s.* Horrour; sorrow.

To DISMA′NTLE. *v. a.* (*dis* and *mantle.*) 1. To deprive of a dress; to strip (*South*). 2. To loose; to throw off a dress (*Shakspeare*). 3. To strip a town of its outworks (*Hakewill*). 4. To break down any thing external (*Dry.*)

To DISMA′SK. *v. a.* To divest of a mask; to uncover from concealment (*Wotton*).

To DISMA′Y. *v. a.* (*desmayar*, Spanish.) To terrify; to discourage; to affright (*Raleigh*).

Disma′y. *s.* (*desmayo*, Spanish.) Fall of courage; terrour felt; desertion of mind; fear impressed (*Milton*).

DISMA′YEDNESS. *s.* (from *dismay.*) Dejection of courage; dispiritedness (*Sidney*).

DISME. *s.* (French.) A tenth; the tenth part; tithe (*Shakspeare*).

To DISME′MBER. *v. a.* To divide member from member; to cut in pieces (*Swift*).

To DISMI′SS. *v. a.* (*dismissus*, Latin.) 1. To send away (*Acts*). 2. To give leave of departure (*Dryden*). 3. To discard; to divest of an office.

DISMI′SSION. *s.* (from *dismissio*, Latin.) 1. Dispatch; act of sending away (*Dryden*). 2. An honourable discharge from any office or place (*Milton*). 3. Deprivation; obligation to leave any post or place (*Shakspeare*).

To DISMO′RTGAGE. *v. a.* (*dis* and *mortgage.*) To redeem from mortgage (*Howel.*)

To DISMO′UNT. *v. a.* (*demonter*, Fr.) 1. To throw off a horse (*Shakspeare*). 2. To throw from any elevation. 3. To throw a cannon from its carriage (*Knol.*)

To Dismo′unt. *v. n.* 1. To alight from a horse (*Addison*). 2. To descend from any elevation.

To DISNA′TURALIZE. *v. a.* (*dis* and *naturalize.*) To alienate; to make alien.

DISNA′TURED. *a.* (*dis* and *nature.*) Unnatural; wanting natural tenderness (*Shaks.*)

DISOBE′DIENCE. *s.* (*dis* and *obedience.*) 1. Violation of lawful command or prohibition; breach of duty due to superiours (*Shakspeare*). 2. Incompliance (*Blackmore*).

DISOBE′DIENT. *a.* Not observant of lawful authority (*Kings*).

To DISOBE′Y. *v. a.* (*dis* and *obey.*) To break commands, or transgress prohibitions (*Denham*).

DISOBLIGA′TION. *s.* (*dis* and *obligation.*) Offence; cause of disgust (*Clarendon*).

To DISOBLI′GE. *v. a.* (*dis* and *oblige.*) To offend; to disgust; to give offence to (*Addison*).

DISOBLI′GING. *part. a.* Disgusting; unpleasing; offensive (*Gov. of Tongue*).

DISOBLI′GINGLY. *ad.* In a disgusting or offensive manner; without attention to please.

DISOBLI′GINGNESS. *s.* Offensiveness; readiness to disgust.

DISO′RBED. *a.* (*dis* and *orb.*) Thrown out of the proper orbit (*Shakspeare*).

DISO′RDER. *s.* (*disordre*, French.) 1. Want of regular disposition; irregularity; confusion (*Spectator*). 2. Tumult; disturbance; bustle (*Waller*). 3. Neglect of rule; irregularity (*Pope*). 4. Breach of laws; violation of standing institution (*Wisdom*). 5. Breach of that regularity in the animal economy which causes health; sickness; distemper (*Locke*). 6. Discomposure of mind.

To Diso'rder. *v. a.* (*dis* and *order.*) 1. To throw into confusion; to confound; to disturb; to ruffle (*Milton*). 2. To make sick; to disturb the body. 3. To discompose; to disturb the mind. 4. To turn out of holy orders (*Dryden*).

DISO'RDERED. *a.* (from *disorder.*) Disorderly; irregular; vitious; loose (*Shaks.*).

DISO'RDEREDNESS. *s.* Irregularity; want of order; confusion (*Knolles*).

DISO'RDERLY. *a.* (from *disorder.*) 1. Confused; immethodical (*Hale*). 2. Irregular; tumultuous (*Addison*). 3. Lawless; contrary to law; inordinate; vitious (*Bacon*).

Diso'rderly. *ad.* 1. Without rule; without method; irregularly; confusedly (*Raleigh*). 2. Without law; inordinately (*Thessalonians*).

DISO'RDINATE. *a.* Not living by the rules of virtue; inordinate (*Milton*).

DISO'RDINATELY. *ad.* Inordinately; vitiously.

DISO'RIENTATED. *a.* (*dis* and *orient.*) Turned from the east; turned from the right direction (*Harris*).

To DISO'WN. *v. a.* (*dis* and *own.*) 1. To deny; not to allow (*Dryden*). 2. To abnegate; to renounce (*Swift*).

To DISPA'ND. *v. a.* (*dispando*, Latin.) To display; to spread abroad.

DISPA'NSION. *s.* (from *dispansus*, Lat.) The act of displaying; diffusion; dilatation.

To DISPA'RAGE. *v. a.* (from *dispar*, Latin.) 1. To marry any one to another of inferiour condition. 2. To match unequally; to injure by union with something inferiour in excellence. 3. To injure by a comparison with something of less value. 4. To treat with contempt; to mock; to flout; to reproach (*Milton*). 5. To bring reproach upon; to be the cause of disgrace (*Atterbury*).

DISPA'RAGEMENT. *s.* (from *disparage.*) 1. Injurious union, or comparison with something of inferiour excellence (*L'Estrange*). 2. (In law.) Matching an heir in marriage under his or her degree, or against decency (*Sidney*). 3. Reproach; disgrace; indignity (*Wotton*).

DISPA'RAGER. *s.* One that disgraces.

DI'SPARATES. *s.* (*disparata*, Latin.) Things so unlike that they cannot be compared with each other.

DISPA'RITY. *s.* (from *dispar*, Latin.) 1. Inequality; difference in degree either of rank or excellence (*Rogers*). 2. Dissimilitude; unlikeness.

To DISPA'RK. *v. a.* (*dis* and *park.*) 1. To throw open a park (*Shakspeare*). 2. To set at large; to release from enclosure (*Waller*).

To DISPA'RT. *v. a.* (*dis* and *part*; *dispertior*, Latin.) To divide in two; to separate; to break; to burst; to rive (*Dyer*).

Dispart, in gunnery, is the setting a mark upon the muzzle-ring, or thereabouts, of a piece of ordnance, so that a sight line taken upon the top of the base ring against the touch-hole, by the mark set on or near the muzzle, may be parallel to the axis of the concave cylinder. The common way of doing this is to take the two diameters of the base ring, and of the place where the dispart is to stand, and divide the difference between them into two equal parts, one of which will be the length of the dispart which is set on the gun with wax or pitch, or fastened there with a piece of twine or marlin. By means of an instrument it may be done with all possible nicety.

DISPA'SSION. *s.* (*dis* and *passion.*) Freedom from mental perturbation (*Temple*).

DISPA'SSIONATE. *s.* (*dis* and *passionate.*) Cool; calm; moderate; temperate (*Clarendon*).

DISPATCH, or Despatch, a letter on some affair of state, or other business of importance, sent with care and expedition by a courier express. The business of dispatches lies on the secretaries of state and their clerks. The king gives directions to his ministers abroad by dispatches. The word is also used for the packet or mail containing such letters. The French, during the reign of Louis XIV. had a *conseil des depêchés*, "council of dispatches," held in the king's presence, at which the dauphin, the duke of Orleans, the chancellor, and four secretaries of state, assisted.

To DISPE'L. *v. a.* (*dispello*, Latin.) To drive by scattering; to dissipate (*Locke*).

DISPE'NCE. *s.* (*dispense*, Fr.) Expence; cost; charge; profusion (*Spenser*).

To DISPE'ND. *v. a.* (*dispendo*, Lat.) To spend; to consume; to expend (*Spenser*).

DISPENSARY. (from *dispenso*, to distribute.) The shop or place in which medicines are prepared.

The word dispensary is used more particularly to denote a charitable institution very common in London and some other large towns of Britain. They are supported by voluntary subscriptions, and each has one or more physicians, surgeons, and apothecaries, who attend, or ought to attend at stated times, in order to prescribe for the poor, and if necessary to visit them at their own habitations. The poor are supplied with medicines gratis. Where these institutions are managed with care, they are of the utmost importance to society: it being unquestionably more for the comfort of the sick to be attended at their own houses, than to be dragged from their families to an hospital.

DISPENSA'TION. *s.* (from *dispensatio*, Latin.) 1. Distribution; the act of dealing out any thing (*Woodward*). 2. The dealing of God with his creatures; method of providence (*Taylor*). 3. An exemption from some law; a permission to do something forbidden (*Ward*).

Dispensation, in law, &c. a permission to do something contrary to the standing laws; or a relaxation, or suspension of a law, on some just occasion.

Some confound dispensation with equity; but they are very different things; for equity is only the correction, or modification, of a law which is too general: but a dispensation suspends the obligation of the law itself, and can, therefore, be only given by the legislative power.

The archbishop of Canterbury has a power, by stat. 25 Hen. VIII. c. 21. of dispensing in any case, within the realm, wherein dispensations, not contrary to the law of God, were formerly granted by the see of Rome, as well to the king as to his subjects: but in extraordinary matters, or in a case that is new, the king and council are to be consulted; and the dispensation must be confirmed under the broad seal: and during the vacancy of the archbishop's see, the guardian of the spiritualities may grant dispensations. Every bishop, of common right, has the power of dispensing in common cases.

DISPENSA'TOR, *s.* (Lat.) One employed in dealing out any thing; a distributer (*Bac.*)

DISPE'NSATORY. *s.* (from *dispense.*) A book in which the composition of medicines is described and directed; a pharmacopeia (*Hammond*).

To DISPE'NSE. *v. a.* (*dispenser*, French.) 1. To deal out; to distribute (*D. of Piety.*) 2. To make up a medicine. 3. *To* Dispense *with*; to excuse; to grant dispensation for; to allow (*Raleigh*). 4. *To* Dispense *with*; to set free from an obligation (*Addison*).

Dispe'nse. *s.* (from the verb.) Dispensation; exemption: not in use (*Milton*).

DISPE'NSER. *s.* (from *dispense.*) One that dispenses; a distributer (*Spratt*).

To DISPE'OPLE. *v. n.* To depopulate; to empty of people (*Pope*).

DISPE'OPLER. *s.* (from *dispeople.*) A depopulator; a waster (*Gay*).

To DISPE'RGE. *v. a.* (*dispergo*, Latin.) To sprinkle; to scatter (*Shakspeare*).

DISPERMOUS, in botany, a term applied to a fructification containing two seeds only, as in umbellate and stellate plants.

To DISPE'RSE. *v. a.* (*dispersus*, Latin.) 1. To scatter; to drive to different parts (*Ez.*). 2. To dissipate (*Milton*). 3. To deal about; to distribute (*Bacon*).

DISPE'RSEDLY. *ad.* (from *dispersed.*) In a dispersed manner; separately (*Hooker*).

DISPE'RSEDNESS. *s.* (from *dispersed.*) The state of being dispersed; dispersion.

DISPE'RSENESS. *s.* (from *disperse.*) Thinness; scatteredness (*Brerewood*).

DISPE'RSER. *s.* (from *disperse.*) A scatterer; a spreader (*Spectator*).

DISPERSION, in general, signifies the scattering or dissipating something. Hence, in optics, it denotes the same with the divergency of the rays of light.

Dispersion (Point of), in dioptrics, the point from which refracted rays begin to diverge, where their refraction renders them divergent.

Dispersion of inflammation, in surgery, is the removing an inflammation, and restoring the inflamed part to its natural state.

Dispersion of mankind, in the history of the world, was occasioned by the confusion of tongues, and took place in consequence of the overthrow of Babel at the birth of Peleg; whence he derived his name. See Babel and Confusion of tongues.

Dispersion of light, in optics, denotes the enlargement of a pencil or beam of light, which is produced by its passage from one medium to another, and this enlargement arises from the nature of the medium.

Dr. Wollaston's mode of examining refractive and dispersive powers is described in Phil. Transac. for 1802, or Nicholson's Jour. vol. iv. pa. 89. Extensive tables of refractive and dispersive powers are given by Dr. T. Young, at pp. 296, 299, vol. ii. of his Natural Philosophy.

To DISPI'RIT. *v. a.* (*dis* and *spirit.*) 1. To discourage; to deject; to depress; to damp; to terrify; to intimidate (*Clarendon*). 2. To exhaust the spirits; to oppress the constitution of the body (*Collier*).

DISPI'RITEDNESS. *s.* (from *dispirit.*) Want of vigour; want of vivacity.

To DISPLA'CE. *v. a.* (*dis* and *place.*) 1. To put out of place. 2. To put out of any state or condition (*Bacon*). 3. To disorder (*Shakspeare*).

DISPLA'CENCY. *s.* (*displicentia*, Latin.) 1. Incivility; disobligation. 2. Disgust; any thing unpleasing (*Decay of Piety*).

To DISPLA'NT. *v. a.* (*dis* and *plant.*) 1. To remove a plant. 2. To drive a people from the place in which they have fixed their residence (*Bacon*).

DISPLANTA'TION. *s.* 1. The removal of a plant. 2. The ejection of a people (*Raleigh*).

To DISPLA'Y. *v. a.* (*desployer*, French.) 1. To spread wide (*Spenser*). 2. To exhibit to the sight or mind (*Locke*). 3. To carve; to cut up (*Spectator*). 4. To talk without restraint (*Shakspeare*). 5. To set ostentatiously to view (*Shakspeare*).

Displa'y. *s.* (from the verb.) An exhibition of any thing to view (*Spectator*).

DISPLAYED, in heraldry, an eagle or any other bird so drawn that it stands erect, with its wings expanded.

DISPLEA'SANCE. *s.* (from *displease.*) Anger; discontent: obsolete (*Spenser*).

DISPLEA'SANT. *a.* Unpleasing; offensive; unpleasant (*Glanville*).

To DISPLE'ASE. *v. a.* (*dis* and *please.*) To offend; to make angry (*Chronicles*).

To Disple'ase. *v. n.* To disgust; to raise aversion (*Locke*).

DISPLE'ASINGNESS. *s.* (from *displeasing.*) Offensiveness; quality of offending (*Locke*).

DISPLE'ASURE. *s.* (from *displease.*) 1. Uneasiness; pain received (*Locke*). 2. Offence; pain given (*Judges*). 3. Anger; indignation (*Knolles*). 4. State of disgrace; disfavour (*Peacham*).

To DISPLE'ASURE. *v. a.* To displease; not to gain favour: out of use (*Bacon*).

To DISPLO'DE. *v. a.* (*displodo*, Latin.) To disperse with noise; to vent with violence (*Milton*).

DISPLO'SION. *s.* (from *displosus*, Latin.) The act of disploding; a sudden burst or dispersion with noise and violence.

DISPONDEE, in the Greek and Latin poetry, a double spondee or foot, consisting of four long syllables; as jūrāmêntūm, cōnclūdēntēs, θαῡμᾱζο̄ντω̄ν.

DISPO'RT. *s.* (*dis* and *sport.*) Play; sport; pastime; diversion (*Hayward*).

To DISPO'RT. *v. a.* To divert (*Shaks.*).

To DISPO'RT. *v. n.* To play; to toy; to wanton (*Pope*).

DISPO'SAL. *s.* (from *dispose.*) 1. The act of disposing or regulating any thing; regulation; distribution (*Milton*). 2. The power of distribution; the right of bestowing (*Atterbury*). 3. Government; management (*Locke*). 4. Establishment in a new state (*Tatler*).

To DISPO'SE. *v. a.* (*disposer*, French.) 1. To employ to various purposes; to diffuse (*Prior*). 2. To give; to place; to bestow (*Spratt*). 3. To turn to any particular end or consequence (*Dryden*). 4. To adapt; to form for any purpose (*Spenser*). 5. To frame the mind; to incline (*Smalrid.*). 6. To make fit (*Locke*). 7. To regulate; to adjust (*Dryden*). 8. *To* DISPOSE *of.* To apply to any purpose; to transfer to any other person or use (*Swift*). 9. *To* DISPOSE *of.* To put into the hands of another (*Tatler*). 10. *To* DISPOSE *of.* To give away (*Waller*). 11. *To* DISPOSE *of.* To conduct; to behave (*Bacon*). 12. *To* DISPOSE *of.* To place in any condition (*Dryden*). 13. *To* DISPOSE *of.* To put away by any means (*Burnet*).

To DISPO'SE. *v. n.* To bargain; to make terms: obsolete (*Shakspeare*).

DISPO'SE. *s.* (from the verb.) 1. Power; management; disposal (*Shakspeare*). 2. Distribution: act of government (*Milton*). 3. Disposition; cast of behaviour (*Shakspeare*). 4. Cast of mind; inclination (*Shakspeare*).

DISPO'SER. *s.* (from *dispose.*) 1. Distributer; giver; bestower (*Graunt*). 2. Governour; regulator; director (*Boyle*). 3. One who gives to whom he pleases (*Prior*).

DISPOSI'TION. *s.* (from *dispositio*, Lat.) 1. Order; method; distribution (*Dryden*). 2. Natural fitness; quality (*Newton*). 3. Tendency to any act or state (*Bacon*). 4. Temper of mind (*Shakspeare*). 5. Affection of kindness or ill-will (*Swift*). 6. Predominant inclination (*Locke*).

DISPOSITION, in oratory. See ORATORY.

DISPOSITION, in painting. See PAINTING.

DISPOSITION, in human nature. In every man there is something original, that serves to distinguish him from others, that tends to form a character, and to make him meek or fiery, candid or deceitful, resolute or timorous, cheerful or morose. This original bent, termed *disposition*, must be distinguished from a *principle*: the latter, signifying a law of human nature, makes part of the common nature of man; the former makes part of the nature of this or that man. *Propensity* is a term common to both; for it signifies a principle as well as a disposition.

The poets have observed, that men have their "mollia tempora fandi," when they are averse from saying or doing a harsh thing. This disposition is commonly termed by the English "good humour," of which, in the fair sex, Mr. Pope says,

"Good humour only teaches charms to last,
"Still makes new conquests, and maintains
the past."

There is no disposition more comfortable to the person, to the possessor himself, or renders him more agreeable to others, than good humour. It is to the mind what good health is to the body; it gives a man the capacity of enjoying every thing that is agreeable in life, and the faculty of communicating much enjoyment to others.

DISPO'SITIVE. *a.* That implies disposal of any property; decretive (*Ayliffe*).

DISPO'SITIVELY. *ad.* 1. In a dispositive manner. 2. Distributively (*Brown*).

DISPO'SITOR. *s.* The lord of that sign in which the planet is.

To DISPOSSE'SS. *v. a.* To put out of possession; to deprive; to disseize (*Tillotson*).

DISPO'SURE. *s.* (from *dispose.*) 1. Disposal; government; power; management (*Sandys*). 2. State; posture (*Wotton*).

DISPRA'ISE. *s.* Blame; censure (*Addison*).

To DISPRA'ISE. *v. a.* To blame; to censure; to condemn (*Shakspeare*).

DISPRAI'SER. *s.* A censurer.

DISPRA'ISIBLE. *a.* Unworthy of commendation.

DISPRA'ISINGLY. *ad.* With blame (*Shakspeare*).

To DISPRE'AD. *v. a.* (*dis* and *spread.*) To spread different ways (*Pope*).

DISPRO'FIT. *s.* Loss; damage; detriment.

DISPRO'OF. *s.* Confutation; conviction of errour or falsehood (*Atterbury*).

DISPROPO'RTION. *s.* Unsuitableness in form or quantity of one thing to another; want of symmetry; disparity (*Denham*).

To DISPROPO'RTION. *v. a.* To mismatch; to join things unsuitable (*Suckling*).

DISPROPO'RTIONABLE. *a.* Unsuitable in form or quantity (*Smalridge*).

DISPROPO'RTIONABLENESS. *s.* Unsuitableness to something else.

DISPROPO'RTIONABLY. *ad.* Unsuitably; not symmetrically (*Tillotson*).

DISPROPO'RTIONAL. *a.* Disproportionable; unsymmetrical; unsuitable.

DISPROPO'RTIONALLY. *ad.* Unsuitably with respect to quantity or value.

DISPROPO'RTIONATE. *a.* Unsymmetrical; unsuitable to something else (*Ray*).

DISPROPO'RTIONATELY. *ad.* Unsuitably; unsymmetrically.

DISPROPO'RTIONATENESS. *s.* Unsuitableness in bulk, form, or value.

To DISPRO'VE. *v. a.* (*dis* and *prove.*) 1. To confute an assertion; to convict of errour or falsehood (*Hooker*). 2. To convict of a practice of errour (*Hooker*). 3. To disapprove; to disallow (*Hooker*).

DISPRO'VER. *s.* (from *disprove.*) 1. One that disproves or confutes. 2. One that blames; a censurer (*Wotton*).

DISPU'NISHABLE. *a.* Without penal restraint (*Swift*).

DISPU'TABLE. *a.* (from *dispute.*) 1. Liable to contest; controvertible (*South*). 2. Lawful to be contested (*Swift*).

DI'SPUTANT. *s.* (*disputans*, Latin.) A controvertist; an arguer; a reasoner (*Specta.*).

DI'SPUTANT *a.* Disputing; engaged in controversy: not in use (*Milton*).

DISPUTA'TION. *s.* (from *disputatio*, Latin.) 1. The skill of controversy; argumentation. 2. Controversy; argumental contest (*Sidney*).

DISPUTA'TIOUS. *a.* (from *dispute.*) Inclined to dispute; cavilling (*Addison*).

DISPU'TATIVE. *a.* (from *dispute.*) Disposed to debate (*Watts*).

To DISPU'TE. *v. n.* (*disputo*, Latin.) To contend by argument; to altercate; to debate; to controvert (*Tillotson*).

To DISPU'TE. *v. a.* 1. To contend for (*Hooker*). 2. To question; to reason about (*Dryden*). 3. To discuss; to think on (*Shakspeare*).

DISPU'TE. *s.* Contest; controversy (*Bentley*).

DISPU'TELESS. *a.* Undisputed; uncontrovertible.

DISPU'TER. *s.* A controvertist; one given to argument and opposition (*Stillingfleet*).

DISQUALIFICA'TION. *s.* That which disqualifies; that which makes unfit (*Spectator*).

To DISQUA'LIFY. *v. a.* (*dis* aud *qualify.*) 1. To make unfit; to disable by some natural or legal impediment (*Swift*). 2. To deprive of a right or claim by some positive restriction; to disable (*Swift*).

To DISQUA'NTITY. *v. a.* To lessen (*Shakspeare*).

DISQUI'ET. *s.* Uneasiness; restlessness; vexation; anxiety (*Tillotson*).

DISQUI'ET. *a.* Uneasy; restless (*Shakspeare*).

To DISQUI'ET. *v. a.* To disturb; to make uneasy; to fret; to vex (*Roscommon*).

DISQUI'ETER. *s.* A disturber; a harasser.

DISQUI'ETLY. *ad.* Without rest; anxiously; uneasily; without calmness (*Shakspeare*).

DISQUI'ETNESS. *s.* Uneasiness; restlessness; anxiety; disturbance (*Hooker*).

DISQUI'ETUDE. *s.* Uneasiness; anxiety; disturbance; want of tranquillity (*Addison*).

DISQUISI'TION. *s.* (*disquisitio*, Latin.) Examination; disputative inquiry (*Arbuthnot*).

To DISRA'NK. *v. a.* To degrade from his rank.

DISREGA'RD. *s.* Slight notice; neglect.

To DISREGA'RD. *v. a.* To slight; to neglect; to contemn (*Smalridge*).

DISREGA'RDFUL. *a.* Negligent; contemptuous.

DISREGA'RDFULLY. *ad.* Contemptuously.

DISRE'LISH. *s.* (*dis* and *relish.*) 1. Bad taste; nauseousness (*Milton*). 2. Dislike; squeamishness (*Locke*).

To DISRE'LISH. *v. a.* 1. To infect with an unpleasant taste (*Rogers*). 2. To want a taste of; to dislike (*Pope*).

DISREPUTA'TION. *s.* (*dis* and *reputation.*) 1. Disgrace; dishonour (*Bacon*). 2. Loss of reputation; ignominy (*Taylor*).

DISREPU'TE. *s.* (*dis* and *repute.*) Ill character; dishonour; want of reputation (*South*).

DISRESPE'CT. *s.* (*dis* and *respect.*) Incivility; want of reverence (*Clarendon*).

DISRESPE'CTFUL. *a.* Irreverent; uncivil.

DISRESPE'CTFULLY. *ad.* Irreverently (*Addison*).

To DISRO'BE. *v. a.* To undress; to uncover; to strip (*Wotton*).

DISRU'PTION. *s.* (*disruptio*, Latin.) 1. The act of breaking asunder (*Ray*). 2. Breach; rent; dilaceration (*Woodward*).

DISS, a town in Norfolk, with a market on Friday. Here are manufactures of sailcloth, linen cloth, hose, and stays. Lat. 52. 25 N. Lon. 1. 9 E.

DISSATISFA'CTION. *s.* The state of being dissatisfied; discontent (*Rogers*).

DISSATISFA'CTORINESS. *s.* Inability to give content.

DISSATISFA'CTORY. *a.* Unable to give content.

To DISSA'TISFY. *v. a.* (*dis* and *satisfy*). 1. To discontent; to displease (*Collier*). 2. To fail to please (*Locke*).

To DISSE'CT. *v. a.* (*disseco*, Latin.) 1. To cut in pieces (*Roscommon*). 2. To divide and examine minutely (*Atterbury*).

DISSECT. In botany, applied to the leaf, LANCINIATE or GASHED. See these terms.

The gashed leaf however is distinguished from the lanciniate, by the sections being determinate in the first, and intermediate in the second.

DISSE'CTION. *s.* (*dissectio*, Latin.) 1. The act of separating the parts of animal bodies; anatomy (*Addison*). 2. Nice examination (*Granville*). 3. The cutting to pieces of any part of an animal or vegetable, for the purpose of examining its structure.

To DISSE'IZE. *v. a.* (*disseiser*, French.) To dispossess; to deprive (*Locke*).

DISSE'ISIN. *s.* (from *dissaisir*, French.) An unlawful dispossessing a man of his right (*Cowell*).

DISSE'IZOR. *s.* (from *disseize.*) He that dispossesses another.

To DISSE'MBLE. *v. a.* (*dissimulo*, Latin.) 1. To hide under false appearances; to pretend that not to be which really is (*Hayward*). 2. To pretend that to be which is not (*Prior*).

To DISSE'MBLE. *v. n.* To play the hypocrite; to use false professions; to wheedle (*Rowe*).

DISSE'MBLER. *s.* A hypocrite; a man who conceals his true disposition (*Raleigh*).

DISSE'MBLINGLY. *ad.* With dissimulation; hypocritically (*Knolles*).

To DISSE'MINATE. *v. a.* (*dessemino*, Latin.) To scatter as seed; to spread every way (*Atterbury*).

DISSEMINA'TION. *s.* (*disseminatio*, Lat.) The act of scattering like seed. (*Brown*).

It has been long a prevailing opinion, among philosophers, that the electric fluid is universally disseminated, and in continual action. To prove this to others, various instruments have been contrived to detect the smallest variations, and discover the minutest signs of its existence. See ELECTROMETER.

DISSEMINA'TOR. *s.* He that scatters; he that propagates a doctrine or opinion.

DISSE'NSION. *s.* (*dissensio*, Latin.) Disagreement; strife; contention; quarrel (*Knolles*).

DISSE'NSIOUS. *a.* Disposed to discord; contentious; quarrelsome (*Ascham*).

To DISSE'NT. *v. n.* (*dissentio*, Latin.) 1. To disagree in opinion (*Addison*). 2. To differ; to be of a contrary nature (*Hooker*).

DISSE'NT. *s.* (from the verb.) 1. Disagreement; difference of opinion (*Bentley*). 2. Contrariety of nature: not used (*Bacon*).

DISSENTA'NEOUS. *a.* (from *dissent.*) Disagreeable; inconsistent; contrary.

DISSE'NTER. *s.* (from *dissent.*) 1. One that disagrees, or declares his disagreement, from an opinion (*Locke*). 2. One who, for whatever reason, refuses the communion of the English church.

DISSENTERS, in church history, are a numerous body of people in this country, who made their appearance in queen Elizabeth's time, when, on account of the extraordinary purity, which they proposed in religious worship and conduct, they were reproached with the name of puritans. They increased in numbers by reason of the act of uniformity, which took place on Bartholomew's day 1662, in the reign of Charles II. By this act 2000 ministers of the establishment, refusing to conform to certain conditions, with which they could not conscientiously comply (see BARTHOLOMEW'S DAY), were obliged to quit their livings, and hence arose the name of non-conformists. The descendants of these are known by the name of protestant dissenters: they may be considered in general as divided into the denominations of PRESBYTERIANS, INDEPENDENTS, and BAPTISTS, which see.

The principles on which dissenters separate from the church of England, are the same with those on which the latter separates herself from the church of Rome; these are the right of private judgment; liberty of conscience; and the perfection of scripture as a christian's only rule of faith and practice. (See NONCONFORMISTS.) These principles are defended at length, by Watts, Neal, Palmer, Towgood, Flower, and some other writers. A History of the Dissenters was published some time ago by Mr. Cornish, and a much more extensive though a far from impartial one is just published in 4 vols. octavo, by Messrs. Bogue and Bennett.

DISSEPIMENT, in botany, PARTITION, which see.

DISSERTA'TION. *s.* (*dissertatio*, Latin.) A discourse; a disquisition; a treatise (*Pope*).

To DISSE'RVE. *v. a.* (*dis* and *serve.*) To do injury to; to mischief; to harm (*Clarendon*).

DISSE'RVICE. *s.* (*dis* and *service.*) Injury; mischief; ill turn (*Collier*).

DISSE'RVICEABLE. *a.* Injurious; mischievous; hurtful.

DISSE'RVICEABLENESS. *s.* Injury; harm; hurt; mischief; damage (*Norris*).

To DISSE'TTLE. *v. a.* To unsettle; to unfix.

To DISSE'VER. *v. a.* To sever; to part in two; to divide; to separate: a barbarous word (*Raleigh*).

DI'SSIDENCE. *s.* (*dissideo*, Latin.) Discord; disagreement.

DISSI'LIENCE. *s.* (*dissilio*, Lat.) The act of starting asunder.

DISSI'LIENT. In botany, a bursting or elastic pericarp or fruit. Bursting open with a spring; as in hura, dentaria, cardamine, momordica elaterium.

DISSILI'TION. *s.* (*dissilio*, Latin.) The act of bursting in two (*Boyle*).

DISSI'MILAR. *a.* (*dis* and *similar.*) Unlike; heterogeneous (*Newton*).

DISSIMILA'RITY. *s.* (from *dissimilar.*) Unlikeness; dissimilitude (*Cheyne*).

DISSIMI'LITUDE. *s.* (*dissimilitudo*, Lat.) Unlikeness; want of resemblance (*Pope*).

DISSIMULA'TION. *s.* (*dissimulatio*, Lat.) The act of dissembling; hypocrisy (*South*).

Lord Chesterfield, in his 151st letter to his son, quotes from lord Bacon the distinction between *simulation* and *dissimulation*; "the last of which is only to hide a man's own cards, whereas *simulation* is put on in order to look into other people's." Does not the following account of his own management, which he recommends to his son as an example, come under the description of *simulation*? "I should desire nothing better in any negociation, than to have to do with one of these men of warm, quick passions; which I would take care to set in motion. By artful provocations I would extort rash unguarded expressions; and, by hinting at all the several things I could suspect, infallibly discover the true one, by the alteration it occasioned in the countenance of the person." Is not this to look into another man's cards? We pretend not to determine whether this be proper and able conduct, in a negociator; but in a man it is surely detestable.

DI'SSIPABLE. *a.* (from *dissipate.*) Easily scattered; liable to dispersion (*Bacon*).

To DI'SSIPATE. *v. a.* (*dissipatus*, Latin.) 1. To scatter every way; to disperse (*Wood-*

ward). 2. To scatter the attention (*Savage's Life*). 3. To spend a fortune (*London*).

DISSIPA'TION. *s.* (*dissipatio*, Latin.) 1. The act of dispersion (*Hale*). 2. The state of being dispersed (*Milton*). 3. Scattered attention (*Swift*).

Dissipation, in physics, an insensible loss or consumption of the minute parts of the body; or that mode whereby they fly off, and are lost.

Dissipation (Circle of), in optics, denotes that circular space upon the retina, which is taken up by one of the extreme pencils or rays issuing from an object.

To DISSO'CIATE. *v. a.* (*dissocio*, Latin.) To separate; to disunite; to part (*Boyle*).

DISSO'LVABLE. *a.* (from *dissolve*,) Capable of dissolution; liable to be melted (*Newton*).

DI'SSOLUBLE. *a.* (*dissolubilis*, Lat.) Capable of separation (*Woodward*).

DISSOLUBI'LITY. *s.* (from *dissoluble.*) Liableness to suffer a disunion of parts (*Hale*).

To DISSO'LVE. *v. a.* (*dissolvo*, Latin.) 1. To destroy the form of any thing by disuniting the parts with heat or moisture; to melt; to liquefy (*Woodward*). 2. To break; to disunite (*Peter*). 3. To loose; to break the ties of any thing (*Milton*). 4. To separate persons united (*Shakspeare*). 5. To break up assemblies (*Bacon*). 6. To solve; to clear (*Dan.*). 7. To break an enchantment (*Milton*). 8. To be relaxed by pleasure (*Dryden*).

To Disso'lve. *v. n.* 1. To be melted; to be liquefied (*Addison*). 2. To fall to nothing (*Shakspeare*). 3. To melt away in pleasure.

DISSO'LVENT. *a.* (from *dissolve.*) Having the power of dissolving or melting (*Ray*).

Disso'lvent. Disso'lver. *s.* That which has the power of disuniting the parts of any thing (*Arbuthnot*).

DISSO'LVIBLE. *a.* (from *dissolve.*) Liable to perish by dissolution (*Hale*).

DI'SSOLUTE. *a.* (*dissolutus*, Lat.) Loose; wanton; unrestrained; luxurious; debauched; dissolved in pleasures (*Rogers*).

DI'SSOLUTELY. *ad.* Loosely; in debauchery; without restraint (*Wisdom*).

DI'SSOLUTENESS. *s.* Looseness; laxity of manners; debauchery (*Locke*).

DISSOLU'TION. *s.* (*dissolutio*, Latin.) 1. The act of liquefying by heat or moisture. 2. The state of being liquefied. 3. The state of melting away (*Shakspeare*). 4. Destruction of any thing by the separation of its parts (*South*). 5. The substance formed by dissolving any body (*Bacon*). 6. Death; the resolution of the body into its constituent elements (*Raleigh*). 7. Destruction (*Hooker*). 8. Breach of any thing compacted (*South*). 9. The act of breaking up an assembly. 10. Looseness of manners (*Atterbury*).

Dissolution, in chemistry, the solution of a substance, accompanied with the decomposition of its elementary principles, or at least a general change in its nature. Of lime we may obtain a solution in muriatic acid, of chalk a dissolution in the same liquid. Dissolution is, therefore, properly a species of what is comprised in the generic term decomposition.

DI'SSONANCE. *s.* (*dissonance*, French.) A mixture of harsh, unharmonious sounds (*Milton*). (See Discord.)

DI'SSONANT. *a.* (*dissonans*, Latin.) 1. Harsh; unharmonious (*Thomson*). 2. Incongruous; disagreeing (*Hakewill*).

To DISSU'ADE. *v. n.* (*dissuadeo*, Latin.) 1. To dehort; to divert by reason or importunity from any thing (*Shakspeare*). 2. To represent any thing as unfit (*Milton*).

DISSUA'DER. *s.* He that dissuades.

DISSUA'SION. *s.* (*dissuasio*, Latin.) Urgency of reason or importunity against any thing; dehortation (*Boyle*).

DISSUA'SIVE. *a.* (from *dissuade.*) Dehortatory; tending to divert from any purpose.

Dissua'sive. *s.* Dehortation; argument to turn the mind off from any pursuit.

DISSY'LLABLE. *s.* (δισσυλλαβος.) A word of two syllables (*Dryden*).

DI'STAFF. *s.* (ꝺıꞅꞇæꝼ, Saxon.) 1. The staff from which the flax is drawn in spinning (*Fairfax*). 2. It is used as an emblem of the female sex.

Distaff thistle, in botany. See Carthamus.

To DISTA'IN. *v. a.* (*dis* and *stain.*) 1. To stain; to tinge (*Pope*). 2. To blot; to sully with infamy (*Spenser*).

DI'STANCE. *s.* (*distance*, Fr. *distantia*, Latin.) 1. Space considered barely in length between any two beings (*Locke*). 2. Remoteness in place (*Prior*). 3. the space kept between two antagonists in fencing (*Shakspeare*). 4. Contrariety; opposition (*Shakspeare*). 5. A space marked on the course where horses run (*L'Estrange*). 6. Space of time (*Prior*). 7. Remoteness in time (*Smalridge*). 8. Ideal disjunction; mental separation (*Locke*). 9. Respect; distant behaviour (*Dryden*). 10. Retraction of kindness; reserve (*Milton*).

Distance, in astronomy. The real distances of the sun, planets, and comets, are found from their parallaxes. (See Parallax.) Or, with respect to the planets, as the distance of the earth from the sun has been found by transits of Venus, to be 95 millions of miles; from this one real distance and the periodic times of the planets, the respective real distances of the whole may be found by means of Kepler's second law. For the relative, as well as real distances of the planets from the sun (see Astronomy). As to the distances of the fixed stars, since they have no sensible parallax, all that we could say on this subject would be little else than guessing.

Curtate distance. See Curtate.

Accessible Distances, in geometry, are measured with the chain, decempeda or ten-foot rod, or the like.

Inaccessible Distances, are found by taking bearings to them, from the two extremities of a line whose length is given. Various ways of performing this may be seen in Hutton's Mensuration, Bonnycastle's Trigonometry, and most other books on the latter subject.

Distance of the bastions, in fortification, the side of the exterior polygon. See Polygon.

Apparent Distance, in optics, that distance which we judge an object is placed at when seen afar off, being usually very different from the true distance; because we are apt to think that all very remote objects, whose parts cannot well be distinguished, and which have no other object in view near them, are at the same distance from us, though perhaps the one is thousands of miles nearer than the other, as is the case with regard to the sun and moon.

M. De la Hire enumerates five circumstances, which assist us in judging of the distance of objects; viz. their apparent magnitude, the strength of the colouring, the direction of the two eyes, the parallax of the objects, and the distinctness of their small parts. On the contrary, Dr. Smith maintains, that we judge of distance principally, or solely, by the apparent magnitude of objects; and concludes universally, that the apparent distance of an object seen in a glass, is to its apparent distance seen by the naked eye, as the apparent magnitude to the naked eye is to its apparent magnitude in the glass: but it was long since observed by Alhazen, that we do not judge of distance merely by the angle under which objects are seen; and Mr. Robins clearly shews that Dr. Smith's hypothesis is contrary to fact, in the most common and simple cases. Thus if a double convex glass be held upright before some luminous object, as a candle, there will be seen two images, one erect, and the other inverted; the first is made simply by reflexion from the nearest surface; the second by reflexion from the farther surface, the rays undergoing a refraction from the first surface both before and after the reflexion. If this glass has not too short a focal distance, when it is held near the object, the inverted image will appear larger than the other, and also nearer; but if the glass be carried off from the object, though the eye remain as near to it as before, the inverted image will be diminished so much faster than the other, that at length it will appear much less than it, but still nearer. Here, says Mr. Robins, two images of the same object are seen under one view, and their apparent distances immediately compared; and it is evident that those distances have no necessary connexion with the apparent magnitude. This experiment may be made still more convincing, by sticking a piece of paper on the middle of the lens, and viewing it through a short tube. He observes farther, that the apparent magnitude of very distant objects is neither determined by the magnitude of the angle only under which they are seen, nor is the exact proportion of that angle compared with their true distance, but is compounded also with a deception concerning that distance; so that if we had no idea of difference in the distance of objects, each would appear in magnitude proportional to the angle under which it was seen; and if our apprehension of the distance were always just, our idea of their magnitude would be unvaried, in all distances; but in proportion as we err in our conception of their distance, the greater angle suggests a greater magnitude. By not attending to this compound effect, Mr. Robins apprehends that Dr. Smith was led into his mistake.

Dr. Porterfield gives a distinct and comprehensive view of the natural methods of judging concerning the distance of objects.

The confirmation of the eye, he observes, can be of no use to us with respect to objects that are placed without the limits of distinct vision. As the object, however, does then appear more or less confused, according as it is more or less removed from those limits, this confusion assists the mind in judging of the distance of the object; it being always esteemed so much the nearer, or the farther off, by how much the confusion is greater. But this confusion hath its limits also, beyond which it can never extend; for when an object is placed at a certain distance from the eye, to which the breadth of the pupil bears no sensible proportion, the rays of light that come from a point in the object, and pass the pupil, are so little diverging, that they may be considered as parallel. For a picture on the retina will not be sensibly more confused, though the object be removed to a much greater distance.

The most universal, and frequently the most sure, means of judging of the distance of objects is, he says, the angle made by the optic axis. For our two eyes are like two different stations, by the assistance of which distances are taken; and this is the reason why those persons who are blind of one eye so frequently miss their mark in pouring liquor into a glass, snuffing a candle, and such other actions as require that the distance be exactly distinguished. To convince ourselves of the usefulness of this method of judging of the distance of objects, he directs us to suspend a ring in a thread, so that its side may be towards us, and the hole in it to the right and left hand; and taking a small rod crooked at the end, retire from the ring two or three paces, and having with one hand covered one of our eyes, to endeavour with the other to pass the crooked end of the rod through the ring. This, says he, appears very easy; and yet upon trial, perhaps once in 100 times we shall not succeed, especially if we move the rod a little quickly.

Our author observes, that, by persons recollecting the time when they began to be subject to the mistakes above-mentioned, they may tell when it was that they lost the use of one of their eyes; which many persons are long ignorant of, and which may be a circumstance of some consequence to a surgeon. The use of this second method of judging of distances De Chales limited to 120 feet; beyond which, he says, we are not sensible of any difference in the angle of the optic axis.

A third method of judging of the distance of objects consists in their apparent magnitudes, on which so much stress was laid by Dr. Smith. From this change in the magnitude of the image upon the retina we easily judge of the distance of objects, as often as we are otherwise acquainted with the magnitude of the objects themselves; but as often as we are ignorant of the real magnitude of bodies, we can never, from their apparent magnitude, form any judgment of their distance.

From this we may see why we are so frequently deceived in our estimates of distance by any extraordinary magnitudes of objects seen at the end of it; as, in travelling towards a large city, or a castle, or a cathedral church, or a mountain larger than ordinary, we fancy them to be nearer than we find them to be. This also is the reason why animals, and all small objects, seen in valleys contiguous to large mountains, appear exceedingly small. For we think the mountain nearer to us than if it were smaller; and we should not be surprised at the smallness of the neighbouring animals, if we thought them farther off. For the same reason, we think them exceedingly small, when they are placed upon the top of a mountain, or a large building, which appear nearer to us than they really are, on account of their extraordinary size.

Dr. Jurin clearly accounts for our imagining objects, when seen from a high building, to be smaller than they are, and smaller than we fancy them to be when we view them at the same distance on level ground. It is, says he, because we have no distinct idea of distance in that direction, and therefore judge of the things by their pictures upon the eye only; but custom will enable us to judge rightly even in this case.

Let a boy, says he, who has never been upon any high building, go to the top of the Monument, and look down into the street; the objects seen there, as men and horses, will appear so small as greatly to surprise him. But 10 to 20 years after, if in the mean time he has used himself now and then to look down from that and other great heights, he will no longer find the same objects to appear so small. And if he were to view the same objects from such heights as frequently as he sees them upon the same level with himself in the streets, he supposes that they would appear to him just of the same magnitude from the top of the Monument as they do from a window one story high. For this reason it is, that statues placed upon very high buildings ought to be made of a larger size than those which are seen at a nearer distance; because all persons, except architects, are apt to imagine the height of such buildings to be much less than it really is.

The fourth method by which Dr. Porterfield says that we judge of the distance of objects, is the force with which their colour strikes upon our eyes. For if we be assured that two objects are of a similar and like colour, and that one appears more bright and lively than the other, we judge that the brighter object is the nearer of the two.

The fifth method consists in the different appearance of the small parts of objects. When these parts appear distinct, we judge that the object is near; but when they appear confused, or when they do not appear at all, we judge that it is at a greater distance. For the image of any object, or part of an object, diminishes, as the distance of it increases.

The sixth and last method by which we judge of the distance of objects is, that the eye does not represent to our mind one object alone, but at the same time all those that are placed betwixt us and the principal object, whose distance we are considering; and the more this distance is divided into separate and distinct parts, the greater it appears to be. For this reason, distances upon uneven surfaces appear less than upon a plane: for the inequalities of the surfaces, such as hills, and holes, and rivers, that lie low and out of sight, either do not appear, or hinder the parts that lie behind them from appearing, and so the whole apparent distance is diminished by the parts that do not appear in it. This is the reason that the banks of a river appear contiguous to a distant eye, when the river is low and not seen.

Dr. Porterfield very well explains several fallacies in vision depending upon our mistaking the distances of objects. Of this kind, he says, is the appearance of parallel lines, and long vistas consisting of parallel rows of trees; for they seem to converge more and more as they are farther extended from the eye. The reason of this, he says, is because the apparent magnitudes of their perpendicular intervals are perpetually diminishing, while, at the same time, we mistake their distances. Hence, we may see why, when two parallel rows of trees stand upon an ascent whereby the more remote parts appear farther off than they really are, because the line that measures the length of the vistas now appears under a greater angle than when it was horizontal, the trees, in such a case, will seem to converge less, and sometimes, instead of converging, they will be thought to diverge.

For the same reason that a long vista appears to converge more and more, the farther it is extended from the eye, the remoter parts of a horizontal walk or a long floor will appear to ascend gradually; and objects placed upon it, the more remote they are, the higher they will appear, till the last be seen on a level with the eye; whereas, the ceiling of a long gallery appears to descend towards a horizontal line drawn from the eye of the spectator. For this reason also, the surface of the sea, seen from an eminence, seems to rise higher and higher the farther we look; and the upper parts of high buildings seem to stoop, or incline forwards over the eye below, because they seem to approach towards a vertical line proceeding from the spectator's eye; so that statues on the top of such buildings, in order to appear upright, must recline or lean backwards a little.

This author also shews the reason why a windmill, seen from a great distance, is sometimes imagined to turn the contrary way from what it really does, by our taking the nearer end of the sail for the more remote. The uncertainty we sometimes find in the course of the motion of a branch of lighted candles, turned round at a distance, is owing to the same cause; as also our sometimes mistaking a convex for a concave surface, more especially in viewing seals and impressions with a convex glass or a double microscope; and, lastly, that, upon coming in a dark night into a street, in which there is but one row of lamps, we often mistake the side of the street they are on. Some important reflections are made upon this curious subject by M. Bouguer, also by Mr. Harris in his Optics, and by Dr. Young, and M. Haüy, in their respective courses of Natural Philosophy.

Distance of the eye, in perspective, is a line drawn from the eye to the principal point.

Point of Distance, in perspective, a point in the horizontal line at such distance from the principal point, as is that of the eye from the same.

Distance, as applied to the turf, is a length of two hundred and forty yards from the winning-post of a race-course; precisely at which spot is fixed a post corresponding with others, but having a gallery, capable of holding three or four persons, which is called the distance post. In this gallery, as well as in the gallery of the winning-post, before the horses start each heat, a person is stationed, holding a crimson flag; during the time the horses are running, each flag is suspended from the front of the gallery to which it belongs; and the flag is inclined forwards as a horse passes either post. Now, if there be any horse which has not come up to the distance post, before the first horse in that heat has reached the winning post, as manifested by the motion of the flag, such horse is said to be distanced, and is incapable of running any more during that race.

To DI'STANCE. *v. a.* (from the noun.) 1. To place remotely; to throw off from the view (*Dryden*). 2. To leave behind at a race the length of a distance (*Gay*).

DI'STANT. *a.* (*distans*, Latin.) 1. Remote in place; not near (*Pope*). 2. Remote in time either past or future. 3. Remote to a certain degree. 4. Reserved, shy. 5. Remote in nature; not allied (*G. of Tongue*). 6. Not obvious; not plain (*Addison*).

Distant, in botany, a term applied to the whorl, when the flowers which compose it, being few in number, are remote from each other. It is applied also to stamens (stamina distantia), as in mint.

DISTA'STE. *s.* (*dis* and *taste.*) 1. Aversion of the palate; disgust (*Bacon*). 2. Dislike; uneasiness (*Bacon*). 3. Anger; alienation of affection (*Pope*).

To Dista'ste. *v. a.* 1. To fill the mouth with nauseousness (*Shakspeare*). 2. To dislike; to loathe (*Shakspeare*). 3. To offend; to disgust (*Davies*). 4. To vex; to exasperate; to sour (*Pope*).

DISTA'STEFUL. *a.* 1. Nauseous to the palate; disgusting (*Glanville.*) 2. Offensive; unpleasing (*Davies*). 3. Malignant; malevolent (*Brown*).

DISTE'MPER. *s.* (*dis* and *temper.*) 1. A disproportionate mixture of parts. 2. A disease; a malady (*Suckling*). 3. Want of due temperature (*Raleigh*). 4. Bad constitution of the mind (*Shakspeare*). 5. Want of due balance between contraries (*Bacon*). 6. Depravity of inclination (*K. Charles*). 7. Tumultuous disorder (*Waller*). 8. Disorder; uneasiness (*Shakspeare*).

To Diste'mper. *v. a.* 1. To disease (*Shakspeare*). 2. To disorder (*Boyle*). 3. To disturb; to ruffle (*Dryden*). 4. To destroy temper or moderation (*Addison*). 5. To make disaffected (*Shakspeare*).

DISTE'MPERATE. *a.* Immoderate (*Ral.*)

DISTE'MPERATURE. *s.* 1. Intemperateness; excess of heat or cold, or other qualities (*Abbot*). 2. Violent tumultuousness; outrageousness. 3. Perturbation of the mind (*Shakspeare*). 4. Confusion; loss of regularity (*Shakspeare*).

To DISTE'ND. *v. a.* (*distendo*, Latin.) To stretch out in breadth (*Thomson*).

DISTE'NT. *s.* (from *distend.*) The space through which any thing is spread (*Wotton*).

DISTE'NTION. *s.* (*distentio*, Latin.) 1. The act of stretching; state of things stretched (*Arbuthnot*). 2. Breadth; space occupied by the thing distended. 3. The act of separating one part from another; divarication (*Wotton*).

To DISTHRONI'ZE. *v. a.* (*dis* and *throne.*) To dethrone: not used (*Spenser*).

DISTICH, Διϛιχον, a couplet of verses; or a piece of poetry, the sense whereof is comprehended in two lines. There are excellent morals in Cato's Distichs. See Vigneul de Marville on the Distichs of Cato, tom. i. p. 54, 55.

Hexameter and pentameter verses, otherwise called elegiacs, are disposed in distichs.

DISTICHIASIS. (*distichiasis*, διϛιχιασις; from διϛιχια, from δις, double, and ϛιχος, row.) A disease of the eyelash, in which there is a double row of hairs, the one row growing outwards, the other inwards towards the eye.

DISTICHOUS. In botany. (δις, and στιχος, row or rank.) Two-ranked. Distichus caulis: ramos situ horizontali, nec decussatim sitos exserens. A distich or two-ranked stem, or stalk: putting forth branches not decussated, but in a horizontal position. Disticha folia: duo latera rami tantum respicientia, licet undique incerta. Respecting two sides of the branch only, though inserted on all parts of it: as in fir and diervilla. Or, pointing two ways only, though not in the same plane.

This term is applied in the same sense to a spike (spica disticha); floribus ad utrumque latus spectantibus; all the flowers pointing two ways.

To DISTI'L. *v. n.* (*distillo*, Latin.) 1. To drop; to fall by drops (*Pope*). 2. To flow gently and silently (*Raleigh*). 3. To use a still (*Shakspeare*).

To Disti'l. *v. a.* 1. To let fall in drops (*Drayton*). 2. To force by fire through the vessels of distillation (*Shakspeare*). 3. To draw by distillation (*Boyle*). 4. To dissolve or melt (*Addison*).

DISTILLA'TION. *s.* (*distillatio*, Latin.) 1. The act of dropping, or falling in drops. 2. The act of pouring out in drops. 3. That which falls in drops. 4. The act of distilling by fire (*Newton*). 5. The substance drawn by the still (*Shakspeare*).

Distillation. (*distillatio*, from *distillo*, to drop by little and little.) A chemical process, very similar to evaporation, instituted to separate the volatile from the fixed principles by means of heat. Distillatory vessels are either alembics or retorts; the former consist of an inferior vessel, called a cucurbit, designed to contain the matter to be examined, and having an upper part fixed to it, called the capital or head. In this last the vapours are condensed by the contact of the surrounding air, or, in other cases, by the assistance of cold water surrounding the head, and contained in a vessel called a refrigeratory. From the lower part of the capital proceeds a tube, called the nose, beak, or spout, through which the vapours, after condensation, are, by a proper figure of the capital, made to flow into a vessel called the receiver, which is usually spherical. These receivers have different names, according to their figure, being called mattrasses, balloons, &c. Retorts are a kind of bottle of glass, pottery, or metal, the bottom being spherical, and the upper part gradually diminishing into a neck, which is turned on one side.

But the greatest improvement which the process of distillation has perhaps ever received consists in the comparatively modern addition of a separate series of tubes and vessels to convey and collect the gasseous products of substances submitted to the operation, and to avoid all the danger from sudden expansion, without the necessity of letting off to waste a large portion of the difficultly condensible, but frequently most important products of the operation.

This part of the machinery, from the name of its inventor, is denominated Woulfe's apparatus. Something of the same kind, however, was invented by Glauber as early as the year 1655; who, aware of the numerous defects of the common apparatus, substituted to the series of perpendicular aludel-shaped receivers, a lateral series of plain stone or earthen jars, each connected with the other by earthen tubes bent at right angles, and the covers of each jar having two holes, one to receive the tube bringing the vapour from the adjoining jar or the retort, and the other for the passage of the tube which conveyed the excess of this vapour into the next in succession. The chief improvement upon this machinery in Woulfe's apparatus consists in filling the lateral vessels with water, into which the inventor dips the extremity of each tube, bringing into it the uncondensed part of the vapour by which a vast quantity of product is saved.

The practical uses of distillation in chemistry are too numerous to be mentioned. By it the volatile part of any substance is separated from that which is fixed, as in the distillation of turpentine, in which the essential oil rises and the rosin is left behind; the more evaporable is separated from the less evaporable, as in the preparation or rectification of ardent spirit; liquids are freed from foreign or accidental impurities, as in the distillation of common water; volatile substances are united in an easy and commodious manner, as in preparing the odorous distilled waters of aromatic vegetables; bodies are decomposed and analyzed, new compounds are formed, and a knowledge is obtained of the native and chemical properties of foreign substances.

When the products of distillation are solid and dry, the process is usually termed SUBLIMATION, which see.

There are various modes of applying heat in distillation, depending upon the nature of the apparatus employed, as well as upon the substance to be distilled. The common still, being formed of metal, is immediately exposed to the naked fire, since from its tenacity, and its property of conducting heat with facility, it is not liable to crack, which is not the case with glass and earthen ware. If the vessel holding the substance to be distilled be of the latter kind, it is essential to apply the heat very gradually and uniformly, and after the process, to suffer it to cool in a similar manner. This is effected in different ways; the most common of which is the sand bath, which consists of a vessel of iron filled with fine dry sand. The retort, or other vessel, is imbedded in the sand previous to the application of the fire; the inferior conducting power of the sand does not allow the heat to approach the retort, but in that gradual way, which will ensure its safety from cracking. The heat must also be more uniform, since any sudden increase, or diminution of the fire, will not so immediately affect the retort.

In experiments in the small way, the lamp will answer every purpose of the sand bath, as the sliding rest containing the retort admits of its being placed at any given distance from the flame. In addition to this, the Argand lamp can be adjusted by the rack, to almost any degree of intensity below its maximum. Another method of defending the retort from the too rapid effect of the heat, consists in coating the outside with a mixture of horse-dung and clay, or loam. When a limited degree of heat is required in distillation, recourse is had to a bath of some liquid, whose boiling point will give the degree of heat required, such as water, oil, or mercury. If, for instance, it were required to separate any substance from water, more volatile than that liquid, it would be necessary to employ a water bath, in which to place the retort, keeping the water in the bath below its boiling point.

Yet the laws of distillation are so modified by other circumstances as to render several of the preceding rules in some degree exceptionable. Thus we frequently find that one volatile substance will carry along with it other bodies of considerable fixity. From the affinity water has to air, an evaporation of the former takes place at all temperatures below its boiling point; and though it has been thought that water might be freed from saline matter by distillation, experiment proves that several salts are carried over, along with the vapour of the water, which, in their dry state, would undergo decomposition before they would be induced to assume the elastic form; whence water by common distillation cannot be rendered pure.

The salts most disposed to rise with water in distillation are carbonat of ammonia, muriats of lime, and magnesia, and nitrat of soda. Indeed this tendency appears to be directly as the solubility of the salt, or rather as its deliquescent property, which is as its affinity for water.

It is chiefly in consequence of the ascent of bodies of greater fixity with certain bodies of greater volatility that there is so much difficulty in our own country of imitating the foreign vinous spirits of other countries, as, for example, French brandies, and West India rums. All these are individuated by the character of the essential oil that ascends with the spirit, and gives it the peculiar flavour by which one spirit differs from another. Now we can obtain an essential oil from any of the vegetables that furnish these different spirits: but we cannot readily obtain a spirit altogether tasteless, and destitute of some sort of essential oil still combining with it, from whatever substance we distil in our own country. Could we do this we could manufacture to perfection an artificial Coniac brandy or Jamaica rum; but as we cannot altogether separate the inherent essential oil from the purest and most colourless and most insipid spirit we can obtain, when we add the essential oil with which we mean to flavour it, the union of the two oils gives us necessarily a different result, and betrays the artifice to every one who is acquainted with the taste of the genuine material.

In order, then, to prepare the oil of wine, or of the grapes from which French brandies are distilled; which are generally the worst and most unripe that the country affords, the best being selected for the process of wine itself, which pays a far ampler profit; take some cakes of dry wine-lees, such as are used by our hatters, dissolve them in 6 or 8 times their weight of water, distil the liquor with a slow fire, and separate the oil with a separating glass, reserving for only the nicest uses that which comes over first; the succeeding oil being coarser and more resinous. Having procured this fine oil of wine, it may be dissolved in alcohol; by which means it may be preserved a long time fully possessed of all its flavour, but otherwise it will soon grow rancid.

With a fine essential oil of wine thus procured, and a pure and insipid spirit, French brandies may be imitated to some degree of perfection. The essential oil, however, must be drawn from the same kind of lees as the brandy to be imitated was procured from; *e. g.* in order to imitate Coniac brandy, it will be necessary to distil the essential oil from Coniac lees; and the same for any other kind of brandy. For as different brandies have different flavours, and as these flavours are entirely owing to the essential oil of the grape, it would be preposterous to endeavour to imitate the flavour of Coniac brandy with an essential oil, procured from the lees of Bourdeaux wine. When the flavour of the brandy is well imitated by a proper dose of the essential oil, and the whole reduced into one simple and homogeneous fluid, other difficulties are still behind: the flavour, though the essential part, is not, however, the only one; the colour, the proof, and the softness, must also be regarded, before a spirit that perfectly resembles brandy can be procured. With regard to the proof, it may be easily accomplished, by using a spirit rectified above proof; which, after being intimately mixed with the essential oil of wine, may be let down to a proper standard with fair water: and the softness may, in a great measure, be obtained by distilling and rectifying the spirit with a gentle fire; and what is wanting of this criterion in the liquor when first made, will be supplied by time: for it must be remembered, that it is time alone that gives this property to French brandies, they being at first acrid, foul, and fiery. But with regard to the colour, a particular method is required to imitate it to perfection, which may be effected by means of treacle or burnt sugar. The treacle gives the spirit a fine colour nearly resembling that of French brandy; but as its colour is dilute, a large quantity must be used. This is not, however attended with any bad consequences; for notwithstanding the spirit is really weakened by this addition, yet the bubble-proof, the general criterion of spirits, is greatly mended by the tenacity imparted to the liquor by the treacle. The spirit also acquires from the mixture a sweetish or luscious taste, and a fulness in the mouth; both which properties render it very agreeable to some palates. A much smaller quantity of burnt sugar than of treacle will be sufficient for colouring the same quantity of spirits: the taste is also very different; for, instead of the sweetness imparted by the treacle, the spirit acquires from the burnt sugar an agreeable bitterness, and by that means recommends itself to many who are offended with a luscious spirit. The burnt sugar is prepared by dissolving a proper quantity of sugar in a little water, and scorching it over the fire till it acquires a black colour. Either treacle or burnt sugar will nearly imitate the genuine colour of old French brandy; but neither of them will succeed when put to the test of the vitriolic solution.

The spirit distilled from melasses or treacle is very pure. It is made from common treacle dissolved in water, and fermented in the same manner as the wash for the common malt spirit. But if some particular art be not used in distilling this spirit, it will not prove so vinous as malt spirit, but more flat and less pungent and acrid, though otherwise much cleaner tasted, as its essential oil is of a much less offensive flavour. Therefore, if good fresh wine-lees, abounding in tartar, be well fermented with melasses, the spirit will acquire a much greater vinosity and briskness, and approach much nearer to the nature of foreign spirits. Where the melasses spirit is brought to the common proof-strength, if it be found not to have a sufficient vinosity, it will be very proper to add some dulcified spirit of nitre; and if the spirit be clean worked, it may, by this addition only, be made to pass on ordinary judges for French brandy. Great quantities of this spirit are used in adulterating foreign brandy, rum, and arrack. Much of it is also used alone in making cherry-brandy and other cordials by infusion; in all which, many, and perhaps with justice, prefer it to foreign brandies. Melasses, like all other spirits, is entirely colourless when first extracted; but distillers always give it as nearly as possible the colour of foreign spirits.

In this manner we may imitate foreign spirits of all kinds. Thus if Jamaica rum be our object, instead of French brandy, it will only be necessary to procure some of the tops or other useless parts of the sugar-canes, from which an essential oil being drawn and mixed with clear melasses spirit, will give it the true flavour; or at least a flavour as true as a spirit not totally divested of all essential flavour of its own can possibly communicate. The principal difficulty therefore must still lie in procuring a spirit totally, or nearly, free from all flavour of its own. The spirit drawn from the refuse of a sugar-house has been commended as superior to that drawn from melasses; though it is very probable, that to procure an absolutely flavourless spirit is impossible. The only method, therefore, of imitating foreign spirits is, by choosing such materials as will yield a spirit flavoured as much like them as possible; and the materials most recommended, and probably the best that can be used, are raisins.

In the process of obtaining Holland gin, the Dutch distillers first intermix an unequal quantity of malt ground to a meal, and rye; some prefer that the former should predominate, and ome that the latter should. Before this intermixture takes place, however, each substance is to be made into a thin batter or lob, first with a very small portion of cold water, and then a larger quantity of boiling water, and then suffered to ferment by the addition of a sufficient quantity of yeast, for the space of about eight and forty hours. The fluid is rendered just dilute enough for the purpose of distillation without endangering its burning to the bottom of the still. By these means they commodiously reduce the processes of brewing and fermenting to one common operation. By using cold water to wet the malt uniformly, all danger of clogging the spending of the tap would be necessarily avoided; but here is no occasion to do any thing more than sufficiently dilute the wash, consisting of the whole of the grain, thin enough to be fermented and distilled together, by which means the spirit of the bran and husky part, as well as of the flour of the grain, are completely extracted, yet their wash, compared with ours, is about three-eighths thinner. For these reasons, they obtain more spirit from their grain than we do, and of a better quality, with not half the trouble taken by our distillers.

To rectify this spirit into Holland-gin, which constitutes the next process, add to every twenty gallons of spirit of the second extraction, about the strength of proof spirit, three pounds of juniper berries, and two ounces of oil of juniper, and distil with a slow fire, till the feints begin to ascend; than change the receiving can. This produces the best Rotterdam-gin. An inferior kind is made with a still less proportion of berries, sweet fennel-seeds, and Strasburg turpentine without a drop of juniper oil. This last, as also a better sort though still inferior to that of Rotterdam, is produced in very large quantities at Welsoppe.

DISTI′LLATORY. *a.* (from *distil.*) Belonging to distillation; used in distillation (*Boyle*).

DISTILLED WATERS. See Pharmacy.

DISTI′LLER. *s.* (from *distil.*) 1. One who practices the art or trade of distilling (*Boyle*). 2. One who makes and sells pernicious and inflammatory spirits.

By stat. 3 Geo. III. c. 5. s. 12, persons who sell liquors chargeable with duty, and distil spirits, are deemed common distillers, and are liable to surveys, penalties, &c. See Excise.

DISTI′LMENT. *s.* (from *distil.*) That which is drawn by distillation: obsolete (*Shakspeare*).

DISTI′NCT. *a.* (*distinctus*, Latin.) 1. Different; not the same (*Stillingfleet*). 2. Separate; being apart (*Tillotson*). 3. Clear; unconfused (*Milton*). 4. Spotted; variegated (*Milton*). 5. Marked out; specified (*Milton*).

Distinct leaves, in botany. Folia distincta. Quite separate from each other. Contrasted with connate: as in several of the mesembryanthema. Distinct leaflets, as in jasminum officinale; contrasted with confluent, as in j. grandiflorum. Distinct or separate anthers, as in most flowers; contrasted with connate.

DISTI′NCTION. *s.* (*distinctio*, Latin.) 1. The act of discerning one as preferable to the other (*Shakspeare*). 2. Note of difference. 3. Honourable note of superiority. 4. That by which one differs from another (*Locke*). 5. Difference regarded (*Dryden*). 6. Separation of complex notions (*Shakspeare*). 7. Division into different parts (*Dryden*). 8. Notation of difference between things seemingly the same; discrimination (*Norris*). Discernment; judgment.

Distinction, in logic, is an assemblage of two or more words, whereby disparate things, or their conceptions, are denoted.

There are three kinds of distinctions, taken from the three different modes of existence, real, modal, and rational. The first is that between two substances, or the modes of two substances. The second, or modal distinction, is that between several things, one whereof may exist without the other, but not vice versa, the other without that. The third, or rational distinction, is that between several things which are really one and the same, and whereof one cannot exist without the other; nor vice versa, the other without this: such is that between a thing and its essence, between the essences and properties, &c. Of this distinction some authors admit two kinds: the one barbarously called rationis ratiocinatæ, having some foundation in things, as when we distinguish the justice of God from his mercy; the other called rationis raticionantis, which has no foundation at all, and therefore is by many rejected. (*Chauvin*).

DISTI′NCTIVE. *a.* (from *distinct.*) 1. That marks distinction or difference (*Pope*). 2. Having the power to distinguish and discern; judicious (*Brown*).

DISTI′NCTIVELY. *ad* Particularly; not confusedly (*Shakspeare*).

DISTI′NCTLY. *ad.* (from *distinct.*) 1. Not confusedly (*Newton*). 2. Plainly; clearly (*Dryden*).

DISTI′NCTNESS. *s.* (from *distinct.*) 1. Nice observation of the difference between different things (*Ray*). 2. Such discrimination of things as makes them easy to be observed.

To DISTI′NGUISH. *v. a.* (*distinguo*, Lat.) 1. To note the diversity of things (*Hooker*). 2. To separate from others by some mark of honour or preference (*Prior*). 3. To divide by notes or diversity (*Burnet*). 4. To know one from another by any mark or note of difference (*Watts*). 5. To discern critically; to judge (*Shakspeare*). 6. To constitute difference; to specificate (*Locke*). 7. To make known or eminent.

To Disti′nguish. *v. n.* To make distinction; to find or shew the difference (*Child*).

DISTI′NGUISHABLE. *a.* (from *distinguish.*) 1. Capable of being distinguished (*Hale*). 2. Worthy of note; worthy of regard (*Swift*).

DISTI′NGUISHED. *particip. a.* Eminent; transcendent; extraordinary (*Rogers*).

DISTI′NGUISHER. *s.* (from *distinguish.*) 1. A judicious observer; one that accurately discerns one thing from another (*Dryden*). 2. He that separates one thing from another by proper marks of diversity (*Brown*).

DISTI′NGUISHINGLY. *ad.* With distinction; with some mark of preference (*Pope*).

DISTI′NGUISHMENT. *s.* Distinction; observation of difference (*Graunt*).

To DISTO′RT. *v. a.* (*distortus*, Latin.) 1. To writhe; to twist; to deform by irregular motions (*Smith*). 2. To put out of the true direction or posture (*Tillotson*). 3. To wrest from the true meaning (*Peacham*).

DISTO′RTION. *s.* (*distortio*, Latin.) Irregular motion by which the face is writhed or the parts disordered (*Prior*).

To DISTRA′CT. *v. a.* part. pass. *distracted*; anciently *distraught.* (*distractus*, Latin.) 1. To pull different ways at once (*Brown*). 2. To separate; to divide (*Shakspeare*). 3. To turn from a single direction towards various points (*South*). 4. To fill the mind with contrary considerations; to perplex; to confound (*Locke*). 5. To make mad (*Bacon*).

DISTRA′CTEDLY. *ad.* (from *distract.*) Madly; frantickly (*Shakspeare*).

DISTRA′CTEDNESS. *s.* (from *distract.*) The state of being distracted; madness.

DISTRA′CTION. *s.* (*distractio*, Latin.) 1. Tendency to different parts (*Shakspeare*). 2. Confusion; state in which the attention is called different ways (*Dryden*). 3. Perturbation of mind (*Tatler*). 4. Madness; franticknesss; loss of the wits; vagrancy of the mind (*Atterbury*). 5. Disturbance; discord (*Clarendon*).

To DISTRA′IN. *v. a.* (from *distringo*, Lat.) To seize; to lay hold on (*Shakspeare*).

To DISTRA′IN. *v. n.* To make seizure (*Marvel*).

DISTRA′INER. *s.* He that seizes.

DISTRA′INT. *s.* (from *distrain.*) Seizure.

DISTRA′UGHT. *part. a.* (from *distract.*) Distracted (*Camden*).

DISTRE′SS. *s.* (*distresse*, French.) 1. The act of making a legal seizure (*Spenser*). 2. Compulsion, by which a man is assured to appear in court, or to pay a debt (*Cowell*). 3. The thing seized by law. 4. Calamity; misery; misfortune (*Shakspeare*).

DISTRESS, in law, the taking of a personal chattel, out of the possession of the wrong-doer, into the custody of the person who is injured, to procure a satisfaction for the wrong committed. It is of two kinds; cattle for trespassing, for doing damage; or for nonpayment of rent or other duties. But the most usual injury for which a distress may be taken is that of nonpayment of rent.

A distress may now be taken for any kind of rent in arrear, the detaining of which beyond the day of payment is an injury to him that is entitled to receive it. 4 *G.* II. c. 28. This is the most common and best remedy for the recovery of rent in arrear; and the effect of it is to compel the party to replevy the distress, and contest the taking in an action against the distrainer; or, which is more usual, to compound or pay the debt or duty for which he was distrained. 3 Black. 6.

Distress infinite, is a process commanding the sheriff to distrain a person from time to time, and continually afterwards, by taking his goods, by way of pledge, to inforce the performance of something due from the party distrained upon. Generally, it is provided that distress shall be reasonable and moderate; but in case of distress for suit of court, or for defect of appearance, in several cases where this is the only method of enforcing compliance, no distress can be immoderate; because, be it of what value it will, it cannot be sold, but shall be immediately restored on satisfaction made. 3 Black. 251.

Who may distrain for rent. By the common law and the various statutes in favour of this species of remedy for recovery of rent, all persons having the reversion or remainder of lands, &c. after the determination of the particular estate, or existing term therein, may of common right distrain for rent in arrear, without any clause for that purpose contained in the lease. Co. Lit. 142.

What may or may not be distrained. Every thing upon the premises is liable to the landlord's distress for rent, whether they are the effects of a tenant or a stranger, because of the lien the landlord has on them in respect of the place where the goods are found, and not in respect to the person to whom they belong. Co. Lit. 47. 3. Bur. 1502. 3 Durnf. and East, 601.

Things not distrainable are, tools of a man's trade, corn sent to a mill, a horse sent to a smith's shop or in a common inn, cloth at a taylor's, goods in the hands of a carrier. 1 Salk. 249. 1 Esp. Rep. 206. 4 T. R. 569. Dogs, rabbits, beasts of the plough, milk, fruit, and things fixed to the freehold. 3 Black. 8 and 9. 4 T. R. 569. But beasts of the plough, and working tools, not actually in use at the time, may be distrained, if there is not sufficient without them. 4 T. R. 569. So may wearing apparel not actually in use. 1 Esp. Rep. 206. Money in a bag sealed may be distrained.

Horses and carriages sent to stand at livery are distrainable by the landlord. 3 Bur. 1498.

By 2 W. and M. it is provided, that where any goods or chattels shall be distrained for rent due on any demise, lease, or contract whatsoever, and the owner shall not, within five days next after such distress taken, and notice thereof, and of the cause of the taking left at the dwelling-house, or other most notorious place on the premises charged with the rent, replevy the same, that then, at the expiration of the said five days, the distrainer may, with the assistance of the sheriff, under-sheriff, or constable, cause the goods and chattels so distrained to be appraised by two sworn appraisers, and sold for the best price that can be got for the same, towards satisfaction of the rent for which the said goods and chattels have been distrained, and the costs and charges of such distress, appraisement, and sale; leaving the overplus (if any) in the hands of the said sheriff, or constable, for the use of the owner.

By stat. 2 W. c. 5, on any pound breach, or rescous of goods distrained for rent, the persons grieved thereby shall, in a special action on the case, recover treble damages and costs against the offender, or against the owner of the goods, if they are afterwards found to have come to his use or possession.

DISTRESS FOR PENALTIES. By 27 G. II. c. 20. s. 1, in all cases where any justice of the peace shall be required or empowered by any act of parliament to issue a warrant of distress for the levying any penalty inflicted, or any sum of money directed to be paid by such act, it shall be lawful for the justice granting such warrant, therein to order and direct the goods and chattels so to be distrained to be sold and disposed of within a certain time to be limited in such warrant; so as such time be not less than four days, nor more than eight days; unless the penalty, or sum of money for which the distress shall be made, together with the reasonable charges of taking and keeping such distress, shall be sooner paid.

To DISTRE'SS. *v. a.* (from the noun.) 1. To prosecute by law to a seizure. 2. To harass; to make miserable (*Deuteronomy*).

DISTRE'SSFUL. *a.* (*distress* and *full.*) Miserable; full of trouble; full of misery (*Pope*).

To DISTRI'BUTE. *v. a.* (*distribuo*, Lat.) To divide among more than two; to deal out; to dispensate (*Spenser*).

DISTRI'BUTER. *s.* One who deals out any thing; a dispenser (*Woodward*).

DISTRIBU'TION. *s.* (*distributio*, Latin.) 1. The act of distributing or dealing out to others; dispensation (*Swift*). 2. Act of giving in charity (*Atterbury*).

DISTRIBUTION, in architecture, relates either to the plan, or the ornaments: 1. It denotes the dividing and dispensing the several parts and members, which enter into the plan of a building. 2. It denotes a judicious orderly placing of the ornaments in any order or edifice.

DISTRIBUTION, in rhetoric, a kind of description, whereby an orderly division and enumeration is made of the principal qualities of the subject. David supplies us with an example of this kind, when in the heat of his indignation against sinners, he gives a description of their iniquity: "Their throat is an open sepulchre; they flatter with their tongues; the poison of asps is under their lips; their mouth is full of cursing and lies; and their feet are swift to shed blood."

DISTRIBUTION, in printing, the taking a form asunder, separating the letters, and disposing them in the cases again, each in its proper cell. See PRINTING.

DISTRI'BUTIVE. *a.* (from *distribute.*) That is employed in assigning to others their portions; that allots to each his claim (*Dry.*).

DISTRI'BUTIVELY. *ad.* (from *distributive.*) 1. By distribution. 2. Singly; particularly (*Hooker*).

DI'STRICT. *s.* (*districtus*, Latin.) 1. The circuit within which a man may be compelled to appearance (*Cowell*). 2. Circuit of authority; province (*Addison*). 3. Region; country; territory (*Blackmore*).

DISTRI'CTION. *s.* (*districtus*, Latin.) Sudden display (*Collier*).

DISTRINGAS, a writ directed to the sheriff, or other officer, commanding him to distrain one for a debt to the king; or for his appearance at a certain day. See DISTRESS.

DISTRINGAS JURATORES, a writ directed to a sheriff, whereby he is commanded to distrain upon a jury to appear, and to return issues on their lands, &c. for non-appearance. This writ issues for the sheriff to have their bodies in court, &c. at the return of the writ.

To DISTRU'ST. *v. a.* (*dis* and *trust.*) To regard with diffidence; not to trust (*Wisdom*).

DISTRU'ST. *s.* (from the verb.) 1. Loss of credit; loss of confidence (*Milton*). 2. Suspicion; want of faith (*Dryden*).

DISTRU'STFUL. *a.* (*distrust* and *full.*) 1. Apt to distrust; suspicious (*Boyle*). 2. Not confident; diffident (*Gov. of Tongue*). 3. Diffident of himself; timorous (*Pope*).

DISTRU'STFULLY. *ad.* In a distrustful manner.

DISTRU'STFULNESS. *s.* The state of being distrustful; want of confidence.

To DISTU'RB. *v. a.* (*disturbo*, low Latin.) 1. To perplex; to disquiet (*Collier*). 2. To confound; to put into irregular motions. 3. To interrupt; to hinder. 4. To turn off from any direction (*Milton*).

DISTU'RB. *s.* (from the verb.) Confusion; tumultuary emotion (*Milton*).

DISTU'RBANCE. *s.* (from *disturb.*) 1. Perplexity; interruption of a settled state (*Locke*). 2. Confusion; disorder of thoughts (*Watts*). 3. Tumult; violation of peace (*Milton*).

DISTU'RBER. *s.* (from *disturb.*) 1. A violator of peace; he that causes tumults and public disorders (*Glanville*). 2. He that injures tranquillity (*Shakspeare*).

To DISTU'RN. *v. a.* (*dis* and *turn.*) To turn off; to turn aside: not in use (*Daniel*).

DISVALUA'TION. *s.* (*dis* and *valuation.*) Disgrace; diminution of reputation (*Bacon*).

To DISVA'LUE. *v. a.* To undervalue (*G. of Tongue*).

To DISVE'LOP. *v. a.* (*developer*, French.) To uncover.

DISU'NION. *s.* (*dis* and *union.*) 1. Separation; disjunction (*Granville*). 2. Breach of concord.

To DISUNI'TE. *v. a.* (*dis* and *unite.*) 1. To separate; to divide (*Pope*). 2. To part friends or allies.

To DISUNI'TE. *v. n.* To fall asunder; to become separate (*South*).

DISU'NITY. *s.* (*dis* and *unity.*) A state of actual separation (*More*).

DISU'SAGE. *s.* (*dis* and *usage.*) The gradual cessation of use or custom (*Hooker*).

DISU'SE. *s.* (*dis* and *use.*) 1. Cessation of use; desuetude (*Addison*). 2. Cessation of custom (*Arbuthnot*).

To DISU'SE. *v. a.* 1. To cease to make use of (*Dryden*). 2. To disaccustom (*Dryden.*)

To DISVO'UCH. *v. a.* (*dis* and *vouch.*) To destroy the credit of; to contradict (*Shakspeare*).

DISWI'TTED. *a.* (*dis* and *wit.*) Deprived of the wits; mad: not in use (*Drayton*).

DIT. *s.* (*dicht*, Dutch.) A ditty; a poem; a tune: obsolete (*Spenser*).

DITA'TION. *s.* (*ditatus*, Latin.) The act of enriching (*Hall*).

DITCH. *s.* (ðic, Saxon.) 1. A trench cut out in the ground, usually between fields (*Arbuthnot*). 2. Any long narrow receptacle of water (*Bacon*). 3. *Ditch* is used, in composition, of any thing worthless, or thrown into ditches (*Shakspeare*).

DITCH, in fortification, called also foss, and moat, is a trench dug round the rampart, or wall of a fortified place, between the scarp and counterscarp.

Ditches are either dry, or wet, that is, having water in them; both of which have their particular advantages. The earth dug out of the ditch serves to raise the rampart.

The ditch in front should be of such breadth as that tall trees may not reach over it, being from 12 to 24 fathoms wide, and 7 or 8 feet deep. The ditches on the sides are made smaller. But the most general rule is perhaps, that the dimensions of the ditch be such as that the earth dug out may be sufficient to build the rampart of a proper magnitude. The space sometimes left between the rampart and ditch, being about 6 or 8 feet, is called the berm, or list, serving to pass and repass, and to prevent the earth from rolling into the ditch.

To DITCH. *v. a.* To make a ditch (*Swift*).

DITCH-DELIVERED. *a.* Brought forth in a ditch (*Shakspeare*).

DI'TCHER. *s.* One who digs ditches (*Swift*).

DITHYRAMBIC, something that relates to the dithyrambus. We say a dithyrambic verse, dithyrambic poet, dithyrambic heat, &c. A compound dithyrambic word, Mr. Dacier observes, has sometimes its beauty and force. Some moderns call compositions which are in the taste of an ode, only not distinguished into strophes, and consisting of all kinds of verse indifferently, dithyrambic odes.

DITHYRAMBIC, is sometimes adjectively, to signify wild, or enthusiastic.

DITHYRAMBUS, Διθυραμβος, in the ancient poetry, a hymn in honour of Bacchus, full of transport, and poetical rage.

The measure, which is what distinguishes this kind of poetry, is said to have been invented by Dithyrambus, a Theban: but Pindar attributes it to the Corinthians; and the modern etymologists furnish us with another origin of the word.

In effect, the verse might be called thus from the god it was consecrated to, who himself was named Dithyrambus, either on account of his having been brought twice into the world, according to the fable of Semele and Jupiter, or by reason of his having triumphed twice, from δις, twice, and θριαμβος, triumph. Be this as it will, the ancients, we are told by Aristotle and Horace, gave the appellation dithyrambus to those verses wherein none of the common rules or measures were observed; much like those called by the French *vers libres*, by the Italians *versi sciolti*, and by the modern Greeks *politici*, a name they give to prose, which these verses resemble more than poetry.

DITONE, DITONUM, in music, an interval comprehending two tones, a greater and a less. (See INTERVAL and TONE.) The word is formed of δις, twice, and τονος, tone. The ratio of the sounds that form the ditone is of 4 to 5; and that of the semi-ditone, of 5 to 6.

DITRIGLYPH, in architecture, the space between two triglyphs.

DITTANDER, in botany. See NASTURTIUM and DICTAMNUS.

DITTANY, in botany. See ORIGANUM.

DI'TTIED. *a.* (from *ditty.*) Sung; adapted to music (*Milton*).

DITTO, in books of accounts, often written d°. signifies the same, viz. as the preceding article.

DITTON (Humphry), an eminent mathematician, was born at Salisbury, May 29, 1675. Being an only son, and his father observing in him an extraordinary good capacity, determined to cultivate it with a good education. For this purpose he placed him in a reputable private academy; upon quitting of which he, at the desire of his father, though against his own inclination, engaged in the profession of divinity, and began to exercise his function at Tunbridge, in the county of Kent, where he continued to preach some years; during which time he married a lady of that place. But a weak constitution, and the death of his father, induced Mr. Ditton to quit that profession. And at the persuasion of Dr. Harris and Mr. Whiston, both eminent mathematicians, he engaged in the study of mathematics; a science to which he had always a strong inclination. In the prosecution of this science, he was much encouraged by the success and applause he received: being greatly esteemed by the chief professors of it, and particularly by sir Isaac Newton, by whose interest and recommendation he was elected master of the new mathematical school in Christ's hospital; where he continued till his death, which happened in 1715. Mr. Ditton published several tracts on different subjects: but is most noted for his Treatises on the New Law of Fluids, and on Perspective, his Institution of Fluxions, and his valuable Discourse on the Resurrection of Jesus Christ.

DI'TTY. *s.* (*dicht*, Dutch.) A poem to be sung; a song, generally of a pensive cast.

DIU, an island at the entrance of the gulf of

Cambay, in the Deccan of Hindustan, three miles long and one broad. On it is a large fortified town of the same name, built of freestone and marble, and containing some fine churches, erected by the Portuguese. Lat. 20. 43 N. Lon. 69. 52 E.

DIVALIA, a feast held among the ancient Romans, on the twenty-first of December, in honour of the goddess Voluptia, or Angerona. It is sometimes called Angeronalia.

DIVAN, a council-chamber, or court, wherein justice is administered, in the eastern nations, particularly among the Turks. Divan is an Arabic word, signifying the same with sopha in the Turkish dialect. There are two sorts of divans, that of the grand signior, called the council of state, which consists of seven of the principal officers of the empire; and that of the grand vizir, composed of six other vizirs, or counsellors of state, the chancellor, and secretaries of state, for the distribution of justice.

Divan-beghi, the superintendant of justice in Persia, whose place is the last of the six ministers of the second rank, who are all under the athemadauler or first minister.

To DIVA'RICATE. *v. n.* (*divaricatus*, Lat.) To be parted into two; to become bifid (*Woodward*).

To Diva'ricate. *v. a.* To divide into two (*Grew*).

DIVARICA'TION. *s.* (*divaricatio*, Latin.) 1. Partition into two (*Ray*). 2. Division of opinions (*Brown*).

To DIVE. *v. a.* (ꝺippan, Saxon.) 1. To sink voluntarily under water (*Dryden*). 2. To go under water in search of any thing (*Raleigh*). 3. To go deep into any question, doctrine, or science (*Blackmore*). 4. To immerge into any business or condition (*Shakspeare*). 5. To depart from observation; to sink (*Shakspeare*).

To Dive. *v. a.* To explore by diving (*Denham*).

To DIVE'LL. *v. a.* (*divello*, Lat.) To pull; to separate; to sever (*Brown*).

DI'VER. *s.* (from *dive.*) 1. One that sinks voluntarily under water (*Pope*). 2. One that goes under water in search of treasure (*Woodward*). 3. He that enters deep into knowledge or study (*Wotton*).

Diver, in ornithology. See Colymbus.

To DIVE'RGE. *v. n.* (*divergo*, Latin.) To tend various ways from one point (*Newton*).

DIVE'RGENT. *a.* (from *divergens*, Latin.) Tending to various parts from one point.

DIVERGING SERIES, in mathematics, series, the terms of which grow larger and larger, the farther they are continued.

DI'VERS. *a.* (*diversus*, Lat.) Several; sundry; more than one: out of use (*Whitgift*).

DIVE'RSE. *a.* (*diversus*, Latin.) 1. Different from another (*Daniel*). 2. Different from itself; multiform (*Ben Jonson*). 3. In different directions (*Pope*).

DIVERSIFICA'TION. *s.* (from *diversify.*) 1. The act of changing forms or qualities (*Boyle*). 2. Variation; variegation. 3. Variety of forms; multiformity. 4. Change; alteration (*Hale*).

To DIVE'RSIFY. *v. a.* (*diversifier*, Fr.) 1. To make different from another; to distinguish; to discriminate (*Addison*). 2. To make different from itself; to vary; to variegate (*Sidney*).

DIVERSIFYING, in rhetoric, is of infinite service to the orator; it is an accomplishment essential to his character, and may fitly be called the subject of all his tropes and figures. Vossius lays down six ways of diversifying a subject. 1. By enlarging on what was briefly mentioned before. 2. By a concise enumeration of what had been insisted on at length. 3. By adding something new to what is repeated. 4. By repeating only the principal heads of what had been said. 5. By transposing the words and periods. 6. By imitating them. Voss. Rhet. lib. v. p. 281, seq.

DIVE'RSION. *s.* (from *divert.*) 1. The act of turning any thing off from its course (*Bacon*). 2. The cause by which any thing is turned from its proper course or tendency (*Denham*). 3. Sport; something that unbends the mind by turning it off from care (*Waller*). 4. (In war.) The act or purpose of drawing the enemy off from some design, by threatening or attacking a distant part.

DIVE'RSITY. *s.* (*diversité*, Fr. *diversitas*, Lat.) 1. Difference; dissimilitude; unlikeness (*Arbuthnot*). 2. Variety (*Rogers*). 3. Distinct being; not identity (*Locke*). 4. Variegation (*Pope*).

DI'VERSLY. *ad.* (from *diverse.*) 1. In different ways; differently; variously (*Wotton*). 2. In different directions (*Pope*).

To DIVE'RT. *v. a.* (*diverto*, Lat.) 1. To turn off from any direction or course (*Locke*). 2. To draw forces to a different part (*Davies*). 3. To withdraw the mind (*Philips*). 4. To please; to exhilarate (*Swift*).

DIVE'RTER. *s.* (from the verb.) Any thing that diverts or alleviates (*Walton*).

DIVERTI'CULUM. (*diverticulum*). A mal-formation or diseased appearance of intestine, in which a portion of intestine goes out of the regular course of the tube; and thereby forms a deviation from the usual course of the alimentary canal.

Diverti'culum nuckii. The opening through which the round ligaments of the uterus pass. Nuck asserted that it remained open a long time after birth; to these openings he gave the name of diverticula.

To DIVERTI'SE. *v. a.* (*divertiser*, Fr.) To please; to exhilarate; to divert (*Dryden*).

DIVE'RTISEMENT. *s.* (*divertissement*, Fr.) Diversion; delight; pleasure (*Government of the Tongue*).

DIVE'RTIVE. *a.* (from *divert.*) Recreative; amusive; exhilarating (*Rogers*).

To DIVE'ST. *v. a.* (*devestir*, Fr.) To strip; to make naked; to denude (*Denham*).

DIVE'STURE. *s.* (from *divest.*) The act of putting off (*Boyle*).

DIVI'DABLE. *a.* (from *divide.*) Separate; different; parted: not used (*Shakspeare*).

DIVI'DANT. *a.* (from *divide.*) Different; separate: not in use (*Shakspeare*).

To **DIVI'DE.** *v. a.* (*divido*, Latin.) 1. To part one whole into different pieces (*Dryden. Locke*). 2. To separate; to keep apart, by standing as a partition between (*Dryden*). 3. To disunite by discord (*Luke*). 4. To deal out; to give in shares (*Locke*).

To **DIVI'DE.** *v. n.* 1. To part; to sunder. 2. To break friendship (*Shakspeare*).

DIVIDEND OF STOCKS, is a share or proportion of the interest of stocks erected on public funds, as the South-sea, &c. divided among, and paid to, the stock-holders half-yearly.

The amount of unclaimed dividends remaining in the hands of the Bank of England, previous to the year 1750, seldom exceeded 50,000*l.*; its increase since that period will appear from the following extract from an account laid before the House of Commons.

	£.	*s.*	*d.*
On July, 5, 1759	102,075	4	11¾
1769	227,928	6	2¼
1779	314,885	8	3¼
1789	547,366	16	6¾

In 1791, an act was passed, authorising the Bank to advance out of the unclaimed dividends in their hands 500,000*l.* for the public service; with a provision that if the sum in their hands should be reduced under 600,000*l.* the difference should be repaid them. In consequence of the publication of the names of the proprietors of the dividends then unclaimed, a considerable part of them were received, and the sum advanced to government thus became only 376,739*l.* The amount of unclaimed dividends ,has accumulated considerably, being

On April 1, 1806	£1,235,265
—- July 1	1,003,599
—- October 1	1,067,778
—- January 1, 1807	1,019,336

In consequence of this great increase, the Bank, in 1808, advanced the further sum of 500,000*l* for the public service, on condition that the balance in their hands, on this account, should never be reduced below 100,000*l.*

DIVIDEND, in the university, signifies that part or share which every one of the fellows equally divide among themselves of their yearly stipend.

DIVIDEND, in arithmetic and algebra, the number given to be divided.

DIVI'DER. *s.* (from *divide.*) 1. That which parts any thing into pieces (*Digby*). 2. A distributer; he who deals out to each his share (*Luke*). 3. A disuniter (*Swift*). 4. A particular kind of compasses.

DIVIDING INSTRUMENTS, are contrivances invented for the purpose of making with accuracy the graduations upon astronomical and mathematical instruments. A very interesting history of the various methods devised for this purpose, from the time of Dr. Hooke, down to the year 1786, is given by Mr. Smeaton, in the Phil. Transac. vol. lxxvi.; or in the New Abridgment, vol. xvi. p. 30—56.

DIVI'DUAL. *a.* (*dividuus*, Lat.) Divided; shared or participated in common with others (*Milton*).

DIVINATION, implies the knowledge of things obscure or future, which cannot be attained by any natural means. It was a received opinion among the heathens, that the gods were wont to converse familiarly with some men, whom they endowed with extraordinary powers, and admitted to the knowledge of their councils and designs. Plato, Aristotle, Plutarch, Cicero, and others, divide divination into two species, viz. natural and artificial. The former was so called, because not attained by any rules of art, but infused or inspired into the diviner, without his taking any farther care about it than to purify and prepare himself for the reception of the divine afflatus. Of this kind were all those who delivered oracles, and foretold future events by inspiration, without observing external signs or accidents. The second species of divination was called artificial, because it was not obtained by immediate inspiration, but proceeded upon certain experiments and observations arbitrarily instituted, and mostly superstitious. Of this sort there were various kinds, as by sacrifices, entrails, flame, cakes, flour, wine, water, birds, lots, verses, omens, &c.

In Holy Scripture we find mention made of nine different kinds of divination. The first performed by the inspection of planets, stars, and clouds: it is supposed to be the practisers of this whom Moses calls מעינן, *meonen*, of אנן, *anan*, cloud, Deuter. ch. xviii. v. 10. 2. Those whom the prophet calls in the same place מנחש *menachesch*, which the Vulgate and generality of interpreters render augur. 3. Those who in the same place are called מכשף, *mecascheph*, which the Septuagint and Vulgate translate, " a man given to ill practices." 4. Such authors whom Moses in the same chapter, ver. 11, calls חנבר *hhober*. 5. Those who consult the spirits called Python; or, as Moses expresses it, in the same book, אוב אשל, " those who ask questions of Python." 6. Witches or magicians, whom Moses calls ידעני, *judeoni*. 7. Those who consult the dead; necromancers. 8. The prophet Hosea, chap. iv. ver. 12, mentions such as consult staves, מקלי שאל; which kind of divination may be called rhabdomancy. 9. The last kind of divination mentioned in Scripture is hepatoscopy, or the consideration of the liver.

Divination of all kinds was necessarily made an occult science, which naturally remained in the hands of the priests and priestesses, the magi, the soothsayers, &c. Much to the honour of the eighteenth century, the pure doctrines of Christianity, and the spirit of philosophy, which become every day more diffused, equally concur in banishing these visionary opinions; though there are still a few impostors of the lowest order that practise their frauds on the ignorant and unthinking.

DIVI'NE. *a.* (*divinus*, Lat.) 1. Partaking of the nature of God (*Dryden*). 2. Proceeding from God; not natural; not human

(*Hooker*). 3. Excellent in a supreme degree (*Davies*). 4. Presageful; divining; prescient (*Milton*).

DIVI′NE. *s.* 1. A minister of the gospel; a priest; a clergyman (*Bacon*). 2. A man skilled in divinity; a theologian (*Denham*).

To DIVI′NE. *v. a.* (*divino*, Lat.) To foretel; to foreknow; to presage (*Shakspeare*).

To DIVI′NE. *v. n.* 1. To utter prognostication (*Shakspeare*). 2. To feel presages (*Shakspeare*). 3. To conjecture; to guess (*Granville*).

DIVI′NELY. *ad.* (from *divine.*) 1. By the agency or influence of God (*Bentley*). 2. Excellently; in the supreme degree (*Milton*). 3. In a manner noting a deity (*Addison*).

DIVI′NENESS. *s.* (from *divine.*) 1. Divinity; participation of the divine nature (*Grew*). 2. Excellence in the supreme degree (*Shakspeare*).

DIVI′NER. *s.* (from *to divine.*) 1. One that professes divination, or the art of revealing occult things by supernatural means (*Brown*). 2. Conjecturer; guesser (*Locke*).

DIVI′NERESS. *s.* (from *diviner.*) A prophetess; a woman professing divination (*Dryden*).

DIVING, the art or act of descending under water to considerable depths, and abiding there a competent time. The uses of diving are very considerable, particularly in the fishing for pearls, corals, spunges, &c. See PEARL-FISHING, &c.

There have been various methods proposed, and machines contrived, to render the practice of diving more safe and easy. The great point is to furnish the diver with fresh air; without which he must either make a short stay or perish. Hence, where there has been occasion to continue long at the bottom, some have contrived double flexible pipes, to circulate air down into a cavity, inclosing the diver as with armour, both to furnish air and to bear off the pressure of the water, and allow his breast to dilate upon inspiration; the fresh air being forced down one of the pipes with bellows, and returning by the other pipe.

But this method is impracticable when the depth surpasses three fathoms; the water embracing the bare limbs so closely as to obstruct the circulation of the blood in them; and also pressing so strongly on all the junctures where the armour is made tight with leather, that, if there be the least defect in any of them, the water rushes in, and instantly fills the whole engine, to the great danger of the diver's life.

It is said to be a fact, that people, by being accustomed to the water from their infancy, will at length be enabled, not only to stay much longer under water than could be supposed, but put on a kind of amphibious nature, so that they seem to have the use of all their faculties as well when their bodies are immersed in water as when they are on dry land. Most savage nations are remarkable for this. According to the accounts of our late voyagers, the inhabitants of the South sea islands are such expert divers, that when a nail or any piece of iron was thrown overboard, they would instantly jump into the sea after it, and never failed to recover it, notwithstanding the quick descent of the metal. Even among civilized nations, many persons have been found capable of continuing an incredible length of time under water. The most remarkable instance of this kind is the famous Sicilian diver Nicolo Pesce, who, according to the marvellous account given by Kircher, had from his infancy been so used to the sea, that at last it became his almost natural element. It is said, he was frequently known to spend five days in the midst of the waves, without any other provisions than the fish which he caught there and ate raw. He often swam over from Sicily into Calabria, a tempestuous and dangerous passage, carrying letters from the king; and as frequently swam among the gulphs of the Lipari islands, no way apprehensive of danger. "In order (says Kircher) to aid these powers of enduring in the deep, nature seemed to have assisted him in a very extraordinary manner: for the spaces between his fingers and toes were webbed, as in a goose; and his chest became so very capacious, that he could take in, at one inspiration, as much breath as would serve him for a whole day." At length, however, we are told, this extraordinary person met his fate in exploring the depths of Charybdis, at the instance of the king; who, after he had once succeeded in fetching up a golden cup that had been thrown in, ordered him to repeat the experiment.

The following description of a diving-machine, invented by Mr. Bushnell, of Connecticut, is given in the Transactions of the American Philosophical Society.

The external shape of the sub-marine vessel bore some resemblance to two upper tortoise-shells of equal size, joined together; the place of entrance into the vessel being represented by the opening made by the swell of the shells, at the head of the animal. The inside was capable of containing the operator, and air sufficient to support him thirty minutes without receiving fresh air. At the bottom, opposite to the entrance, was fixed a quantity of lead for ballast. At one edge, which was directly before the operator, who sat upright, was an oar for rowing forward or backward. At the other edge was a rudder for steering. An aperture, at the bottom, with its valve, was designed to admit water, for the purpose of descending; and two brass forcing-pumps served to eject the water within, when necessary for ascending. At the top there was likewise an oar for ascending or descending, or continuing at any particular depth. A water-gauge, or barometer, determined the depth of descent, a compass directed the course, and a ventilator within supplied the vessel with fresh air, when on the surface.

The entrance into the vessel was elliptical, and so small as barely to admit a person. This entrance was surrounded with a broad elliptical iron band, the lower edge of which was let into the wood of which the body of the vessel was made, in such a manner as to give its utmost support to the body of the vessel against the pressure of the water. Above the upper edge of this iron band there was a brass crown, or cover, resembling a hat with its crown and brim, which shut water-tight upon the iron band: the crown was hung to the iron band with hinges, so as to turn over sideways when opened. To make it perfectly secure when shut, it might be screwed down upon the band by the operator, or by a person without.

There were in the brass crown three round doors, one directly in front, and one on each side, large enough to put the hand through. When open they admitted fresh air; their shutters were ground perfectly tight into their places with emery, hung with hinges, and secured in their places when shut. There were likewise several small glass windows in the crown for looking through, and for admitting light in the day-time, with covers to secure them. There were two air-pipes in the crown. A ventilator within drew fresh air through one of the air-pipes, and discharged it into the lower part of the vessel; the fresh air introduced by the ventilator expelled the impure light air through the other air-pipe. Both air-pipes were so constructed, that they shut themselves whenever the water rose near their tops, so that no water could enter through them, and opened themselves immediately after they rose above the water.

The vessel was chiefly filled with lead fixed to its bottom; when this was sufficient, a quantity was placed within, more or less, according to the weight of the operator; its ballast made it so stiff, that there was no danger of oversetting. The vessel with all its appendages, and the operator, was sufficient to settle it very low in the water. About two hundred pounds of the lead, at the bottom for ballast, would be let down forty or fifty feet below the vessel; this enabled the operator to rise instantly to the surface of the water, in case of accident.

When the operator would descend, he placed his foot on the top of a brass valve, depressing it, by which he opened a large aperture in the bottom of the vessel, through which the water entered at his pleasure; when he had admitted a sufficient quantity, he descended very gradually; if he admitted too much, he ejected as much as was necessary to obtain an equilibrium, by the two brass forcing pumps, which were placed at each hand. Whenever the vessel leaked, or he would ascend to the surface, he also made use of these forcing pumps. When the skilful operator had obtained an equilibrium, he could row upward, or downward, or continue at any particular depth, with an oar, placed near the top of the vessel, formed upon the principle of the screw, the axis of the oar entering the vessel; by turning the oar one way he raised the vessel, by turning it the other way he depressed it.

A glass tube eighteen inches long, and one inch in diameter, standing upright, its upper end closed, and its lower end, which was open, screwed into a brass pipe, through which the external water had a passage into the glass tube, served as a water-gauge or barometer. There was a piece of cork, with phosphorus on it, put into the water-gauge. When the vessel descended the water rose in the water-gauge, condensing the air within, and bearing the cork, with its phosphorus, on its surface. By the light of the phosphorus, the ascent of the water in the gauge was rendered visible, and the depth of the vessel under water ascertained by a graduated line.

An oar, formed upon the principle of the screw, was fixed in the fore part of the vessel; its axis entered the vessel, and being turned one way, rowed the vessel forward, but being turned the other way rowed it backward; it was made to be turned by the hand or foot.

A rudder, hung to the hinder part of the vessel, commanded it with the greatest ease. The rudder was made very elastic, and might be used for rowing forward. Its tiller was within the vessel, at the operator's right hand, fixed, at a right angle, on an iron rod, which passed through the side of the vessel; the rod had a crank on its outside end, which commanded the rudder, by means of a rod extending from the end of the crank to a kind of tiller, fixed upon the left hand of the rudder. Raising and depressing the first-mentioned tiller, turned the rudder as the case required.

A compass marked with phosphorus directed the course, both above and under the water; and a line and lead sounded the depth when necessary.

The internal shape of the vessel, in every possible section of it, verged towards an ellipsis, as near as the design would allow, but every horizontal section, although elliptical, yet as near to a circle as could be admitted. The body of the vessel was made exceedingly strong; and to strengthen it as much as possible, a firm piece of wood was framed, parallel to the conjugate diameter, to prevent the sides from yielding to the great pressure of the incumbent water, in a deep immersion. This piece of wood was also a seat for the operator.

Every opening was well secured. The pumps had two sets of valves. The aperture at the bottom, for admitting water, was covered with a plate, perforated full of holes to receive the water, and prevent any thing from choaking the passage, or stopping the valve from shutting. The brass valve might likewise be forced into its place with a screw, if necessary. The air-pipes had a kind of hollow sphere, fixed round the top of each, to secure the air-pipe valves from injury: these hollow spheres were perforated full of holes, for the passage of the air through the pipes: within the air-pipes were shutters to secure them, should any accident happen to the pipes, or the valves on their tops.

Wherever the external apparatus passed through the body of the vessel, the joints were round, and formed by brass pipes, which were driven into the wood of the vessel, the holes through the pipes were very exactly made, and the iron rods, which passed through them, were turned in a lathe to fit them; the joints were also kept full of oil, to prevent rust and leaking. Particular attention was given to bring every part, necessary for performing the operations, both within and without the vessel, before the operator, and as conveniently as could be devised; so that every thing might be found in the dark, except the water-gauge and the compass, which were visible by the light of the phosphorus, and nothing required the operator to turn to the right hand, or to the left, to perform any thing necessary.

The inventor next pursues the subject under the following heads:

1. Description of a magazine, and its appendages, designed to be conveyed by the sub-marine vessel to the bottom of a ship.—In the fore part of the brim of the crown of the sub-marine vessel was a socket, and an iron tube, passing through the socket; the tube stood upright, and could slide up and down in the socket, six inches: at the top of the tube was a wood-screw, fixed by means of a rod, which passed through the tube, and screwed the wood-screw fast upon the top of the tube: by pushing the wood-screw up against the bottom of a ship, and turning it at the same time, it would enter the planks; driving would also answer the same purpose: when the wood-screw was firmly fixed, it could be cast off by unscrewing the rod, which fastened it upon the top of the tube.

Behind the sub-marine vessel was a place, above the rudder, for carrying a large powder magazine;

this was made of two pieces of oak timber, large enough, when hollowed out, to contain 150 pounds of powder, with the apparatus used in firing it, and was secured in its place by a screw, turned by the operator. A stronger piece of rope extended from the magazine to the wood-screw above-mentioned, and was fastened to both. When the wood-screw was fixed, and to be cast off from its tube, the magazine was to be cast off likewise by unscrewing it, leaving it hanging to the wood-screw; it was lighter than the water, that it might rise up against the object, to which the wood-screw and itself were fastened.

Within the magazine was an apparatus, constructed to run any proposed length of time, under twelve hours; when it had run out its time, it unpinioned a strong lock resembling a gun lock, which gave fire to the powder. This apparatus was so pinioned, that it could not possibly move, till, by casting off the magazine from the vessel, it was set in motion.

The skilful operator could swim so low on the surface of the water, as to approach very near a ship, in the night, without fear of being discovered, and might, if he chose, approach the stem or stern above water, with very little danger. He could sink very quickly, keep at any depth he pleased, and row a great distance in any direction he desired, without coming to the surface, and when he rose to the surface, he could soon obtain a fresh supply of air, when, if necessary, he might descend again, and pursue his course.

2. Experiments made to prove the nature and use of a submarine vessel.—The first experiment made was with about two ounces of gunpowder, which were exploded four feet under water, to prove to some of the first personages in Connecticut that powder would take fire under water.

The second experiment was made with two pounds of powder, inclosed in a wooden bottle, and fixed under a hogshead, with a two-inch oak plank between the hogshead and the powder; the hogshead was loaded with stones as deep as it could swim; a wooden pipe descending through the lower head of the hogshead, and through the plank, into the powder contained in the bottle, was primed with powder. A match put to the priming exploded the powder, which produced a very great effect, rending the plank into pieces; demolishing the hogshead; and casting the stones and the ruins of the hogshead, with a body of water, many feet into the air, to the astonishment of the spectators. This experiment was likewise made for the satisfaction of the gentlemen above-mentioned.

There were afterwards made many experiments of a similar nature, some of them with large quantities of powder; they all produced very violent explosions, much more than sufficient for any purpose had in view.

In the first essays with the sub-marine vessel, the inventor took care to prove its strength to sustain the great pressure of the incumbent water, when sunk deep, before he trusted any person to descend much below the surface: and he never suffered any person to go under water without having a strong piece of rigging made fast to it, until he found him well acquainted with the operations necessary for his safety. After that he made him descend, and continue at particular depths, without rising or sinking, row by the compass, approach a vessel, go under her, and fix the wood-screw mentioned before into her bottom, &c. until he thought him sufficiently expert to put any design into execution.

It required many trials to make a person of common ingenuity a skilful operator: the first employed was very ingenious, and made himself master of the business, but was taken sick in the campaign of 1776, at New York, before he had an opportunity to make use of his skill, and never recovered his health sufficiently afterwards.

3. Experiments made with a sub-marine vessel. After various attempts to find an operator to his wish, Mr. Bushnell sent one, who appeared more expert than the rest, from New York, to a fifty-gun ship, lying not far from Governor's Island. He went under the ship, and attempted to fix the wooden screw into her bottom, but struck, as he supposes, a bar of iron, which passes from the rudder hinge, and is spiked under the ship's quarter. Had he moved a few inches, which he might have done, without rowing, he would probably have found wood where he might have fixed the screw; or, if the ship were sheathed with copper, he might easily have pierced it: but not being well skilled in the management of the vessel, in attempting to move to another place, he lost the ship; after seeking her in vain, for some time, he rowed some distance, and rose to the surface of the water, but found day-light had advanced so far, that he durst not renew the attempt. The adventurer said he could easily have fastened the magazine under the stem of the ship, above water, as he rowed up to the stern, and touched it before he descended. Had he fastened it there, the explosion of 150 pounds of powder (the quantity contained in the magazine) must have been fatal to the ship. In his return from the ship to New York, he passed near Governor's Island, and thought he was discovered by the enemy on the island; being in haste to avoid the danger he feared, he cast off the magazine, as he imagined it retarded him in the swell, which was very considerable. After the magazine had been cast off one hour, the time the internal apparatus was set to run, it blew up with great violence.

Afterwards, there were two attempts made in Hudson's river, above the city, but they effected nothing. One of them was by the afore-mentioned person. In going towards the ship, he lost sight of her, and went a great distance beyond her: when he at length found her, the tide ran so strong, that, as he descended under water, for the ship's bottom, it swept him away. Soon after this, the enemy went up the river, and pursued the boat which had the sub-marine vessel on board, and sunk it with their shot. "Though, (says Mr. Bushnell), I afterwards recovered the vessel, I found it impossible, at that time, to prosecute the design any further. I had been in a bad state of health, from the beginning of my undertaking, and was now very unwell; the situation of public affairs was such, that I despaired of obtaining the public attention, and the assistance necessary. I was unable to support myself, and the persons I must have employed, had I proceeded. Besides, I found it absolutely necessary, that the operators should acquire more skill in the management of the vessel, before I could expect success: which would have taken up some time, and made no small additional expence. I therefore gave over the pursuit for that time, and waited for a more favourable opportunity, which never arrived."

4. Other experiments made with a design to fire shipping.—In the year 1777, Mr. Bushnell made

an attempt from a whale-boat against the Cerberus frigate, then lying at anchor between Connecticut river and New London, by drawing a machine against her side, by means of a line. The machine was loaded with powder, to be exploded by a gun-lock, which was to be unpinioned by an apparatus, to be turned by being brought alongside of the frigate. This machine fell in with a schooner at anchor, astern of the frigate, and concealed from his sight. By some means or other it was fired, and demolished the schooner and three men; and blew the only one left alive overboard, who was taken up very much hurt.

After this he fixed several kegs under water, charged with powder, to explode, upon touching any thing, as they floated along with the tide: he set them afloat in the Delaware, above the English shipping at Philadelphia, in December, 1777. "I was unacquainted, (says he,) with the river, and obliged to depend upon a gentleman very imperfectly acquainted with that part of it, as I afterwards found. We went as near the shipping as he durst venture; I believe the darkness of the night greatly deceived him, as it did me. We set them adrift, to fall with the ebb, upon the shipping. Had we been within sixty rods I believe they must have fallen in with them immediately, as I designed; but, as I afterwards found, they were set adrift much too far distant, and did not arrive until after being detained some time by frost, they advanced in the day-time, in a dispersed situation, and under great disadvantages. One of them blew up a boat with several persons in it, who imprudently handled it too freely, and thus gave the British that alarm which brought on the battle of the kegs."

Diving-bell, is a machine so contrived that the diver is safely conveyed to any reasonable depth, and may stay more or less time under the water, as the bell is greater or less. It is most conveniently made in form of a truncated cone, the smallest base being closed, and the larger open. It is to be poised with lead, and so suspended, that it may sink full of air, with its open basis downward, and as near as may be in a situation parallel to the horizon, so as to close with the surface of the water all at once.

Under this covercle the diver sitting, sinks down with the included air to the depth desired; and if the cavity of the vessel can contain a ton of water, a single man may remain a full hour, without much inconvenience, at five or six fathoms deep. But the lower he goes, still the more the inclined air contracts itself, according to the weight of the water that compressed it; so that at thirty-three feet deep, the bell becomes half full of water; the pressure of the incumbent water being then equal to that of the atmosphere; and at all other depths, the space occupied by the compressed air in the upper part of its capacity, is to the space filled with water, as thirty-three feet to the depth of the surface of the water in the bell below the common surface of it. And this condensed air, being taken in with the breath, soon insinuates itself into all the cavities of the body, and has no ill effect, provided the bell be permitted to descend so slowly as to allow time for that purpose.

One inconvenience that attends it, is found in the ears, within which there are cavities which open only outwards, and that by pores so small, as not to give admission even to the air itself, unless they be dilated and distended by a considerable force. Hence, on the first descent of the bell, a pressure begins to be felt on each ear, which, by degrees, grows painful, till the force overcoming the obstacle, what constringes these pores, yields to the pressure, and letting some condensed air slip in, presently ease ensues. The bell descending lower, the pain is renewed, and afterwards it is again eased in the same manner. But the greatest inconvenience of this engine is, that the water entering it, contracts the bulk of air into so small a compass, that it soon heats, and becomes unfit for respiration: so that there is a necessity for its being drawn up to recruit it; besides the uncomfortable abiding of the diver, who is almost covered with water.

To obviate the difficulties of the diving-bell, Dr. Halley, to whom we owe the preceding account, contrived some further apparatus, by which not only to recruit and refresh the air from time to time, but also to keep the water wholly out of it at any depth.

But before we proceed to the minuter description of diving-bells, we shall speak a little of the history of such contrivances. In the works of Aristotle, we read of a kind of kettle used by divers to enable them to remain for some time under water; but the manner in which those kettles were employed is not clearly described. "The oldest information (says professor Beckmann) which we have of the use of the diving-bell in Europe, is that of John Taisnier, who was born at Hainault in 1509, had a place at court under Charles V. whom he attended on his voyage to Africa. He relates in what manner he saw at Toledo, in the presence of the emperor and several thousand spectators, two Greeks let themselves down under water, in a large inverted kettle, with a burning light, and rise up again without being wet. It appears that this art was then new to the emperor and the Spaniards, and that the Greeks were caused to make the experiment in order to prove the possibility of it."

When the English, in 1588, dispersed the Spanish fleet, called the Invincible Armada, part of the ships went to the bottom, near the isle of Mull, on the western coast of Scotland; and some of these, according to the account of the Spanish prisoners, contained great riches. This information excited, from time to time, the avarice of speculators, and gave rise to several attempts to procure part of the lost treasure. In the year 1665, a person was so fortunate as to bring up some cannon, which, however, were not sufficient to defray the expences. Of these attempts, and the kind of diving-bell used in them, the reader will find an account in a work printed at Rotterdam in 1669, and entitled *G. Sinclari Ars nova et magna gravitatis et levitatis.* In the year 1680, William Phipps, a native of America, formed a project for searching and unloading a rich Spanish ship sunk on the coast of Hispaniola; and represented his plan in such a plausible manner, that king Charles II. gave him a ship, and furnished him with every thing necessary for the undertaking. He set sail in the year 1683; but being unsuccessful, returned again in great poverty, though with a firm conviction of the possibility of his scheme. By a subscription promoted chiefly by the duke of Albemarle, the son of the celebrated Monk, Phipps was enabled, in 1687 to try his fortune once more, having previously engaged to divide the profit according to the twenty shares of which the subscription consisted. At first all his labour proved fruitless; but at last, when his patience was almost entirely exhausted, he was so lucky as to bring up, from the depth of six or seven fathoms, so much treasure that he returned to England with the value of two hundred thousand pounds sterling. Of this sum he himself got about sixteen, others say twenty thousand, and the duke ninety thousand pounds. After he came back, some persons endeavoured to persuade the king to seize both the ship and the cargo, under a pretence that Phipps, when he solicited for his majesty's permission, had not given accurate information respecting the business. But the king answered, with much greatness of mind, that he knew Phipps to be an honest man, and that he and his friends should share the whole among them had he returned with double the value. His majesty even conferred upon him the honour of knighthood, to shew how much he was satisfied with his conduct. We know not the construction of Phipps's apparatus; but of the old figures of a diving-machine, that which approaches nearest to the diving-bell is in a book on fortification by Lorini; who describes a square box bound round with iron, which is furnished with windows, and has a stool affixed to it for the diver. This ingenious contrivance appears, however, to be older than that Italian; at least he does not pretend to be the inventor of it.

In the year 1617, Francis Kessler gave a description of his water-armour, intended also for diving, but which cannot really be used for that purpose. In the year 1671, Witsen taught, in a better manner than any of his predecessors, the construction and use of the diving-bell; but he is much mistaken when he says that it was invented at Amsterdam. In 1679 appeared, for the first time, Borelli's well-known work *de motu animalium*, in which he not only described the diving-bell, but also proposed another, the impracticability of which was shewn by James Bernoulli. When Sturm published his *Collegium curiosum* in 1678, he proposed some hints for the improvement of this machine, on which remarks were made in the Journal des Sçavans. To him succeeded Dr. Halley, whose bell may be sufficiently understood from the following account. It was made of wood, containing about sixty cubic feet in its concavity, and was the form of a truncated cone, whose diameter at the top was three feet, and at the bottom five. It was so loaded with lead that it would go down in a perpendicular direction and no other. In the top was a window to let in light, and likewise a cock to let out the hot air that had been breathed; and below, about a yard under the bell, was a stage suspended by three ropes, each of which was charged with about one hundred weight to keep it steady. To supply air, the bell had a couple of barrels so cased with lead as to sink when empty, each having a bung-hole in its lowest part to let in the water as the air in them condensed on their descent, and to let it out again when they were drawn up full from below. To a hole in the uppermost part of these was fixed a leathern trunk or hose, long enough to fall below the bung-hole, and kept down by a weight in such a way that the air in the upper part of the barrels could not escape, unless the lower ends of these hose were first lifted up. These air barrels were made to rise and fall like two buckets in a well; by means of these barrels fresh air was continually supplied from above, and it was done with so much ease, that two men with less than half their strength could perform all the labour required. By an additional contrivance it was found practicable for a diver to go out of the engine, to some distance from it, the air being conveyed to him in a continual stream by small flexible pipes.

A great improvement in the diving-bell was made by the late Mr. Spalding, of Edinburgh. This construction seems designed to remedy some inconveniences of Dr. Halley's, which are very evident, and of a very dangerous tendency. These are, 1. By Dr. Halley's construction, the sinking or raising of the bell depends entirely on the people who are at the surface of the water; and as the bell even when in the water has a very considerable weight, the raising it not only requires a great deal of labour, but there is a possibility of the rope breaking by which it is raised, and thus every person in the bell would inevitably perish. 2. As there are, in many parts of the sea, rocks which lie at a considerable depth, the figure of which cannot possibly be perceived from above, there is danger that some of their ragged prominences may catch hold of one of the edges of the bell in its descent, and thus overset it before any signal can be given to those above, which would infallibly be attended with the destruction of the people in the bell; and as it must always be unknown, before trial, what kind of a bottom the sea has in any place, it is plain, that without some contrivance to obviate this last danger, the descent in Dr. Halley's diving-bell is not at all eligible.

How these inconveniences are remedied by Mr. Spalding's new contrivance, will be easily understood from the following description. A B C D, Pl. 58, fig. 1. represents a section of the bell, which is made of wood; *e*, *e*, are iron hooks, by means of which it is suspended by ropes QBF *e*, and QAE *e*, and QS, as expressed in the figure: *c*, *c*, are iron hooks, to which are appended leaden weights, that keep the mouth of the bell always parallel to the surface of the water, whether the machine taken altogether is lighter or heavier than an equal bulk of water. By these weights alone, however, the bell would not sink: another is therefore added, represented at L, and which can be raised or lowered at pleasure, by means of a rope passing over the pulley *a*, and fastened to one of the sides of the bell at M. As the bell descends, this weight, called by Mr. Spalding the balance-weight, hangs down a considerable way below the mouth of the bell. In case the edge of the bell is caught by any obstacle, the balance-weight is immediately lowered down so that it may rest upon the bottom. By this means the bell is lightened, so that all danger of oversetting is removed; for being lighter, without the balance-weight, than an equal bulk of water, it is evident that the bell will rise, as far as the length of the rope affixed to the balance-weight will allow it. This weight, therefore, will serve as a kind of anchor to keep the bell at any particular depth which the divers may think necessary; or by pulling it quite up the descent may be continued to the very bottom.

By another very ingenious contrivance, Mr. Spalding rendered it possible for the divers to raise the bell, with all the weights appended to it, even to the surface, or to stop at any particular depth, as they think proper; and thus they could still be safe, even though the rope designed for pulling up the bell was broken. For this purpose the bell is divided into two cavities, both of which are made as tight as possible. Just above the second bottom EF, are small slits in the sides of the bell, through which the water, entering as the

bell descends, displaces the air originally contained in its cavity, which flies out at the upper orifice of the cock GH. When this is done, the divers turn the handle G, which stops the cock; so that if any more air was to get into the cavity AEFB, it could no longer be discharged through the orifice H as before. When this cavity is full of water the bell sinks; but when a considerable quantity of air is admitted it rises. If therefore the divers have a mind to raise themselves, they turn the small cock G, by which a communication is made between the upper and under cavities of the bell. The consequence of this is, that a quantity of air immediately enters the upper cavity, forces out a quantity of the water contained in it, and thus renders the bell lighter by the whole weight of the water which is displaced. Thus, if a certain quantity of air is admitted into the upper cavity the bell will descend very slowly; if a greater quantity, it will neither ascend nor descend, but remain stationary; and if a larger quantity of air be still admitted it will rise to the top. It is to be observed, however, that the air which is thus let out into the upper cavity must be immediately replaced from the air-barrel; and the air is to be let out very slowly, or the bell will rise to the top with so great velocity that the divers will be in danger of being shaken out of their seats. But by following these directions every possible accident may be prevented, and people may descend to very great depths without the least apprehension of danger. The bell also becomes so easily manageable in the water, that it may be conducted from one place to another by a small boat with the greatest ease, and with perfect safety to those who are in it.

Instead of wooden seats used by Dr. Halley, Mr. Spalding made use of ropes suspended by hooks *bbb*; and on these ropes the divers may sit without any inconvenience. There are two windows made of thick strong glass, for admitting light to the divers. N represents an air-cask with its tackle, and OCP the flexible pipe through which the air is admitted to the bell. In the ascent and descent of this cask the pipe is kept down by a small appended weight, as in Dr. Halley's machine. R is a small cock by which the hot air is discharged as often as it becomes troublesome. Annexed is a representation of the whole diving apparatus, which, no doubt, will be readily understood without any further explanation. Two air-barrels are represented in this figure; but Mr. Spalding was of opinion that one, capable of containing thirty gallons, is sufficient for an ordinary machine.

Mr. Adam Walker recommends, for the purposes of diving, a conical tub of wood three feet diameter at the bottom, two and a half feet at the top, and three feet high, so loaded with lead at the bottom as just to sink itself, with a small seat for the diver. (See Plate 58, fig. 3.) A bent metal tube is attached to the outside of the bell, as *abc*, with a stop-cock *a*, and a flexible leathern tube to the other end at *c*; this tube terminates in a forcing air-pump fastened to the side of a ship; *d* is a solid piston acted upon by a lever *e*; upon the piston being drawn up the air rushes in at the valve *g*, and fills the space *n*; in its descent the valve g shuts, and the conical valve *o* opens, and thus the air is forced down the hose into the bell. The pump is kept working, while the diver, by opening and shutting the stop-cock, is abundantly supplied with fresh air, and that which is vitiated is forced out at the bottom of the bell. By a machine of this kind, the greatest part of the wreck was saved from the rich ship Belgiosa.

Mr. Smeaton's diving-bell was a square chest of cast-iron, four and a half feet in height, four and a half feet in length, and three feet wide, and afforded room for two men to work in it. It was supplied with fresh air by a forcing-pump. This was used with great success at Ramsgate.

Several other machines have been contrived to answer the purposes of the diving-bell; one of which, fig. 4, was invented in 1753, by —— Rowe, esq. and published in the Universal Magazine.

The engine is a trunk, or hollow vessel, of copper or brass, of sufficient strength to resist the pressures of deep waters, and dimensions to contain the body of a man, supposed to enter therein feet foremost at *t*, bent at the bearing of his knees, at *l*, for the more convenient going between rocks and great stones; at *k*, and on the other side, are holes for his arms to pass through, and a glass for his sight at *n*. *h* represents a sleeve made of soft leather, lined with fine cloth, exactly to fit the diver, and fastened to the body of the engine at *k*, where the arms come through; which is likewise defended by a soft quilting, to prevent the arms from being hurt by pressure, and the sleeves from being thrust into the engine; *dd* represents a cover to fit the head of the engine, fastened down with screws, and leather between the borders, so as to prevent leaking in any depth of water; *ab* represents a plate of lead, to be fastened before the engine, in a straight line, passing between the arms, not only as a proper weight to sink the engine, but as a balance thereto; whereby the diver will always be kept in a proper posture for working, and the more so by means of a block, or cradle, supposed to be fastened over the lead, by which means the diver has not only the power of handling what is at the bottom, but may at any time rest his arms from work; *g* is the engine rope by which it is let down and hauled up again from the bottom; *zyu* is called the life-line, with a knot at *y*, so as the handle at *z* may always remain at a due distance for the diver to take hold thereof, in order to give any notice to the persons above, as, by agreement, by giving a certain number of pulls, or sudden twitches, which is immediately felt by the person that holds the line. The diver can tarry under water at least half an hour at one time, without the help of pipes, or any other air than what the engine contains. At *i* and *w* are two brass screw caps, or plugs, both which are to be opened as soon as the diver gets from the bottom to the water's surface, in order to give him fresh air by help of a pair of bellows blowing at the latter; at which, when the engine leaks, we likewise pump out the water. In deep water the diver is forced to make use of a saddle on his back, with a ridge touching the upper part of the engine, whereby he can keep his arms at a due distance out of the engine, which otherwise would be thrust in by the column of water pressing thereon.

The apparatus contrived by Mr. Tonkin to raise property from the Abergavenny East-India ship, has been described in the Monthly Magazine, as below.

The machine itself is expressed in the engraving, Pl. 58. by the figure 2, and consists of a body of copper with iron boots and joints, as in coats of mail. The whole is then covered with leather, and afterwards with canvas painted white, to distinguish it in the water. The arms are made of strong, water-proof leather, and the place for sight is about eight inches diameter, and glazed with glass an inch thick. The diver, Mr. Braithwaite, is sunk in this machine by means of weights fastened equatorially round the waist of the machine, and he is suspended by the rope, 3, by means of which his situation is changed at pleasure.

4. is an air tube communicating with the vessel above, by means of which the diver gives his instructions, and obtains his supply of air.

1. represents the hull of the Abergavenny, as she lies in ten fathoms water, near the Isle of Portland.

5. represents the men who communicate with the diver, and act under his instructions.

6. represents the men raising a box from the wreck by means of forceps.

7. the power of which increases with the weight which is to be raised.

8. represents men on a raft sawing the decks, and making way for the operations of the diver; and 9. is the saw.

DIVI'NITY. *s.* (*divinité*, French; *divinitas*, Latin.) 1. Participation of the nature and excellence of God; deity; godhead (*Stillingfleet*). 2. God; the Deity; the supreme Being; the Cause of causes. 3. False god (*Prior*). 4. Celestial being (*Cheyne*). 5. The science of divine things; theology (*Shakspeare*). 6. Something supernatural (*Shakspeare*).

DIVI'SIBLE. *a.* (*divisibilis*, Latin.) Capable of being divided into parts, separable (*Bent.*).

DIVISIBI'LITY. *s.* (*divisibilité*, French.) The quality of admitting division or separation of parts (*Glanville*).

The word divisibility, restrained to its simple signification, presents no idea that is not perfectly known, since all bodies have parts which are readily conceived to be separable, the one from the other. But is matter itself really divisible to infinity, so that its division does not admit of any possible limits? or rather, is it constituted, in the ultimate result, of indivisible molecules that must be regarded as simple? Here springs a new source of interminable discussions between the partisans of the two opinions, wherein the human mind has exercised all its subtilty to find arguments in favour of each, and to oppose difficulties to the other: What are called mathematical demonstrations of the *infinite* divisibility of matter, fail in their object; they merely prove the infinite divisibility of extension, in a geometrical sense. Thus, after having disputed much, and written much, all on the subject of an atom, it is not at all advanced; and indeed the solution of the question itself would not give one step to the progress of science. Let us then banish from natural philosophy all questions so unfruitful, as they respect the progress of our knowledge. Instead of enquiring whether bodies admit of infinite division, we would analyse them, as far as is consistent with our own powers; and would deduce from the analyses such knowledge as will diffuse light over facts previously regarded as inexplicable. It has been wisely remarked, that the bounds of experience and of observation are, in relation to us, those of nature itself.

It is, however, certain with respect to the division of bodies, that in the result parts are separable the one from the other, the minuteness of which surpasses the imagination. In proof of this, we may first mention colouring substances, and particularly carmine, which is a kind of powder obtained from the insect, commonly called cochineal. Dilute a small quantity of this powder, to the weight of about $\frac{1}{4}$ of a grain, by putting it at the bottom of a vessel, in which is afterward poured nearly 30 pounds of water: the colour will be so diffused as to be perceptible throughout the whole volume of the water. The weight of this water being three hundred thousand times greater than that of five centigrammes of carmine, if it be supposed that each centigramme of the fluid mixture contains only two moleculæ of the colouring principle, there will be three millions of visible parts in five centigrammes of carmine.

The impressions made upon the sense of smelling are not less proper than those which affect the sight, in assisting to judge of the extreme divisibility of which matter is susceptible. There are bodies whose weight is scarcely sensibly altered after a long interval of time, during which, all those who are found within a certain distance incessantly experience the action of the odoriferous particles emanated from the substance of these bodies.

There is taken from a bag, contained in the bodies of certain animals, a substance, to which has been given the name of musk, and of which a single grain will send forth a strong odour, during a certain number of years, in an apartment into which fresh air is frequently admitted. The simple friction of a paper, in which a small portion of the same substance has been wrapped, will suffice to make a habit impart a fragrant smell for several days.

Some operations in the arts will furnish a much more just idea of the same property, because their results are susceptible of being reduced to calculation. According to the observations of Boyle, the weight of a grain of gold, or about 53 milligrammes, reduced to leaves, will cover a surface of 50 square inches; each of which will, of consequence, measure nearly 27 millimetres across; but we may conceive the millimetre (about $\frac{1}{25}$ of an inch) divided into eight visible parts; this will give 46656 little visible squares in a square leaf of gold, each side of which measured 27 millimetres; and, as the number of these leaves is 50, we may conclude that a small mass of gold, weighing only a grain, may be divided into more than two millions of parts, each perceptible to the simple sight; but, by means of a microscope, each of these parts would become as it were a leaf of gold, where the eye and the computation would still find subjects for their exercise.

This division proceeds much farther still, in the labour of wire-drawing gold. Take a certain quantity of leaf gold, in weight not exceeding three decigrammes, or about an ounce, and cover with it a cylinder of silver. Cause this covered cylinder to pass successively through several holes in a wire-drawing iron; and, when it is reduced to a thread as delicate as a hair, it will be covered on all its points by an extremely thin coat of gold; then let the wire be flattened between two steel rollers. In this state it will form a plate, in length nearly equal to 111 leagues, each of 2000 toises. But this plate being clothed with a covering of gold on each of its faces, may be considered as two plates of gold of an extreme tenuity, and placed mentally one at the end of the other. Moreover, the breadth of the lamina being about $\frac{1}{8}$ of a line, we may suppose this breadth divided into two, and thus the quantity of gold employed is equivalent to four plates, the length of each of which is about 444000 metres. Now if it be imagined, that each of the millimetres comprised in this length is divided into eight parts, we shall have more than 14 billions of visible parts, in a mass of gold weighing only an ounce, and which is equivalent to a cube of gold whose side is not more than 12 millimetres, or $5\frac{1}{3}$ lines in length.

This prodigious extension of which gold is susceptible depends upon its ductility, combined with its great density; two qualities equally precious for those arts whose object is to apply this metal upon the surface of wood, copper, and other substances, where it serves at once both for security and for ornament.

We shall add another example, drawn from the stony substance known by the name of *mica*, and which yields, with great facility, to the operation called *mechanical division*. We have succeeded in detaching, from the original piece, a plate, which instead of the yellowish colour natural to the stone, reflected a fine blue, which, as we shall explain when treating of light, indicated an extreme degree of tenuity. Having calculated the thickness of this plate, after a rule marked out by Newton, and which we shall then also make known, we found it equal to 43-millionths of a millimetre, or about 1·6-millionth of an inch; hence it follows, that we might obtain 23255 isolated plates, by dividing a piece of mica of the thickness of a millimetre, or $\frac{4}{9}$ of a line.

We cannot better terminate this article than by exhibiting a very judicious notion derived by Newton from the system of Epicurus, relative to the limits prescribed to the division of bodies in the actual state of things. This great philosopher conceives that the Supreme Being, in creating matter, formed it of various species of elementary molecules, solid, hard, unchangeable, the figures and the different qualities of which were appropriated to the respective ends they were proposed to answer. But such is the fixity of these molecules, that no process of art, nor even any force existing in nature, can either divide or alter them, unless the essence of the body should be changed with time. Thus all the modifications experienced by bodies depend solely upon this, that these durable molecules separate the one from the other, and then become re-united, in various ways forming new combinations. These different molecules are, hence, the simple substances of chemistry; and the results of the operations which they would present singly, should be the design of the efforts of this science; in the mean time we may consider as simple the substances which we have not yet been able to decompose, and wisely imagine simplicity to reside at the place where observation stops. The curious reader may consult farther, Good's translation and notes on Lucretius, Book II., Watts's Remnants of Time improved, sect. 13., and Keill, Introduct. ad Ver. Phys. Lect. 3, 4, and 5

DIVI'SIBLENESS. *s.* Divisibility.

DIVI'SION. *s.* (*divisio*, Latin.) 1. The act of dividing any thing into parts. 2. The state of being divided (*Esdras*). 3. That by which any thing is kept apart; partition. 4. The part which is separated from the rest by dividing (*Addison*). 5. Disunion; discord; difference (*Decay of Piety*). 6. One of the parts into which a discourse is distributed (*Locke*). 7. Space between the notes of music; just time (*Shakspeare*). 8. Distinction (*Exodus*). 9. Subdivision; distinction of the genera into species (*Shakspeare*).

DIVISION, in arithmetic, the separating or parting of any number or quantity given, into any parts assigned. Division may be considered under four different senses; 1. By it we find, how often one number is contained in another. 2. What part of the dividend the divisor is equal to. 3. What number or quantity is contained as often in the dividend as unity is in the divisor. And 4. What number is such a part of the dividend as the divisor denominates. Under one or other of these senses, division is always understood in arithmetic and algebra. For modes of operation, see the treatises on ARITHMETIC and ALGEBRA, in the first vol. of this work.

DIVISION OF REPETENDS, may be readily performed by these rules. 1. If the repetends in the divisor and dividend are both similar and conterminous, and have no terminate parts, divide them as finite decimals. 2. If they are not similar, make them to begin and end together; then, if there are any terminate parts in the divisor or dividend, or both, subtract them, and the remainders will be a new divisor and dividend, which divide as finite numbers.

Ex. Divide $27{\cdot}9\dot{6}372\dot{3}$ by $35{\cdot}6$

Divisor $35{\cdot}6\dot{0}000\dot{0}$ made similar

From	$35{\cdot}6\dot{0}000\dot{0}$	$27{\cdot}9\dot{6}372\dot{3}$	
Sub. ter. part	356	269	
New div.	$35{\cdot}599644$	$27{\cdot}963444$	$\cdot\dot{7}854\dot{9}$ Quo.
Rem. same as div.		27963444	

DIVISION OF POWERS, is performed by subtracting their exponents. Thus, $a^6 \div a^4$ is $= a^2$; and $4a^{\frac{3}{4}}b^2 \div 2a^{\frac{1}{2}}b^{\frac{4}{3}}$ is $= 2a^{\frac{1}{4}}b^{\frac{2}{3}}$.

DIVISION BY LOGARITHMS. See LOGARITHMS.

DIVISION OF ALGEBRAIC FRACTIONS. See FRACTIONS.

DIVISION OF MATHEMATICAL INSTRUMENTS. See GRADUATION.

DIVISION OF SURDS. See SURDS.

DIVISION OF CONCORDS. See CONCORDS.

Division of proportion. See Proportion.

Divisions of an army, in the military art, the several brigades and squadrons into which it is cantoned.

Divisions of a battalion, are the several platoons into which it is divided in marching or firing, each of which is commanded by an officer.

Division, in sea affairs, a select number of ships in a fleet or squadron of men of war, distinguished by a particular flag or pendant, and usually commanded by a general officer. A squadron is commonly ranged into three divisions, the commanding officer of which is always stationed in the centre.

DIVISOR, in arithmetic and algebra, is the dividing number, or that which shews how many parts the dividend is divided into.

Divisor (Common). See Common Measure.

Divisors (Method of), a method first used by sir Isaac Newton, to discover the roots of equations. This method is founded upon the principle that the last term of an equation is the product of all the roots with their signs changed: so that if any root be a whole number it may be found among the divisors of the last term. The number of trials may, according to this method, be lessened by substituting three or more terms of the arithmetical progression 2, 1, 0, — 1, 2, &c. for the unknown quantity, and forming the divisors of the results, taken in order, into arithmetical progressions, in which the common difference is unity; as it will only be necessary to try those divisors of the last term of the equations which are terms in these progressions.

Ex. Let $x^4+x^3-29x^2-9x+180=0$, be the equation proposed. Then substituting successively the terms of the progression, 2, 1, 0, —1, &c. instead of x, the work will stand as follows:

1st Pro.	Results	Divisors.	Progressions.			
2	70	1 . 2 . 5 . 7 . 10 . 14. &c.	1	2	5	7
1	144	1 . 2 . 3 . 4 . 6 . 8. &c.	3	3	4	6
0	180	1 . 2 . 3 . 4 . 5 . 6. &c.		4	3	5
—1	160	1 . 2 . 4 . 5 . 8 . 10. &c.	4	5	2	4
—2	90	1 . 2 . 3 . 5 . 6 . 9. &c.	5	6	1	3

Here are four progressions, of which we take the terms standing in the same line with the 0, and placing the negative sign before such as are taken from decreasing progressions, we have 3, 4, — 3, & — 5, each of which being substituted for x, makes the whole equation vanish: these, therefore, are the roots sought. More examples may be seen in Newton's, Maclaurin's, Bonnycastle's and Wood's Algebra.

DIVORCE, a breach or dissolution of the bond of marriage. (See Marriage and Law.) Divorce is of two kinds: the one, *a vinculo matrimonii*, which alone is properly *divorce*; the other, *a mensa et thoro*, "a separation from bed and board." The woman divorced *a vinculo matrimonii* receives all again that she brought with her: the other has a suitable separate maintenance allowed her out of her husband's effects. The first only happens through some essential impediment, as consanguinity, or affinity within the degrees forbidden, pre-contract, impotency, adultery, &c. of which impediments the canon law allows 14. Divorce is a spiritual judgment, and therefore is passed in the spiritual court. Under the old law, the woman divorced was to have of her husband a writing, as St. Jerom and Josephus testify, to this effect: *I promise that hereafter I will lay no claim to thee*; which was called a *bill of divorce*. Divorce was allowed of in great latitude both among the Pagans and Jews. At Rome, barrenness, age, disease, madness, and banishment, were the ordinary causes of divorce.

The Roman lawyers distinguish between *repudium* and *divortium*; making the former to be the breaking of a contract of espousal, and the latter separation after matrimony. Romulus enacted a severe law, which suffered not a wife to leave her husband, but gave the man the liberty of turning off his wife, for certain causes; however, in later times, the women as well as the men might sue a divorce. The common way of divorcing was by sending a bill to the woman, containing the reasons of separation, and the tender of all her goods which she brought with her: and this was called *repudium mittere*; or else it was performed in her presence, and before seven witnesses, and accompanied with the formalities of tearing the writings, refunding the portion, taking away the keys, and turning the woman out of doors.

The Grecian laws concerning divorces were different: The Cretans allowed divorce to any man that was afraid of having too many children. The Spartans seldom divorced their wives; and it was extremely scandalous for a woman to depart from her husband. The Athenians allowed divorce on very small grounds, by a bill, containing the reason of the divorce, and approved, if the party appealed, by the chief magistrate; and women also were allowed to leave their husbands on just occasions. Persons divorcing their wives were obliged to return their portions; otherwise, the Athenian laws obliged them to pay nine oboli a month for alimony. The terms expressing the separation of men and women from each other were different; the men were said αποπεμπειν or απολυειν, to dismiss their wives; but wives απολειπειν, to leave their husbands.

"The law of Moses (says Paley), for reasons of local expediency, permitted the Jewish husband to put away his wife; but whether for every cause, or for what cause, appears to have been controverted amongst the interpreters of those times. Christ, the precepts of whose religion were calculated for more general use and observation, revokes this permission, as given to the Jews 'for their hardness of heart,' and promulges a law which was thenceforward to confine divorces to the single cause of adultery in the wife: Mat. xix. 9.

"Inferior causes may justify the separation of husband and wife, although they will not authorise such a dissolution of the marriage contract as would leave either at liberty to marry again: for it is that liberty in which the danger and mischief of divorces principally consist. The law of this country, in conformity to our Saviour's injunction, confines the dissolution of the marriage contract to the single case of adultery in the wife; and a divorce even in that case can only be brought about by the operation of an act of parliament, founded upon a previous sentence in the spiritual court, and a verdict against the adulterer at common law: which proceedings, taken together, compose as complete an investigation of the complaint as a cause can receive." It has been proposed to the legislature to annex a clause to these acts, restraining the offending party from marrying with the companion of her crime, since the crime may be committed with that view; and it is also worth considering, whether a law might not be framed, directing the fortune of the adulteress to descend as in case of her natural death; reserving, however, a certain annuity from the produce of it, for her subsistence; and also so far suspending the estate in the hands of the heir, as to preserve the inheritance to any children she might bear to a second marriage, in case there was none to succeed in the place of their mother by the first. (See Paley's Moral and Political Philosophy.) The sentences of our ecclesiastical courts, which release the parties *a vinculo matrimonii*, for impuberty, frigidity, consanguinity within the prohibited degrees, prior marriage, or want of the consent of parents or guardians, are not dissolutions of marriage, but judicial declarations that there never was any marriage; such impediment subsisting at the time as rendered the celebration of the marriage rite a mere nullity; and, indeed, the rite itself contains an exception of these impediments.

To DIVO'RCE. *v. a.* (from the noun.) 1. To separate a husband or wife from the other. 2. To force asunder; to separate by violence (*Waller*). 3. To separate from another (*Hooker*). 4. To take away; to put away (*Shakspeare*).

DIVO'RCEMENT. *s.* (from *divorce.*) Divorce; separation of marriage (*Deuteronomy*).

DIVO'RCER. *s.* (from *divorce.*) The person or cause which produces divorce or separation (*Drummond*).

DIURE'SIS. (*diuresis*, διουρησις; from δια, through, and ρεω, to flow.) An increased secretion of urine. (See DIABETES).

DIURETICS. (*diuretica, medicamenta*, διουρητικα; from διουρησι, a discharge of urine.) Medicines or substances which, when taken internally, augment the flow of urine from the kidneys. This class of medicines comprehends three orders: 1. Stimulating diuretics, as squills, colchicum, and cantharides, which are best calculated for the aged, the lax, the phlegmatic, and those with highly diminished sensibility. 2. Refrigerating diuretics, as the acetosa, acetum, kali acetatum, and cremor tartar; the constitutions in which these are chiefly preferable to others are, the young, the sanguine, and those of remarkable sensibility. 3. Diluent diuretics, as water, acidulated water, and whey, which are well adapted for constitutions whose serosity appears to be deficient, and in which there is a high degree of inanition.

DIU'RIS. In botany, a genus of the class gynandria, order dyandria. Nectary dependent; petals nine, the five outer ones very large, of two shapes; column of the fructification reversed, with a lid at the top. One species only, found wild in Andalusia; a beautiful plant, with leafy scape at the base, and racemed spathaceous flowers.

DIU'RNAL. *a.* (*diurnus*, Latin.) 1. Relating to the day (*Brown*). 2. Constituting the day (*Prior*). 3. Performed in a day; daily; quotidian (*Milton*).

DIURNAL MOTION OF A PLANET; so many degrees and minutes, &c. as any planet moves in twenty-four hours.

DIURNAL MOTION OF THE EARTH (The), is its rotation round its axis, the space whereof constitutes the natural day.

The reality of the diurnal rotation of the earth is now past all dispute.

DIURNAL is also used in speaking of what belongs to the nycthemeron, or natural day of twenty-four hours. In which sense it stands opposed to annual, menstrual, &c. The diurnal phænomena of the heavenly bodies are solved from the diurnal revolution of the earth; that is, from the revolution of the earth round its own axis in twenty-four hours. This rotation is equable, and from west to east; about an axis whose inclination to the ecliptic is nearly 66½°. That small part of the earth's surface which is at once under the view of a spectator seems like an extended plane: and the eye taking a view of the heavens all around defines a concave spherical superficies, concentric with the earth, or rather with the eye, divided by the horizontal plane into two equal parts, the one of which is visible; but the other, by reason of the earth's opacity, hid from the view. As the earth revolves about its axis, the spectator standing upon it, together with his sensible horizon, dividing the visible from the invisible hemisphere of the heavens, is carried round the same way, viz.

towards the east. Hence it is, that the sun and stars, placed towards the east, being before hid, now become visible; the horizon, as it were, sinking below them; and the stars, &c. towards the west, become invisible, the horizon being elevated above them. So that the former stars, to the spectator, who reckons the place he stands on as immoveable, will appear to ascend above the horizon, or rise; and the latter to descend below the horizon, or, to set. Since the earth, with the horizon of the spectator fixed to it, continues to move always towards the same parts, and about the same axis equally; all bodies, and all phenomena, that do not partake of the said motion, (that is, all such things as are entirely separate from the earth) will seem to move in the same time uniformly, but towards the opposite parts, or from east to west: and every one of these objects, according to sense, will describe the circumference of a circle, whose plane is perpendicular to the axis of the earth. And because all these circles, together with the visible objects describing them, appear to be in the concave spherical superficies of the heavens, every visible object will seem to describe a greater or less circle, according to its greater or less distance from the poles, or extremities of the earth's axis produced; the middle circle between these poles, called the equator, is consequently the greatest. (*Hutton's Dictionary*).

Diu'rnal. *s.* (*diurnal*, French, A journal; a day book.

DIU'RNALLY. *ad.* (from *diurnal.*) Daily; every day (*Tatler*).

DIU'RNITY. *s.* (*diuturnitas*, Latin.) Length of duration (*Brown*).

To DIVU'LGE. *v. a.* (*divulgo*, Latin.) 1. To publish; to make publick (*Hooker*). 2. To proclaim (*Milton*).

DIVU'LGER. *s.* (from *divulge.*) A publisher; one that exposes to publick view (*K. Charles*).

DIVU'LSION. *s.* (*divulsio*, Latin.) The act of plucking away (*Brown*).

DIVUS, Diva, in antiquity, appellations given to men and women who had been deified, or ranked among the gods.

DIXAN, the first town in Abyssinia, on the side of Tarauta. It is built on the top of a conical hill, having a road winding spirally up to it from the valley below. Lat. 14. 57 N. Lon. 40. 7 E.

DIXMUNDE, a town in Austrian Flanders, celebrated for its excellent butter. Lat. 51. 3 N. Lon. 2. 57 E.

To DI'ZEN. *v. a.* (from *dight*,) To dress; to deck: a low word (*Swift*).

DI'ZZARD. *s.* (from *dizzy.*) A blockhead; a fool.

DI'ZZINESS. *s.* (from *dizzy.*) Giddiness; whirl in the head (*Glanville*).

DI'ZZY. *a.* (ꝺıꞅıᵹ, Saxon.) 1. Giddy; vertiginous (*Milton*). 2. Causing a giddiness (*Shakspeare*). 3. Giddy; thoughtless (*Milton*).

To Di'zzy. *v. a.* To whirl round; to make giddy (*Shakspeare*).

DNIEPER, or Nieper, a large river of Europe, formerly called the Boristhenes; it rises in the midst of Muscovy, and after passing by Kiow, Oczakow, and other places, it falls into the Black sea between Cherson and Oczakow. Its whole course is about 100 miles.

DNIESTER (the ancient Tyras), a fine river, which rises in Galicia, in Austrian Poland, and visits Chockzim, dividing Podolia from Moldavia; it then separates Bessarabia from the Russian government of Catharinenslaf, and having watered Bender, falls into the Black sea, between the mouths of the Dnieper and the Danube.

To DO. *v. a.* Thou *dost*, he *doth* or *does*; preter. *did*; part. pass. *done.* (ꝺon, Saxon.) 1. To practise or act any thing good or bad. 2. To perform; to achieve (*Collier*). 3. To execute; to discharge (*Shakspeare*). 4. To cause: obsolete (*Spenser*). 5. To transact (*Acts*). 6. To produce any effect to another (*Swift*). 7. To have recourse to; to practise as the last effort (*Jeremiah*). 8. To perform for the benefit or hurt of another (*Samuel*). 9. To exert; to put forth (*Timothy*). 10. To manage by way of intercourse or dealing; to have business (*Rowe*). 11. To gain; to effect by influence (*Bacon*). 12. To make any thing what it is not (*Shakspeare*). 13. To finish; to end (*Duppa*). 14. To conclude; to settle (*Tillotson*). 15. To put (*Shakspeare*). 16. The phrase, *what to* do *with*, signifies how to bestow; what use to make of; what course to take; how to employ; which way to get rid of (*Tillotson*).

To Do. *v. n.* 1. To act or behave in any manner well or ill (*Temple*). 2. To make an end; to conclude (*Spectator*). 3. To cease to be concerned with; to cease to care about (*Stillingfleet*). 4. To fare; to be with regard to sickness or health (*Shakspeare*). 5. To succeed; to fulfil a purpose (*Collier*). 6. *To* Do is used for any verb, to save the repetition of the verb: as, *I shall come; but if I* do *not, go away*; that is, *if I* come *not.* 7. *Do* is a word of vehement command, or earnest request: as, *help me*, do; *make haste*, do. 8. *To* Do is put before verbs sometimes expletively: as, *I* do *love*, or, *I love*; *I* did *love*, or, *I loved.* 9. Sometimes emphatically: as, *I* do *hate him, but will not wrong him.* 10. Sometimes by way of opposition; as, *I* did *love him, but scorn him now.*

Do, in the Italian music, is a syllable used instead of *ut*, being supposed more resonant and musical.

DOBCHICK, in ornithology. See Colymbus.

DOBRZIN, a town of Poland, in Masovia, capital of a territory of the same name. Lat. 52. 54 N. Lon. 19. 5 E.

DO'CIBLE. *a.* (*docilis*, Latin.) Tractable; docile; easy to be taught (*Milton*).

DO'CIBLENESS. *s.* (from *docible.*) Teachableness; docility (*Walton*).

DO'CILE. *a.* (*docilis*, Latin.) Teachable; easily instructed; tractable (*Ellis*).

DOCI'LITY. *s.* (*docilité*, French; *docilitas*, Latin.) Aptness to be taught; readiness to learn (*Grew*).

DOCIMASIA. (from δοκιμαζω, I try). A custom among the Athenians, by which every man before he was admitted to a public employment was obliged to give an account of himself, and his past life. It was done publicly in the forum,

DOCIMASTIC ART. Ars docimastica. The art of examining fossils, in order to discover what metals, &c. they contain.

DOCIMENTUM MARMOR, a name given by the ancients to a species of marble, of a bright and clear white, much used in large and sumptuous buildings, as temples, &c.

DOCK, in botany. See RUMEX.

DOCK-CRESSES. See LAMPRANA.

DOCK, in maritime affairs, is an artificial bason, by the side of an harbour, made convenient either for the building or repairing of ships. It is of two sorts, 1. Dry-dock, where the water is kept out by great flood-gates, till the ship is built or repaired, when the gates are opened, and the water let in to float or launch her. 2. Wet-dock, a place where the ship may be hauled into, out of the tide's way, and so dock herself, or sink herself a place to lie in.

DOCK (London), &c. See LONDON.

DOCK-YARDS, are magazines of all sorts of naval stores and timber, with all the requisite machinery, &c. for ship-building, which is there carried on. The royal dock-yards in England are those at Chatham, Portsmouth, Plymouth, Woolwich, Deptford, and Sheerness. In time of peace ships of war are laid up in these docks; those of the first rates mostly at Chatham, where, and at other yards, they receive from time to time such repairs as are necessary. The principal dock-yards are governed by a commissioner, resident at the port, who superintends all the musters of the officers, artificers, and labourers, employed in the dock-yard, and ordinary. He also controls their payments; examines the accounts; contracts and draws bills on the navy-office to supply the deficiency of stores, and regulates whatever belongs to the yard, maintaining due order in the respective offices.

DOCK. *s.* 1. The stump of the tail, which remains after docking. 2. The solid part of the tail (*Grew*).

To DOCK. *v. a.* (from *dock*, a tail.) 1. To cut off a tail. 2. To cut any thing short (*Swift*). 3. To cut off a reckoning. 4. To lay the ship in a dock.

DO'CKET. *s.* A direction tied upon goods; a summary of a larger writing.

DOCKING, in the manage, the operation of amputating a horse's tail, so called from the part of the tail left to the body being denominated the dock. It is a very short and simple operation, attended with no danger, and may with yearlings be performed even with a common knife. The usual quantity taken off is of the width of a man's hand: if there be much discharge of blood a very slight cauterization with a hot iron, and a little powdered rosin, immediately stops the bleeding, and a cure takes place in a few days. It was formerly a custom to dock horses close to the quarters, under the erroneous idea of making the horse strong in the spine; such absurd practice, however, has been relinquished for some years.

DOCKUM, a town of the United Provinces, in West Friesland, at the mouth of the river Ee. Lat. 53. 18 N. Lon. 5. 41 E.

DOCTOR, a person who has passed all the degrees of a faculty, and is impowered to teach or practise the same: thus we say, doctor of divinity, doctor of physic, doctor of laws, &c. The establishment of the doctorate, as now in use among us, is ordinarily attributed to Irnerius, who himself drew up the formulary. The first ceremony of this kind was performed at Bologna, in the person of Bulgarus, who began to profess the Roman law, and on that occasion was solemnly promoted to the doctorate, i. e. installed *juris utriusque doctor*.

To pass doctor in divinity at Oxford, the candidate must have been four years bachelor of divinity. For doctor of laws, he must have been seven years in the university to commence bachelor of law; five years after which he may be admitted doctor. Otherwise, in three years after taking the degree of master of arts, he may take the degree of bachelor in law; and in four years more, that of LL.D., which same method and time are likewise required to pass the degree of doctor in physic. For the necessary time at Cambridge, see DEGREE.

DOCTOR OF THE LAW, a title of honour among the Jews. The investiture, if we may so say, of this order, was performed by putting a key and table-book in the hands; which is what some authors imagine our Saviour had in view, Luke xi. 52. when, speaking of the doctors of the law, he says, "Woe unto you doctors of the law, for you have taken away the key of knowledge: you entered not in yourselves, and them that were entering you hindered."

DOCTOR OF THE CHURCH, a title given to certain of the fathers whose doctrines and opinions have been the most generally followed and authorised. We usually reckon four doctors of the Greek church, and three of the Latin. The first are St. Athanasius, St. Basil, St. Gregory Nazianzen, and St. Chrysostom. The latter are St. Jerom, St. Augustine, and Gregory the Great.

DOCTOR IN MUSIC, a musician upon whom some university has conferred the degree of doctor in the faculty of music. At what time this degree was first instituted in England authors do not agree: Anthony Wood says, it took place as early as the reign of Henry the Second; but Spelman thinks it had no existence till the reign of king John. No name being to be found of the first professor in music to whom this title was granted, we are in want of the very circumstance which would best decide the question, and must, therefore, be satisfied with the conjecture, that its commencement must have been pretty early, since we know it to have been conferred upon Hambois, who flourished towards the beginning of the fifteenth century. It, however, clearly appears, by the qualifications formerly required of a candidate, either for a doctor's or bachelor's degree in music, that at the time of the institution of these degrees music was regarded as a science merely speculative, and that little, if any, stress was laid on skill in composition. The being able to read and expound Boethius was conceived to be a higher criterion of scientific acquisition than any specimens of invented harmony and melody; and an acquaintance with the ratio of musical intervals, and the philosophy of sound, superseded the operations of creative genius and practical theory. The present statutes, however, are formed on a broader principle, and, looking to talent and active science for the necessary qualifications, require of the candidate an exercise in eight vocal parts, with instrumental accompaniments, which he is to submit to the inspection of the music professor, and to have performed in the music-school, or some other place in the university. (*Busby*).

Doctor, is also an appellation affixed to several specific epithets, expressing the merit of some of the schoolmen: thus, Alexander Hales is called the irrefragable doctor; Thomas Aquinas, the angelic doctor; St. Bonaventure, the seraphic doctor; John Duns Scotus, the subtile doctor; Raimond Lully, the illuminated doctor; Roger Bacon, the admirable doctor, &c.

Doctor, Διδασκαλος, in the Greek church, is a particular officer, appointed to interpret part of the scriptures.

Doctor's commons. See College of civilians.

To Do'ctor. *v. a.* (from the noun.) To physic; to cure: a low word.

DO'CTORAL. *a.* (*doctoralis*, Latin.) Relating to the degree of a doctor.

DO'CTORALLY. *ad.* (from *doctoral.*) In manner of a doctor (*Hakewill*).

DO'CTORATE, or Do'ctorship. *s.* (from *doctor.*) The rank of a doctor (*Claren.*).

DOCTRI'NAL. *a.* (*doctrina*, Latin.) 1. Containing doctrine (*South*). 2. Pertaining to the act or means of teaching (*Hooker*).

DOCTRI'NALLY. *ad.* In the form of doctrine; positively (*Ray*).

DO'CTRINE. *s.* (*doctrina*, Latin.) 1. The principles or positions of any sect or master; that which is taught (*Atterbury*). 2. The art of teaching (*Mark*).

DO'CUMENT. *s.* (*documentum*, Latin.) 1. Precept; instruction; direction (*Watts*). 2. Precept, in an ill sense; a precept magisterially dogmatical (*Govern. of the Tongue*).

DODARTIA, in botany, a genus of the class didynamia, order angiospermia. Calyx five-toothed; corol with the lower lip twice as long as the upper; capsule globular, two-celled. Two species; herbaceous and creeping, with yellow flowers; native of Palestine.

DODD (Dr. William), an unfortunate English divine, eldest son of the rev. William Dodd, many years vicar of Bourne in Lincolnshire, was born May 29, 1729. He was sent, at the age of 16, to the university of Cambridge; and admitted, in the year 1745, a sizar of Clare-Hall. In 1749-50 he took the degree of B.A. with great honour, being upon that occasion in the list of wranglers. Leaving the university, he imprudently married a Miss Mary Perkins in 1751, was ordained a deacon the same year, priest in 1753, and soon became a celebrated and popular preacher. His first preferment was the lectureship of West-Ham. In 1754 he was also chosen lecturer of St. Olave's, Hart-street; and in 1757 took the degree of M.A. at Cambridge. On the establishment of the Magdalen Hospital in 1758, he was a strenuous supporter of that charity, and soon after became preacher at the chapel of it. By the patronage of bishop Squire, he in 1763 obtained a prebend of Brecon, and, by the interest of some city-friends, procured himself to be appointed one of the king's chaplains; soon after which he had the education of the present earl of Chesterfield committed to his care. In 1766 he went to Cambridge, and took the degree of LL.D. At this period, the estimation in which he was held by the world was sufficient to give him expectations of still higher preferment, and hopes of greater riches and honours, and these he might probably have acquired, had he possessed a common portion of prudence and discretion. But, impatient of his situation, and eager for advancement, he rashly fell upon means which, in the end, were the occasion of his ruin. On the living of St. George, Hanover-square, becoming vacant, he wrote an anonymous letter to the lord chancellor's lady, offering 3000 guineas if by her assistance he was promoted to it. This being traced to him, complaint was immediately made to the king, and Dr. Dodd was dismissed with disgrace from his office of chaplain. From this period he lived neglected, if not despised; and his extravagance still continuing, he became involved in difficulties, which tempted him to forge a bond from his late pupil lord Chesterfield, Feb. 4, 1777, for 4200l., which he actually received: but being detected, he was tried at the Old Bailey, found guilty, and received sentence of death; and, in spite of every application for mercy, was executed at Tyburn, June 27, 1777. Dr. Dodd was a voluminous writer, and possessed considerable abilities, but not much judgment. An accurate list of his various writings is prefixed to his Thoughts in Prison, ed. 1781.

DODDER, in botany. See Cuscuta.

DODDERED. *a.* (from *dodder.*) Overgrown with dodder.

DODDRIDGE (Philip), D.D. an eminent English divine. He descended from a very respectable family: his great grandfather's brother was sir John Doddridge, one of the judges of the court of King's Bench. The subject of this article was the son of Daniel Doddridge, an oilman in London, where he was born June 26, 1702. Having completed the study of the classics at several schools, he was in Oct. 1719, placed under the tuition of the rev. Mr. John Jennings, who kept an academy at Kibworth, in Leicestershire, and was a gentleman of great learning, piety, and usefulness. In 1722, Mr. Jennings removed, with his pupils, from Kibworth to Hinckley, where Doddridge preached his first sermon. In June 1723 he was first settled as a minister to the congregation of dissenters of the independent persuasion at Kibworth. In this obscure village he continued rather more than two years, when he removed his residence to Market Harborough; and on Mr. Jennings's death in 1729, succeeded to the care of a similar academy. On Dec. 24th the same year, Mr. Doddridge removed with his academy from Harborough to Northampton, where he was chosen minister of a large congregation. At this place he resided till about July 1751, and assiduously attended to the discharge of his duties as a minister of the gospel, while at the same time he diligently pursued his private studies, and regularly and faithfully applied to the instruction of his numerous pupils. He taught them with the freedom and tenderness of a father; and never expected or desired that they should blindly follow his sentiments, but encouraged them to judge for themselves. He checked any appearance of bigotry and uncharitableness, and endeavoured to cure them by showing what might be said in defence of those principles they disliked. In the year 1736, the university of Aberdeen conferred upon him the degree of D.D. This very excellent divine died at Lisbon, Oct. 26, 1751, whither he went for the recovery of his health: his remains were interred in the burying-ground belonging to the British factory there: a handsome monument was erected to his memory in the meeting-house at Northampton, on which is an epitaph written by Gilbert West, esq. The following is a list of the works of Dr. Doddridge. 1. The Family Expositor. 2. Letters to the Author of Christianity not founded on Argument. 3. Life of Colonel Gardner. 4. Sermons on the Education of Children. 5. Sermons to Young People. 6. The Principles of Religion, in verse, for Children. 7. Sermons on the Power and Grace of Christ, and the Evidences of his Glorious Gospel. 8. Discourses on Regeneration. 9. Rise and Progress of Religion in the Soul. 10. Sermons on Salvation by Grace; Care of the Soul; Absurdity of Persecution; Death of Children; Compassion for the Sick; Christian Warrior; Tears of Jesus over the Grave of Lazarus, &c. &c. 11. Address to the Master of a Family, on Family Religion. 12. Hymns. 13. Theological Lectures. 14. Life of Mr. Steffe. The number and variety of his works shew the intenseness of his industry, and the extent of his capacity. The zeal and purity of his faith were expressed and enforced by a polished diction. His mind was capacious, his curiosity excursive, and his diligence continual. Few men have left behind such purity of character, or such monuments of laborious piety. Respecting the value of his writings, there is but one opinion. As an expositor, uniting the plain import of the text, supported by learned and elegant criticism, and a judicious, animated improvement, he has no superior. His sermons and other works are alike directed to inform the judgment, to affect the heart, and to regulate the life. Memoirs of his life were published by the rev. Job Orton, and by Dr. Kippis.

The admiration paid to the writings of Dr. Doddridge is willingly offered by the greatest ornaments of the national church, as well as by his dissenting brethren. Our most celebrated prelates have passed upon many of his works the warmest commendations. As a specimen of these encomiums, the justice of which none can deny, we extract a passage from a Charge delivered by the bishop of Durham, in 1792. "In reading the New Testament," says this distinguished prelate, "I recommend Doddridge's Family Expositor, as an impartial interpreter, and faithful monitor. Other expositions and commentaries might be mentioned greatly to the honour of their respective authors, for their several excellencies; such as, elegance of composition, acuteness of illustration, and copiousness of erudition: but *I know of no expositor, who unites so many advantages as Doddridge*; whether you regard the solidity of his version, the fulness and perspicuity of his composition, the utility of his general and historical information, the impartiality of his doctrinal comments, or, lastly, the piety and pastoral earnestness of his moral and religious applications. He has made, as he professes to have done, ample use of the commentators that preceded him; and in the explanation of grammatical difficulties, he has profited much more from the philological writers on the Greek Testament than could almost have been expected in so multifarious an undertaking as the Family Expositor; indeed, for all the most valuable purposes of a commentary on the New Testament, the Family Expositor cannot fall too early into the hands of those intended for holy orders."

DODECAGON, a regular polygon of 12 equal sides and angles.

If the side of a dodecagon be 1, its area will be equal to 3 times the tan. of $75^\circ = 3 \times \overline{2 + \sqrt{3}} =$ 11·1961524 nearly; and, the areas of plane figures being as the squares of their sides, therefore 11·1961524 multiplied by the square of the side of any dodecagon, will give its area. See Hutton's Mensuration, p. 114, 2d. ed.

To inscribe a dodecagon in a given circle.—Carry the radius 6 times round the circumference, which will divide it into 6 equal parts, or will make a hexagon; then bisect each of those parts, which will divide the whole into 12 parts, for the dodecagon.

DODECAHEDRON, one of the Platonic bodies, or five regular solids, being contained under a surface composed of twelve equal and regular pentagons.

To form a dodecahedron. See REGULAR BODY.

If the side, or linear edge, of a dodecahedron be s, its surface will be

$$15s^2\sqrt{1+\tfrac{2}{5}\sqrt{5}}=20{\cdot}6457788s^2$$

and its solidity

$$5s^3\sqrt{\frac{47+21\sqrt{5}}{40}}=7{\cdot}6631189\;6s^3$$

If the radius of the sphere that circumscribes a dodecahedron be r, then is its side or linear edge $=\dfrac{\sqrt{15}-\sqrt{3}}{3}r$,

its superficies $=10r^2\sqrt{2-\tfrac{2}{5}\sqrt{5}}$,

and its solidity $=\dfrac{20r^3}{3}\sqrt{\dfrac{3+\sqrt{5}}{30}}$. (*Hutton.*)

DODECANDRIA. In botany. (δωδεκα, twelve, and ανηρ, a husband). Twelve-stamened. The name of the eleventh class in Linnéus's Artificial System; comprehending all those plants which have hermaphrodite flowers with from twelve to nineteen stamens inclusive.

DODECAS, in botany, a genus of the class dodecandria, order monogynia. Calyx five-cleft, superior, bearing the corol; petals five; capsule one-celled, four-valved, many seeded, crowned with the calyx. One species only; a Surinam shrub.

DODECATEMORY. (from δωδεκα, twelve, and μερος, part). The twelfth part of a circle. Astronomers sometimes use this word for a sign of the zodiac: astrologers for one of their 12 houses.

DODECATHEON, in botany, a genus of the class pentandria, order monogynia. Corol wheel-shaped, reflected; stamens seated on the tube; capsule one-celled, oblong. One species only; an elegant plant, indigenous to Virginia.

To DODGE. *v. n.* (corrupted from *dog*.) 1. To use craft; to deal with tergiversation; to play mean tricks; to use low shifts (*Hall*). 2. To shift place as another approaches (*Milton*). 3. To play fast and loose; to raise expectations and disappoint them (*Swift*).

DO'DKIN. *s.* (*duytken*, Dutch.) A doitkin, or little doit; a low coin (*Lily*).

DO'DMAN. *s.* The name of a fish (*Bacon*).

DODO, in ornithology. See DIDUS.

DODONÆA, in botany, a genus of the class octandria, order monogynia. Calyx four-leaved; corolless; capsule three-celled, three-winged; seeds in pairs. Three species; India, New Holland, and the Cape.

DODONÆUS, in antiquity, an epithet sometimes applied to Jupiter.

DODONA, a town of Thesprotia, in Epirus, or, according to others, in Thessaly. There was in its neighbourhood a celebrated oracle of Jupiter. The town and temple of the god were first built by Deucalion, after the universal deluge. It was supposed to be the most ancient oracle of all Greece; and, according to the traditions of the Egyptians mentioned by Herodotus, it was founded by a dove. The extensive grove which surrounded Jupiter's temple was endowed with the gift of prophecy; and oracles were frequently delivered by the sacred oaks and the doves which inhabited the place.

DODONIDES, the priestesses who gave oracles in the temple of Jupiter at Dodona.

DODRA, in Roman antiquity, a drink prepared from nine different ingredients; which are enumerated by the epigrammatist in the following line.

> "Jus, aqua, mel, vinum, panis, piper, herba, oleum, sal."

See Auson. Epigram 86.

DODRANS, in antiquity, three-fourths of the AS.

DODRANT. (*dodrantalis mensura*). In botany, the space between the end of the thumb and of the little finger, both extended. About nine Paris inches. This measure may be called in English the long span, and spithama the short span. See MEASURES.

DODSLEY (Robert), an eminent bookseller, and ingenious writer, born at Mansfield in Nottinghamshire, in the year 1703. He was not indebted to education for his literary fame, being originally a livery servant; but his natural genius, and early passion for reading, soon elevated him to a superior station. He wrote an elegant little satirical farce called the Toy-shop, which was acted with applause in 1735, and which recommended him to the patronage of Mr. Pope. The following year he produced the King and Miller of Mansfield. The profits of these two farces enabled him to commence bookseller, and his own merit procured him eminence in that profession. He wrote some other dramatic pieces, and published a collection of his works in one vol. 8vo., under the modest title of Trifles; which was followed by Public Virtue, a poem in 4to. Besides what he wrote himself, the public were obliged to him for exerting his judgment in the way of his business; he having collected several volumes of well chosen Miscellaneous Poems and Fugitive Pieces, whose brevity would else have endangered their being totally lost to posterity. He died in 1764.

DODWELL (Henry), a learned writer, born at Dublin in 1641. He received his education in Trinity college, where he was chosen scholar and fellow, but he quitted the college in 1666, on account of the statute which binds the fellows to enter into orders. The same year he went to Oxford for the benefit of the public library. In 1688 he was elected Camden's professor of history in that university, and presented with his degree of M.A. but on the revolution he was deprived of his place for not taking the oaths. He died in Berkshire, in 1711. He wrote a great number of books which cannot here be enumerated. We shall therefore only mention the most eminent: 1. De Veteribus Græcorum Romanorumque cyclis, obiterque de Cyclo Judæorum ætate Christi, Dissertationes decem, cum Tabuliis necessariis, 1701, 4to. 2. An epistolary discourse proving from the scriptures and the first fathers, that the soul is a principle naturally mortal; but immortalized actually by the pleasure of God, to punishment or reward, by its union with the divine baptismal spirit. Wherein is proved that none have the power of giving this divine immortalizing spirit, since the apostles, but only the bishops, 1706, 8vo. This book occasioned a sharp controversy, and several able writers, as Dr. Clarke, Mr. Norris, and others, wrote expressly against it; but Mr. Dodwell attempted a sort of vindication of his notion in three treatises. 3. Julii Vitalis Epitaphium, cum Notis Henrici Dodwelli, et Commentario G. Musgrave, 1711, 8vo. &c.

DOE. In natural history. (See CERVUS.) The female of the fallow deer, bred in parks: the male of which is called a buck, and the young (of which she produces but one annually) a fawn. Doe venison is not equal in estimation with buck venison, either in fat or flavour; nor is it in season till the latter has declined: this happens at the beginning of autumn, when the copulating or rutting time approaches. Fawns are killed for the table at three months old, consequently are fit for eating towards the latter end of August, and the beginning of September.

DOE. *s.* (from *to do.*) A feat; what one has to do; what one can perform (*Hudibras*).

DO'ER. *s.* (from *to do.*) 1. One that does any thing good or bad (*South*). 2. Actor; agent (*Hooker*). 3. Performer (*Sidney*). 4. An active, or busy, or valiant person (*Knolles*). 5. One that habitually performs or practises (*Hooker*).

DOES. The third person from *do*, for *doth.*

To DOFF. *v. a.* (from *do off.*) 1. To put off dress (*Milton. Dryden*). 2. To strip; to divest of any thing (*Crashaw*). 3. To put away; to get rid of (*Shakspeare*). 4. To shift off; to delay (*Shakspeare*).

DOFRINE MOUNTAINS, or DOFRE FIELD, the highest mountains of Norway: they divide that kingdom from Sweden.

DOG. *s.* (*dogghe*, Dutch.) 1. A domestic animal remarkably various in its species. (See CANIS.) 2. A reproachful name for a man (*Shakspeare*). 3. *To give or send to the* DOGS; to throw away. *To go to the* DOGS; to be ruined, destroyed, or devoured. 4. It is used as the term for the male of several species; as, the *dog* fox, the *dog* otter.

To DOG. *v. a.* To hunt, as a dog, insidiously and indefatigably (*Herbert*).

DOG, in astronomy. See CANIS MAJOR and MINOR, and SIRIUS.

DOG-DAYS. See CANICULAR DAYS.

DOG-FISH, in ichthyology. See SQUALUS.

DOG-TICK, in entomology. See ACARUS.

DOG'S-BANE (Syrian). This plant, asclepias syriaca of Linnéus, is particularly poisonous to dogs, and also to the human species. Boiling appears to destroy the poison in the young shoots, which are then said to be esculent, and flavoured like asparagus. See ASCLEPIAS and APOCYNUM.

There are various other plants which appear to derive the same benefit from boiling. Thus the root of Indian cassava or jatropa manihot of Linnéus, which, in its natural state, is a most fatal poison, may be safely eaten after having been submitted to the same culinary operation.

DOG-FLY. See CYNOMYIA.

DOG-BERRY, in botany. See CORNUS.

DOG'S-STONE. See ORCHIS.

DOG'S-TOOTH, (Violet). See ERYTHRONIUM.

DOG'S-TOOTH, (Spar). See SPATUM.

DOG-ROSE. See ROSA.

DOG-WOOD. See CORNUS.

DOG-WOOD (Jamaica). See ERYTHRINA.

DOGADO, a province of the late Venetian states, in which is the capital. It is bounded on the E. by the Gulf of Venice, on the S. by Palesino, on the W. by Paduano, and on the N. by Trevisano. It comprehends many small islands near it, called the Lagunes of Venice.

DO'GCHEAP. *a.* (*dog* and *cheap.*) Cheap as dogs meat (*Dryden*).

DOGE, the chief magistrate of the republics of Venice and Genoa. The word properly signifies duke, being formed from the Latin *dux*, as *dogate*, and *dogado*, from *ducatus*, duchy. The dogate, or office and dignity of doge, is elective: at Venice, the doge is elected for life; at Genoa, only for two years: he is addressed under the title of Serenity, which among the Venetians is superior to that of highness.

The doge of Venice, however, is no more than the shadow of a prince; all the authority being reserved to the republic. Anciently indeed the doges were sovereigns; but at present it is far otherwise. The doge indeed gives audience to ambassadors; but does not give them any answer for himself in matters of any importance; only he is allowed to answer according to his own pleasure, to the compliments they make to the signiory; such answers being of no consequence. The doge, as being first magistrate, presides in all the councils; and the credentials which the senate furnishes its ministers in foreign courts are written in his name. He does not sign them, however; but a secretary of state signs them, and seals them with the arms of the republic. The ambassadors direct their dispatches to the doge; and yet he must not open them but in presence of the counsellors.

DO'GGED. *a.* (from *dog.*) Sullen; sour; morose; ill-humoured; gloomy (*Hudibras*).

DO'GGEDLY. *ad.* Sullenly; gloomily; sourly.

DO'GGEDNESS. *s.* (from *dogged.*) Gloom of mind; sullenness; moroseness.

DOGGER, a small ship, built after the Dutch fashion, with a narrow stern, and two masts; viz. a main-mast, and a mizen-mast, principally used in fishing on the Dogger bank.

DOGGER BANK, a very extensive sand bank in the German ocean, between the coast of England and Germany.

DO'GGEREL. *a.* (from *dog.*) Vile; despicable; mean: used of verses (*Dryden*).

Do'ggerel. *s.* Mean, despicable, worthless verses (*Swift*).

DO'GGISH. *a.* (from *dog.*) Currish; brutal.

DO'GHEARTED. *a.* (*dog* and *heart.*) Cruel; pitiless; malicious (*Shakspeare*).

DO'GHOLE. *s.* (*dog* and *hole.*) A vile hole; a mean habitation (*Pope*).

DO'GKENNEL. *s.* (*dog* and *kennel.*) A little hut or house for dogs (*Tatler*).

DO'GLOUSE. *s.* (*dog* and *louse.*) An insect that harbours on dogs.

DOGMA, Δογμα, a maxim, tenet, settled proposition, or principle; particularly in matters of religion, or philosophy.

DOGMATICAL, something relating to a doctrine, or opinion.

In common use, a dogmatical philosopher is such an one as asserts every thing positively; in opposition to a sceptic, who doubts of every thing.

A dogmatical physician is he, who, on the principles of the school philosophy, rejects all medicinal virtues not reducible to manifest qualities.

DOGMATICI, Dogmatists, a sect of ancient physicians, called also logici, logicians, from their using the rules of logic and reason, in subjects of their profession.

They laid down definitions, and divisions, reducing diseases to certain genera, those genera to species, and furnishing remedies for them all; supposing principles, drawing consequences, and applying those principles and consequences to the particular diseases under consideration. In which sense the dogmatists stand contradistinguished to empirics, and methodists.

DOGMA'TICALLY. *ad.* (from *dogmatical.*) Magisterially; positively (*South*).

DOGMA'TICALNESS. *s.* (from *dogmatical.*) Magisterialness; mock authority.

DO'GMATIST. *s.* (*dogmatiste*, French.) A magisterial teacher; a positive assertor; a bold advancer of principles (*Watts*).

To DO'GMATIZE. *v. n.* (from *dogma.*) To assert positively; to advance without distrust; to teach magisterially (*Blackmore*).

DOGMATI'ZER. *s.* (from *dogmatize.*) An assertor; a magisterial teacher (*Hammond*).

DO'GSLEEP. *s.* (*dog* and *sleep.*) Pretended sleep (*Addison*).

DO'GSMEAT. *s.* (*dog* and *meat.*) Refuse; vile stuff (*Dryden*).

DO'GSTAR. *s.* (*dog* and *star.*) The star which gives name to the dogdays. See Sirius.

DO'GTROT. *s.* A gentle trot like that of a dog (*Hudibras*).

DOGWEA'RY. *a.* Tired as a dog (*Shak.*).

DO'INGS. *s.* (from *to do.*) 1. Things done; events; transactions (*Shakspeare*). 2. Feats; actions (*Milton*). 3. Behaviour; conduct (*Sidney*). 4. Conduct; dispensation (*Hooker*). 5. Stir; bustle; tumult (*Hooker*). 6. Festivity; merriment; as, *gay* doings.

DOIT. *s.* (*duyt*, Dutch.) A small piece of money (*Shakspeare*).

DOLABRIFORM. (*dolabra.* an axe, *a dolando.*) In botany, an axe or hatchet-shaped leaf. Battledore-shaped. Compressed, roundish, obtuse, gibbous on the outside with a sharp edge, roundish below. As in mesembryanthemum dolabriforme.

DOLABRUM, a knife used in the Roman sacrifices.

DOLCE, a musical term, from the Italian, denoting that the passage over which it is placed is to be sung or played in a soft and sweet style.

DOLCIGNO, an episcopal town of Albania, in European Turkey. Lat. 42. 12 N. Lon. 19. 20 E.

DOLE. *s.* (from *deal*, ꝺælan, Saxon.) 1. The act of distribution or dealing (*Cleavel.*). 2. Any thing dealt out or distributed (*Hudib.*). 3. Provisions or money distributed in charity (*Dryden*). 4. Blows dealt out (*Milton*). 5. (from *dolor*, Lat.) Grief; sorrow (*Shakspeare*).

To Dole. *v. a.* (from the noun.) To deal; to distribute.

Dole, in the Saxon and British tongues, signified a part or portion, most commonly of a meadow, where several had shares. It also still signifies a distribution or dealing of alms, or a liberal gift made by a great man to the people.

Dole, in the laws of Scotland, is used for a malevolent intention. It is essential to the criminality of an action.

DO'LEFUL. *a.* (*dole* and *full.*) 1. Sorrowful; expressing grief (*South*). 2. Melancholy; feeling grief (*Sidney*). 3. Dismal; impressing sorrow (*Hooker*).

DO'LEFULLY. *ad.* In a doleful manner; sorrowfully; dismally; querulously.

DO'LEFULNESS. *s.* 1. Sorrow; melancholy. 2. Querulousness. 3. Dismalness.

DO'LESOME. *a.* (from *dole.*) Melancholy; gloomy; dismal; sorrowful (*Pope*).

DO'LESOMELY. *ad.* In a dolesome manner.

DO'LESOMENESS. *s.* Gloom; melancholy.

DOLGELHEW, or Dolgelly, a town of Merionethshire, in North Wales, having a market on Tuesdays. It is seated at the foot of the great rock Cader Idris. Lat. 52. 42 N. Lon. 9. 48 W. This town contains 658 houses, and 2950 inhabitants.

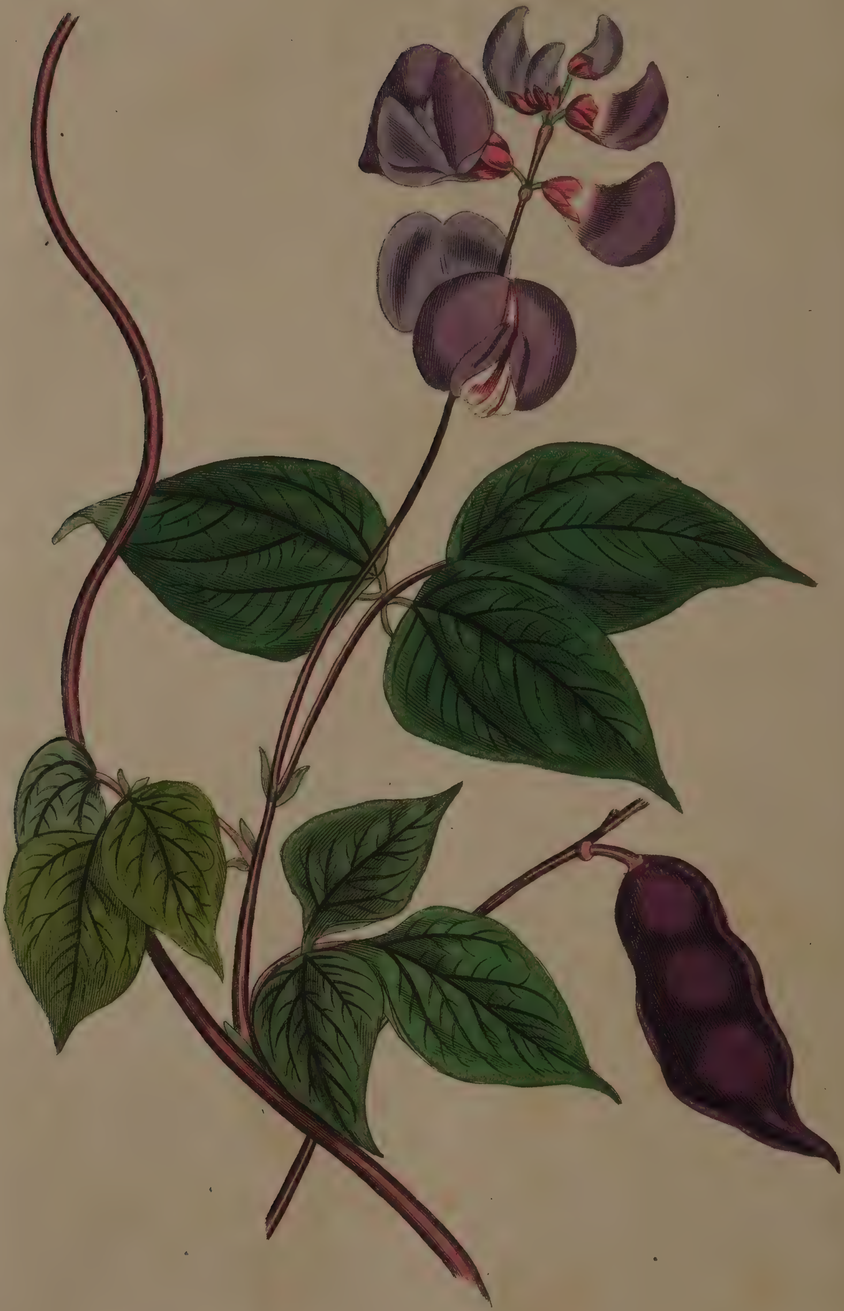
DOLICHOS, in antiquity, according to Suidas, signifies a race or course of 12 stadia, or of 24.

Dolichos. Cowhage. In botany, a genus of the class diadelphia, order decandria; banner with two parallel, oblong callosities at the base, compressing the wings underneath. Fifty-three species; natives of the East or West Indies, or the Cape, which may be thus subarranged:

A. Twining.
B. Erect.
C. Doubtful.

The following are the chief:

Dolichos Lablab



S. Edwards Del.

London Published by G. Kearsley 46 Fleet Street Decr. 1809

1. D. lablab. Twining: legumes ovate, scymitar-shaped; seeds ovate, with a curved eye towards one end. A beautiful climbing shrub, and largely cultivated in the gardens of Egypt for the purpose of making bowers and arbours, on account of the excellent shade afforded by its leaves. See Botany, Pl. LXXXV.

2. D. soja. Soy cowhage. Called by the Japonese daidsu or the pod-flower by way of eminence, on account of its beauty. Stem erect, flexuous, racemes axillary, erect; legumes pendulous, bristly, about two-seeded. This plant is also highly valued by the Japonese for its culinary purposes: their cooks obtaining from it a kind of butter which they term miso, and a pickle called sooja, whence the present specific name; this is obtained from the seeds, and is known among ourselves under the name of soy.

3. D. pruriens. Itching cowhage, or common cowitch. Twining; legumes racemed; the valves slightly carinate and hairy; peduncles three together. The hairs upon this and several other species, as d. ureus, produce a pungent itching smart, if handled or blown upon the skin by a slight breeze. These hairs grow upon the leaves which are covered with them; the legumes are compressed, influted at the base and reflected at the tip like an Italian *ſ*. The flowers of this plant are very beautiful, and would more frequently be cultivated were it not for the troublesome property of its leaf-hairs. It flowers in the cooler months of the year; generally from September to March. The spiculæ or leaf-hairs of the plant have been long regarded in the West Indies as an excellent vermifuge, particularly in the case of ascarides; and they are said to have been tried of late years with success in our own country. The spiculæ of a single pod mixed into an electuary with molasses is a dose for an adult.

DOLL. *s.* A little girl's puppet or baby-toy.

DOLLAR, or DALLER, a silver coin current in several parts of Spain, Germany, and Holland. There are various kinds and divisions of dollars, as the Rix-dollar, Semi-dollar, Quarter-dollar, &c. See MONEY TABLES.

DOLLOND (John), was born in Spitalfields in June 1706: his parents were French protestants, who quitted Normandy at the revocation of the edict of Nantz in 1685.

The first years of Mr. Dollond's life were employed at the loom; but, being of a very studious and philosophic turn of mind, his leisure hours were engaged in mathematical pursuits; and though by the death of his father, which happened in his infancy, his education gave way to the necessities of his family, yet at the age of fifteen, before he had an opportunity of seeing works of science or elementary treatises, he amused himself by constructing sun-dials, drawing geometrical schemes, and solving problems. Under the pressure of a close application to business for the support of his family, he found time, by abridging the hours of his rest, to extend his mathematical knowledge, and made a considerable proficiency in optics and astronomy, to which he now principally devoted his attention, having in the earlier stages of his life prepared himself for the higher parts of those subjects by a correct knowledge of algebra and geometry. He also acquired a very respectable knowledge of the Latin and Greek languages.

He designed his eldest son, Peter Dollond, for the same business with himself; and for several years they carried on their manufacture together in Spitalfields; but the employment neither suited the expectations nor dispositions of the son, who, having received much information upon mathematical and philosophical subjects from the instruction of his father, and observing the great value which was set upon his father's knowledge in the theory of optics by professional men, determined to apply that knowledge to the benefit of himself and his family; and accordingly, under the directions of his father, commenced optician. Success attended every effort; and in the year 1752 John Dollond, embracing the opportunity of pursuing a profession congenial with his mind, joined his son, and in consequence of his theoretical knowledge, soon became a proficient in the practical parts of optics.

His first attention was directed to improve the combination of the eye-glasses of refracting telescopes; and having succeeded in his system of four eye-glasses, he proceeded one step further, and produced telescopes furnished with five eye-glasses, which considerably surpassed the former; and of which he gave a particular account in a paper presented to the Royal Society, and which was read on the 1st of March 1753, and printed in the Phil. Trans. vol. lxviii. page 103.

Soon after this he made a very useful improvement in Mr. Savery's micrometer; for instead of employing two entire object-glasses, as Mr. Savery and M. Bouguer had done, he used only one glass cut into two equal parts, one of them sliding or moving laterally by the other. This was considered to be a great improvement, as the micrometer could now be applied to the reflecting telescope with much advantage, and which Mr. James Short immediately did. An account of the same was given to the Royal Society, in a paper which was afterwards printed in the Phil. Trans. vol. xlviii. page 178.

Mr. Dollond's celebrity in optics became now universal; and the friendship and protection of the most eminent men of science flattered and encouraged his pursuits. Surrounded by these enlightened men, in a state of mind prepared for the severest investigation of philosophic truths, and in circumstances favourable to liberal enquiry, Mr. Dollond engaged in the discussion of a subject, which at that time not only interested this country, but all Europe. Sir Isaac Newton had declared, in his Treatise on Optics, page 112, "That all refracting substances diverged the prismatic colours in a constant proportion to their mean refraction;" and drew this conclusion, "that refraction could not be produced without colour;" and consequently, "that no improvement could be expected in the refracting telescope." No one doubted the accuracy with which Sir Isaac Newton had made the experiment; yet some men, particularly M. Euler and others, were of opinion that the conclusion which Newton had drawn from it went too far, and maintained that in very small angles refraction might be obtained without colour. Mr. Dollond was not of that opinion, but defended Newton's doctrine with much learning and ingenuity, as may be seen by a reference to the letters which passed between Euler and Dollond upon that occasion, and which were published in the Phil. Trans. vol. xlviii. page 287. and contended that, "If the result of the experiment had been as described by sir Isaac Newton, there could not be refraction without colour."

A mind constituted like Mr. Dollond's could not remain satisfied with arguing in this manner from an experiment made by another, but determined to try it himself: and, accordingly, in the year 1757, began the examination; and, to use his own words, with "a resolute perseverance," continued during that year, and a great part of the next, to bestow his whole mind on the subject, until in the month of June 1758 he found, after a complete course of experiments, the result to be very different from that which he expected, and from that which sir Isaac Newton had related. He discovered "the difference in the dispersion of the colours of light, when the mean rays are equally refracted by different mediums." The discovery was complete, and he immediately drew from it this practical conclusion, "That the object-glasses of refracting telescopes were capable of being made without being affected by the different refrangibility of the rays of light." His account of this experiment, and of others connected with it, was given to the Royal Society, and printed in their transactions, vol. l. page 743, and he was presented in the same year, by that learned body, with sir Godfrey Copley's medal, as a reward of his merit, and a memorial of the discovery, though not at that time a member of the society.

This discovery no way affected the points in dispute between Euler and Dollond, respecting the doctrine advanced by sir Isaac Newton. A new principle was in a manner found out, which had no part in their former reasonings, and it was reserved for the accuracy of Dollond to have the honour of making a discovery which had eluded the observation of Newton. This new principle being now established, he was soon able to construct object-glasses, in which the different refrangibility of the rays of light was corrected, and the name of achromatic given to them by the late Dr. Bevis, on account of their being free from the prismatic colours.

As usually happens on such occasions, no sooner was the achromatic telescope made public, than the rivalship of foreigners, and the jealousy of philosophers at home, led them to doubt of its reality; and Euler himself, in his paper read before the Academy of Sciences at Berlin, in the year 1764, says, "I am not ashamed frankly to avow, that the first accounts, which were published of it, appeared so suspicious, and even so contrary to the best established principles, that I could not prevail upon myself to give credit to them;" and he adds, "I should never have submitted to the proofs which Mr. Dollond produced to support this strange phenomenon, if M. Clairaut, who must at first have been equally surprised at it, had not most positively assured me, that Dollond's experiments were but too well founded." And when the fact could no longer be disputed, they endeavoured to find a prior inventor, to whom it might be ascribed, and several conjecturers were honoured with the title of discoverers.

In the beginning of the year 1761, Mr. Dollond was elected fellow of the Royal Society, and appointed optician to his majesty, but did not live to enjoy those honours long; for on the 30th of November, in the same year, as he was reading a new publication by M. Clairaut, on the theory of the moon, and on which he had been intently engaged for several hours, he was seized with apoplexy, which rendered him immediately speechless, and occasioned his death in a few hours afterwards. Besides Mr. Peter Dollond, whom we have had occasion to mention in the course of this memoir, his family, at his death, consisted of three daughters and a son, who, possessing the name of his father, and, we may add, a portion of the family abilities, carries on the optical business in partnership with his elder brother. (*Phil. Mag.*)

DOLOMITE. See Marmor.

DOLORI'FIC. *a.* (*dolorificus*, Lat.) That causes grief or pain (*Ray*).

DO'LOROUS. *a.* (from *dolor*, Lat.) 1. Sorrowful; doleful; dismal (*Milton*). 2. Painful (*More*).

DO'LOUR. *s.* (*dolor*, Latin.) 1. Grief; sorrow (*Shakspeare*). 2. Lamentation; complaint (*Sidney*). 3. Pain; pang (*Bacon*).

DOLOUREUX TIC. Dolor faciei. A painful intermittent disease which attacks the face. It consists in a chronic fixed pain, which has paroxysms of acute pain, during which last the patient feels violent lancinating twitches, like the ticking of a clock. The seat of this affection is in the branches of the facial nerve and the suborbitar branches of the fifth pair.

DOLPHIN, in zoology. See Delphinus.

DOLT. *s.* (*dol*, Teutonick.) A heavy stupid fellow; a blockhead (*Shakspeare*).

DO'LTISH. *a.* (from *dolt.*) Stupid; mean; dull; blockish (*Sidney*).

DOM, or Don, a title of honour invented and chiefly used by the Spaniards, signifying sir or lord. This title, it seems, was first given to Pelayo, in the beginning of the eighth century. In Portugal no person can assume the title of don without the permission of the king; since it is looked upon as a mark of honour and nobility. In France it was sometimes used among the religious. It is an abridgment of *domnus*, from *dominus*.

Dom and Som, in old charters, signifies full property and jurisdiction.

DO'MABLE. *a.* (*domabilis*, Latin.) Tameable.

DOMA'IN. *s.* (*domaine*, French.) 1. Dominion; empire (*Milton*). 2. Possession; estate. See Demesne.

DOMBEYA, in botany, a genus of the class monodelphia, order dodecandria. Calyx double; the outer three-leaved, deciduous; petals five; stamens ten or twenty, five of them barren; style five-cleft; capsules five, united, one-celled, one or many-seeded. Twelve species; chiefly natives of the isles of Bourbon and Mauritius.

DOME, in architecture, a round, vaulted, or arched roof, sometimes hemispherical, raised over the middle of a building, as a church, hall, pavilion, vestibule, &c. by way of crowning.

The word is formed from the corrupt Latin, *doma*, a roof, or open porch. Domes are the same with what the Italians call *cuppolas*, and we *cupolas*; the Latins, *tholi*.

The erection of a dome is, manifestly, a scientific art, proceeding on the principles of equilibration; principles that require, or admit of, modifications, in consequence of the cohesion and friction of materials. At first sight, a dome appears a more difficult piece of work than a plain arch; but when we observe potters kilns and glasshouse domes and cones of vast extent, erected by ordinary bricklayers, and with materials vastly inferior in size to what can be employed in common arches of equal extent, we must conclude that the circumstance of curvature in the horizontal direction, or the abutment of a circular base, gives some assistance to the artist. Of this we have complete demonstration in the case of the cone. We know that a vaulting in the form of a pent roof could not be executed to any considerable extent, and would be extremely hazardous, even in the smallest dimensions; while a cone of the greatest magnitude can be raised with very small stones, provided only that we prevent the bottom from flying out, by a hoop, or any similar contrivance. And when we think a little of the matter, we see plainly, that if the horizontal section be perfectly round, and the joints be all directed to the axis, they all equally endeavour to slide inwards, while no reason can be offered why any individual stone should prevail. They are all wedges, and operate only as wedges. When we consider any single course, therefore, we see that it cannot fall in, even though it may be part of a curve which could not stand as a common arch; nay, we see that a dome may be constructed, having the convexity of the curve, by the revolution of which it is formed, turned towards the axis, so that the outline is concave. The force which binds the stones of a horizontal course together, by pushing them towards the axis, will be greater in flat domes than those that are more convex; it will be still greater in a cone; and greater still in a curve whose convexity is turned inwards. Nay, since the friction of two pieces of stone is not less than half of their mutual pressure, it may be proved that a dome will stand, although the tangent to the curve at the base should be horizontal, provided the horizontal thrust be double the weight of the dome, which may easily be the case, if it do not rise high. As to a cone, it may be loaded on the top with the greatest weight, without the smallest danger of forcing it down, so long as the bottom course is firmly kept from bursting outwards. The stone lantern on the top of St. Paul's cathedral in London weighs several hundred tons, and is carried by a brick cone of eighteen inches thick, with perfect safety, as long as the bottom course is prevented from bursting outwards. The reason is evident: The pressure on the top is propagated along the cone in the direction of the slant side; and, so far from having any tendency to break it in any part, it tends rather to prevent its being broken by any irregular pressure from foreign causes.

The stability of a dome obviously depends upon very different principles from that of a common arch, and is, in general, much greater. It differs also in another important circumstance, viz. it may be open in the middle: for the uppermost course, by tending equally in every part to slide in towards the axis, presses all together in the vertical joints, and acts on the next course like the key stone of a common arch. Therefore, an arch of equilibration which is the weakest of all, may be open in the middle, and carry at top another building, such as a lanthern, if its weight do not exceed that of the circular segment of the dome that is omitted. A greater load than this would indeed break the dome, by causing it to spring up in some of the lower courses; but this load may be increased if the curve is flatter than that of equilibration: and any load whatever, which will not crush the stones to powder, may be set on a truncate cone, or on a dome formed by a curve that is convex toward the axis; provided always, that the foundation be effectually prevented from flying out, either by a hoop of iron, which need seldom exceed an inch in thickness, or by a sufficient mass of solid pier on which it is set. It is possible to construct domes, particularly hemispherical ones, without centering, provided the stones be cut in the proper converging wedge-like form, so that they must be inserted from the outside, and cannot fall through; but we do not recommend the plan to general adoption.

Persuaded that what has been said on the subject convinces the reader that a vaulting perfectly equilibrated throughout is by no means the best form, provided that the base is secured from separating, we think it unnecessary to give the investigation of that form, which has a considerable intricacy; and shall content ourselves with merely giving its dimensions. The thickness is supposed uniform. The numbers in the first column of the table express the portion of the axis counted from the vertex, and those of the second column are the lengths of the ordinates.

AD	DB	AD	DB	AD	DB
0,4	100	610,4	1080	2990	1560
3,4	200	744	1140	3442	1600
11,4	300	904	1200	3972	1640
26,6	400	1100	1260	4432	1670
52,4	500	1336	1320	4952	1700
91,4	600	1522	1360	5336	1720
146,8	700	1738	1400	5756	1740
223,4	800	1984	1440	6214	1760
326,6	900	2270	1480	6714	1780
465,4	1000	2602	1520	7260	1800

The curve formed according to these dimensions appears destitute of gracefulness; because its curvature changes abruptly at a little distance from the vertex, so that it has some appearance of being made up of different curves pieced together. But if the middle be occupied by a lantern of equal, or of smaller weight, this defect will cease, and the whole will be elegant, nearly resembling the exterior dome of St. Paul's in London.

It is not a small advantage of dome-vaulting that it is lighter than any that can cover the same area. If, moreover, it be spherical, it will admit considerable varieties of figure, by combining different spheres. Thus, a dome may begin from its base as a portion of a large hemisphere, and may be broken off at any horizontal course, and then a similar or a greater portion of a smaller sphere may spring from this course as a base.

We conclude this article with observing, that the connection of the parts, arising from cement and from friction, has a great effect on dome-vaulting. In the same way as in common arches and cylindrical vaulting, it enables an overload on one place to break the dome in a distant place. But the resistance to this effect is much greater in dome-vaulting, because it operates all round the overloaded part. Hence it happens that domes are much less shattered by partial violence, such as the falling of a bomb or the like. Large holes may be broken in them without much affecting the rest; but, on the other hand, it greatly diminishes the strength which should be derived from the mutual pressure in the vertical joints. Friction prevents the sliding in of the arch stones which produces this mutual pressure in the vertical joints, except in the very highest courses, and even there it greatly diminishes it. These causes make a great change in the form which gives the greatest strength; and as their laws of action are but very imperfectly understood as yet, it is perhaps impossible, in the present state of our knowledge, to determine this form with tolerable precision. We see plainly, however, that it allows a greater deviation from the best form than the other kind of vaulting, and domes may be made to rise perpendicular to the horizon at the base, although of no great thickness; a thing which must not be attempted in a plain arch. The immense addition of strength which may be derived from hooping, largely compensates for all defects; and there is hardly any bounds to the extent to which a very thin dome-vaulting may be carried, when it is hooped or framed in the direction of the horizontal courses. (*Sup. Ency. Brit.*)

For more on this subject, see Hutton's Tracts, vol. i. Gregory's Mechanics, vol. i. the Treatise on Arches at the end of Bossut's Mechanics, and Berard, Statique des Voutes.

DOMENICHINO, an Italian painter, born at Bologna in 1681. He studied in the school of the Caracci, where his fellow pupils, from his slowness, called him in derision, the Ox; but one of his masters told them, that "this ox would in time make his ground so fruitful, that painting would be fed by what it produced." This prediction he completely fulfilled. He was no less skilled in architecture; and pope Gregory XV. appointed him the chief architect of the apostolical palace. He died in 1641.

DOMES-DAY or DOOMS-DAY-BOOK. (*Liber judiciarius vel censualis Angliæ.*) The judicial book, or book of the survey of England; a most ancient record made in the time of William the Conqueror; upon a survey, or inquisition, of the several counties, hundreds, tithings, &c.

Its name is formed from the Saxon *dom*, doom, judgment, sentence; and day, which has the same force: so that dome-day is no more than a reduplicative, importing judgment judgment.

But some condemn this etymology as whimsical; and contend that if it were just, the Latin for domes-day would be *dies judicii*; whereas, as appears above, it is styled *Liber judiciarius, vel censualis Angliæ.* Bullet, in his Celtic Dictionary, hath the word *dom*, which he reads *seur*, *seigneur*, and hence the Spanish word *don*, as also the words *deya*, and *deia*, which he renders proclamation, advertisement. Dooms-day therefore signifies the lord's or king's proclamation, or advertisement, to the tenants who hold under him; and agrees well with great part of the contents of this famous survey. Observations on the Statutes, p. 190. note (*m*).

Domes-day-book consists of two volumes, a greater and a less. The first is a large folio, written on 382 double pages of vellum, in a small but plain character; each page having a double column. Some of the capital letters and principal passages are touched with red ink; and some have strokes of red ink run across them, as if scratched out. This volume contains the description of 31 counties. The other volume is in quarto, written upon 450 double pages of vellum, but in a single column, and in a large but very fair character. It contains the counties of Essex, Norfolk, Suffolk, part of the county of Rutland included in that of Northampton, and part of Lancashire in the counties of York and Chester.

This work, according to the red book in the exchequer, was begun by order of William the Conqueror, with the advice of his parliament, in the year of our Lord 1080, and completed in the year 1086. The reason given for taking this survey, as assigned by several ancient records and historians, was, that every man should be satisfied with his own right, and not usurp with impunity what belonged to another. But, besides this, it is said by others, that now all those who possessed landed estates became vassals to the king, and paid him so much money by way of fee or homage in proportion to the lands they held. This appears very probable, as there was at that time extant a general survey of the whole kingdom, made by order of king Alfred.

William's survey, at the time it was made, gave great offence to the people; and occasioned a jealousy that it was intended for some new imposition. But notwithstanding all the precaution taken by the conqueror to have this survey faithfully and impartially executed, it appears from indisputable authority, that a false return was given in by some of the commissioners; and that, as it is said, out of a pious motive. This was particularly the case with the abbey of Croyland in Lincolnshire, the possessions of which were greatly under-rated, both with regard to quantity and value. Perhaps more of these pious frauds were discovered; as it is said Ralph Flambard, minister to William Rufus, proposed the making a fresh and more vigorous inquisition; but this was never executed.

Notwithstanding this proof of its falsehood in some instances, which must throw a suspicion on all others, the authority of domesday-book was never permitted to be called in question; and always, when it has been necessary to distinguish whether lands were held in ancient demesne, or in any other manner, recourse was had to domesday-book, and to that only, to determine the doubt. From this definitive authority, from which, as from the sentence pronounced at domesday, or the day of judgment, there could be no appeal, the name of the book is said to have been derived. But Stowe assigns another reason for this appellation; namely, that domesday-book is a corruption of *domus Dei book*; a title given it because heretofore deposited in the king's treasury, in a place of the church of Westminster or Winchester, called *domus Dei*. From the great care formerly taken for the preservation of this survey, we may learn the degree of estimation in which it was held. The dialogue de Scaccariis says, "*Liber ille* (domesday) *sigilli regis comes est individuus in thesauro.*" Until lately it has been kept under three different locks and keys; one in the custody of the treasurer, and the others in that of the two chamberlains of the exchequer. It is now deposited in the chapter-house at Westminster, where it may be consulted on paying to the proper officers a fee of 6*s.* 8*d.* for a search, and fourpence per line for a transcript.

Besides the two volumes above-mentioned, there is also a third made by order of the same king; and which differs from the others in form more than in matter. There is also a fourth called domesday, which is kept in the exchequer; which, though a very large volume, is only an abridgment of the others. In the remembrancer's office in the exchequer, is kept a fifth book, likewise called domesday, which is the same with the fourth book already mentioned. King Alfred had a roll which he called domesday; and the domesday-book made by William the Conqueror referred to the time of Edward the Confessor, as that of king Alfred did to the time of Ethelred. The fourth book of domesday having many pictures and gilt letters in the beginning relating to the time of king Edward the Confessor, some were led into a false opinion that domesday-book was composed in the reign of king Edward.

DOME'STICAL. Dome'stic. *a.* (*domesticus*, Latin.) 1. Belonging to the house; not relating to things public (*Hooker*). 2. Private; done at home; not open (*Hooker*). 3. Inhabiting the house; not wild (*Addison*). 4. Not foreign; intestine (*Shakspeare*).

To DOME'STICATE. *v. a.* (from *domestic.*) To make domestic; to withdraw from the public (*Clarissa*).

DOME'STIC. *s.* One kept in the same house (*South*).

DOMESTICUS, in antiquity, an officer in the court of the emperors of Constantinople. *Domestici* were such as assisted the prince in the administration of affairs, whether those of his family, of justice, or of the church. They had appropriate names to distinguish their peculiar offices; as *domesticus murorum*, he who superintended the fortifications.

To DO'MIFY. *v. a.* (*domifico*, Lat.) To tame.

DOMIFYING, Domification, in astrology, the dividing or distributing the heavens into twelve houses; in order to erect a theme, or horoscope.

DO'MINANT. *a.* (*dominans*, Lat.) Predominant; presiding; ascendant.

Dominant. (from the Latin word *dominari*, to rule or govern.) Among musicians, is used either as an adjective or substantive; but these different acceptations are far from being indiscriminate. In both senses it is explained by Rousseau as follows: the dominant or sensible chord is that which is practised upon the dominant of the tone, and which introduces a perfect cadence. Every perfect major chord becomes a dominant chord, as soon as the seventh minor is added to it.—Dominant (subst.) Of the three notes essential to the tone, it is that which is a fifth from the tonic. The tonic and the dominant fix the tone; in it they are each of them the fundamental sound of a particular chord; whereas the mediant, which constitutes the mode, has no chord peculiar to itself, and only makes a part of the chord of the tonic. Mr. Rameau gives the name of dominant in general to every note which carries a chord of the seventh, and distinguishes that which carries the sensible chord by the name of a tonic dominant; but, on account of the length of the word, this addition to the name has not been adopted by musicians: they continue simply to call that note a dominant which is a fifth from the tonic; and they do not call the other notes which carry a chord of the seventh dominants, but fundamentals; which is sufficient to render their meaning plain, and prevents confusion. A dominant, in that species of church-music which is called plain-chant, is that note which is most frequently repeated or beaten, in whatever degree it may be from the tonic. In this species of music there are dominants and tonics, but no mediant.

To DO'MINATE. *v. a.* (*dominatus*, Lat.) To predominate; to prevail over the rest (*Dr.*).

DOMINA'TION. *s.* (*dominatio*, Latin.) 1. Power; dominion (*Shakspeare*). 2. Tyranny; insolent authority (*Arbuthnot*). 3. One highly exalted in power: used of angelic beings (*Milton*).

DO'MINATIVE. *a.* (from *dominate.*) Imperious; insolent.

DOMINA'TOR. *s.* (Latin.) The presiding power, or influence (*Camden*).

To DOMINE'ER. *v. n.* (*dominor*, Latin.) To rule with insolence; to swell; to bluster; to act without control (*Prior*).

DOMINGO (St.) or Hispaniola, one of the richest islands of the West Indies, is about 400 miles in length, and 75 in breadth, and lies between Jamaica and Porto Rico. It was discovered by Columbus in 1492, and is surrounded by craggy rocks and dangerous shoals. The heat would be almost insupportable, were it not mitigated by the easterly winds, and frequent rains. It has a great many rivers, and mines of gold, talc, and crystal. Before the treaty of peace between France and Spain, in 1795, the W. part of this island only belonged to the French, the E. to the Spaniards; but by that treaty the Spanish part was ceded to France. The W. part of this island is now divided into two well organized governments, one, monarchical, under Christophe, who is called Henry the 1st; the other republican, under Petion. The chief town is also named St. Domingo; it is built in the Spanish manner, with a great square in the middle of it; it is seated on the S. E. shore of the island. Lat. 18. 20 N. Lon. 70. 10 W.

DOMINICA, a small island of the West Indies, 30 miles N. of Martinico. It was discovered by Columbus on a Sunday, which gave rise to its name. Lat. 15. 18 N. Lon. 61. 27 W.

Dominica, one of the Marquesas, in the South sea. Lat. 9. 41 S. Lon. 139. 2 W.

DOMINICAL LETTER, in chronology, properly called Sunday letter, one of the seven letters of the alphabet ABCDEFG, used in almanacks, ephemerises, &c. to denote the Sundays throughout the year.

In our almanacks, the first seven letters of the alphabet are commonly placed to shew on what days of the week the days of the months fall throughout the year. And because one of those seven letters must necessarily stand against Sunday, it is printed in a capital form, and called the dominical letter; the other six being inserted in different characters, to denote the other six days of the week. Now, since a common Julian year contains 365 days, if this number be divided by 7 (the number of days in a week) there will remain one day. If there had been no remainder, it is plain the year would constantly begin on the same day of the week: but since one remains, it is plain, that the year must begin and end on the same day of the week; and therefore the next year will begin on the day following. Hence, when January begins on a Sunday, A is the dominical or Sunday letter for that year: then, because the next year begins on Monday, the Sunday will fall on the seventh day, to which is annexed the seventh letter G, which therefore will be the dominical letter for all that year: and as the third year will begin on Tuesday, the Sunday will fall on the sixth day; therefore F will be the Sunday letter for that year. Whence it is evident, that the Sunday letters will go annually in retrograde order thus, G, F, E, D, C, B, A. And, in the course of seven years, if they were all common ones, the same days of the week and dominical letters would return to the same days of the months. But because there are 366 days in a leap-year, if the number be divided by 7, there will remain two days over and above the 52 weeks of which the year consists. And, therefore, if the leap-year begins on Sunday, it will end on Monday; and as the year will begin on Tuesday, the first Sunday whereof must fall on the sixth of January, to which is annexed the letter F, and not G, as in common years. By this means, the leap-year returning every fourth year, the order of the dominical letters is interrupted; and the series cannot return to its first state till after four times seven, or 28 years; and then the same days of the months return in order to the same days of the week as before.

The dominical letter may be found universally, for any year of any century, thus:

Divide the centuries by 4; and twice what
does remain
Take from 6; and then add to the number
you gain
Their odd years and their 4th; which dividing by 7,
What is left take from 7, the letter is given.

Thus, for the year 1878 the letter is F.

For the centuries 18 divided by 4, leave 2; the double of which taken from 6 leaves 2 again; to which add the odd years 78, and their 4th part 19, the sum 99 divided by 7 leaves 1; which taken from 7, leaves 6, answering to F the 6th letter in the alphabet.

DOMINICANS, an order of religious, called in some places Jacobins; and in others, Predicants, or Preaching Friars. The Dominicans take their name from their founder Dominic de Gusman, a Spanish gentleman, born in 1170, at Calaroga, in Old Castile. He was first canon and archdeacon of Osma; and afterwards preached with great zeal and vehemence against the Albigenses in Languedoc, where he laid the foundation of his order. The first convent was founded at Tholouse by the bishop and Simon de Montfort. Two years afterwards they had another at Paris; and some time after, a third in the rue St. Jacques, whence the denomination of Jacobins. Just before his death, Dominic sent Gilbert de Fresney, with twelve of the brethren, into England, where they founded their first monastery at Oxford, in the year 1221, and soon after another at London. In the year 1276, the mayor and aldermen of the city of London gave them two whole streets by the river Thames, where they erected a very commodious convent, whence that spot is still called Black Friars, a name by which the Dominicans were then distinguished. St. Dominic, at first, only took the habit of the regular canons; that is, a black cassock and rochet; but this he quitted in 1219, for that which they now wear, which, it is pretended, was shown by the Blessed Virgin herself to the beatified Renaud d'Orleans. The dogmata of the Dominicans are usually opposite to those of the Franciscans.

There are also nuns or sisters of this order, called in some places Preaching Sisters. These are even more ancient than the friars; St. Dominic having founded a society of religious maids at Prouilles, some years before the institution of his order of men; viz. in 1206. There is also a third order of Dominicans, both for men and women.

DOMI'NION. *s.* (*dominium,* Latin.) 1. Sovereign authority; unlimited power (*Milton*). 2. Power; right of possession or use, without being accountable (*Locke*). 3. Territory; region; district (*Davies*). 4. Predominance; ascendant (*Dryden*). 5. An order of angels (*Colossians*).

DOMINO. (*dominus,* Lat. a chief, or master.) A hood worn by a canon of a cathedral, in token of his superiority.

Domino. (from *dominus,* as above.) A long, loose cloak, worn at a masquerade, by way of general disguise, by the guests or spectators of this amusement, formerly constituting its superiors: the personifiers of the different characters having been in earlier times hired for this purpose.

Domino. (from the above.) A long, loose cloak, worn by the superior ranks in Spain, and not unfrequently for the purpose of concealment.

Domino. (from the above.) The game of disguise or concealment; the black backs of the ivory pieces made use of, being turned towards the antagonist party. A game played by two or four persons, with twenty-eight pieces of oblong ivory plates, plain at the back, but on the face divided by a black line in the middle, and indented with spots from one to a double-six. These pieces consist of a double-blank, ace-blank, double-ace, deuce-blank, deuce-ace, double-deuce, trois-blank, trois-ace, trois-deuce, double-trois, four-blank, four-ace, four-deuce, four-trois, double-four, five-blank, five-ace, five-deuce, five-trois, five-four, double-five, six-blank, six-ace, six-deuce, six-trois, six-four, six-five, and double-six. Sometimes a double set is played with, of which double-twelve is the highest.

At the commencement of the game, the cards (as they are called) are shuffled with their faces on the table. Each person draws one, and if four play, those who choose the two highest are partners against those who take the two lowest: drawing the latter also serves to determine who is to lay down the first piece, which is reckoned a great advantage. Afterwards each player takes seven pieces at random. The eldest hand having laid down one, the next must pair him at either end of the piece he may choose, according to the number of pips, or being a blank in the compartment of the piece, but whenever any one cannot match the part not paired either of the card last put down, or of that unpaired at the other end of the row, then he says *go*; and the next is at liberty to play. Thus they play alternately either until one party has wholly discarded, and thereby wins the game, or till the game is *blocked*; that is, when neither party can play by matching the pieces where unpaired at either end, then they win who have the smallest number of pips on the pieces remaining in their possession. It is to the advantage of every player to dispossess himself as early as possible of the heavy pieces, such as double-sixes, fives, fours, &c.

Sometimes when two persons play, they take each only seven pieces, and agree to *play* or *draw*; i. e. when one cannot come in, or pair with the pieces on the board at the end unmatched, he then is to draw from the fourteen pieces in stock till he find one to pair with one of the end-pieces.

DOMITIANUS (Titus Flavius), son of Vespasian and Flavius Domitilla, made himself emperor of Rome, at the death of his brother Titus, whom, according to some accounts, he destroyed by poison. The beginning of his reign promised tranquillity to the people, but their expectations were soon frustrated. Domitian became cruel, and gave way to incestuous and unnatural indulgences. He commanded himself to be called God and Lord in all the papers which were presented to him. He passed the greatest part of the day in catching flies and killing them with a bodkin. In the latter part of his reign Domitian became suspicious, and his anxieties were increased by the predictions of astrologers, but still more poignantly by the stings of remorse. He was so distrustful even when alone, that round the terrace, where he usually walked, he built a wall with shining stones, that from them he might perceive as in a looking-glass, whether any body followed him. All these precautions were unavailing; he perished by the hand of an assassin the 18th of September, A.D. 96, in the 45th year of his age, and the 15th of his reign. He was the last of the twelve Cæsars. After his death he was publicly deprived by the senate of all the honours which had been profusely heaped upon him, and even his body was left in the open air without the honours of a funeral. This disgrace might perhaps have proceeded from his having once assembled that august body to know in what vessel a turbot might be more conveniently dressed.

DOMUS, in classical antiquity, is commonly used for all sorts of houses, either magnificent or ordinary; but it is often taken by writers to intimate a mansion or fine house of some great lord, or a palace of some prince, as it appears by these verses of Virgil, speaking of the palace of Dido.

"At domus interior regali splendida luxu."

These great houses were built with much magnificence, and were of a vast extent; for they had many courts, apartments, wings, cabinets, bagnios, stoves, and a great many fine halls, either to sit at table, or to transact matters of consequence.

Before these great houses there was a large place or porch, where clients and persons giving attendance to great men waited till it was daylight, to be admitted to make their court. It is supposed that this porch was covered, for the conveniency of persons, who were sometimes waiting very long before they were admitted.

There was a second part to these houses, called *cavum-ædium*, or *cavædium*: it was a spacious court, inclosed with rows of houses.

The third part was called *atrium interius*, i. e. in general the whole inside of the house. Virgil has took this word in Vitruvius's sense, when he said, "Apparet domus intus, et atria longa patescunt;" for it is plain that Virgil means by the word atria, that all may be seen in the inside of a house when the doors are opened. There was a porter waiting at the atrium, called *servus atriensis*. Within this place there were many figures; for the Romans, who passionately loved glory and praises, raised every where trophies and statues, to leave eternal monuments of their great actions to posterity, not only in the provinces, which they subdued to the empire, but also in public places, and their own palaces at Rome.

There were painted or engraven battles, axes, bundles of rods, and the other badges of the offices that their ancestors or themselves had possessed, and statues of wax or metal, representing their fathers in basso relievo, were set up in niches of precious wood or rare marble. The days of their solemn feasts, or their triumphal pomp, these niches were opened, and the figures crowned with festoons and garlands, and carried about the town. When some persons of the family died, these statues accompanied the funeral parade; wherefore Pliny says, that the whole family was there present from the first to the last.

Besides there were great galleries in these houses, adorned with pillars, and other works of architecture, and great halls, closets for conversation and painting, libraries, and gardens neatly kept.

These halls were built after the Corinthian or Ægyptian order. The first halls had but a row of pillars set upon a pedestal, or on the pavement, and supported nothing but their architrave, and cornish of joiners work or stud, over which was the ceiling in form of a vault; but the last halls had architraves upon pillars, and on the architraves of the ceilings made of pieces joined together, which make an opened terras, turning round about. These houses had many apartments, some for men, and others for women; some for dining-rooms called *triclinia*, others for bed-chambers named *dormitoria*; and some others to lodge strangers, to whom they were obliged to be hospitable.

Ancient Rome was so large, that there were eight and forty thousand houses standing by themselves, being so many insula; and these houses were very convenient, because they had a light on every side, and doors on the streets, and not exposed to the accidents of fire. But this must be understood of Rome, that was rebuilt by Nero, after he had reduced it himself (as it is thought) into ashes.

The Greeks built after another manner than the Romans; for they had no porch, but from the first door they entered into a narrow passage; on one side of it there were stables, and on the other there was the porter's lodge; at the end of this passage there was another door, to enter into a gallery supported with pillars, and this gallery had piazzas on three sides.

Within the Greeks' houses there were great halls, for the mistresses of the family, and their servant maids to spin in; in the entry both on the right and left hand there were chambers, one was called *thalamus*, and the other *antithalamus*. Round about the piazzas there were dining-rooms, chambers, and wardrobes. To this part of the house was joined another part, which was bigger and had very large galleries, with four piazzas of the same height. The finest entries and most magnificent doors were at this part of the house. There were four great square halls, so large and spacious, that they would easily hold four tables, with three seats in form of beds, and leave room enough for the servants and gamesters. They entertained in these halls, for it was not the custom for women to sit amongst men. On the right and the left of these buildings there were small apartments, and very convenient rooms to receive the chance guests; for among the Greeks wealthy and magnificent men kept apartments, with all their conveniencies to receive persons who came far off to lodge at their houses. The custom was, that after they had given them an entertainment the first day only, they sent them afterwards every day some present that they received from the country, as chickens, eggs, pulse, and fruits; and so the travellers were lodged as they had been at their own house, and might live in these apartments privately and in all liberty.

These apartments were paved with mosaic or inlaid work. Pliny tells us, that the pavements that were painted and wrought with art came from the Greeks, who called them λιθοστρωτα. These pavements were in fashion at Rome, during the time of Sylla, who got one made at Præneste, in the temple of Fortune. This Greek word λιθοστρωτον signifies only a pavement of stones, but the Greeks meant by that word those pavements made of small stones of several colours, inlaid into the cement, representing different figures by the variety of their colours and order. This pavement was not only used for paving the courts of houses and the halls, but also in chambers, and wainscotting the walls, and this kind of pavements were called *musæa, musia,* and *musiva,* because ingenious works were ascribed to the muses, and that the muses and sciences were thereby represented. The word mosaic is derived from the Latin word *musivum,* and not from Moses nor the Jews. (*Danet*).

DON. *s.* (*dominus,* Lat.) The Spanish title for a gentleman; as, Don Quixote. See DOM.

To DON. *v. a.* (*To do on.*) To put on; to invest with: the contrary to *doff* (*Fairfax*).

DON, or TANAIS, one of the principal rivers of Europe, which separates it from Asia. It rises in the province of Rezan, in Muscovy, and, passing by a great number of towns, falls into the Palus Mæotis, or sea of Asoph. In Britain, there are two rivers of the same name, viz. one in Yorkshire and one in Aberdeenshire.

DONA'CIA, in entomology, a tribe of the coleopterous genus leptura, thus named in the Fabrician System. See LEPTURA.

DONAGHADEE, a seaport of Ireland, in the county of Down, twenty miles W. by S. of Port Patrick, in Scotland. Between these two places a packet-boat sails every day.

DONARIA, in antiquity, the places where oblations offered to the gods were kept: in after times, the same word denoted the offerings, and sometimes the temples.

DO'NARY. *s.* (*donarium,* Latin.) A thing given to sacred uses.

DONA'TIA, in botany, a genus of the class triandria, order trigynia. Calyx three-leaved, corol many-petalled. One species; a native of Terra del Fuego; a small simple plant, with sometimes a branch or two forming close tufts; terminal, solitary flowers; petals twice as long as the calyx.

DONA'TION. *s.* (*donatio,* Latin.) 1. The act of giving any thing (*South*). 2. The grant by which any thing is given or conferred (*Raleigh*).

DONATISTS, ancient schismatics in Africa, so denominated from their leader Donatus. They had their origin in the year 311, when, in the room of Mensurius, who died in that year, on his return to Rome, Cæcilian was elected bishop of Carthage, and consecrated without the concurrence of the Numidian bishops, by those of Africa alone; whom the people refused to acknowledge, and to whom they opposed Majorinus; who, accordingly, was ordained by Donatus, bishop of Casæ Nigræ. They were condemned, in a council held at Rome, two years after their separation; and afterwards in another at Arles, the year following; and again at Milan, before Constantine the Great, in 316. The errors of the Donatists, beside their schism, were, 1. That baptism conferred out of the church, that is, out of their sect, was null; and, accordingly, they re-baptized those who joined their party from other churches, and re-ordained their ministers. 2. That theirs was the only true, pure, and holy church; all the rest of the churches they held as prostitute and fallen.

Donatus seems likewise to have given into the doctrine of the Arians, with whom he was closely allied; and, accordingly, St. Epiphanius, Theodoret, and some others, accused the Donatists of Arianism; and it is probable that the charge was well founded, because they were patronized by the Vandals, who were of these sentiments. But St. Augustine, ep. 185, to count Boniface, et Hær. 69, affirms that the Donatists, in this point, kept clear of the errors of their leader.

DO'NATIVE. *s.* (*donatif,* French.) 1. A gift; a largess; a present (*Hooker*). 2. (In law.) A benefice merely given and collated by the patron to a man (*Cowell*).

DONATO (Jerom), a Venetian nobleman of the sixteenth century, famous for his skill as a statesman, and as a man of letters. He was sent by the republic to effect a reconciliation between them and pope Julius II. That pontiff asked him for the title to the claims of Venice to the sovereignty of the Adriatic. "Your holiness, (said the ambassador,) will find it on the back of the record of Constantine's donation of the city of Rome, and its territories, to the pope."

DONATUS, a schismatic bishop of Carthage, founder of the sect of Donatists. His followers swore by him, and honoured him like a god. He died about the year 368.

DONAX, in zoology, a genus of the class vermes, order testacea. Animal a tethys; shell bivalve, with generally a crenulate margin; the frontal margin very obtuse; hinge with two teeth, and a single marginal one placed a little behind; sometimes with a double, and sometimes without any. Nineteen species; scattered through the different seas of the globe: of which three are found on our own shores:

1. D. trunculus. Shell smooth in front, within violet, the margin crenate.

2. D. denticulata. Shell very obtuse in front, the lips transversely wrinkled, finely striate longitudinally, the margin denticulate

3. D. irus. Shell oval, with transverse waved, erect, striate, membranaceous wrinkles or foliations. Inhabits the Mediterranean, and is found frequently on the shores of Devonshire and Cornwall, buried in the sands. About the size of a small kidney-bean. The interior parts very obtuse, and marked with arched wrinkles, which are erect and a little reflected, and larger towards the rim. The hinge somewhat resembles that of a Venus. See Plate LXXVII.

DONAWERT, a strong town of Germany, on the frontiers of Suabia, subject to the duke of Bavaria. Lat. 48. 52 N. Lon. 11. 5 E.

DONCASTER, a borough town in the West Riding of Yorkshire, with a market on Saturdays. This town contains 1246 well-built houses, and 5697 inhabitants. It is governed by a mayor, and has a manufacture of stockings, knit-waistcoats, and gloves. Lat. 53. 33 N. Lon. 1. 12 W.

DONE. The part. pass. of *To do.*

Done. *interject.* The word by which a wager is concluded (*Cleaveland*).

DONEGAL, a county of Ireland, in the province of Ulster, 68 miles long, and 44 broad. It is bounded on the E. by Londonderry and Tyrone, on the W. and N. by the ocean, and on the S. by Fermanagh and the bay of Donegal. It contains forty parishes, and did send twelve members to parliament. It is, in general, a champaign country, and abounds with harbours.

Donegal, a town of Ireland, capital of a county of the same name, seated on the bay of Donegal. Lat. 54. 42 N. Lon. 7. 47 W.

DONERAILE, a town of Ireland, in the county of Cork. Near it are quarries of beautiful variegated marble. Lat. 52. 5 N. Lon. 8. 42 W.

DONGALA, a town of Nubia, with a castle. It contains 10,000 houses of wood, and is seated on the Nile. Lat. 21 N. Lon. 30. 35 E.

DO'NJON. *s.* (now *dungeon.*) The highest and strongest tower of the castle, in which prisoners were kept (*Chaucer*).

DONNINGTON, a town in Lincolnshire, with a market on Saturdays. Lat. 52. 55 N. Lon. 0. 7 W.

DO'NOR. *s.* (from *dono*, Latin.) A giver; a bestower (*Atterbury*).

DO'NSHIP. *s.* (from *don.*) Quality or rank of a gentleman or knight (*Hudibras*).

DONN (Benjamin), an English mathematician, born at Biddeford, in Devonshire, in 1729. He kept a school in that town for some years, and while there made a complete survey of the county, for which he received a premium of 100*l.* from the society for promoting arts and commerce. He also published his Mathematical Essays in 8vo. which had a favourable reception, and procured him the office of keeper of the library at Bristol; where he also kept a flourishing academy for some years. In 1771 he printed an Epitome of Natural and Experimental Philosophy, 12mo. and in 1774, a work entitled The British Mariner's Assistant, being a collection of tables for nautical purposes. In 1796 he was appointed master of mechanics to the king. He died in 1798, leaving behind him the character of an ingenious and worthy man. Besides the books above-mentioned, he wrote Treatises on Geometry, Book-keeping, and Trigonometry.

DONNE (Dr. John), an excellent poet and divine of the seventeenth century. His parents were of the Romish religion, and used their utmost efforts to keep him firm to it; but his early examination of the controversy between the church of Rome and the Protestants, at last determined him to choose the latter. He travelled into Italy and Spain, where he made many useful observations, and learned their languages to perfection. Soon after his return to England, sir Thomas Egerton, keeper of the great seal, appointed him his secretary; in which post he continued five years. He marrying privately Anne, the daughter of sir George Moore, then chancellor of the garter, and niece to the lord keeper's lady, was dismissed from his place, and thrown into prison. But he was reconciled to sir George by the good offices of sir Francis Wolley. In 1612, he accompanied sir Robert Drury to Paris. During this time many of the nobility solicited the king for some secular employment for him. But his majesty, who took pleasure in his conversation, had engaged him in writing his Pseudo Martyr, printed at London in 1610; and was so highly pleased with that work, that in 1614 he prevailed with him to enter into holy orders; appointed him one of his chaplains, and procured him the degree of doctor of divinity from the university of Oxford. In 1619 he attended the earl of Doncaster in his embassy into Germany. In 1621 he was made dean of St. Paul's: and the vicarage of St. Dunstan in the west, in London, soon after fell to him; the advowson of it having been given to him long before by Richard, earl of Dorset. By these and other preferments, he was enabled to be charitable to the poor, kind to his friends, and to make good provision for his children. He wrote, besides the above, 1. Devotions upon emergent Occasions. 2. The Ancient History of the Septuagint, translated from the Greek of Aristeus, quarto. 3. Three volumes of Sermons, folio. 4. A considerable number of Poems; and other works. He died in 1631, and was interred in St. Paul's cathedral, where a monument was erected to his memory. His writings show him to be a man of incomparable wit and learning; but his greatest excellence was satire. He had a prodigious richness of fancy, but his thoughts were much debased by his versification. He was, however, highly esteemed by all the great men of that age.

DOOAB, or Doobah, a fertile tract of Hindustan Proper, between the Ganges and Jumna, and formed by the confluence of those rivers. The principal part of it is subject to the nabob of Oude.

DOO'DLE. *s.* A trifler; an idler.

DOOLS, a term used in several parts of the kingdom for balks, or slips of pasture, left between the furrows of ploughed lands.

To DOOM. *v. a.* (ꝺeman, Saxon.) 1. To judge (*Milton*). 2. To condemn to any punishment; to sentence (*Smith*). 3. To pronounce condemnation upon any (*Dryden*). 4. To command judicially or authoritatively (*Shakspeare*). 5. To destine; to command by uncontrollable authority (*Dryden*).

Doom. *s.* (ꝺom, Saxon.) 1. Judicial sentence; judgment (*Milton*). 2. The great and final judgment (*Shakspeare*). 3. Condemnation (*Shakspeare*). 4. Determination declared (*Shakspeare*). 5. The state to which one is destined (*Dryden*). 6. Ruin; destruction (*Pope*).

DO'OMSDAY. *s.* (*doom* and *day.*) 1. The day of final and universal judgment; the last, the great day (*Brown*). 2. The day of sentence or condemnation (*Shakspeare*).

Do'omsday-book. See Dome's-day-book.

DOON (Loch), a lake of Ayrshire, in the district of Kyle, six miles in length, and of considerable breadth. A river of the same name issues from this lake, and falls into the frith of Clyde.

DOOR. *s.* (ꝺoꞃ, ꝺoꞃe, Saxon.) 1. The gate of a house; that which opens to yield entrance (*Denham*). 2. In familiar language, a house (*Arbuthnot*). 3. Entrance; portal (*Dryden*). 4. Passage; means of approach (*Hammond*). 5. *Out of* Door, or Doors. No more to be found; quite gone; fairly sent away (*Locke*). 6. *At the* Door *of any one.* Imputable; chargeable upon him (*Dryden*). 7. *Next* Door *to.* Approaching to; near to; bordering upon (*L'Estrange*).

Door, in architecture, an aperture in a wall, to give entrance and exit in and out of the building, or some apartment thereof. Most of the observations that are applicable to windows may be applied to doors.

It is an observation of Palladio, that the principal door, or entrance of a house, must never be regulated by any certain dimensions, but by the dignity of the person that is to live in it: yet, to exceed rather in the more, than the less, is a mark of generosity; and may be excused with some noble emblem, or inscription, as that of the conte de Bevilacqua over his large gate at Verona, where had been committed a like disproportion, *patet Janua, cor magis.* The principal door should, unless it be very inconvenient, stand in the centre of the front.

Inside-doors, however small the building may be, should never be narrower than two feet nine inches; nor should they ever, in private houses, exceed three feet six inches in breadth, which is more than sufficient to admit the bulkiest person. Their height should at least be six feet three or four inches; otherwise a tall person cannot pass without stooping. In churches, palaces, &c. where there is a constant ingress and egress of people, the apertures must be larger.

DO'ORCASE. *s.* (*door* and *case.*) The frame in which the door is enclosed (*Moxon*).

DOOR-HINGE. See Hinge.

DO'ORKEEPER. *s.* (*door* and *keeper.*) Porter; one that keeps the entrance of a house (*Taylor*).

DOQUET, a paper containing a warrant.

DORADO, or Dory, in ichthyology. See Zeus.

Dorado, in astronomy. See Xiphias.

DORÆ'NA, in botany, a genus of the class pentandria, order monogynia. Corol five-cleft; stigma notched; capsule one-celled, one-valved, many-seeded. One species; a native as is supposed of Japan; a dwarf tree, with alternate branches; white, minute flowers, in lateral racemes.

DORCHESTER, the capital of Dorsetshire, with markets on Wednesdays and Saturdays. It is a town of great antiquity. It now has three parishes, 353 houses, 2402 inhabitants, sends two members to parliament, and is governed by a mayor. It is seated on the river Frome, and has been long celebrated for its stong beer. Lat. 50. 42 N. Lon. 2. 45 W.

Dorchester, a town in Oxfordshire, which was a station of the Romans, and ruined in the wars with the Danes. It was a bishop's see till 1086, when William the Conqueror translated it to Lincoln; and it had five stately churches, though now but one. Lat. 51. 39 N. Lon. 1. 0 W.

DORDOGNE, a department of France, which includes the late province of Perigord. It receives its name from a river which rises in the mountains of Auvergne, and falls into the Garonne near Bourdeaux.

DOREE, or Jaune Doree, whence we have John Dory, in ichthyology. See Zeus.

DORIAN, in ancient music, the fourth species of the diapason.

DORIC, in architecture, is the second of the five orders, being that between the Tuscan and Ionic: its character is grave, robust, and masculine; hence, it is often termed the Herculean order.

At its first invention it was more simple than at present; and when in after-times they came to adorn and enrich it more, the appellation Doric was restrained to this richer manner, and the primitive simple manner they called by a new name, the Tuscan order, which was chiefly used in temples; as the former, being somewhat more light and delicate, was for porticos and theatres. The tradition is, that Dorus, king of Achaia, having first built a temple of this order at Argos, which he dedicated to Juno occasioned it to be called Doric; though others derive its name, from its being invented or used by the Dorians.

For the description of the principal parts which compose this order, we refer to sect. vi. of our Treatise on Architecture, Plate 3 and 16.

Doric dialect, in grammar, one of the five dialects, or manners of speaking which were principally in use among the Greeks.

It was first used by the Lacedæmonians, and particularly those of Argos; thence it passed into Epirus, Libya, Sicily, the islands of Rhodes and Crete.

In this dialect, Archimedes and Theocritus wrote, who were both of Syracuse; as likewise Pindar.

The general rules of this dialect are thus given by the Port-royalists:

D'ε Ητα, d'ω grand, d'ι, d'ο & d'ȣ l'α fait le
Dore.
D'ει fait ητα; d'ȣ, ω; & d'ω αυ fait encore.
Oste ι de l'infini: & pour le singulier
Se sert au femenin du nombre plurier.

But they are much better explained in the fourth book of Rulandus; where he even notes the minuter differences of the dialects of Sicily, Crete, Tarentum, Rhodes, Lacedæmon, Laconia, Macedonia, and Thessaly.

Doric mode, in music, the first of the authentic modes of the ancients. Its character is to be severe, tempered with gravity and joy; and is proper upon religious occasions, as also to be used in war. It begins *D, la, sol, re.* Plato admires the music of the Doric mode, and judges it proper to preserve good manners as being masculine; and on this account allows it in his commonwealth. The ancients had likewise their subdoric or hypodoric mode, which was one of the plagal modes. Its character was to be very grave and solemn: it began with *re*, a fourth lower than the Doric.

DORIS, in zoology, a genus of the class vermes, order mollusca. Body creeping, oblong, and flat beneath; mouth placed below on the fore-part; vent behind on the back, and surrounded by a fringe. Feelers from two to four, seated on the upper part of the body in front, and retractile within their proper receptacles. Twenty-four species; some with four tentacles or feelers; some with only two. Generally found in the European seas, north or south, adhering to floating timber, or sea-weeds, or zoophytes; some of them move like naked snails. There are three found on our own coasts; of which one,

D. argo, is usually called the sea-lemon, with oval body, smooth; two feelers at the mouth; vent surrounded by a ramified fringe; body red, with sulphur spots and black dots; length three inches and a half.

The most splendid of the tribe is d. radiata, about an inch long, found in the ocean around the West Indies. Body pale blue, with a silver gloss; the margin and tips of all the papillæ rich blue; obtuse in front, and tapering to a fine point behind.

Doris, a country of Greece, between Phocis, Thessaly, and Acarnania. It received its name from Dorus, the son of Deucalion, who made a settlement there. It was called Tetrapolis, from the four cities which it contained.

DO'RMANT. *a.* (*dormant*, Fr.) 1. Sleeping (*Congreve*). 2. In a sleeping posture (*Brown*). 3. Private; not publick (*Bacon*). 4. Concealed; not divulged (*Swift*). 5. Leaning; not perpendicular (*Cleaveland*).

Dormant-tree, in building, a summer-beam.

DORMER, in architecture, a window made in the roof of a house, being raised upon the rafters; it is often called a luthern.

DO'RMITORY. *s.* (*dormitorium*, Latin.) 1. A place to sleep in; a room with many beds (*Mortimer*). 2. A burial place (*Ayliffe*).

DORMOUSE, in mastiology. See Myoxus.

DORN. *s.* (from *dorn*, German, a thorn.) A fish; the thornback (*Carew*).

DO'RNICK. *s.* (of *Deornick*, in Flanders, where first made.) A species of linen cloth used in Scotland for the table.

DORNOCH, the county-town of Sutherlandshire, at the entrance of a frith of the same name, over which there is a ferry to Tain. Lat. 57. 52 N. Lon. 3. 48 W.

DORO'NICUM. Leopard's bane. In botany, a genus of the class syngenesia, order polygamia superflua. Receptacle naked; down simple; calyx scales in a double row, equal, longer than the disk; seeds of the ray naked and without down. Six species; all European plants: but of which the two following are alone worth noticing.

1. D. pardalianches. A native of Germany; leaves denticulate, uppermost roundish hearted; middle ones spatulate-hearted; lower and radical ones heart-shaped, petioled. The flowers are yellow; and the plant is often cultivated in our own gardens, which it may be by its seeds, and that so readily, as where it once takes root, to overrun the entire garden. The plant is known in old pharmacopœias under the name of doronicum Romanum: its root, if given largely, exhibits poisonous properties; but instances are upon record of its efficacy in epileptic and other nervous diseases.

2. D. austriacum. Leaves denticulate; uppermost lanceolate, clasping; lower ones spatulate-ovate; radical ones heart-shaped, petioled. It is found wild in our own mountainous pastures, and in some vernacular floras is denominated, like the former, d. pardalianches.

To DORR. *v. a.* (*tor*, stupid, Teutonick.) To deafen or stupify with noise (*Skinner*).

Dorr. *s.* A kind of flying insect; the hedge-chafer (*Grew*).

DORSAL. (from *dorsum*, back.) Any thing that belongs to the back; as dorsal glands, dorsal nerves, dorsal muscles, &c.

Dorsal awn. (*dorsalis arista.*) In botany, fixed to the back or outer side of the glume, not springing from the end; as in bromus and avena. *Lateri exteriori glumæ imposita.*

DO'RSEL. Do'rser. *s.* (from *dorsum*, the back.) A pannier; a basket or bag, one of which hangs on either side of a beast of burden.

DORSETSHIRE, a county of England, bounded on the N. by Somersetshire and Wiltshire; on the E. by Hampshire; on the S. by the English channel; and on the W. by Devonshire and Somersetshire; extending 50 miles in length from E. to W. and 38 from N. to S. where broadest; containing 22 market-towns, 248 parishes, 22,262 houses, and 115,319 inhabitants. It sends 20 members to parliament, and contains 610,000 acres of land, 85,000 of which are uncultivated, including woodlands. The air is for the most part very good and wholesome. On the hills it is somewhat bleak and sharp, but it is very mild and pleasant near the coast. The soil is generally rich and fertile, though in some parts very sandy. The northern part, which is divided by a range of chalk hills from the southern, was anciently overspread with forests, but now affords good pasture for cattle; while the southern part chiefly consists of fine downs, and feeds incredible numbers of sheep. The chalk hills, which run through every county from the S. E. part of the kingdom thus far, terminate at the farther extremity of this; but on the coast, chalk cliffs extend beyond it into Devonshire, ten miles W. of Lyme. This county sends 411 men to the national militia.

DORSI SPINALIS, in anatomy. See SPINALIS DORSI.

DORSTE'NIA. So called in honour of Dr. Dorsten. In botany, a genus of the class tetrandria, order monogynia. Receptacle common, one-leaved, fleshy, in which the seeds are separately imbedded. Eleven species; almost all natives of the West Indies or South America. They are low, herbaceous plants, with roots full of knots, an inch or two in length, about half an inch thick, externally of a reddish brown colour, but pale within. The contreyerva of the dispensaries is obtained almost indiscriminately from the roots of three of these species. D. contrajerva; d. Houstoni, so named from Dr. Houston; d. Drakena, so named from sir Francis Drake. See CONTRAYERVA.

DORT, or DORDRECHT, a strong town of Holland, in the United Provinces, famous for a synod held there in 1618, when the opinions of Arminius and his followers were condemned. It is seated on an island formed by an inundation of the sea, which, in 1421, swallowed up 70 villages, and 100,000 people. It is 37 miles almost S. of Amsterdam. Lat. 51. 50 N. Lon. 4. 48 E.

DORTMUND, a strong imperial town of Westphalia, in the county of Marck, seated on the Elster. Lat. 51. 26 N. Lon. 7. 35 E.

DO'RTURE. *s.* (from *dormiture*, *dortoir*, Fr.) A dormitory; a place to sleep in (*Bacon*).

DORY, or JOHN DORY, in ichthyology. See ZEUS.

DORY'CRINUM, in botany, a genus of the class diadelphia, order decandria. Calyx five-toothed, two-lipped; filaments subulate; stigma capitate; legume turgid, one or two-seeded. Three species; natives of the south of France, and the Levant.

DO'RYLUS, in zoology, a tribe of hymenopterous insects, belonging to the genus mutilla; thus denominated in the system of Fabricius.

DORYPHORI. (from δορυ, spear, and φερω, I bear.) An appellation given to the life-guard men of the Roman emperors.

DOSE. *s.* (δοσις.) 1. So much of any medicine as is taken at one time (*Quincy*). 2. Any thing nauseous (*South*). 3. As much of any thing as falls to a man's lot (*Hudibras*). 4. Quantity (*Granville*).

To DOSE. *v. a.* To proportion a medicine properly to the patient or disease (*Derham*).

DOSITHEANS, DOSITHEI, an ancient sect among the Samaritans, in the first century of the Christian æra.

Mention is made in Origen, Epiphanius, Jerom, and divers other Greek and Latin fathers, of one Dositheus, the chief of a faction among the Samaritans; but the learned are not at all agreed as to the time wherein he lived. St. Jerom, in his Dialogue against the Luciferians, places him before our Saviour; wherein he is followed by Drusius, who, in his answer to Serrarius, places him about the time of Sennacherib, king of Assyria; but Scaliger will have him posterior to our Saviour's time. And, in effect, Origen intimates him to have been contemporary with the apostles; where he observes, that he endeavoured to persuade the Samaritans, that he was the Messiah foretold by Moses.

Archbishop Usher takes Dositheus to be the author of all the changes made in the Samaritan Pentateuch; which he argues from the authority of Eulogius: but all we can justly gather from the testimony of Eulogius is, that Dositheus corrupted the Samaritan copies since used by that sect; but that corruption did not pass into all the copies of the Samaritan Pentateuch, now in use among us, which vary but little from the Jewish Pentateuch.

Tertullian, making mention of the same Dositheus, observes, that he was the first who dared to reject the authority of the prophets, by denying their inspiration. But he charges that as a crime peculiar to this sectary, which, in reality, is common to the whole sect, who have never allowed any but the five books of Moses for divine.

DO'SSIL. *s.* (from *dorsel.*) A pledget; a lump of lint to be laid on a sore (*Wiseman*).

DOST. The second person of *do.*

DOT. *s.* (from *jot*, a point.) A small point or spot made to mark any place in a writing.

DOT, in music, a point placed after a note, which increases the duration of that note by one half. If another dot be placed after this dot, the increase is augmented by its half; or the original note is lengthened by three-fourths of its value.

To DOT. *v. n.* (from the noun.) To make dots or spots.

DO'TAGE. *s.* (from *dote.*) 1. Loss of understanding; imbecility of mind; deliriousness (*Dav. Suck.*). 2. Excessive fondness (*Dry.*).

DO'TAL. *a.* (*dotalis*, Latin.) Relating to the portion of a woman (*Garth*).

DO'TARD. *s.* (from *dote.*) A man whose age has impaired his intellects (*Spenser*).

DOTA'TION. *s.* (*dotatio*, Lat.) The act of giving a dowry or portion.

To DOTE. *v. n.* (*doten*, Dutch.) 1. To have the intellect impaired by age or passion; to be delirious (*Jeremiah*). 2. To be in love to extremity (*Sidney*). 3. *To* DOTE *upon.* To regard with excessive fondness; to love to excess (*Burnet*).

DO'TER. *s.* (from *dote.*) 1. One whose understanding is impaired by years; a dotard (*Burton*). 2. A man fondly, weakly, and excessively in love (*Boyle*).

DO'TINGLY. *ad.* (from *doting.*) Fondly (*Dryden*).

DO'TTARD. *s.* A tree kept low by cutting (*Bacon*).

DOTTED LEAF. (*folium punctatum.*) In botany, besprinkled or pounced with hollow dots or points. Quod punctis excavatis adspersum est. As in anthemis maritima. Applied also to the receptacle; as in leontodon, cacalia, ethulia, xeranthemum, chrysanthemum, othonna.

DOTTREL, in ornithology. See Charadrius.

DOUAY, a considerable town of France, in the department of the North, and late French Flanders. It has a fine arsenal, a foundery for cannon, and a military school. Lat. 50. 22 N. Lon. 3. 10 E.

DO'UBLE. *a.* (*double*, French.) 1. Two of a sort; one corresponding to the other; in pairs (*Ecclus.*). 2. Twice as much; containing the same quantity repeated (*Ben Jonson*). 3. Having one added to another; having more than one in the same order or parallel (*Bacon*). 4. Twofold; of two kinds (*Dryden*). 5. Two in number (*Davies*). 6. Having twice the effect or influence (*Shakspeare*). 7. Deceitful; acting two parts (*Shakspeare*).

Do'uble. *ad.* Twice over (*Bacon*).

To Do'uble. *v. a.* (from the adjective.) 1. To enlarge any quantity by addition of the same quantity (*Shakspeare*). 2. To contain twice the quantity (*Dryden*). 3. To repeat; to add (*Dryden*). 4. To add one to another in the same order or parallel (*Exodus*). 5. To fold (*Prior*). 6. To pass round a headland (*Knolles*).

To Do'uble. *v. n.* 1. To increase to twice the quantity (*Burnet*). 2. To enlarge the stake to twice the sum in play (*Dryden*). 3. To turn back, or wind in running (*Bacon*). 4. To play tricks; to use sleights.

Do'uble, *s.* 1. Twice the quantity or number (*Graunt*). 2. Strong beer; beer of twice the common strength (*Shakspeare*). 3. A turn used to escape pursuit (*Blackmore*). 4. A trick; a shift; an artifice (*Addison*).

Double, in botany. Double leaves; two connected by one petiole. Double stipules: two and two by pairs. Double peduncle: two from the same point. Different from Two-flowered and Twin, which see.

Double, in hare-hunting. The hare is said to double, when, being considerably ahead of the hounds, she throws herself to the right or left, and returns in a parallel line to the track she went before; getting into which, she is said to run the foil. If during the chase she lies down, she is then said to squat.

Double, in the manage. A horse is said to double the reins, when he leaps several times successively in order to throw his rider.

DOUBLE-BASS, or Violono, a large, deep-toned bass stringed instrument, the tones of which are an octave below those of the violoncello.

DO'UBLE-BITING. *a.* Biting or cutting on either side (*Dryden*).

DO'UBLE-BUTTONED. *a.* Having two rows of buttons (*Gay*).

DOUBLED, in music, the D below G gammut.

DO'UBLE-DEALER. *s.* A deceitful, subtle, insidious fellow; one who says one thing and thinks another (*L'Estrange*).

DO'UBLE-DEALING. *s.* Artifice; dissimulation; low or wicked cunning (*Pope*).

To DO'UBLE-DIE. *v. a.* To die twice over.

DOUBLE EMPLOYMENT, in music, a name given by M. Rameau to the two different ways in which the chord of the sub-dominant may be regarded and treated, viz. as the fundamental chord of the sixth superadded, or as the chord of the greater sixth, inverted from fundamental chord of the seventh. In reality, the chords carry exactly the same notes, are figured in the same manner, are employed upon the same chord of the tone, in such a manner that frequently we cannot discern which of the two chords the author employs, but by the assistance of the subsequent chord, which resolves it, and which is different in these different cases. To make this distinction we must consider the diatonic progress of the two notes which form the fifth and the sixth, and which, constituting between them the interval of a second, must one or the other constitute the dissonance of the chord. Now, this progress is determined by the motion of the bass. Of these two notes, then, if the superior be the dissonance, it will rise by one gradation into the subsequent chord, the lower note will keep its place, and the higher note will be a superadded sixth. If the lower be the dissonance, it will descend into the subsequent chord, the higher will remain in its place, and the chord will be that of the great sixth.

DO'UBLE-HEADED. *a.* Having the flowers growing one to another (*Mortimer*).

DOUBLE-LETTER, in grammar, a letter which has the force and effect of two; as the Hebrew *tsade*, which is equivalent to T and S; or the Greek ξ, or Latin *x*, &c.

These letters are evidently equal to two; when we pronounce the Latin *axis*, or the English axillary, we give the *x* the same sound as if it were written with two *cc*, *accis*, accillary; or a *c* and *s*, *acsis*, acsillary.

The Greeks have three, ζ, Ξ, Ψ; the Latins only two, X and Z; and most of the modern languages have the same.

To DO'UBLE-LOCK. *v. a.* To shoot the lock twice (*Tatler*).

DO'UBLE-MINDED. *a.* Unsettled; undetermined (*James*).

DOUBLE-OCTAVE, in music, an interval composed of fifteen notes in diatonic progression; and which, for that reason, is called a fifteenth. "It is (says Rousseau) an interval composed of two octaves, called by the Greeks *disdiapason*."

DO'UBLE-PLEA. *s.* That in which the defendant alleges for himself two several matters, whereof either is sufficient to effect his desire in debarring the plaintiff (*Cowell*).

DOUBLE-POINT, in the higher geometry, is a point which is common to two legs or branches of some curve of the second or higher order: such as an infinitely small oval, or a cusp, or the cruciform intersection of some curve. See Curve.

DO'UBLE-SHINING. *a.* Shining with double lustre (*Sidney*).

DO'UBLE-TONGUED. *a.* Deceitful; giving contrary accounts of the same thing (*Dryden*).

DOUBLE-TONGUEING, in music, a particular motion of the lips, adopted by players on the German flute, to give a brilliant, yet distinct articulation to rapid divisions. In order to this, Mr. Gunn recommends a kind of action and re-action, by pronouncing distinctly the syllables *diddle, diddle*, of which the first syllable articulates one note; and the second is articulated, but in a less distinct manner, by the re-action of the tongue in the second syllable.

DOUBLED TOGETHER, in botany. See CONDUPLICATE.

DO'UBLENESS. *s.* (from *double.*) The state of being double (*Shakspeare*).

DO'UBLER. *s.* He that doubles any thing.

DOUBLER, in electricity. See ELECTRICITY.

DO'UBLET. *s.* (from *double.*) 1. The inner garment of a man; the waistcoat (*Hudibras*). 2. Two; a pair (*Grew*).

DOUBLETS, a game on dice within tables; the men, which are only fifteen, being placed thus: Upon the size, cinque, and quatre points, there stand three men apiece; and upon the trey, duce, and ace, only two. He that throws highest has the benefit of throwing first, and what he throws he lays down, and so does the other; what the one throws, and has not, the other lays down for him, but on his own account; and thus they continue till all the men are down, and then they bear. He that is down first, bears first; and will doubtless win the game, if the other throw not doublets to overtake him: which he is sure to do, since he advances or bears as many as the doublets make, viz. eight for two fours.

DOUBLING, in the military art, is the putting two ranks or files of soldiers into one. Thus, when the word of command is, double your ranks, the second, fourth, and sixth ranks march into the first, third, and fifth, so that the six ranks are reduced to three, and the intervals between the ranks become double what they were before. To double by half-files, is when the fourth, fifth, and sixth ranks march up to double the first, second, and third, or the contrary. To double the files to the right, is when every other file faces to the right, and marches into the next file to it, so that the six ranks are turned into twelve, and every file is twelve deep. To double the files to the left, is when every other file faces to the left, and marches into the next. In doubling the files, the distance between the files becomes double.

DOUBLING, in navigation, the act of sailing round a cape, point of land, &c. so as that the cape or point of land becomes between the ship and her former situation.

DOUBLINGS, in heraldry, the linings of robes and mantlings in achievements.

DOUBLON, or DOUBLOON, a Spanish and Portuguese coin, being the double of a pistole.

DO'UBLY. *ad.* (from *double.*) In twice the quantity; to twice the degree (*Dryden*).

DOUBLY-COMPOUND. In botany. See DECOMPOUND.

DOUBLY-CRENATE LEAF. In botany. Having small notches on the larger.

DOUBLY-PINNATE. In botany. See BIPINNATE.

DOUBLY-SERRATE. In botany. Duplicato-serratum. Having small teeth on the larger.

DOUBLY-TERNATE. In botany. See BITERNATE.

To DOUBT. *v. n.* (*doubter*, French.) 1. To question; to be in uncertainty (*Tillotson*). 2. To question any event, fearing the worst (*Shakspeare*). 3. To fear; to be apprehensive of ill (*Baker*). 4. To suspect; to have suspicion (*Daniel*). 5. To hesitate; to be in suspense (*Dryden*).

To DOUBT. *v. a.* 1. To hold questionable; to think uncertain. 2. To think endangered (*Milton*). 3. To fear; to suspect (*Bacon*). 4. to distrust; to hold suspected (*Pope*).

The words doubt and but are frequently used erroneously in grammatical construction: an ingenious writer in the Monthly Magazine for Jan. 1804, gave a curious exposition of this matter by the aid of mathematical signs; we shall here insert it for the amusement of our readers, especially as a similar method may be sometimes applied to the solution of other grammatical questions.

I.

1. I *think* it.
I *doubt* it.
2. I do not *doubt* that I shall; or
I do not *think* that I shall not.
3. I do not *doubt* that I shall; or
I *think* that I shall.
Cor. Thus, 1. *doubt* and *think* are opposite.
2. *doubt* is equivalent to *think not*; and,
3. *think* is equivalent to *doubt not.*
Or, adopting the positive and negative signs of algebra,
2. $+\mathit{doubt} = -\mathit{think}$; and
3. $+\mathit{think} = -\mathit{doubt}$.

II.

1. I do not think *that* I shall.
I do not think *but* I shall.
2. I do not think *but* I shall; or,
I do not think *that* I shall *not.*
3. I do *not* think *but* I shall; or,
I think *that* I shall.
Cor. Thus, 1. *that* and *but* are opposite:
2. *but* is equivalent to *that not*; and
3. *that* is equivalent to *but not.*
Algebraically,
2. $+\mathit{but} = -\mathit{that}$; and
3. $+\mathit{that} = -\mathit{but}$.

III.

Then,
1. I do not *doubt that* I shall (I. 2. 3.), and
I do not *think but* I shall (II. 2. 3.), being each equivalent to
2. I do *not think* that I shall *not* (I. 2, II. 2.), and to
I *think* that I shall, (I. 3, II. 3:)
Cor. The former two phrases are equivalent to each other; whence

1. *doubt that* is equivalent to *think but,* algebraically *—think that* (I. 2.) = *think—that* (II. 2):
And the latter two phrases are also equivalent to each other; whence
2. two opposing negatives are equivalent to an affirmative, (algebraically, *—think—that* = *+ think that.*)

IV.

Hence, by I.,
I do not think but I shall; and,
I do not doubt but I shall,
must be *opposite*: And,
I DO NOT DOUBT THAT I SHALL
will be equivalent to,
I do not think that I shall not, or (III. *Cor.* 2.)
I THINK THAT I SHALL.
Also, by II.,
I do not doubt that I shall; and,
I do not doubt but I shall,
must be *opposite*: And,
I DO NOT DOUBT BUT I SHALL
will be equivalent to,
I do not doubt that I shall not; or (III. *Cor.* 2.)
I doubt that I shall, i. e. (I. *Cor.* 2.)
I THINK THAT I SHALL NOT.

Johnson explains *But* (see its thirteenth sense in his Dictionary) as being "used after *no doubt*, *no question*, and such words; and signifying the same with *that*." It is curious that in every one of the three examples which he quotes, it means strictly the contrary to *that* (or, algebraically, *— that*), and the use of *that* alone will express a meaning precisely opposite.

But is used in the same erroneously indiscriminate manner after the verbs *to deny*, *dispute*, *question*, *believe*, *think*, *&c.* and also after such words as *impossible*, *improbable*, &c. in all which cases *that* should be substituted for *but*.

DOUBT. *s.* (from the verb.) 1. Uncertainty of mind; suspense (*South*). 2. Question; point unsettled (*Pope*). 3. Scruple; perplexity; irresolution (*Shakspeare*). 4. Uncertainty of condition (*Deuteronomy*). 5. Suspicion; apprehension of ill (*Galatians*). 6. Difficulty objected (*Blackmore*).

DO'UBTER. *s.* (from *doubt.*) One who entertains scruples; one who hangs in uncertainty.

DO'UBTFUL. *a.* (*doubt* and *full.*) 1. Dubious; not settled in opinion (*Shakspeare*). 2. Ambiguous; not clear in its meaning. 3. Obscure; questionable; uncertain (*Dryden*). 4. Hazardous; of uncertain event (*Milton*). 5. Not secure; not without suspicion (*Hooker*). 6. Not confident; not without fear (*Milton*). 7. Partaking of different qualities (*Milton*).

DO'UBTFULLY. *ad.* 1. Dubiously; irresolutely. 2. Ambiguously; with uncertainty of meaning (*Spenser*).

DO'UBTFULNESS. *s.* (from *doubtful.*) 1. Dubiousness; suspense; instability of opinion (*Watts*). 2. Ambiguity; uncertainty of meaning (*Locke*). 3. Hazard; uncertainty of event.

DO'UBTINGLY. *ad.* (from *doubt.*) In a doubting manner; dubiously (*Bacon*).

DO'UBTLESS. *a.* (from *doubt.*) Free from fear; void of apprehension of danger (*Shakspeare*).

DO'UBTLESS. *ad.* Without doubt; unquestionably (*Woodward*).

DOUCE'T. *s.* (*doucet*, French.) A custard (*Skinner*).

DOUCINE, in architecture, the same as CYMATIUM or GULA.

DOVE, in ornithology. See COLYMBA.

DO'VECOT. *s.* (*dove* and *cot.*) A small building in which pigeons are bred and kept (*Shakspeare*).

DO'VEHOUSE. *s.* (*dove* and *house.*) A house for pigeons (*Dryden*).

DOVE'S-FOOT, in botany. See GERANIUM.

DOVE-TAILING, in joinery, a very excellent method of fastening boards together, by letting one piece into another: the tenon, or piece of wood which is put in, goes widening to the extreme, so that it cannot be drawn out obliquely without breaking the stuff.

DOVELLA, in ichthyology. See LABRUS.

DOVER (the ancient Dubris), a seaport of Kent, with markets on Wednesdays and Saturdays. It is strong both by nature and art. This town contains 3570 houses, and 14,845 inhabitants. It is one of the cinque ports, and a corporation, governed by a mayor and 12 jurats, and sending two members to parliament. From this place to Calais packet-boats are regularly passing in time of peace. Here is an ancient castle, built on a high hill, E. from the town. The harbour is made by a gap in the cliffs, which are here of a sublime height, though certainly exaggerated in Shakspeare's celebrated description. Lat. 51. 8 N. Lon. 1. 24 E.

DOVER, a town in the county of Kent, and state of Delaware, in N. America. It is the seat of the government, and stands on Jones's Creek. Lat. 39. 10 N. Lon. 75. 30 W.

DOVER STRAITS, the narrow channel between Dover and Calais, which separates our island from the opposite continent. Britain is supposed by many to have been once peninsulated, the present straits occupying the site of the isthmus which joined it to Gaul. These celebrated straits are only 21 miles wide in the narrowest part. From the pier at Dover to that of Calais is 24. The spring tides in the straits rise, on an average, 24 feet, the neap-tides, 15 feet.

DOUGH. *s.* (ðah, Saxon.) 1. The paste of bread yet unbaked (*Dryden*). 2. *My cake is* DOUGH. My affair has miscarried (*Shak.*).

DOUGHBA'KED. *a.* (*dough* and *baked.*) Unfinished; not hardened to perfection (*Donne*).

DOUGLAS (Gawin), a Scotch poet and bishop, was the younger son of the sixth earl of Angus, and born at Brechin in 1471. After going through his academical studies, he went to Italy, where he acquired a taste for poetry. On his return to his own country he obtained some ecclesiastical preferment, and in 1515 the bishopric of Dunkeld. He had afterwards the rich abbey of Aberbrothic added to his bishopric. He died at London in 1522. His works are: 1. A Translation of Virgil's Æneis. 2. The Palace of Honour, a poem. 3. Aureæ Narrationes, Comediæ aliquot Sacræ. 4. De Rebus Scoticis Liber.

Douglas, a seaport of the Isle of Man, having the best harbour in the island, and the best mart for trade. It is a populous, improving town, and has an ancient fort near the harbour. Lat. 54. 12 N. Lon. 4. 20 W.

DO'UGHTY. *a.* (ꝺohꞇıᵹ, Saxon.) Brave; noble; illustrious; eminent (*Spenser*). This word is now commonly used ironically.

DO'UGHY. *a.* (from *dough.*) Unsound; soft; unhardened (*Shukspeare*).

DOURLACH, a town of Suabia, capital of Baden-dourlach. Lat. 49. 2 N. Lon. 9. 28 E.

DOURO, a river which rises in Old Castile, in Spain, and running across Portugal, falls into the Atlantic, a little below Porto.

DOUSA (James), a learned Dutchman, born in 1545. He became eminent both as a scholar and as a soldier, and obtained in 1574 the government of Leyden. The year following a university was founded there, and Dousa made the first curator. He died in 1604. His son James, born in 1572, distinguished himself while a mere child, by his Latin poems. He also wrote notes upon Plautus, and at the age of 16 published his book, De Rebus Celistibus, and his Panegyric on a Shadow. He became tutor to the prince of Orange, and librarian of the university of Leyden. He died in 1597. (*Watkins*).

To DOUSE. *v. a.* (δυσις.) To put over head suddenly in the water.

To Douse. *v. n.* To fall suddenly into the water (*Hudibras*).

DOW (Gerard), an eminent painter, born at Leyden, in 1613. He was the disciple of Rembrandt, and acquired uncommon excellence in painting in miniature; and his pictures are so exquisitely touched, so transparent, and so wonderfully delicate, as to excite astonishment as well as pleasure. He died in 1674. (*Watkins*).

DO'WAGER *s.* (*douairiere*, French.) 1. A widow with a jointure (*Shakspeare*). 2. The title given to ladies who survive their husbands (*Shakspeare*).

DO'WDY. *s.* An awkward, ill-dressed, inelegant woman (*Shakspeare*).

DO'WER. Do'wery. *s.* (*douaire*, Fr.) 1. That which the wife brings to her husband in marriage (*Pope*). 2. That which the widow possesses (*Bacon*). 3. The gifts of a husband for a wife (*Genesis*). 4. Endowment; gift (*Davies*).

Dower, the portion which a widow hath of the lands of her husband, after his decease, for the sustenance of herself, and the education of her children.

Dower by the common law, is a third part of such lands or tenements whereof the husband was sole seised in fee-simple, or fee-tail, during the marriage, which the wife is to enjoy during her life; for which there lies a writ of dower.

Dower by custom. This kind of dower varies according to the custom and usage of the place, and is to be governed accordingly; and where such custom prevails, the wife cannot wave the provision thereby made for her, and claim her thirds at common law, because all customs are equally ancient with the common law itself.

Dower ad ostium ecclesiæ, is where a man of full age, seised of lands in fee, after marriage, endows his wife at the church door of a moiety, a third, or other part of his lands, declaring them in certainty; in which case, after her husband's death, she may enter into such lands without any other assignment, because the solemn assignment at the church door is equivalent to the assignment *in pais* by metes and bounds; but this assignment cannot be made before marriage, because before she is not entitled to the dower.

Dower ex assensu patris, is where the father is seised of lands in fee; and his son and heir apparent after marriage endows his wife by his father's assent, *ad ostium ecclesiæ*, of a certain quantity of them; in which case after the death of the son, his wife may enter into such parcel without any other assignment, though the father be living; but this assent of the father's must be by deed, because his estate is to be charged *in futuro*, and this may likewise be of more than a third part.

The dowers *ad ostium ecclesiæ*, or *ex assensu patris*, if the wife enter and assent to them, are a good bar of her in the common law; but she may, if she will, wave them, and claim her dower at common law, because being made after marriage, she is not bound by them.

DO'WERED. *a.* (from *dower.*) Portioned; supplied with a portion (*Shakspeare*).

DO'WERLESS. *a.* (from *dower.*) Wanting a fortune; unportioned (*Shakspeare*).

DO'WLAS. *s.* A coarse kind of linen (*Shakspeare*).

DOWLATABAD, formerly called Amednagur, a province of the Deccan of Hindustan; bounded by Candeish, Malvay, the Gauts, Visiapour, Golconda, and Berar.

Dowlatabad, a fortress of the Deccan of Hindustan. Lat. 19. 55 N. Lon. 76. 0 E.

DOWLE and Deal, in our old writers, are used to denote a division, or parting.

DOWN. *s.* (*duun*, Danish.) 1. Soft feathers (*Wotton*). 2. Any thing that soothes or mollifies (*Southern*). 3. Soft wool, or tender hair (*Prior*). 4. The soft fibres of plants which wing the seed (*Bacon*).

Down. *s.* (ꝺun, Saxon.) A large open plain; a flat on the top of a hill (*Pope*).

Down, in botany, is properly the English term for some sorts of pubescence; but it is used also for the pappus or little crown fixed on the top of some seeds, by which they fly: as dandelion, thistle, &c. This is, 1. feathered or plumose; or else, 2. capillary, hairy or simple. Some of these crowns are stiped, others sessile. Down ought not to be used in both senses. Pappus cannot well make an English substantive, though pappous may be employed as an adjective. Feather is not proper, for we cannot say, a *feathered* feather, and a *hairy* feather. Seed-down will distinguish it from pubescence. See Pappus.

Down, a county of Ireland, 42 miles long, and 34 broad, having St. George's Channel on the E. Armagh on the W. Antrim on the N. and N.W. and the Ocean on the S. It sends 14 members to parliament; and is fertile, though encumbered with bogs.

Down, the capital of the above county, remarkable for the tomb of St. Patrick. Lat. 54. 29 N. Lon. 5. 42 W.

Down. *prep.* (aꝺuna, Saxon.) 1. Along a descent; from a higher place to a lower (*Shakspeare*). 2. Toward the mouth of a river (*Knolles*).

Down. *ad.* Not up. 1. On the ground (*Milton*). 2. Tending toward the ground. 3. From former to latter times. 4. Out of sight; below the horizon (*Shakspeare*). 5. To a total subjection (*Arbuthnot*). 6. Into disgrace (*South*).

Down. *interject.* 1. An exhortation to destruction or demolition (*Dryden*). 2. A contemptuous threat (*Shakspeare*).

Down. (*To go.*) To be digested; to be received (*Locke*).

To **Down.** *v. a.* (from the participle.) To knock; to subdue; to conquer (*Sidney*).

DO'WNCAST. *a.* (*down* and *cast.*) Bent down; directed to the ground (*Addison*).

DO'WNFALL. *s.* (*down* and *fall.*) 1. Ruin; fall from rank or state (*South*). 2. A body of things falling (*Dryden*). 3. Destruction of fabrics (*Dryden*).

DO'WNFALLEN. *part. a.* (*down* and *fall.*) Ruined; fallen (*Carew*).

DO'WNGYRED. *a.* (*down* and *gyre.*) Let down in circular wrinkles (*Shakspeare*).

DOWNHAM, a town of Norfolk, with a market on Saturdays. This town is famous for its butter. Lat. 52. 40 N. Lon. 0. 20 E.

DO'WNHILL. *s.* Declivity; descent (*Dryden*).

Do'wnhill. *a.* Declivous; descending (*Con.*).

DO'WNLOOKED. *a.* (*down* and *look.*) Having a dejected countenance; gloomy; sullen; melancholy (*Dryden*).

DO'WNLYING. *a.* (*down* and *lie.*) About to be in travail of childbirth.

DO'WNRIGHT. *ad.* (*down* and *right.*) 1. Straight or right down (*Hudibras*). 2. In plain terms; without ceremony (*Shakspeare*). 3. Completely; without stopping short (*Arbuthnot*).

Do'wnright. *a.* 1. Plain; open; apparent; undisguised (*Rogers*). 2. Directly tending to the point (*Ben Jonson*). 3. Unceremonious; honestly surly (*Addison*). 4. Plain; without palliation (*Brown*).

DOWNS, a bank or elevation of sand, which the sea gathers and forms along its shores; and which serves it as a barrier. The word is formed from the French *dune*, of the Celtic *dum*, a " mountain."

Downs are particularly used for a famous road for ships along the eastern coast of the county of Kent, from Dover to the North Foreland; where both the outward and homeward-bound ships frequently make some stay; and squadrons of men of war rendezvous in time of war. It affords excellent anchorage; and is defended by the castles of Deal, Dover, and Sandwich.

DO'WNSITTING. *s.* (*down* and *sit.*) Rest; repose; the act of sitting down (*Psalm*).

DOWNTON, a borough in Wiltshire, with a market on Fridays. It is governed by a mayor, and sends two members to parliament. Lat. 51. 0 N. Lon. 1. 36 W.

DO'WNWARD. Do'wnwards. *ad.* (ꝺuneƿeaꞃꝺ, Saxon.) 1. Toward the centre (*Newton*). 2. From a higher situation to a lower (*Milton*). 3. In a course of successive or lineal descent (*Shakspeare*).

Do'wnward. *a.* 1. Moving on a declivity; tending toward the centre; tending to the ground (*Dryden*). 2. Declivous; bending (*Dryden*). 3. Depressed; dejected (*Sidney*).

DO'WNY. *a.* (from *down.*) 1. Covered with down or nap (*Shakspeare*). 2. Made of down or soft feathers (*Dryden*). 3. Soft; tender; soothing (*Crashaw*).

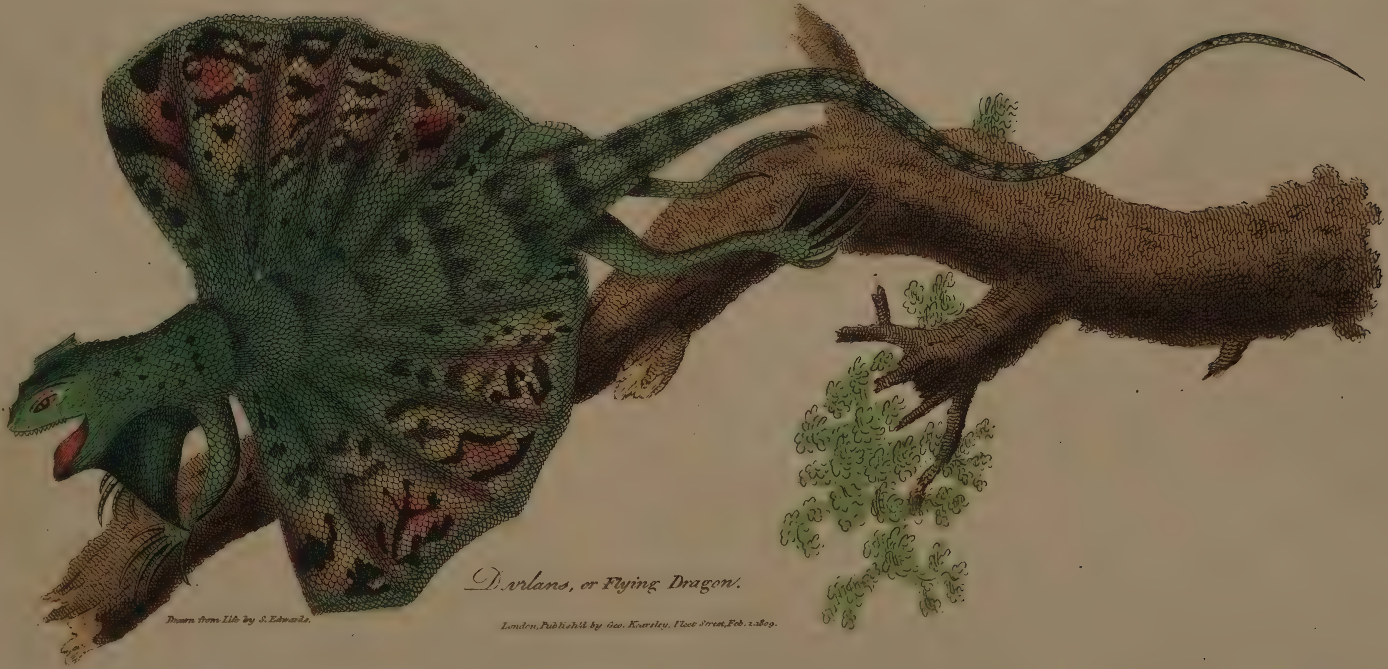
Downy-leaf, in botany. See Tomentous.

DO'WRE. Do'wry. *s.* (*douaire*, French. It ought to be written *dower.*) 1. A portion given with a wife (*Sidney*). 2. A reward paid for a wife (*Cowley*). See Dower.

DOXOLOGY, an appellation given by the Greeks to the fourteenth verse of the second chapter of St. Luke, *Glory be to God in the highest*, &c. because beginning with the Greek word δοξα, *glory*.

This they distinguish by the name of *great doxology*; and the *Gloria Patria*, *Glory be to the Father*, they call the *less doxology*, as beginning with the same word δοξα.

Philostorgius, lib. iii. n. 13. gives three formulas of the *lesser doxology*. The first is *Glory be to the Father, and to the Son, and to the Holy Ghost*; the second, *Glory be to the Father, by the Son, in the Holy Ghost*; and the third, *Glory be to the Father, in the Son, and the Holy Ghost*. Sozomen, and Nicephorus, give a fourth; viz. *Glory be to the Father, and the Son, in the Holy Ghost*. The first of these *doxologies* is that in common use throughout the western church. It was first instituted about the year 350, by the Catholics of Antioch, then called *Eustathians*.



D. volans, or Flying Dragon.

Drawn from Life by S. Edwards.

London, Publish'd by Geo. Kearsley, Fleet Street, Feb. 2. 1809.

The three others were composed by the Arians: the second was that of Eunomius, and Eudoxus, and was approved by Philostorgius. The three were all made about the year 341, in the council of Antioch, when they first began to disagree among themselves.

There were anciently very great disputes, and principally at Antioch, as to the form of *doxology*; that mostly used among the orthodox was the same as still obtains; the rest were affected by the Arians, and other Antitrinitarians; yet St. Basil, in his book on the Holy Spirit, defends the second as orthodox, and legitimate; and it is certainly more agreeable to Scripture authority; to which we must ultimately appeal, as the only infallible rule of our devotion, as well as of our conduct: and it has been urged, that no instance of the former *doxology* occurs in the New Testament.

DO′XY. *s.* (*δοξα*, praise or glory, used ironically.) A whore; a loose wench (*Shakspeare*).

To DOZE. *v. n.* (ꝺꞃæꞃ, Sax. *daes*, Dutch.) 1. To slumber; to sleep lightly (*L'Estrange*). 2. To be half asleep (*Pope*).

To Doze. *v. a.* To stupify; to dull (*Clarendon*).

DO′ZEN. *s.* (*douzaine*, French.) The number of twelve (*Raleigh*).

DO′ZINESS. *s.* Sleepiness; drowsiness (*Locke*).

DO′ZY. *a.* (from *doze*.) Sleepy; drowsy; sluggish (*Dryden*).

DRAB. *s.* (ꝺꞃabbe, Saxon, lees.) A whore; a strumpet (*Pope*).

DRA′BA. Whitlow-grass. In botany, a genus of the class tetradynamia, order siliculosa. Silicle entire, oval-oblong, with flattish valves parallel to the partition; generally style-less. Sixteen species, some leafy, others leafless in their stems; chiefly natives of the South of Europe, but three or four indigenous to our own country; of these, the most common is D. verna, found wild on old walls, with naked stalks; lanceolate, hairy, slightly serrated leaves; and cloven petals. The blossoms are white, and hang down towards the evening. It flowers very early in the spring, and is eaten by horses, sheep, and goats; not relished by cows, and refused by swine. There is a more elegant species described by Dr. Turton, under the name of D. aizoides, found by himself on the maritime rocks of Gower, with yellow flowers in a terminal raceme, petals rounded, emarginate, twice as long as the calyx; and pale green imbricate leaves.

DRABS, in the English salt-works, a name given to a sort of wooden cases, into which the salt is put as soon as it is taken out of the boiling-pan. See Salt-works.

DRACHM, a Grecian coin of the value of seven-pence three farthings. This was also the name of a kind of weight, consisting of three scruples, and each scruple of two oboli. As to the proportion that the drachm of the Greeks bore with the ounce of the Romans, Q. Remnius, in his poem of weights and measures, makes the drachm the eighth part of an ounce, not much different from the crown of the Arabians, which weighs something more than the drachm.

Drachm, or Dra′chma, (*δραχμη*, from *δραττομαι*, to grasp, it being about a handful; or much rather, perhaps, from the Hebrew דרכמין, drachmin.) A drachm. The eighth part of an ounce, containing three scruples or sixty grains.

DRACO, a celebrated lawgiver of Athens. When he exercised the office of archon, he made a code of laws for the use of his citizens, which, on account of their severity, were said to be written in letters of blood. By them idleness was punished with as much severity as murder, and death was denounced against the one as well as the other. Solon totally abolished these sanguinary laws, except that one which punished a murderer with death. The popularity of Draco was uncommon, but the gratitude of his admirers proved fatal to him. Once when he appeared on the theatre, he was received with repeated applause; and the people, according to the custom of the Athenians, showed their respect to their lawgiver by throwing garments upon him. This was done in such profusion, that Draco was soon hid under them, and smothered by the too great veneration of his citizens. He lived about 624 years before the Christian era.

Draco, in astronomy, *the dragon*, an old constellation of the northern hemisphere. It consists of 77 stars of the 1st six magnitudes, i. e. 0. 4. 7. 11. 23. 32.

Dra′co, in zoology, a genus of the class amphibia, order reptilia. Body four-footed, tailed and winged. One species only:

D. volans. Flying dragon. Forelegs distinct from the wings: body ash colour, varied and clouded with brown and whitish, and covered with minute scales; gular pouch large, pointed; tail very long, annulate with whitish brown. Inhabits Africa and India: is distinguished from the lizard tribe merely by having a broad, lateral membrane, strengthened by radii or bony processes: wanders about trees, and is able, by means of the membrane, to spring from bough to bough, and support itself, for a few moments, in the air: feeds on insects. Length of the body about four inches: of the tail eight. It is in every respect a harmless and inoffensive animal, and in its very limited power of flying resembles the flying squirrel or the bat.

Linnéus has mentioned d. præpos as a second species on the authority of Seba: but Seba is the only naturalist who has seen this second species: and it is now generally conceived that what Seba thus delineated and Linnéus thus arranged is only a variety of d. volans. It may not be impertinent to adjoin that the tremendous dragons of ancient poets, and those actually figured in the works of some of the older naturalists, are mere fictitious beings, either artificially composed of the members or skins of different animals; or made by warping some particular species of the ray or skate tribe into a dragon-like shape, by expanding and drying the fins, in an elevated position, adding the legs of birds, and otherwise disguising the animal. Some of these monsters are represented by Gesner and Aldrovandus with seven hideous heads, gaping mouths, long bodies, snake-like necks and tail, and feet resembling those of birds. Linnéus himself detected a very curious imposition of this kind when at Hamburgh, the proprietor of which had the modesty to ask ten thousand florins as its price; but he was obliged to flee from the city immediately afterwards, to escape the proprietor's denounced vengeance.

For a representation of the real draco volans, see Nat. Hist. Pl. LXXVI.

DRACOCE'PHALUM. Dragons-head. In botany, a genus of the class didynamia, order gymniospermia. Corol with an inflated throat, the upper lip concave; lower lip three cleft, the latter divisions erect, middle one hanging down. Eighteen species: of which some have their flowers in spikes, others in whorls; they are all indigenous, and are obtained from the Levant, Austria, or Siberia: and most of them are easily propagated by seeds in our own gardens: in which the species most frequently met with is d. Canariense, or balm of gilead: hairy at the joints; leaves soft, wrinkled, three or five together, ovate, pointed, toothed; corol flesh-colour, with white lines.

DRACONARIUS, in antiquity, *dragon-bearer.* Several nations, as the Persians, Romans, &c. bore dragons on their standards, whence the standards themselves were called dracones, and the soldiers who bore them draconarii.

DRACONIS SANGUIS. See Sanguis draconis.

DRACO'NTIUM. (*dracontium*, δραχωντιον; from δραχων, a dragon: so called, because its roots resemble a dragon's tail.) Dracontium sive serpentaria. Dragon's wort. In botany, a genus of the class gynandria, order polyandria. Spathe boot-shaped, spadix covered; calyxless; petals five; berries many seeded. Five species: all natives of the East or West Indies. The only species much cultivated among ourselves is D. pertusum, with climbing stalks, and leaves pierced with holes; it easily runs up trees or walls to the height of thirty feet: the flowers are terminal, of a pale whitish yellow. It is easily propagated by cuttings, which should be planted in pots filled with poor sandy earth, and plunged into a hot-bed. Its roots and leaves are extremely acrimonious, more so than the arum maculatum, with which it agrees in medicinal virtues.

DRACUNCULUS. (dim. of *draco*, a dragon.) A species of dragon-wort. Also a worm in Guinea, so called because it is supposed to be poisonous; and produces in the inhabitants of that country a disease of the skin, named *vena medinensis.* The Guinea-worm. See Filaria.

DRAFF. *s.* (ꝺꞃoꝼ, Saxon; *draf*, Dutch.) Refuse; lees; dregs (*Ben Jonson*).

DRA'FFY. *a.* (from *draff.*) Worthless; dreggy.

DRAFT. *a.* (corrupt for *draught.*) Employed to draw, as oxen (*Shakspeare*).

To DRAG. *v. a.* (ꝺꞃaᵹan, Saxon.) 1. To pull-along the ground by main force (*Swift*). 2. To draw any thing burdensome (*Smith*). 3. To draw contemptuously along (*Stillingfleet*). 4. To pull about with violence (*Clarendon*). 5. To pull roughly and forcibly (*Dryden*).

To Drag. *v. n.* To hang so low as to trail or grate upon the ground (*Moxon*).

Drag. *s.* (from the verb.) 1. A net drawn along the bottom of the water (*Rogers*). 2. An instrument with hooks to catch hold of things under water (*Walton*). 3. A kind of car drawn by the hand (*Moxon*).

Drag, is a term in hunting, and used exactly in the same sense in regard to the fox, as trail is in regard to the hare. Upon throwing the hounds into covert to draw for a fox, any single hound giving tongue, is said to challenge, and to have hit upon drag; that is, to have come upon the foot or scent of the fox, where he had been in the night or early part of the morning, before he retired to secrete himself for the day. When it was the custom to be at the covert side as soon as there was day-light sufficient to ride up to the hounds, drag was speedily obtained; and in many instances a good drag proved better than a bad chase; but in the present fashion of going to covert, and throwing off at mid-day, drag is but very little known, and but of trifling use if found; for the scent must, from the great length of intervening time, have so generally died away, that no expectation can be entertained of the hounds carrying it up to the game.

Drag-net. See Net.

DRAGACANTHA. See Tragacantha.

DRAGANT GUM. See Tragacantha.

To DRA'GGLE. *v. a.* (from *drag.*) To make dirty by dragging on the ground (*Gay*).

To Dra'ggle. *v. n.* To grow dirty by being drawn along the ground (*Hudibras*).

DRAGOMAN, or Drogman, a term of general use through the east, for an interpreter, whose office is to facilitate commerce between the orientals and occidentals. These are kept by the ambassadors of Christian nations residing at the Porte, for this purpose.

DRAGON, in astronomy. See Draco.

Dragonflying, in amphibiology. See Draco.

Dragon-fly, in entomology. See Libellula.

Dragon-beams, in building, two struts which stand under a brest-summer, and meet on the shoulder of the king-piece.

DRAGONS. See Dracontium, and Arum.

Dragon's blood. See Sanguis draconis.

Dragon's-head, in botany. See Dracocephalum.

Dragon's-head, and tail, in astronomy, are the nodes of the planets, but more particularly of the moon, being the points in which the ecliptic is intersected by her orbit, in an angle of about 5° 18′. One of these points looks northward, the moon beginning then to have north latitude; and the other southward, where she commences south latitude; the former point being represented by the knot ☊ for the head, and the other by the same reversed, or ☋, for the tail. And near these points it is that all eclipses of the sun and moon happen. See MOON.

DRAGON-SNAP, in botany. See ANTIRRHINUM.

DRAGON-TREE. See DRACŒNA.

DRAGONET, in ichthyology. See CALLIONYMUS.

DRA′GONISH. *a.* (from *dragon.*) Having the form of a dragon (*Shakspeare*).

DRA′GONLIKE. *a.* Furious; fiery (*Shakspeare*).

DRA′GONSBLOOD. *s.* A resin, so named as to seem to have been imagined an animal production (*Hill*).

DRAGO′ON. *s.* (from *dragen*, Ger. to carry.) A kind of soldier that serves indifferently either on foot or horseback (*Tatler*).

To DRAGO′ON. *v. a.* To persecute by abandoning a place to the rage of soldiers (*Prior*).

To DRAIN. *v. a.* (*droiner,* French.) 1. To draw off gradually (*Bacon*). 2. To empty, by drawing gradually away what it contains (*Roscommon*). 3. To make quite dry (*Swift*).

DRAIN. *s.* (from the verb.) The channel through which liquors are gradually drawn; a watercourse; a sink (*Mortimer*).

DRAINING, in agriculture, is the art or practice of making artificial channels, for carrying off superfluous moisture or water from wet or marshy lands.

This highly useful art did not generally engage the attention of agriculturists till about the middle of last century. It was formerly practised by persons, called *undertakers*, who received one-third of the drained land as a recompense. The advantages to be derived from their labours being obvious, several public-spirited men of talent have lately, with considerable success, investigated the subject; and, with great exertions, not only rendered the most boggy and unfruitful soils firm and stable, but, in many instances, so much improved their fertility as to be productive of the finest grain.

Lands to be drained are usually divided into two classes: 1. *Uplands*, or those which are situated so high, that the water can descend from them, if properly collected and conducted; and, 2. *Fens, marshes*, or those lands which lie so low as to command no fall; have no descent; and some being even below the level of the sea.

I. With regard to *uplands*, it generally happens that the waters from the springs beneath the soil are obstructed in their course to the neighbouring rivers. These springs originate from the atmospheric moisture; which, being condensed on the summits of hills into water, by the greater coldness of those parts, perforates the different strata of the incumbent soil, where it is of a porous nature; the water continues to descend, sometimes for many miles together, but generally from the nearest eminences into the adjoining valley, till its course is intercepted by a stratum of clay; where, being collected in considerable quantities, it is forced to work itself a passage through the porous strata of sand, gravel, or rock, that may be above the clay, following the course of these strata, till they approach the surface of the earth, or are interrupted by any obstacle, which causes the water to rise to the surface, and to form springs, bogs, marshes, &c.

At the foot of hills, therefore, where the plain begins to be too moist, some augur-holes should be bored, in order to find the depth of the springs, and consequently the thickness of the upper stratum of the soil. If this be only 4 or 6 feet, an horizontal ditch should be cut along the bottom of the hill, to intercept the water, which ought to be carried off by one or more ditches communicating with the former, and conducting the water thus collected into the neighbouring rivulet. Farther, as the strata, through which the water descends in forming these springs, have, with a few exceptions, the same inclination as the surface of the hill, the holes should be bored, and the ditch cut, not vertically downwards, as is commonly practised, but perpendicularly to that surface; a method which greatly facilitates the arriving at the second stratum.

If, nevertheless, on cutting a ditch five or six feet deep, along the foot of a hill, vertically to the rising plain, the upper stratum be not penetrated, and consequently no water ooze in to the bottom of the ditch, it will be expedient to bore other holes at the bed of such ditch, some yards deeper, or till water ascend through them. Where this succeeds, many holes should be made, and the water conducted into the adjacent brook, or river; for it will then rise, collect in those trenches six feet below the wet surface of the valley, and thus be carried off, instead of rising up from the lower wall-springs, or apertures of the stratum, through the incumbent soil, to the surface of the valley, which is so many feet higher.

This is the method which has been successfully practised for several years, by Mr. Elkington; but the prior, or at least coeval, discovery of which, is justly claimed by Dr. James Anderson, who states (in the introduction to his ingenious Essays on Agriculture, vol. iii.) that he sunk a hole with a wimble into the earth at the bottom of a ditch, in the year 1764; that the water rose six feet above the surface of the ground, and has continued flowing ever since, though with less rapidity.

These ditches should be made narrower as they descend, by spades of a proportionate size and breadth: but the lowest part ought to be contracted more than any other, so that the shoulders or edges of it may support stones or faggots, in order to cover the whole, at a small expence, without obstructing the currents of water. In many places, hollow-bricks, ridge-tiles, or old fragments of plastered floors, may be applied to the same purpose; as they may be substituted for stones, or faggots, and at a reduced expence.

Situations, however, frequently occur, where the first stratum of the earth may be too thick to be easily perforated; or where the water, condensed from the atmosphere on the summits of the hills, may work itself a passage between the second and third, or between the third and fourth strata, which form the sides of those hills, from a deficiency of so many of the strata at their summits. Hence the water lies too deep to be retarded in its progress by a ditch, or by boring; but, being dammed up by the materials that form the plain of the valley, it ascends through them to the surface, and thus forms boggy or marshy ground. In such cases, the common mode of draining may be successfully employed: it consists in cutting several ditches four or six feet across the bog or morass; and in covering them so that the water may not be obstructed in its passage, but be thus in part collected and conveyed away, though certainly with less advantage than where springs can be intercepted.

Another method of draining is, that of opening trenches, or drains, almost annually, by a large plough with two converging coulters, and other appropriate machinery, for the purpose of cutting both sides of a ditch at the same time, and turning out the intervening soil. These large ploughs are still kept in some parishes, and drawn over moist commons, by twelve or twenty horses, so as to form parallel ditches.

An instrument was invented for this purpose by Mr. Adam Scott, of Guildford, Surrey, called by him a mole-plough, and for which the Society for the Encouragement of Arts, &c. in 1797, gave him a bounty of thirty guineas. It consists of a coulter 15 inches in length, and 2½ in width, to cut the sward. Behind this is applied an horizontal cone of cast iron, 20 inches long, and 2½ in diameter at the base, to the middle of which is fixed an upright bar 2 feet long, and 3½ inches broad, with a sharp edge. If this cone be drawn along moist lands, 6 or 8 inches beneath the turf, either in the spring or in autumn, in several parallel directions, the water will be conveyed away for a considerable space of time, without breaking the surface. With Mr. Scott's mole-plough, a man and boy with four horses may, with ease, drain thirty acres in a day; but, at the lower side of the ground intended to be drained, there should be an open gripe or ditch, in order to receive the water from those small cavities which are formed by the plough at the depth of 12 or 14 inches. In very moist lands, or in very wet seasons, if a larger number than six or eight horses be employed, their feet will not sink so deeply into the turf, as each animal will draw less; should, however, the ground be so exceedingly soft as scarcely to support the cattle, that inconvenience may be obviated by fixing to the horses' feet broad wooden shoes, similar to the snow shoes made use of by the inhabitants of northern climates. The price of this useful plough, when complete, does not exceed two guineas and a half.

The last method of draining uplands, of which we shall give an account, is that practised in the county of Berks. It consists in digging a trench 2 feet deep, one foot wide at the top, and 9 inches at the bottom, with a steep descent to a ditch, extending along the bottom of the grounds, and made of a proper width and depth, to receive and carry off the water. Within these trenches is formed a channel, the sides of which are composed of hard white chalk, cut nearly into the size of bricks; the whole is covered with pieces of the same material, and the crevices filled up with the chippings. The mouth of the channel, where the water falls into the ditch, is constructed with brick or flint, as chalk will not bear the frost to which this part of the work must necessarily be exposed. On the top of the chanenl is placed a thin coat of wheat-straw, brambles, or any small brush-wood. The passage for the water will be somewhat more than 3 inches. In digging trenches of this kind the workmen lay the best earth on one side by itself, in order to replace it on the surface, when the trenches are again filled up. But, in all cases, where land lies on a declivity, care should be taken that the drains have an easy and gentle descent; for, if they have too rapid a fall, they are apt to burst, or excavate; and, their protection below being lost, the least pressure from above will consequently destroy the work.

II. With respect to the draining of those plains or morasses where no fall can be procured, the water may, in many situations, be collected by cutting a long horizontal ditch above the level of the morass, so as to intercept all the wall-springs; and may then be carried off in wooden troughs, or hollow bricks, above the surface; and, if any water continue to penetrate the morass, it may be conducted to the extremity of the ground, either in open drains, or in covered brick drains.

The draining of low moist lands may also be advantageously effected by a roller or wheel. This is made of cast-iron, weighs 4 cwt. and is 4 feet in diameter: the cutting edge or extreme circumference of the wheel is half an inch thick; which, increasing in thickness towards the nave or centre, will cut a drain half an inch in width at the bottom, 4 inches wide at the top, and about 15 inches deep. This wheel is so placed in a frame that it may be loaded at pleasure, in order to score out a greater or less depth, according to the resistance of the ground; which being thus cut during the winter, the wheel-tracks are either then filled with straw ropes, and lightly covered over, or left to crack wider and deeper, during the succeeding summer; when the fissures should be kept open with twisted straw and bushes, and lightly covered with such porous soil as can be most conveniently procured. Thus hollow drains may be formed upon grass or ley-land, at little expence, and will answer every useful purpose.

The necessity and utility of draining the surface-water from clay soils, in wet seasons, is generally acknowledged; but excellent as the different methods are in the cases before mentioned, they do not appear to be so simple or so effectual, as could be wished in the present. Covered drains frequently fail in producing the desired effect, in consequence of the covering materials being of too close a texture to admit the water to filtrate through them with sufficient freedom. Mole-ploughs, of the best construction, require such a number of horses to draw them, as must necessarily injure the soil, by poaching it. Farther, covered drains are not only dangerous to full-grown sheep and young lambs, but from the quantity of clay necessarily dug up, and spread over the richer surface-soil, they are also injurious to vegetation. None of the several modes of draining now in use being subservient to the essential purpose of conducting large quantities of water from a deep soil, we feel satisfaction in communicating the following simple contrivance of Mr. John Middleton, published in the 22d No. of the Commercial and Agricultural Magazine. It consists merely in adding a piece of wood to the felly of a common six-inch cart-wheel, to which is prefixed a rim of iron, of a triangular form. The whole expence of this addition does not exceed one guinea. A wheel of this description, when put on the axle of a cart in the usual way, will of course rest on the edge of the triangular rim of iron above alluded to; and, on driving the horses forward, will make a small indent in the ground, merely by its own revolution. But, in order to press it down to the depth of six or eight inches, that side of the cart should be laden with stones, iron, or any other heavy material, until the whole of the rim, as well as the additional piece of wood, and the felly itself, if necessary, sink into the soil. The cart should then be drawn in such a direction that the cutting-wheel may revolve where the drains are intended to be formed. Sometimes it will be necessary to apply the indenting machine to every furrow; but, where the land is level, it should be drawn over it in parallel lines, five or ten yards apart. The wheel on the opposite end of the axle is a common six-inch wheel, which supports only the empty side of the cart, and consequently will not cut the ground.

The advantage of this contrivance, as stated by Mr. Middleton, is, that it makes an indent in the soil sufficient to carry off the water during the ensuing winter, by pressing down the herbage, without destroying it. In the succeeding spring, these drains will be nearly grown up, so that there is no injury done to the grass. He observes, however, that this wheel should be drawn over the ground every year, on the approach of winter; but so easy is its application, that by means of it, and two old horses, one stout boy, or man, may drain from ten to twenty acres in eight hours.

The first object in draining a bog or marsh, is, to discover the lowest spot of dry ground that surrounds it, in order to open on that part the main trench which is to carry off the water: if there be the least appearance of any stream, it should be traced with care; for this will point out the proper spot on which to begin. The main trench, commencing at the lowest part, may be carried to whatever distance it is thought proper: if it begin at the right spot, 10 acres may be detached from the marsh, however extensive, and completely drained; but, if the drainage be not begun where there is a sufficient fall, the labour bestowed will be to no purpose: the main cut or trench should be 10 feet broad in the clear, with a proper slope, to prevent the sides from falling in, and filling it up.

Bogs are divided into two sorts, black and red. The former are solid, and make excellent fuel for common fires, or for burning lime; but the red bog consists of a loose, porous, fungous mass, which burns badly, and yields no ashes. Hence, in black bogs only, the drains ought to be cut into turfs, dried, carted, and piled.

As the main canal advances, small ones may be conducted into it on either side, inclosing such spots of ground as are intended to be improved. No certain rule can be laid down for the depth of drains; yet we apprehend the prevailing practice of cutting them down to the solid ground beneath the bog, is founded on the erroneous principle, that such depth is sufficient as will leave the surface dry. Numerous drains, however, being always useful and necessary, the spots inclosed ought not to contain more than five acres; but in such space it is requisite that several cross cuts be made, which should be 4 feet broad at the top, and 3 feet deep. A whole year will be requisite to complete these drains; and, in the ensuing spring, it will be necessary to open, deepen, and clear them of the adventitious boggy matter; a work which should be occasionally renewed. The second year may be employed in extending the main trench; in taking in fresh inclosures by new lateral cuts; and in draining these by means of small transverse drains. Although this annual deepening and clearing of marshy grounds be attended with great labour and expence, yet the operation is thus progressively completed, and in succeeding years both trouble and costs will be gradually diminished, in proportion as the bog subsides.

As soon as the drains have rendered the marshes sufficiently firm for oxen to walk on them, the heaviest rollers that can be procured should be employed, to act by repeated pressure. Indeed, without a considerable degree of such pressure, during the first year, no bog can be effectually consolidated. An alternate draining and rolling, annually (the drains being still kept open), would, probably, contribute much to the destruction of weeds. Previous to rolling in the spring, it has been strongly recommended to sow every kind of grass seeds, indiscriminately, such as ray-grass, hay-seed, clover, &c.

Stone drains are calculated for soils where the common methods of draining cannot be adopted. Such drains ought to be cut 10 or 12 inches wide, with perpendicular sides; and flat stones should be so placed as to leave a water-course at the bottom, by setting two stones triangularly to meet at the points. Or, the bottom may be covered with a flat stone, and three others placed upright, and the water left to work itself a passage between them. In either case, the cavity of the drain ought to be filled nearly up to the top with loose stones: screened or washed gravel, where it is found in greater abundance, has been successfully substituted. Those pebbles, however, which are often found on the sea-shores, are well adapted for filling drains; as, being smooth, and generally round, the water flows through them more freely.

The principal drains ought to be 3 feet deep, and 18 inches in width; the bottom and top should be laid with flag-stones; the sides built up to a sufficient height with common stones; and the whole covered with sods of turf, but the grassy sides downwards: these again are to be overspread with earth, sufficient to admit the plough. The smaller drains are, in general, to be conducted at an acute angle into the main trenches.

Sod or earth-drains are usually dug two feet deep with a spade, when the soil is taken out by an instrument, or scoop, about four inches wide, and the drain covered with the sods first dug out, if the ground be firm enough to support them; or, some black thorns are put in, in order to bear the weight of the sods. Those drains which have the smallest passage for the water at the bottom are reputed to be the most durable: as the force of the water has been found sufficient to clear away any small obstacles accidentally obstructing its course.

The following sketch of the drainage and improvement of a marsh, near Marazion in Cornwall, describing a peculiar mode of taking off the water, and securing the land from the overflowing of the sea, by Mr. Richard Moyle, of Marazion, is taken from the Communications to the Board of Agriculture.

A piece of land called the marsh, or bog, near Marazion in Cornwall, containing thirty-six statute acres, has, from time immemorial, been covered with two or three feet of water, and which, at spring-tides, was overflowed with the sea, by means of a river which passed through the land. This ground looks towards the south, and is separated from the sea by a long skirting of sand of about seventeen acres, over which the turnpike road passes towards Penzance, on its most elevated part: on the north of the marsh lies some croft ground (i. e. higher and not subject to inundations), which gradually rises as it retires from the bog, so that the marsh is surrounded on the north and south by elevated spots; and the water on its surface usually crept away to the sea, by means of a river, through which the water at high spring-tides always had access. From the depressed situation of this marsh, it was impossible to take off all the surface water through the river, and recourse was had, for this purpose, to a square wooden pipe of nine inches diameter, which was introduced at that part of the shore called half-ebb, and which was eight feet lower than the surface of the marsh. This pipe was introduced through the sandy soil, in some places twenty-four feet deep, till it arrived at the south part of the bog, where it was found to be six feet under the surface. At this place a reservoir of eighteen feet square, and eight feet deep, was immediately cut out; and the water draining from the marsh, during the time the tide was in, was received in the reservoir and discharged when the tide was out through the pipe with great velocity. The sea, at high water, covers this pipe with nine or ten feet of water: a long trench of three feet deep and five wide, was extended from this place, east and west, on the south side of the bog, for its whole length, bordering on the sandy soil; and at the distance of every sixty yards, a similar trench was cut up directly north towards the croft, which divided the whole marsh into oblong square fields. By the means of these trenches, or open drains, the whole surface water was conveyed directly to the reservoir, and thence to the sea. The pipe at both its extremities was guarded with valves, which shut at the approach of the tide; and during its flowing, the water accumulated about two or two feet and a half high in the reservoir; and as the sea retires, the collected water runs off without any interruption, till the next return of the tide: the pipe is covered with the sea six hours in every twelve. This singular mode of drainage answers uncommonly well, and has never once failed in five years: the extremities of the pipe have also iron bars placed before them, to prevent the intrusion of extraneous bodies. As soon as the surface water was removed, a strong embankment of turf was made on the south and east sides, to prevent the overflowing of the tides; and the water, which formerly diffused itself over the whole of this ground, was collected into a river, and carried to the sea on the outside of this embankment. In cutting the open drains, a pot of copper coins, containing about a thousand, was discovered three feet under the surface, and which appeared to belong to the emperor Victorinus, who reigned in the third century. These coins were much injured by the corrosion of the salt water; but several were still perfect enough to trace the outlines of the emperor. As soon as the evaporation had assisted the consolidation of the surface, the air, within a mile of the marsh, became so strongly impregnated with a sulphureous smell, as to render the place quite noxious to passengers.

On examining the different strata, we found that two feet and a half of the surface consisted of mud and a peaty substance, most strongly interwoven with the roots of goss (arundo phragmites) and common rushes, which were the only substance that grew spontaneously on its surface; below this, was a stratum of three feet and a half of pure peat, of a very inflammable nature, and which seems to have extended over twenty acres of the marsh: under the peat lay a bed of sand, from four to six feet deep; from which we may conjecture that the whole was formerly an arm of the sea, and that the dropping of vegetables, and deposition of mud (which possibly formed the peat), had gradually expelled the sea, except at spring-tides. This stratum of sand does not appear to be the original bed of the sea; for, on streaming for tin, another floor from six to ten feet deeper was discovered, consisting of round smooth pebbles, and gravelly substances, containing tin; among which were willow trees and hazel nuts, in the most perfect state.

The mode of improvement adopted was the following: The surface was pared and burned; and after repeated ploughings, &c. for two years, large bodies of clay, with manure, were then carried on its surface, and a slight crop of white oats with ever-grass (ray), common and Dutch clover, sown in the spring. The saltness of this ground was so very powerful for the first three years, as to destroy every crop; on the fourth, the land began to vegetate partially; but on the fifth, or present year, 1798, every part seems to be quite alive; so that every kind of vegetable now flourishes with great luxuriancy. It has afforded this summer very good crops of hay, and an abundant and rich pasture, with a prospect of improvement the next season. The expences of draining this ground, with trenching, paring, ploughing, burning, and manuring it, with the failure of three years crops, amount to a very considerable sum; and this distressing circumstance is increased, on its being only a leasehold for three lives.

The sandy land has been partly inclosed, and covered with large bodies of clay and manure; it has afforded remarkably fine crops of turnips, and the grass of this season has been very luxuriant. The crofty land on the north (twenty-two acres) has been all cultivated, first with potatoes, and afterwards sown with wheat, barley, oats, and turnips, and produced very good crops.

The whole of this improved ground has been productive of considerable advantages to the public, particularly to the poor. Four hundred persons yearly receive turf from it: two hundred and fifty are fed most plentifully with potatoes, which are planted here by very poor people, who are, in consequence of having land given them, become uncommonly industrious; and the whole neighbourhood, by its drainage, have got rid of low nervous fevers and agues, with which it was continually pestered.

The whole ground under improvement consists of seventy-five acres, of which thirty-six are marsh, twenty-two croft, and seventeen of sand. In 1798, forty acres were under different crops; viz. wheat two acres and a half, barley nine, oats eight, turnips two, potatoes five, hay and pasture thirteen and a half.

On the sides of every open trench is planted a row of quicksets, interspersed with a few planes and pineastres. These are defended from the cattle and blights by means of a temporary turf hedge, and promise to afford a pleasing division of the land in a few years. To every inclosure of the marsh a part of the rising ground of the croft is annexed to accommodate cattle in wet seasons.

In the year 1798 this land was visited and examined on the spot as to the facts, by sir John Call, and the above particulars given him by the proprietor.

We shall conclude this article with an account of the effect of a luxuriant weed, called by botanists the equisetum palustre, upon drains. Sir Joseph Banks, in a letter to the secretary of the Board of Agriculture, communicates the following particulars:

"Few objects of agricultural utility," says the baronet, "have ever interested me so much, and I have no hesitation in saying that none are, in my opinion, so interesting to the increasing prosperity of the landed interest of this kingdom, as the theory of draining whole districts, by tapping the mother springs that overflow their surface, and conducting drains through the principal valleys, so contrived as not only to render the boggy parts of them sound land, but also to free the sides of the hills which form them from all outbursts of water.

"Mr. Elkington is certainly the father of this system of drainage, but Mr. Farey has perfectly comprehended all the works done by that gentleman for the duke of Bedford, and in the mode of conducting the operations now carrying on, has, in some instances, excelled them, founding his practice on an extensive and enlightened theory, applicable to all valley bogs, in the drainage of which, it appears to me almost impossible that this method should fail under any circumstances.

"One thing, however, has occurred, in the short experience of the Woburn operations (about five years), which appears to me of consequence enough to warrant the trouble this will give to you and the Board. Some bogs, drained by under drains made at a great expence through the most miry parts of them, appeared at first perfectly dry, but have since been found to grow by degrees less and less so. On examination, these drains have been found more or less choked up by a plant vegetating within them, and forming both stems and roots, the whole several yards in length, intercepting the course of the water, weakening the current by degrees, and at last wholly choking up the drain.

"This plant is the equisetum palustre, a weed common in moorish and swampy places, but hitherto little noticed by naturalists; its root, or rather its stem under ground, is a yard or more in length, and in size like packthread; from this a root of twice the size of the stem runs horizontally in the ground, taking its origin from a lower root, which strikes downwards perpendicularly to a depth I have not hitherto been able to trace, as thick as a small finger; this perpendicular root forms in some places beds, which occupy a large portion of the more solid part of a peaty bog, as may be seen in some parts of the banks of the duke's open drains.

"As the bud by which the plant appears to renew itself in the spring is situated on the horizontal root, a yard or more in depth, the shoot must, in its progress upwards, be liable to meet with under drains, and penetrate into them through the openings left for the passage of the water. When once entered, nature, which has given to the plant the power of piercing the soil upwards from a great depth, enables it to live in the confined atmosphere of a drain, where, as it is continually drawn forward by the current, the joints lengthen themselves beyond their natural dimensions; hence it is probable that when drains choked with it are taken up and carefully examined, the length of the plants will be found very much to exceed those I have observed."

The author hopes that this will lead to further discussion, and to the discovery of a remedy for this evil, which seems likely to put a stop to the practice of draining bogs, where this mischievous plant grows, by under drains. It is necessary for the evil to be known, in order that those who possess bogs that have become miry after being drained, may be apprised of an evil which can certainly be cured by the simple expedient of casting the under drains into open ones.

Common earth-drains are sometimes dug two or three spits deep, with a broad spade, the bottom is taken out with a narrow one, and filled with stones. Sometimes a furrow is drawn with a plough, and cleared by a common spade: the draining instrument is then introduced to the depth of 18 inches from the surface; afterwards taking out the loose mold with a scoop.

Hollow drains, without stones, have been tried on stiff lands: they are made narrow at the bottom, and covered half way up with sods, or square pieces of the surface-sward, resting on ledges cut for that purpose.

It is much to be lamented, that we possess, in this cold climate, no grain similar to rice, that would grow in watery grounds which cannot be drained, nor indeed any esculent roots or foliage, except water-cresses. In such situations, some plants may perhaps be cultivated with profit to the proprietor, as the festuca fluitans, or floating fescue; callitriche, or star-grass, or star-wort; to which may be added the orchis, for the purpose of making salep, by drying the peeled roots in an oven. If these plants should not completely succeed, other vegetables of quick growth may be raised for manures, such as the typha, or cat's-tail; the caltha, or marsh-marigold, &c.; which should be mown twice a-year, while they are young, and abound with saccharine and mucilaginous matter, ready to pass into fermentation. (*Willich, English Ency. &c.*)

DRAKE. *s.* (of uncertain etymology.) 1. The male of the duck (*Mortimer*). 2. A small piece of artillery (*Clarendon*).

Drake (Francis), a celebrated English commander. He was born at Tavistock, in Devonshire, 1545, and went to sea with his relation sir John Hawkins. In 1570, he went to the West Indies with two ships; and in 1572 he made another expedition, which proved very successful. He next served under Walter, earl of Essex, in Ireland, where he distinguished himself so much by his bravery, that sir Christopher Hatton introduced him to queen Elizabeth, who granted him her protection, for it must be allowed that Drake was little better than a freebooter. In 1577 he made another voyage to the Spanish settlements, in America, and sailed as far as to 48 degrees N. latitude, calling the country which he discovered New Albion. He then went to the East Indies, and having doubled the Cape of Good Hope, returned to Plymouth, Nov. 3, 1580; so that this voyage round the world took up two years and nearly ten months. His fame was now great; queen Elizabeth went on board his ship, and after dinner conferred on him the honour of knighthood. In 1585, he sailed again for the West Indies, where he took several places from the Spaniards, and returned laden with wealth. In 1587, he commanded a fleet of 30 sail, with which he entered Cadiz, and destroyed above 10,000 tons of shipping, which he called "burning the king of Spain's beard." The year following, he commanded as vice-admiral under lord Howard, and was highly instrumental in the destruction of the Spanish armada. After this he went to the West Indies with sir John Hawkins, but the two commanders disagreeing in their plans, little was done by them. Drake died on board his ship off Nombre de Dios, in 1596. He was representative for the town of Plymouth, to which he had been a great benefactor, in causing water to be conveyed to it from springs at eight miles distance,

DRAKENA. See Contrayerva.

DRAM. *s.* (from *drachm.*) 1. In weight the eighth part of an ounce (*Bacon*). See Drachm. 2. A small quantity (*Dryden*). 3. Such a quantity of distilled spirits as is usually drank at once (*Swift*). 4. Spirit; distilled liquor (*Pope*).

To Dram. *v. n.* To drink distilled spirits.

DRAMA, a poem containing some certain action, and representing a true picture of human life, for the delight and improvement of mankind. The principal species of the drama are two, comedy and tragedy. Some others there are of less note, as pastoral, satire, tragicomedy, opera, &c.

DRAMATIC, an epithet given to that which is not narrative, but represented by action on the stage.

The successful dramatic writer, says Dr. Cogan, catches the ideas and imitates the language of every passion, emotion, and affection, in their different stages and degrees. His professed object is to suppose a diversity of characters, and to support them with a correspondent train of ideas; to inspire them with predilections and aversions, or call forth particular passions and affections, according to the situations in which he has placed them. His hopes of success depend upon the closeness of the imitation; and success itself consists in being able to interest the heart, by exciting affections and emotions similar to those which would be felt by the reader or spectator, were he an immediate witness to similar scenes in real life . . . . . The complete actor possesses the happy talent of expressing by manner the state of mind represented by the author. He adopts what modern orators reject, and attempts to give force to pertinent ideas and language by imitative tones, gestures, and countenance, which he varies according to the versatile state of those who are tossed upon the billows of passion, or agitated by some contending emotions, or under the more permanent influence of particular affections . . . . In theatrical exhibitions there is a conspiracy to delude the imagination; and all the powers of sympathy are called forth to produce the effect. Correspondent scenery points out to the spectator the very spot of action, and characteristic dresses exert their influence to aid the deception. The spectator leaves every idea of real life at the door of entrance, and voluntarily yields himself up to the pleasing delusion. He finds himself in a new world. He is transported in an instant into distant regions and remote ages, and feels in fiction all the force of truth. He laughs at mimic folly, sincerely weeps at artificial misery, is inspired with horror and indignation at imaginary baseness, and is in an extasy of joy at counterfeit happiness. (*Cogan on the Passions*, p. 269.)

The subjects of the drama are either the light and the gay, or the grave and affecting incidents of human life. The former constitute the subject of comedy, and the latter of tragedy.

As great and serious objects command more attention than little and ludicrous ones; as the fall of a hero interests the public more than the marriage of a private person; tragedy has been always held a more dignified entertainment than comedy. The first thing required of the tragic poet is, that he pitch upon some moving and interesting story, and that he conduct it in a natural and probable manner. For we must observe, that the natural and probable are more essential to tragic than even to epic poetry. Admiration is excited by the wonderful; but passion can be raised only by the impressions of nature and truth upon the mind.

The subject best fitted for tragedy is where a man has himself been the cause of his misfortune; not so as to be deeply guilty, nor altogether innocent: the misfortune must be occasioned by a fault incident to human nature, and therefore in some degree venial. Such misfortunes call forth the social affections, and warmly interest the spectator. An accidental misfortune, if not extremely singular, doth not greatly move our pity; the person who suffers, being innocent, is freed from the greatest of all torments, that anguish of mind which is occasioned by remorse. An atrocious criminal, on the other hand, who brings misfortunes upon himself, excites little pity, for a different reason; his remorse, it is true, aggravates his distress, and swells the first emotions of pity; but then our hatred of him as a criminal blending with pity, blunts its edge considerably. Misfortunes that are not innocent, nor highly criminal, partake the advantages of each extreme: they are attended with remorse to embitter the distress, which raises our pity to a great height; and the slight indignation we have at a venial fault detracts not sensibly from our pity. The happiest of all subjects accordingly for raising pity, is where a man of integrity falls into a great misfortune by doing an action that is innocent, but which, by some singular means, is conceived by him to be criminal: his remorse aggravates his distress; and our compassion, unrestrained by indignation, knows no bounds. Pity comes thus to be the ruling passion of a pathetic tragedy; and, by proper representation, may be raised to a height scarce exceeded by any thing felt in real life. A moral tragedy takes in a larger field; as it not only exercises our pity, but raises another passion, which, though selfish, deserves to be cherished equally with the social affection. The passion we have in view is fear or terror; for, when a misfortune is the consequence of some wrong bias in the temper, every spectator who is conscious of such a bias in himself takes the alarm, and dreads his falling into the same misfortune: and by the emotion of fear or terror, frequently reiterated in a variety of moral tragedies, the spectators are put upon their guard against the disorders of passion.

The commentators upon Aristotle, and other critics, have been much puzzled about the account given of tragedy by that author: "That by means of pity and terror, it refines or purifies in us all sorts of passion." But no one who has a clear conception of the end and effects of a good tragedy, can have any difficulty about Aristotle's meaning: our pity is engaged for the persons represented; and our terror is upon our own account. Pity indeed is here made to stand for all the sympathetic emotions, because of these it is the capital. There can be no doubt, that our sympathetic emotions are refined or improved by daily exercise; and in what manner our other passions are refined by terror, has just now been said. One thing is certain, that no other meaning can justly be given to the foregoing doctrine than that now mentioned; and that it was really Aristotle's meaning, appears from his thirteenth chapter, where he delivers several propositions conformable to the doctrine as here explained. These, at the same time, we take the liberty to mention; because, so far as authority can go, they confirm the foregoing reasoning about subjects proper for tragedy. The first proposition is, that it being the province of tragedy to excite pity and terror, an innocent person falling into adversity ought never to be the subject. This proposition is a necessary consequence of his doctrine as explained: a subject of that nature may indeed excite pity and terror; but the former in an inferior degree, and the latter in no degree for moral instruction. The second proposition is, that the history of a wicked person in a change from misery to happiness, ought not to be represented; which excites neither terror nor compassion, nor is agreeable in any respect. The third is, that the misfortunes of a wicked person ought not to be represented: such representation may be agreeable in some measure upon a principle of justice; but it will not move our pity; nor any degree of terror, except in those of the same vicious disposition with the person represented. The last proposition is, that the only character fit for representation lies in the middle, neither eminently good, nor eminently bad; where the misfortune is not the effect of deliberate vice, but of some involuntary fault, as our author expresses it. The only objection we find to Aristotle's account of tragedy, is, that he confines it within too narrow bounds, by refusing admittance to the pathetic kind: for, if terror be essential to tragedy, no representation deserves that name but the moral kind, where the misfortunes exhibited are caused by a wrong balance of mind, or some disorder in the internal constitution: such misfortunes always suggest moral instruction; and by such misfortunes only can terror be excited for our improvement.

Thus, Aristotle's four propositions above-mentioned relate solely to tragedies of the moral kind. Those of the pathetic kind are not confined within so narrow limits: subjects fitted for the theatre are not in such plenty as to make us reject innocent misfortunes which excite our sympathy, though they inculcate no moral. With respect indeed to the subject of that kind, it may be doubted, whether the conclusion ought not always to be fortunate. Where a person of integrity is represented as suffering to the end under misfortunes purely accidental, we depart discontented, and with some obscure sense of injustice: for seldom is man so submissive to Providence, as not to revolt against the tyranny and vexations of blind chance; he will be tempted to say, This ought not to be. We give for an example the Romeo and Juliet of Shakspeare, where the fatal catastrophe is occasioned by friar Laurence's coming to the monument a minute too late; we are vexed at the unlucky chance, and go away dissatisfied. Such impressions, which ought not to be cherished, are a sufficient reason for excluding stories of this kind from the theatre.

Besides tragedy, dramatic poetry comprehends comedy and farce. These are sufficiently distinguished from tragedy by their general spirit and strain. While pity and terror, and the other strong passions, form the province of the tragic muse, the chief instrument of comedy and farce is ridicule. These two species of composition are so perpetually running into each other, that we shall not treat of them separately; it is true that what is now known by the name of farce, is too much inclined to extravagance of ridicule; but the most commendable specimens of this kind of entertainment differ in nothing essential from proper comedy. "Comedy," says Blair, "proposes for its object neither the great sufferings, nor the great crimes of men; but their follies and slighter vices, those parts of their character which raise in beholders a sense of impropriety, which expose them to be censured and laughed at by others, or which render them troublesome in civil society.

"The subjects of tragedy are not limited to any age or country; but the scene and subject of comedy should always be laid in our own country, and in our own times. The reason is obvious; those decorums of behaviour, those lesser discriminations of character, which afford subject for comedy, change with the differences of countries and times; and can never be so well understood by foreigners as by natives. The comic poet, who aims at correcting improprieties and follies of behaviour, should 'catch the manners living as they rise.' It is not his business to amuse us with a tale of other times; but to give us pictures taken from among ourselves; to satirize reigning and present vices; to exhibit to the age a faithful copy of itself, with its humours, its follies, and its extravagancies.

"Comedy may be divided into two kinds: comedy of character, and comedy of intrigue. The former is the more valuable species; because it is the business of comedy to exhibit the prevailing manners which mark the character of the age in which the scene is laid: yet there should be always as much intrigue as to give us something to wish and something to fear. The incidents should so succeed one another, as to produce striking situations, and to fix our attention; while they afford at the same time a proper field for the exhibition of character. The action in comedy, though it demands the poet's care in order to render it animated and natural, is a less significant and important part of the performance than the action in tragedy: as in comedy it is what men say, and how they behave, that draws our attention, rather than what they perform or what they suffer.

"In the management of characters, one of the most common faults of comic writers is the carrying of them too far beyond life. Wherever ridicule is concerned, it is indeed extremely difficult to hit the precise point where true wit ends and buffoonery begins. When the miser in Plautus, searching the person whom he suspects of having stolen his casket, after examining first his right hand and then his left, cries out, *Ostende etiam tertiam*—'Show me your third hand,' there is no one but must be sensible of the extravagance. Certain degrees of exaggeration are allowed to the comedian, but there are limits set to it by nature and good taste; and supposing the miser to be ever so much engrossed by his jealousy and his suspicions, it is impossible to conceive any man in his wits suspecting another of having more than two hands."

It appears from the plays of Aristophanes, which remain, that the characters in the old comedy of Athens were almost always overcharged. They were likewise directed and avowed satires against particular persons, who were brought upon the stage by name. "The ridicule employed in them is extravagant, the wit for the most part buffoonish and farcical, the raillery biting and cruel, and the obscenity that reigns in them is gross and intolerable. They seem to have been composed merely for the mob." Yet of these abominable dramas, Hurd has affirmed, with too much truth, that what is now called farce is nothing more than the shadow. The characters in genuine comedy are not those of particular and known persons, but the general characters of the age and nation; which it requires no small skill to distinguish clearly and naturally from each other. In attempting this, poets are too apt to contrast characters and introduce them always in pairs; which gives an affected air to the whole piece. The perfection of art is to conceal art. A masterly writer will give us his characters distinguished rather by such shades of diversity as are commonly found in society, than marked with such strong oppositions as are rarely brought into actual contrast in any of the circumstances of real life.

The style of comedy ought to be pure, elegant, and lively, very seldom rising higher than the ordinary tone of polite conversation; and upon no occasion descending into vulgar, mean, and gross expressions; and, in one word, action and character being the fundamental part of every epic and dramatic composition, the sentiments and tone of language ought to be subservient to these, so as to appear natural and proper for the occasion.

Dramatic compositions have some peculiarities, which it will be proper to mention. The first is a double plot: one of which must resemble an episode in an epic poem; for it would distract the spectator, instead of entertaining him, if he were forced to attend at the same time to two capital plots equally interesting. And even supposing it an under-plot like an episode, it seldom hath a good effect in tragedy, of which simplicity is a chief property; for an interesting subject that engages our affections occupies our whole attention, and leaves no room for any separate concern. Variety is more tolerable in comedy; which pretends only to amuse, without totally occupying, the mind. But even there, to make a double plot agreeable, is no slight effort of art: the under-plot ought not to vary greatly in its tone from the principal; for discordant emotions are unpleasant when jumbled together; which, by the way, is an insuperable objection to tragi-comedy. Upon that account the Provoked Husband deserves censure; all the scenes that bring the family of the Wrongheads into action, being ludicrous and farcical, are in a very different tone from the principal scenes, displaying severe and bitter expostulations between lord Townley and his lady. The same objection touches not the double plot of the Careless Husband; the different subjects being sweetly connected, and having only so much variety as to resemble shades of colours harmoniously mixed. But this is not all. The under-plot ought to be connected with that which is principal, so much at least as to employ the same persons: the under-plot ought to occupy the intervals or pauses of the principal action; and both ought to be concluded together. This is the case of the Merry Wives of Windsor.

Violent action ought never to be represented on the stage. While the dialogue goes on, a thousand particulars concur to delude us into an impression of reality; genuine sentiments, passionate language, and persuasive gesture: the spectator once engaged, is willing to be deceived, loses sight of himself, and without scruple enjoys the spectacle as a reality. From this absent state he is roused by violent action; he wakes as from a pleasing dream; and, gathering his senses about him, finds all to be a fiction. Horace delivers the same rule; and founds it upon the same reason:

> Ne pueros coram populo Medea trucidet;
> Aut humana palam coquat exta nefarius
> Atreus;
> Aut in avem Progne vertatur, Cadmus in anguem:
> Quodcumque ostendis mihi sic, incredulus odi.

The French critics join with Horace in excluding blood from the stage; but, overlooking the most substantial objection, they urge only that it is barbarous and shocking to a polite audience. The Greeks had no notion of such delicacy, or rather effeminacy; witness the murder of Clytemnestra by her son Orestes, passing behind the scene, as represented by Sophocles: her voice is heard calling out for mercy, bitter expostulations on his part, loud shrieks upon her being stabbed, and then a deep silence. An appeal may be made to every person of feeling, whether this scene be not more horrible than if the deed had been committed in sight of the spectators upon a sudden gust of passion. If Corneille, in representing the affair between Horatius and his sister, upon which the murder ensues behind the scene, had no other view than to remove from the spectators a shocking action, he was guilty of a capital mistake: for murder in cold blood, which in some measure was the case as represented, is more shocking to a polite audience, even where the conclusive stab is not seen, than the same act performed in their presence by violent and unpremeditated passion, as suddenly repented of as committed. Addison's observation is just; that no part of this incident ought to have been represented, but reserved for a narrative, with every alleviating circumstance in favour of the hero.

A few words upon the dialogue, which ought to be so conducted as to be a true representation of nature. We talk not here of the sentiments nor of the language; but of what properly belongs to dialogue-writing; where every single speech, short or long, ought to arise from what is said by the former speaker, and furnish matter for what comes after till the end of the scene. In this view, all the speeches from first to last represent so many links of one regular chain. No author, ancient or modern, possesses the art of dialogue equal to Shakspeare. Dryden, in that particular, may justly be placed as his opposite. He frequently introduces three or four persons speaking upon the same subject, each throwing out his own notions separately, without regarding what is said by the rest: take for an example the first scene of Aurengzebe. Sometimes he makes a number club in relating an event, not to a stranger supposed ignorant of it, but to one another, for the sake merely of speaking: of which notable sort of dialogue we have a specimen in the first scene of the first part of the conquest of Granada. In the second part of the same tragedy, scene second, the king, Abenamar, and Zulema, make their separate observations, like so many soliloquies, upon the fluctuating temper of the mob: a dialogue so uncouth puts one in mind of two shepherds in a pastoral excited by a prize to pronounce verses alternately, each in praise of his own mistress.

This manner of dialogue-writing, beside an unnatural air, has another bad effect: it stays the course of the action, because it is not productive of any consequence. In Congreve's comedies, the action is often suspended to make way for a play of wit.

No fault is more common among writers than to prolong a speech after the impatience of the person to whom it is addressed ought to prompt him or her to break in. Consider only how the impatient actor is to behave in the mean time. To express his impatience in violent action without interrupting would be unnatural; and yet to dissemble his impatience, by appearing cool where he ought to be highly inflamed, would be no less so.

Rhyme being unnatural and disgustful in dialogue, is happily banished from our theatre: the only wonder is that it ever found admittance, especially among a people accustomed to the more manly freedom of Shakspeare's dialogue. By banishing rhyme, we have gained so much as never once to dream that there can be any future improvement. And yet, however suitable blank verse may be to elevated characters and warm passions, it must appear improper and affected in the mouths of the lower sort. Why then should it be a rule, that every scene in tragedy must be in blank verse? Shakspeare, with great judgment, has followed a different rule; which is to intermix prose with verse, and only to employ the latter where it is required by the importance or dignity of the subject. Familiar thoughts and ordinary facts ought to be expressed in plain language: to hear, for example, a footman deliver a simple message in blank verse, must appear ridiculous to every one who is not biassed by custom. In short, that variety of characters and of situations, which is the life of a play, requires not only a suitable variety in the sentiments, but also in the diction.

In the drama, as well as in poetry in general, great stress is generally laid upon what are called the three unities, viz. the unity of action, that of time, and that of place. The unity of the dramatic action consists in the unity of the intrigue, in comedy, and that of the danger, in tragedy; and this not only in the plan of the fable, but in the fable extended and filled with episodes. This unity of action is of great consequence; but less so with the moderns, whose dramatic exhibitions admit of so much extraneous assistance, than with the ancients. On the Greek stage, so great was their regard to this unity, that they suffered not the action and representation to be interrupted: the division by acts was totally unknown. The word act never once occurs in Aristotle's Poetics, in which he defines exactly every part of the drama, and divides it into the beginning, the middle, and the end. At certain intervals, indeed, the actors retired; but the stage was not then left empty, nor the curtain let fall; for the chorus continued and sung. Neither do these songs of the chorus divide the Greek tragedies into five portions, similar to our acts; though some of the commentators have endeavoured to force them into this office. But it is plain, that the intervals at which the chorus sung are extremely unequal and irregular, suited to the occasion and the subject; and would divide the play sometimes into three, sometimes into seven or eight acts.

As practice has now established a different plan on the modern stage, has divided every play into five acts, and made a total pause in the representation at the end of each act, the question to be considered is, whether the plan of the ancient or of the modern drama is best qualified for making a deep impression on the mind? That the preference is due to the plan of the modern drama, will be evident from the following considerations. If it be indeed true, as the advocates for the three unities allege, that the audience is deluded into the belief of the reality of a well-acted tragedy, it is certain that this delusion cannot be long supported; for, when the spirits are exhausted by close attention, and by the agitation of passion, an uneasiness ensues, which never fails to banish the waking dream. Now supposing the time that a man can employ with strict attention without wandering to be no greater than is requisite for a single act (a supposition that cannot be far from truth), it follows that a continued representation of longer duration than an act, instead of giving scope to fluctuation and swelling of passion, would overstrain the attention, and produce a total absence of mind. In this respect, the four pauses have a fine effect: for, by affording to the audience a seasonable respite when the impression of reality is gone, and while nothing material is in agitation, they relieve the mind from its fatigue; and consequently prevent a wandering of thought at the very time possibly of the most interesting scenes.

In one article, indeed, the Grecian model has greatly the advantage: its chorus, during an interval, not only preserves alive the impressions made upon the audience, but also prepares their hearts finely for new impressions. In our theatres, on the contrary, the audience, at the end of every act, being left to trifle time away, lose every warm impression; and they begin the next act cool and unconcerned, as at the commencement of the representation. This is a gross malady in our theatrical representations; but a malady that luckily is not incurable: to revive the Grecian chorus, would be to revive the Grecian slavery of place and time; but we can figure a detached chorus coinciding with a pause in the representation, as the ancient chorus did with a pause in the principal action. What objection, for example, can there lie against music between the acts, vocal and instrumental, adapted to the subject? Such detached chorus, without putting us under any limitation of time or place, would recruit the spirits, and would preserve entire the tone, if not the tide, of passion: the music, after an act, should commence in the tone of the preceding passion, and be gradually varied till it accord with the tone of the passion that is to succeed in the next act. The músic and the representation would both of them be gainers by their conjunction; which will thus appear. Music that accords with the present tone of mind is, on that account, doubly agreeable; and, accordingly, though music singly hath not power to raise a passion, it tends greatly to support a passion already raised. Further, music prepares us for the passion that follows, by making cheerful, tender, melancholy, or animated impressions, as the subject requires. Take for an example the first scene of the Mourning Bride, where soft music, in a melancholy strain, prepares us for Almeria's deep distress. In this manner, music and representation support each other delightfully: the impression made upon the audience by the representation, is a fine preparation for the music that succeeds; and the impression made by the music is a fine preparation for the representation that succeeds. It appears evident, that by some such contrivance the modern drama may be improved, so as to enjoy the advantage of the ancient chorus without its slavish limitation of place and time.

In the drama, the unities of time and place are readily allowed to be of less consequence than that of action: the poet, however, ought not to indulge in an unrestrained latitude in these respects: for instance, nothing can be more absurd than at the close to exhibit a full-grown person who appears a child at the beginning: the mind rejects, as contrary to all probability, such latitude of time as is requisite for a change so remarkable. The greatest change from place to place hath not altogether the same bad effect: in the bulk of human affairs place is not material; and the mind, when occupied with an interesting event, is little regardful of minute circumstances: these may be varied at will, because they scarce make any impression.

Our great poet Shakspeare, it is well known, paid no regard to the unities of time and place; and Dr. Johnson is of opinion that a nearer view of the principles on which they stand will diminish their value, and withdraw from them the veneration which, from the time of Corneille, they have very generally received, by discovering that they have given more trouble to the poet, than pleasure to the auditor. We shall present the ingenious argumentation of this great man in his own language.

"The necessity of observing the unities of time and place, arises from the supposed necessity of making the drama credible. The critics hold it impossible, that an action of months or years can be possibly believed to pass in three hours; or that the spectator can suppose himself to sit in the theatre, while ambassadors go and return between distant kings, while armies are levied, and towns besieged, while an exile wanders and returns, or till he whom they saw courting his mistress, should lament the untimely fall of his son. The mind revolts from evident falsehood, and fiction loses its force when it departs from the resemblance of reality.

"From the narrow limitation of time necessarily arises the contraction of place. The spectator, who knows that he saw the first act at Alexandria, cannot suppose that he sees the next at Rome, at a distance to which not the dragons of Medea could, in so short a time, have transported him; he knows with certainty that he has not changed his place, and he knows that place cannot change itself; that what was a house cannot become a plain; that what was Thebes can never be Persepolis.

"Such is the triumphant language with which a critic exults over the miseries of an irregular poet, and exults commonly without resistance or reply. It is time, therefore, to tell him, by the authority of Shakspeare, that he assumes as an unquestionable principle a position, which, while his breath is forming it into words, his understanding pronounces to be false. It is false, that any representation is mistaken for reality; that any dramatic fable, in its materiality, was ever credible, or, for a single moment, was ever credited.

"The objection arising from the impossibility of passing the first hour at Alexandria, and the next at Rome, supposes, that when the play opens, the spectator really imagines himself at Alexandria; and believes that his walk to the theatre has been a voyage to Egypt, and that he lives in the days of Antony and Cleopatra. Surely he that imagines this may imagine more. He that can take the stage at one time for the palace of the Ptolemies, may take it in half an hour for the promontory of Actium. Delusion, if delusion be admitted, has no certain limitation; if the spectator can once be persuaded that his old acquaintance are Alexander and Cæsar, that a room illuminated with candles is the plain of Pharsalia, or the bank of Granicus, he is in a state of elevation above the reach of reason, or of truth, and from the heights of empyrean poetry, may despise the circumspections of terrestrial nature. There is no reason why a mind thus wandering in ecstasy should count the clock; or why an hour should not be a century in that calenture of the brain, that can make the stage a field.

"The truth is, that the (judicious) spectators are always in their senses, and know, from the first act to the last, that the stage is only a stage, and that the players are only players. They come to hear a certain number of lines recited with just gesture and elegant modulation. The lines relate to some action, and an action must be in some place; but the different actions that complete a story may be in places very remote from each other; and where is the absurdity of allowing that space to represent first Athens, and then Sicily, which was always known to be neither Sicily nor Athens, but a modern theatre?

"By supposition, as place is introduced, time may be extended; the time required by the fable elapses for the most part between the acts; for, of so much of the action as is represented, the real and the poetical duration is the same. If, in the first act, preparations for war against Mithridates are represented to be made in Rome, the event of the war may, without absurdity, be represented, in the catastrophe, as happening in Pontus; we know that there is neither war, nor preparation for war; we know, that we are neither in Rome nor Pontus; that neither Mithridates nor Lucullus are before us. The drama exhibits successive imitations of successive actions; and why may not the second imitation represent an action that happened years after the first, if it be so connected with it, that nothing but time can be supposed to intervene? Time is, of all modes of existence, most obsequious to the imagination; a lapse of years is as easily conceived as a passage of hours.

In contemplation we easily contract the time of real actions, and therefore willingly permit it to be contracted when we only see their imitation.

"It will be asked how the drama moves, if it is not credited? It is credited with all credit due to a drama. It is credited, whenever it moves, as a just picture of a real original; as representing to the auditor what he would himself feel, if he were to do or suffer what is there feigned to be suffered or to be done. The reflection that strikes the heart is not that the evils before us are real evils, but that they are evils to which we ourselves may be exposed. If there be any fallacy, it is not that we fancy the players, but that we fancy ourselves unhappy for a moment; but we rather lament the possibility, than suppose the presence of misery, as a mother weeps over her babe, when she remembers that death may take it from her. The delight of tragedy proceeds from our consciousness of fiction; if we thought murders and treasons real, they would please no more.

"Imitations produce pain or pleasure, not because they are mistaken for realities, but because they bring realities to mind. When the imagination is recreated by a painted landscape, the trees are not supposed capable to give us shade, or the fountains coolness; but we consider how we should be pleased with such fountains playing beside us, and such woods waving over us. We are agitated in reading the history of Henry V. yet no man takes the book for the field of Agincourt. A dramatic exhibition is a book recited with concomitants that increase or diminish its effect. Familiar comedy is often more powerful on the theatre than in the page; imperial tragedy is always less. The humour of Petruchio may be heightened by grimace; but what voice or what gesture can hope to add dignity or force to the soliloquy of Cato?

"A play read affects the mind like a play acted. It is therefore evident, that the action is not supposed to be real, and it follows, that between the acts a shorter or longer time may be allowed to pass, and that no more account of space or duration is to be taken by the auditor of a drama, than by the reader of the narrative, before whom may pass in an hour the life of a hero, or the revolutions of an empire."

Dr. Johnson concludes his remarks on this topic, with the following passage: "He that, without diminution of any other excellence, shall preserve all the unities unbroken, deserves the like applause with the architect, who shall display all the orders of architecture in a citadel, without any deduction from its strength: but the principal beauty of a citadel is to exclude the enemy; and the greatest graces of a play are to copy nature, and instruct life." (*Preface to Shakspeare.*)

To these observations we will add nothing, but leave them to make their full impression on the mind of the reader.

DRAMA'TICALLY. *ad.* Representatively; by representation.

DRA'MATIST. *s.* (from *drama.*) The author of dramatic compositions (*Burnet*).

DRANK. The preterit of *drink*.

Drank, a name given by farmers to the great wild oat.

To DRAPE. *v. n.* (*drap*, French.) To make cloth (*Bacon*).

DRA'PER. *s.* (from *drape.*) One who sells cloth.

DRA'PERY. *s.* (*drapperie*, Fr.) 1. Clothwork; the trade of making cloth; woollen manufacture (*Bacon*). 2. Cloth; stuffs of wool (*Arbuthnot*). 3. The dress of a picture (*Prior*).

DRA'PET. *s.* (from *drape.*) Cloth; coverlet: not in use (*Spenser*).

DRASTICS. (*drastica, medicamentu*, δραστικος, active, brisk; from δραω, to effect.) Medicines which are very violent in their action on the whole or some part of the intestinal canal, as drastic purges, drastic emetics, &c.

DRAVE. The preterit of *drive.*

Drave, a considerable river of Germany, which rises in the Tyrol, runs across Carinthia, and entering Stiria, continues its course to Marpurg; then it runs along the confines of Sclavonia and Lower Hungary, passing by Esseck, and a little after falls into the Danube.

DRAUGH. *s.* (corruptly written for *draff.*) Refuse; swill (*Shakspeare*).

DRAUGHT. *s.* (from *draw.*) 1. The act of drinking (*Swift*). 2. A quantity of liquor drank at once (*Boyle*). 3. Liquor drank at pleasure (*Milton*). 4. The act of drawing or pulling carriages (*Temple*). 5. The quality of being drawn (*Mortimer*). 6. Representation by picture (*Dryden*). 7. Delineation; sketch; outline (*Locke*). 8. A picture drawn (*South*). 9. The act of sweeping with a net (*Hale*). 10. The quantity of fishes taken by once drawing the net (*L'Estrange*). 11. The act of shooting with a bow (*Camden*). 12. Diversion in war; the act of disturbing the main design (*Spenser*). 13. Forces drawn off from the main army; a detachment (*Addison*). 14. A sink; a drain (*Matthew*). 15. The depth which a vessel draws, or sinks into the water (*Dryden*). 16. (In the plural, *draughts.*) A kind of play resembling chess. 17. A bill of exchange; or an order for the payment of any sum of money due.

Draught, (or, as it is pronounced, *draft.*) In architecture, the figure of an intended building described on paper; wherein are laid down the several divisions and partitions of the apartments, rooms, doors, passages, &c. in their due proportion. See Design.

Draught-horse, in farming, a sort of coarse-made horse, destined for the service of the cart or plough. On the choice of these, see the article Cart-horse.

Nothing is so essential to the health of these serviceable creatures as cleanliness; if they are fed ever so well, and not kept clean, they will be subject to numerous diseases.

The servant who has the care of them ought to be up very early, and to clean the racks and mangers from all filth. The currying of them ought to be carefully performed every morning; but not in the stable, for the dust to fall upon the other horses, as it is too often done. After the horses are dusted, the groom should daily twist a whisp of straw hard up, and, wetting it in water, rub the legs, shoulders, and body, with it. Many of the diseases of draught-horses, which are not owing to uncleanliness, are owing to bad water; such as is too raw, too muddy, or too cold, being all improper. If there be any running stream in the neighbourhood, they should always be taken to that to water every day in summer; but in winter, well-water, being warmer, is better for them. If there be a necessity of giving them well-water in summer, it must be drawn up some hours before the time, and exposed to the sun-beams in tubs or troughs; marsh-water, or that of low-land ditches, is worst of all. When the labouring horse has drank his water, he should have his oats given him, and these should be carefully sifted, and the manger dusted first. It is a common practice, as soon as a horse is come in from his work, to rub down his legs with a whisp of hay; but some (we think without any good reason) have objected to it.

While a horse is in a sweat, it is a great relief and refreshment to him to have his body rubbed down. The rack is to be well supplied with hay, and the horse should be left to rest and eat about two hours, and then led to water: after this his oats should be given him, and he should then go to work again.

In the evening when the labour of the day is over, the first thing to be done is to examine the feet, and see if any thing is amiss about the shoes; and what earth or gravel is lodged in the foot, between the shoe and the sole, is to be picked out, and some fresh cow-dung put in its place, which will cool and refresh the part.

A very material thing for the preservation of all sorts of cattle, but of none so much as of draught-horses, is fresh and clean litter. This is a thing too often neglected in the care of these creatures; and many even neglect the cleaning away the old litter on purpose, leaving it there to imbibe more moisture, that it may be the better manure for the land. It is true, that by this the dung is enriched, and will go farther: but the benefit they reap from it is nothing in comparison with the mischief they do the horse in the mean time; for the heat this gives his feet is alone enough to hurt him. The owner often finds the effect of this, without knowing the cause; the horse, if his hoof be naturally soft and flat, becomes tender-footed and weakly, and is unable to do his business, though fed in the best manner that can be: the dung in this case is left under him, that there may be some advantage from his feeding; and the mischief is increased, instead of being relieved, till in the end the horse is generally rendered useless.

Draught-oxen. Oxen employed for the purpose of draught of any kind instead of horses; an employment which, though considerably cultivated by several of our most intelligent farmers, has by no means met with so general an introduction as on a great variety of accounts it deserves. Mr. Culley employs a hundred and fifty draught oxen in his husbandry, and has continued to employ them to a very great, though not an equal extent, for upwards of thirty years; he uses them single in carts, and pairs them in his ploughs with reins and no driver: and his advice is, not to mix oxen with horses, on account of the inequality of their steps.

Thus it is not a matter of speculation, but of experience and proof, that all the labour of husbandry may be well performed by oxen; and surely, if the only objection, that of their being somewhat slower than horses, can never be surmounted, there are other considerations of weight sufficient to overbalance it. A greater number of them may be kept to forward labour, and that, instead of being an extra charge (as would be the case with an extra number of horses) to both individual and public emolument. The balance in favour of individuals must be indeed great, if we reflect that three oxen may be purchased for less money than one good cart-horse; that the latter is liable to be worn out, and to become of little or no worth, whereas the former never wear out, but the last stage of their useful lives is as profitable as the first.

The method proposed by most people, desirous of effecting this advantageous change in our agricultural economy, is by the interference of government, either by the way of restrictive taxation, or absolute prohibition; means which ought never to be resorted to in any such case. There is, however, a species of coercion perfectly legitimate, that of the lord of the land over his tenant; and Mr. Culley submits it to public-spirited landlords, whether, in granting leases, it would not be an act of public duty, to stipulate for the employment of draught oxen upon their farms to a certain extent. Such a clause would be an advantageous change for the impolitic one of compelling the tenant to make summer fallows.

But it will be asked of those who are sanguine in recommending the use of bullocks for labour, to point out where such may be had, and that with little trouble too; for it is well known to those most conversant with his character, that the husbandman will not be induced to step a single inch out of his accustomed track by a prospect of the greatest advantage; nay, will even regard the man with a kind of hatred, who should presume to point it out to him. The oxen broken for draught are few; and in numberless situations, particularly out of breeding counties, a man must send five or six score miles to obtain them. This inconvenience must be obviated by the body of landlords, and by our great experimental stock-breeders; on whom it depends to raise an improved species, in sufficient numbers for general use, and to divulge the best methods of breaking and training them to labour. The old fashioned wooden yoke has been long laid aside, and experience shews that oxen draw best in breast collars; indeed their harness differs very little from that of the horse, and any collar-maker can very easily furnish them.

The improvement having obtained thus far in the field of husbandry, and having surmounted its greatest difficulty, it is scarce possible but it must even, by contagion, reach the other departments of public service. Stage waggons are not required to move quick; and if we must give up a few hours in a journey, surely both the proprietors and the public would be amply recompensed for a little lost time, by the exchange of wholesome beef for unprofitable carrion. Teams of oxen were set up years ago in this service, which did not succeed, but were again exchanged for horses; but little stress will be laid upon this by persons versed in the uncertain nature of experiments. The species of cattle might be improper, and we have reason to suspect they were not kept in sufficient good condition. The expected improvement in carriages, from the multiplication of wheels, may possibly have the additional good effect of promoting the use of oxen. All persons concerned in carriages will do well to attend to what Mr. James has said upon the subject.

With respect to the brewery, upon a small scale, or in the country, all the business of draught required in such a situation may be equally well performed by oxen as by horses: a considerable improvement of that concern; since their bullocks, after having worked a sufficient time, might be fattened with their own grains.

How far oxen might be useful in the hurry and bustle of a London porter-brewery, those concerned must be the most proper judges; and there can be no doubt that those gentlemen would be ready enough to catch at any considerable alleviation of the immense expence of horse-keeping, the annual amount of which in a great house is a noble revenue.

Often has it been wished it were possible to extirpate the whole race of those Belgic locusts, the heavy cart-horses, and to divide the duties of slow-draft between polled oxen and cast off machiners. It would be an act of mercy, and securing a kind of retreat for these last, particularly when employed upon a farm; for which reason, we should wish to see them a somewhat wider and squarer race. After all these fine speculations, we fear we must have a few Suffolk punches, to draw us through, when deeply set in heavy roads.

Mr. Lawrence observes that an ox-team ploughs an acre in eight hours, performing the day's work with full as much ease and dispatch as a team of horses. The oxen are exceedingly handy, and may be driven with a heavy load to a hair's breadth. His informant is in the habit of carting lime from the distance of seventeen miles, both with ox and horse teams; and the former usually beat the horses by about an hour in the journey, taking the carts faster up the hills. Oxen, by trial, have walked more miles in a given time than cart-horses. The former are fed with hay and chaff, and but little corn is required for them.

The neat cattle, both of Herefordshire and Shropshire, are a superior species in respect to form as well as size: the latter have the preference for the dairy; the former are reared to great size and beauty, by the judicious and spirited breeders of that county, and annually command extraordinary prices, as grazing stock, in Buckingham and Oxfordshire. In Herefordshire they put their bullocks to work at two years old, continuing them until five or six; but as, during the late excessive prices of stock, every resource has been anticipated, working oxen have been commonly sold to go to keep, at three and four years old. The price of a young bullock, fit to break for harness, before the war, was from ten to seventeen pounds, since which it has been more than doubled. Indeed the price of live stock of all kinds has been high of late, and was, on the commencement of the year 1797, so exorbitant, as scarce to seem deserving of credit; now the price is in some degree moderated.

The ox being an animal of a meek and gentle spirit, and easily intimidated, it is highly necessary to use the utmost mildness and forbearance in breaking him in to labour, and indeed in driving him ever afterwards; a rash and mad-headed driver will soon spoil the tempers, and lower the worth, of the best team of bullocks. They are apt to conceive attachments and antipathies, and to take alarm at persons who have treated them ill. On first beginning to plough with oxen, it is advisable to engage a driver who is their countryman, and has been accustomed to attend the species.

In Sussex, the use of oxen for the plough is general, and they perform well upon the stiffest clays of that country; it has even been asserted, that they hang better to the collar, in a long day, than horses. The Sussex beasts are slower than the Hereford. Some farmers have put their bulls to work with advantage.

Now if accounts be to be relied on, there are oxen to be found nearly, if not altogether, upon a par with horses, both at plough and on the hard road, notwithstanding no improvement in the breed, for that express purpose, has ever been attempted; and it has never yet been the custom to feed them well, or to aim at getting them in high condition, as we do horses. On that account it probably is, that bullocks are sometimes so dull and faint, and liable to such dangerous accidents, from being over fatigued at work.

In Holland they keep their cows curried as fine as racers, and body-clothe them upon turning them out. Our labouring beasts ought to be kept within doors in winter, fed with corn, and dressed as carefully as horses.

The fair question is, does an additional annual product of corn throughout the island result from the labour of horses, sufficient to reimburse their superior expence, and to counterbalance the profit of slaughtering the oxen, after their period of labour shall have expired? We should suppose the negative of the proposition most probable, and that we are merely sacrificing to our prejudices, and to the venerable idol custom, in using such multitude of draught horses. Of the further possible improvement of the breed of oxen, in point of activity, Mr. Lawrence does not hesitate to speak with confidence; yet he candidly acknowledges, that the farmers of Essex assert the superiority of horses, and even the almost impossibility of making any tolerable shift with oxen; at the same time he believes none of them have ever made the experiment. But in Hampshire, a considerable farmer, keeping an equal number of horses and of oxen for the plough, found little or no difference in their services. In Northumberland, Mr. Culley, after thirty years experience, keeps one hundred and fifty draught oxen, using them two in a plough, with reins and no driver, and in carts, singly. In Middlesex, an ox team of the slowest kind, having little or perhaps no corn, ploughed three quarters of an acre per day, where the horse-team did an acre. These bullocks also carted hay to London, returning as usual with dung. In Herefordshire, the oxen, with very little corn, beat the horses both at plough and upon the roads, which are very hilly and stony. In Sussex, oxen are used at plough with the greatest success. In many parts of the west of England, oxen are preferred to horses for both kinds of labour.

From these data every one is at liberty to draw his inferences; but let it be considered, that the number of horses employed in agriculture, and for the different purposes of slow draught, in Britain, probably exceeds one million five hundred thousand, and that if only one half of these could with propriety be changed into good wholesome beef, how immense must be the saving; it being taken into the account, that the time approaches, with fearful strides, when national economy alone can save us from impending destruction. In two respects, we may perhaps pretend to some little originality of thinking on this subject; to wit, on the more liberal feeding, and the breeding the ox to greater speed. Every one who has entered into the philosophy of laborious exertion, and attended the practice, whether in men or animals, must be convinced how much it depends upon ample and solid nutriment. Every adept in the mysteries of the stable well knows how contributory are cleanliness, and keeping the perspiration open and free, by regular diurnal frictions, to the nimbleness and hilarity of the animal. In regard to raising a variety of the ox, with the qualification of more than the usual activity, where should be the difficulty, since we have been long accustomed to vary and mould him at pleasure into such differing shapes and forms as caprice or interest has prompted? Perhaps those gentlemen who have been in the habits of breeding horses for the turf would succeed best in this pursuit: it is of great national importance, and not unworthy attention.

Mr. Arthur Young, in the Annals of Agriculture, after stating, that the labouring ox, with proper management, gains two or three pounds per year, whilst the horse grows annually worse, observes, "that the ox requires no oats, and, instead of hay, is generally contented with straw." This, however, Mr. Lawrence suspects, may have a tendency rather to retard, than forward, the public object of employing oxen. For the grand objection to bullocks for labour being the want of expedition, he thinks this can never be obtained from any animals, without solid and generous keep.

Masgal, farrier to James I. observes, that oxen were generally used and esteemed superior to horses, for the plough, in his days; he mentions disorders brought upon working oxen by poor keep, and their being subject in consequence to lie down in the furrow, when they were with difficulty got up again: he recommends for them, barley in the straw, which will, he says, keep them lusty and strong; also to curry them like horses, and constantly wash their feet and claws. It was the custom in those days to work barreners. The ancients occasionally purged their labouring oxen.

Mr. Young speaks of a hornless breed of Devons, of a red colour, near Bridport. To this place recourse may be easily had by a curious breeder. In breeding the ox for labour, the required points are, clean and fine head and neck, deep shoulder, wide quarters, thin skin, silk coat; and those qualities must be sought among the Herefords, Yorkshire short-horns, North Devons, and those of Sussex. There are exceeding fast walkers amongst the Yorkshire cows; and some well formed for labour, which appeared to be bred between Norman or Alderney stock, and Yorkshire. Equal activity of exertion at dead pulls, or ability to lift great weights, with our best cart-horses, must never be expected in the most improved breed of oxen; at the same time it must be conceded, those qualities are not our material objects of pursuit.

DRAUGHT-HOOKS, are large hooks of iron fixed on the cheeks of a cannon-carriage, two on each side, one near the trunnion-hole, and the other at the train, and are called the fore and hind draught-hooks.

DRAU'GHTHOUSE. *s.* (*draught* and *house.*) A house in which filth is deposited (*Kings*).

DRAUGHTS. (*jeu aux dames,* Fr.) A well known game played with counters, upon a quadrilateral board, containing sixty-four checks. Neither the origin of the word, nor the history of the game, has hitherto been attempted by any of our lexicographers or antiquaries, if we except Skinner; who explains the word draughts as follows: "*Ludus latrunculorum simplicior; nobis sic dictum credo à verbo* to draw, *quia scilicet latrunculi victi hinc, inde rapiuntur et auferentur.*" "The simpler game of table-men; thus denominated among ourselves, as I suppose, from the verb *to draw;* because the table-men here overpowered, are drawn off, and carried away."

There are various sources, however, as it appears to us, from which the word draughts may be more readily derived. Johnson offers no derivation, but in one of his meanings of the word draught explains it to denote "Forces drawn off from the main body; a detachment;" and in another, "Diversion in war; the act of disturbing the main design; perhaps sudden attack."

Now all these apply strictly to the nature of the game, and offer a directer origin than that suggested by Skinner. Yet the real origin, if we mistake not, is the following.

A draught is a sketch, design, or picture; a draught-board is a sketch or picture-board; in the present instance, the board containing the sketch or picture on which the pieces that play the game are to move, and which are on this account called themselves the draughts, draught-men, or occupiers of the draught-board.

Of the history we are totally ignorant. Every one, however, who attends to its general scope and operations, will readily perceive that it is a mere modification of the simpler movements and operations of chess; and consequently that it must have been invented some time after the latter game became known in Europe. The board, on which the game is played, is directly a chess-board, containing the same number of squares. The counters, or men, as they are called at draughts, are the pawns, paons, or footmen, as they are called at chess; in both games these pieces make a similar advance, and are only able to move from one square to another at a time, without any retrograde movement whatever; and in both also they can only take prisoners, by moving in a diagonal direction. There is this difference, however, that in chess the pawns move straight forward when they do not take prisoners, and only in an oblique line when they do; while in the easier game of draughts this complex motion is simplified, and the pawns never move otherwise than in an oblique line.

The great and characteristic difficulty of chess, consists in the diversity of the movements allowed to the pieces called the king and his officers. These pieces, therefore, are entirely laid aside in the game of draughts, which is played by twelve pawns or men alone on each side. The latter game, however, as well as the former, has its kingly dignity, which is the only titled dignity it retains from the parent source. In the European chess, which is derived immediately from the Persians, we allow but one king on each side; in the Hindustanee chess, however, there are two kings, as well as two queens, and two officers of every kind. In draughts, the kings are capable of multiplication, to a much greater extent on either side: and instead of being hereditary as in chess, they are advanced in draughts, from the common ranks, and acquire the regal dignity alone by their own courage and success; for every pawn or man that is capable of pushing forward, and taking possession of a post in the extreme or hindmost line of squares belonging to the hostile party, is immediately crowned, and capable of moving in any diagonal direction whatever, backwards or forwards, to the terrible annoyance of the pawns or common men, who are often in consequence mown down with rapid and tremendous slaughter. Finally, both chess and draughts terminate not unfrequently in the same way, by a check-mate, or complete blockade of the king; with this only difference, that as there is but one king in the usual game of chess, and the whole dignity of the army depends upon him, the game is won the moment he is completely blockaded, whatever the number of officers or of pawns he may have around him; while as the dignity of a king is less considerable in draughts, as well from his plebeian origin, as from the greater number that may exist at the same time, the game does not close by a check-mate, unless every king and pawn is completely check-mated at the same time. From this diminution of dignity also, kings in draughts are liable to the indignity of being taken prisoners like the common men or pawns.

The game of draughts may, with propriety, therefore, be denominated *little chess;* and in reality, this seems to have been very nearly the name by which it was called a few centuries ago: for as the Latin term *ludus latrunculorum,* derived from Seneca, but certainly with an incorrect appropriation, was applied to chess, so the game of draughts was denominated, at the same time, *ludus latrunculorum simplicior,* simpler or little chess.

In playing at draughts the parties may choose either the black or the white squares, for in this game only one set of squares can be played upon at one time. This being decided, the board must be so placed that the double angle of the playing squares must be at the right hand of each player. The number of men is twelve for each, and being placed, one on each of the black or white squares agreed upon, they will just fill up the first three rows, and leave a sufficient field for operations in the centre.

The first move is to be determined by lot, and the rest afterwards follow alternately as in chess. Every movement must be in a diagonal line forwards alone, and only from square to square. To enable a pawn on one side to take a pawn on the other, immediate proximity is not enough, for there must be a blank behind the pawn that is to be taken: and the pawn that takes him, instead of passing, as in chess, into the square that the captured pawn occupies, leaps over the captured pawn into the blank square, as though he had made two movements, and then takes off the captured pawn from the board.

If the victor pawn, on alighting in the blank square, meet with another hostile pawn in a square immediately adjoining, with another blank behind him, he pursues his career, leaps over this second pawn, which is immediately removed after the manner of the first; and continues the same course, without interruption, as long as he meets with a pawn with a blank square behind to rest in.

A pawn is often moved forward by one of the parties, into a direct approximation with a pawn of the other party for the express purpose of being taken, in order by such a sacrifice to carry into effect a plan for taking two or three pawns in return, the player perceiving, that by the advance of one of his antagonist's pawns into the square, it must hereby necessarily reach, he will be able not only to take the pawn that so advances, but also several other pawns towards which his own pawn will be led, in consequence of their being unprotected, or having blank squares behind them.

On this account a player is compelled to take a pawn thus situated, and is not left at his option; for if he do not take his adversary's pawn, and moves another instead of the one he ought to move for this purpose, the adversary immediately takes off from the board the pawn that should have moved, as a forfeit, exclaiming, "*I off you,*" or (as it is vulgarly pronounced) "I *hoff* or *huff* you," i. e. I take you off for not taking my pawn: and this action is hence denominated a *hoff* or *huff*.

The direct object of the game, on either side, is to push forward boldly, yet cautiously, towards the adversary's first or hindmost line, and to compel him to break it, and leave one or more blank squares in that quarter. For, as we have already observed, every pawn or man that reaches a blank square in this line is immediately advanced to the dignity of a king, with the power of moving either backward or forward from one square to another, in any diagonal direction at option; and in consequence of being a king, he is immediately crowned, by having another pawn put upon him, significative of his double power of motion; and in this manner each party has often not less than four, five, or more kings at a time.

To obtain this end, the grand principle is, to spread the pawns or men so widely in their advance, as to be able to take every advantage of the enemy that may offer itself, yet to keep them sufficiently close to each other, to afford an easy and effectual protection. The hindmost, or head-line, as it is called, is usually advanced last of all; and the player, who by dexterous manœuvring, is capable of breaking through this part of his adversary's encampment, so as to give a safe admission to one of his pawns, and thus to make a king of him, in an early part of the game, is almost sure of gaining it when the skill is upon a par. And on this account one pawn (and sometimes two) are readily sacrificed to obtain so important an advantage.

This attack is most commonly attempted towards the double-corner, or on the right hand side of the defendant: for here the assault may be conducted with less danger, and the succéssful pawn, after he has been crowned, returns without interruption or blockade to the field of battle, which is not always the case if he enter in on any other square. This, therefore, is the most important quarter of any, even in the opening of the contest; it is also the most important towards the close; for if one party be weakened, and reduced to two kings by a party who has three, he will be able to defend himself for a very long period of time in this position; and by taking advantage of the movements of the opposite party, and crossing one of his two kings over the board to the opposite double corner, he will effectually prevent him from check-mating, or blockading him, and will of course, inferior as he is in number, reduce the battle to a drawn game. In any other outermost square on the draught-board, a pawn or a king may be so placed (as for example, on the square nearest in a straight line, and directly opposite to the former), that the opposite party having to move, is necessarily check-mated or blockaded, and cannot stir without falling a prisoner to the pawn or king that is blockading. Even a pawn alone so situated, would possess the same power over a king so blockaded. But a king, once securing himself in the double angle on the same line, not only requires two pieces to blockade or check-mate him, but both those pieces must first of all be made kings, in order that they may be able to move both backward and forward, without which double power of action they would not be competent to effect a perfect blockade.

Where the pieces are reduced to one on each side, or, as we have already observed, two on the one side, and three on the other, and so situated that it is impossible for either side to blockade or check-mate the other, the battle is denominated a drawn-game, and neither party lays claim to the victory.

To DRAW. *v. a.* preter. *drew*; part. pass. *drawn.* (ꝺꞃaȝan, Saxon.) 1. To pull along; not to carry (*Samuel*). 2. To pull forcibly; to pluck (*Atterbury*). 3. To bring by violence; to drag (*James*). 4. To raise out of a deep place (*Jeremiah*). 5. To suck (*Ecclus.*). 6. To attract; to call toward itself (*Suckling*). 7. To draw as the magnet does (*Dryden*). 8. To inhale (*Addison*). 9. To take from any thing containing or holding (*Chronicles*). 10. To take off the spit or broacher (*Dryden*). 11. To take from a cask (*Shakspeare*). 12. To pull a sword from the sheath (*Dryden*). 13. To let out any liquid (*Wiseman*). 14. To take bread out of the oven (*Mortimer*). 15. To unclose or slide back curtains (*Dryden*). 16. To close or spread curtains (*Sidney*). 17. To extract (*Cheyne*). 18. To procure, as an agent or cause (*Locke*). 19. To produce, or bring, as an efficient cause (*Tillotson*). 20. To convey secretly or gradually (*Raleigh*). 21. To protract; to lengthen; to spin (*Felton*). 22. To utter lingeringly (*Dryden*). 23. To represent by picture (*Waller*). 24. To form a representative image (*Dryden*). 25. To derive, as from some original (*Temple*). 26. To deduce, as from postulates (*Temple*). 27. To imply (*Locke*). 28. To allure; to entice (*Psalms*). 29. To lead, as a motive (*Dryden*). 30. To persuade to follow (*Shakspeare*). 31. To induce; to persuade (*Davies*). 32. To win; to gain (*Shakspeare*). 33. To receive; to take up (*Shakspeare*). 34. To extort; to force (*Addison*). 35. To wrest; to distort (*Whitgift*). 36. To compose; to form in writing (*Pope*). 37. To withdraw from judicial notice (*Shakspeare*). 38. To eviscerate; to embowel (*King*). 39. *To* Draw *in.* To apply to any purpose by distortion or violence (*Locke*). 40. *To* Draw *in.* To contract; to pull back (*Gay*). 41. *To* Draw *in.* To inveigle; to entice (*Hudibras*). 42. *To* Draw *off.* To extract by distillation (*Addison*). 43. *To* Draw *off.* To drain out by a vent (*Mortimer*). 44. *To* Draw *off.* To withdraw; to abstract (*Addison*). 45. *To* Draw *on.* To occasion; to invite (*Hayward*). 46. *To* Draw *on.* To cause; to bring by degrees (*Boyle*). 47. *To* Draw *over.* To raise in a still (*Boyle*). 48. *To* Draw *over.* To persuade to revolt; to induce to change a party (*Addison*). 49. *To* Draw *out.* To protract; to lengthen (*Shakspeare*). 50. *To* Draw *out.* To beat out, as is done to hot iron (*Moxon*). 51. *To* Draw *out.* To extract; to pump out by insinuation (*Sidney*). 52. *To* Draw *out.* To induce by motive (*Hooker*). 53. *To* Draw *out.* To call to action (*Dryden*). 54. *To* Draw *out.* To range in battle (*Collier*). 55. *To* Draw *up.* To form in order of battle (*Clarendon*). 56. *To* Draw *up.* To form in writing (*Swift*).

To Draw. *v. n.* 1. To perform the office of a beast of draught (*Deuteronomy*). 2. To act as a weight (*Addison*). 3. To contract; to shrink (*Bacon*). 4. To advance, to move (*Milton*). 5. To come together (*Blackmore*). 6. To draw a sword (*Shakspeare*). 7. To practise the art of delineation (*Locke*). 8. To take a card out of the pack; to take a lot (*Dryden*). 9. To make a sore run by attraction. 10. *To* Draw *off.* To retire; to retreat (*Collier*). 11. *To* Draw *on.* To advance; to approach (*Dryden*). 12. *To* Draw *up.* To form troops into regular order (*Clarendon*).

Draw. *s.* (from the verb.) 1. The act of drawing. 2. The lot or chance drawn.

DRAWBACK, in commerce, certain duties, either of the customs or of the excise, allowed upon the exportation of some of our own manufactures; or upon certain foreign merchandise, that have paid duty on importation. The oaths of the merchants importing and exporting are required to obtain the drawback on foreign goods, affirming the truth of the officer's certificate on the entry, and the due payment of the duties: and these may be made by the agent or husband of any corporation or company; or by the known servant of any merchant usually employed in making his entries, and paying his customs.

DRAWBRIDGE, a bridge made after the manner of a floor, to draw up, or let down, as occasion serves, before the gate of a town or castle. See Bridge.

A drawbridge may be made after several different modes, but the most common are made with plyers, twice the length of the gate, and a foot in diameter. The inner square is traversed with a cross, which serves for a counterpoise; and the chains which hang from the extremities of the plyers, to lift up or let down the bridge, are of iron or brass. In navigable rivers it is sometimes necessary to make the middle arch of bridges with two moveable platforms, to be raised occasionally, in order to let the masts and rigging of vessels pass through.

DRAW-NET, a device for catching birds, and especially woodcocks, with a net fixed in a particular manner. The following is the most generally applicable, and consequently the most convenient plan: for the explanation of which see Plate 92, fig. 2.

Pitch upon some clear place on the side of a forest; for example, suppose AD to be the forest, and the space between the tree A and the letter E, to be the void space, five or six fathoms broad; pitch upon a tall and straight tree on the side of the wood, as that marked A, lop off the branches towards your clear ground, and fasten to the top of the tree a strong pole, as K, R, Z: find out a tree in the wood of a middling size, as that represented by E, F, let it be as high and straight as possible; when you have taken off all the branches, carry it to the place where your draw-net lies, and making a hole in the ground, as at E, four or five feet deep, and six or seven fathoms distant from the edge of the forest A, put the thick end of it into this hole, lift it up, and let it stand upright, after you have first tied, within two or three feet of the end F, some bands of wood, fastened endwise to each other, as *a*, *b*, *c*, *d*, *e*, *f*, &c. and then let them be kept tight, with wooden hooks fixed quite round in the ground: they should be nine feet distant from the foot E, and managed like ropes at the mast of a ship: at the same time care must be taken that none of them reach to the glade, or space between A and E, for fear of entangling the net. Set the tree which you have cut, so that the point F incline two feet, or thereabouts, towards the pass to the forest; and fasten the pulley C to the small end, with a cord or packthread thrust through it; as also to the tree A, and through the pulley L. Leave the thick cords there; or as thieves might be tempted to steal them, the best way is to leave only the packthreads, and even to shorten them, by tying a small packthread B to one end, and twisting the others about the trunk of the tree, at a place where they are not to be reached, especially with climbing up as far as the part H of the cut tree: or else take with you a light ladder, six or eight feet high, by which means you may most easily secure your implements.

Another invention is, after the flight is over, to tack two cords together, by means of which you may convey up as many stones as far as the pulleys; then take a stick V, two feet long, and cleft at both ends, about which fold all the rest of the cords; after which pass them both into the clefts at the ends of the stick, and let the whole mount up. Thus the stones S, T, will come down to half the height of the trees, because the cords are tied together at the letter X, and there will the stick V hang downwards: so that to order things rightly, you must have a long pole with a hook at the end, with which to hook the piece of wood V, and pull it; or else take a packthread, and tie a stone as big as a hen's egg to it, that you may throw it between the two cords over the stick V, and by that means pull it as with a hook. It remains only to observe, that you may place several draw-nets round about the forest, and that one man alone may pitch ten or a dozen of the triple ones.

This article might be thought imperfect, unless something should be observed relating to the flying, or buckled draw-net, by some called pantine; which is of use in all places, and especially in countries where there is nothing but coppices and forests, whose owners will not allow the felling any trees, or cutting of branches, necessary for the use of the former net. See Plate 92, fig. 3.

Take two poles, as E, B, D, C, as thick as your arm, of twenty-one feet long; straight and light, and pointed at the thick end: fasten to each small end B, D, an iron, copper, or such like buckle, to serve instead of a pulley; have also a draw-net with buckles, into which you must pass a strong packthread, that is even, and twelve fathoms long: see the letters B, G, D, F; fold it, that it may not be entangled with the net; and have a wooden hook F, of a foot long, for the convenience of carrying your implements, to use as you have occasion.

This draw-net must be pitched no where but on the sides of a coppice, near some vineyard, in the highways or walks in a forest or park; especially when these places adjoin fields, or open grounds, in the middle or between woods. You may likewise spread this net along a brook, at the bottom of a pond, and indeed, in all places frequented by woodcocks. You must use it in the following manner:

Suppose the tree, L, be the side of the wood, or some other place where you have a mind to pitch your net, you must unfold it, and take an end of the thick packthread which passes through the buckle, and tie it to the end of the pole at the letter B; pass a small packthread E, K, into the buckle which is at the end B, and tie it to the first buckle B of the net, that you may draw it like a bed-curtain; then stick the pole B, E, quite round the wood L, in such a manner, that it may stand firm in the ground, and slope a little towards the tree. Take the other end of the thick packthread F, and pass it also into the buckle or ring D, which you are likewise to pitch into the ground, about five or six fathoms distant from the other pole B, E; then withdraw seven or eight fathoms distant from the net, to the foot of some tree or bush, or else to some branch which you have pitched upon on purpose, over against the net, as at the place marked F; here fix the hook, and tie the end of the thick packthread, and then pull the whole till the net is mounted; next twist the cord twice or thrice about the hook, that you may keep it tight, while you proceed to pull the small packthread, E, in order to extend the net; when this is done return to the hook, unfold the cord, and sit near the bush or cover, without stirring, having your eye always to the net, that you may let it fall when the woodcock gets into it, which you must kill as soon as taken; when setting your net readily again, proceed as before. It would not be amiss to put a small packthread into the last buckle D of the net, as on the other side, by which you will adjust the draw-net the more easily.

This sort of draw-net should have no other than lozenge meshes, because they must glide along the cords, like a bed-curtain; the net should not be above five or six fathoms wide, and two and a half or three in height. The meshes should be two inches broad, or two and a half or three at most; the net should be made of fine but strong thread, and the copper buckles fastened to all the meshes of the last upper row B, D; the lever must be made twice as long as you would have the net to be in extent; then having a quarter more than the measure of the height, you must accommodate the buckles, which being adjusted in the manner in which they ought to stand, pass a middling cord, or packthread as thick as a writing-pen, into all these buckles.

You should have two other small packthreads B, G, D, C, which you must pass into the last range of the meshes of both sides, one of which must be fastened to the buckle B, and the other to that at D, in order to keep the net right when you make use of it; and therefore the two ends E and G must be loose, and longer than the height of the net by ten or twelve feet: this net must be of a brown colour.

Draw-nets are usually made with lozenge meshes, because there are few persons who know how to make them otherwise, but here more thread and labour are required than in those with square meshes, which are made sooner, and have no superfluous meshes. However, every one is at liberty in their choice; for both may be employed with advantage.

If you prefer a draw-net with lozenge meshes, measure the breadth of the place where you are to spread it, and let the net be near twice as long as that measure. Its height should be from that branch where the pulley is, to within two feet of the ground. The breadth is from the letter V to the letter X; being the places where the stones should fall, which are supposed to be fastened at M and N; when the net is spread, the height should be taken from the pulley to reach near the letter X; the net must therefore be made one-third part longer than the height; for being extended in breadth, it will shorten by one-third; when the whole net is meshed, you must have a cord not quite so thick as your little finger, through all the meshes of the last range M, N; you must fasten both sides, tying the six first meshes of the row together to the cords so that they may slip along; do the same by the other side; these two places must be distanced, according to the width of the pass, leaving the rest of the meshes of the net above loose, so as to slip or be drawn from one side to the other, like a bed-curtain: then to each of these cords tie a packthread, which you must pass into the last range of meshes on the sides, that so you may fasten the net as it should be, to two trees, A, B; a foot or two of the cord should be suffered to hang down at each end of the net, with which to tie the stones, when you would spread it.

If you prefer a draw-net with square meshes, take the breadth and height, and work as aforesaid: when the net is finished, verge it above with a pretty strong cord, and pass two packthreads through the meshes, on both sides, in the same manner as in that made lozenge-wise, and leave also both ends of the cord, so that the stones may be tied with them.

DRA'WER. *s.* (from *draw.*) 1. One employed in procuring water from the well (*Deuteronomy*). 2. One whose business is to draw liquors from the cask (*Ben Jonson*). 3. That which has the power of attraction (*Swift*). 4. A box in a case, out of which it is drawn at pleasure (*Locke*). 5. (In the plural.) The under part of a man's femoral dress (*Locke*). 6. He who draws a bill of exchange.

DRAWING, an art which consists in justly representing the appearances of objects, upon paper or any plain surface, by means of lines and shades, formed with certain colouring materials adapted to the purpose.

Sect. I. *Of the Materials used for Drawing, and the Manner of employing them.*

Whoever would acquire this elegant art, must begin by furnishing himself with proper materials, such as black-lead pencils, crayons of black, white, or red chalk, crow-quill pens, a ruler and compasses, camels-hair pencils, and Indian ink. He must accustom himself to hold the pencil farther from the point than a pen is held in writing; which will give him a better command of it, and contribute to render his strokes more free and bold. The use of the pencil is to draw the first sketch or outline of the piece, as any stroke that is amiss may in this be easily rubbed out; and when he has made the sketch as correct as he can with the pencil, he may then draw carefully the best outline he has got, with his crow-quill pen dipped in a liquid Indian ink; after which he may discharge the pencil-lines, by rubbing the piece gently with the crumb of stale bread or In-

dian rubber. Having thus got the outline clear, his next work is to shade the piece properly, either by drawing fine strokes with his pen where it requires to be shaded, or by washing it with his pencil and the Indian ink. As to his ruler and compasses, they are never or very rarely to be used, except in measuring the proportions of figures after he has drawn them, to prove whether they are right or not; or in houses, fortifications, and other works of architecture.

Having got all these implements in readiness, the first practice must be to draw straight and curve lines, with ease and freedom, upwards and downwards, sideways to the right or left, or in any direction whatsoever. He must also learn to draw accurately, by command of hand only, squares, circles, ovals, and other geometrical figures: for as the alphabet, or a knowledge of the letters, is an introduction to grammar; so is geometry to drawing. The practice of drawing these simple figures till he is master of them, will enable him to imitate, with greater ease and accuracy, many appearances both in nature and art. And here it is proper to admonish him never to be in a hurry; but to make himself perfectly master of one figure before he proceeds to another: the advantage, and even necessity, of this, will appear as he proceeds. Two observations more may be added: 1. That he accustom himself to draw all his figures very large, which is the only way of acquiring a free bold manner of designing. 2. That he practise drawing till he has gained a tolerable mastership of his pencil, before he attempts to shadow any figure or object of any kind whatever.

Sect. II. *Of the Method of drawing Eyes, Ears, Legs, Arms, Hands, Feet, &c.*

As to the drawing of eyes and ears, legs and arms, the learner will have very little more to do than to copy carefully the different examples given in Plate 64, taken from one of the most approved drawing-books extant. But the actions and postures of the hands are so many and various, that no certain rules can be given for drawing them that will universally hold good. Yet as the hands and feet are difficult members to draw, it is very necessary, and well worth while, to bestow some time and pains about them, carefully imitating their various postures and actions, so as not only to avoid all sameness and imperfection, but also to give them life and spirit. To arrive at this, great care, study, and practice, are requisite; particularly in imitating the best prints or drawings that can be got of hands and feet; for, as to the mechanical way of drawing them by lines and measures, they are not only perplexed and difficult, but also contrary to the practice of the best masters. One general rule, however, may be given (which is universally to be observed in all subjects), viz. not to finish perfectly, at first, any single part, but to sketch out faintly, and with light strokes of the pencil, the shape and proportion of the whole hand, with the action and turn of it; and after considering carefully whether this first sketch be perfect, and altering it wherever it is amiss, you may then proceed to the bending of the joints, the knuckles, the veins, and other small particulars, which, when the learner has got the whole shape and proportion of the hand or foot, will not only be more easily, but also more perfectly done.

Sect. III. *Of drawing the Human Face.*

It is usual with artists to divide the head into four equal parts. 1. From the crown of the head to the top of the forehead. 2. From the top of the forehead to the eye-brows. 3. From the eye-brows to the bottom of the nose. 4. From thence to the bottom of the chin. But this proportion is not constant; those features in different men being often very different as to length and shape. In a well-proportioned face, however, they are nearly right. To direct the learner, therefore, in forming a perfect face, his first business is to draw an oval, or rather the form of an egg; in the middle of which, from the top to the bottom, draw a perpendicular line. Through the centre or middle of this line draw a diameter line, directly across from one side to the other of your oval. On these two lines all the features of the face are to be placed as follows: Divide your perpendicular line into four equal parts: the first must be allotted to the hair of the head; the second is from the top of the forehead to the top of the nose between the eye-brows; the third is from thence to the bottom of the nose; and the fourth includes the lips and chin. Your diameter line, or the breadth of the face, is always supposed to be the length of five eyes; you must therefore, divide it into five equal parts, and place the eyes upon it so as to leave exactly the length of one eye betwixt them. This is to be understood only of a full front face, as *a* in Plate 65; for if it turn to either side, then the distances are to be lessened on that side which turns from you, less or more, in proportion to its turning, as in the examples *bbb*. The top of the ear is to rise parallel to the eye-brows, at the end of the diameter line; and the bottom of it must be equal to the bottom of the nose. The nostrils ought not to come out farther than the corner of the eye in any face; and the middle of the mouth must always be placed upon the perpendicular line.

Sect. IV. *Of delineating Human Figures.*

When the pupil is become tolerably expert in drawing faces, heads, hands, and feet, he may next attempt to draw the whole of the human figure at length. In order to this, let him first sketch the head; then draw a perpendicular line from the bottom of the head seven times its length (for the length of the head is about one-eighth part of the length of the figure). The best proportioned figures of the ancients are 7¾ heads in height. If, therefore, the figure stands upright, as in the example *a*, Plate 64, draw a perpendicular line from the top of the head to the heel, which must be divided into two equal parts. The bottom of the belly is exactly the centre. Divide the lower part into two equal parts again, the middle of which is the middle of the knee. For the upper part of the figure, the method must be varied. Take off with your compasses the length of the face (which is three parts in four of the length of the head); from the throat-pit to the pit of the stomach is one face, from thence to the navel is another, and from thence to the lower rim of the belly is a third. The line must be divided into seven equal parts. Against the end of the first division place the breasts; the second comes down to the navel; the third to the privities; the fourth to the middle of the thigh; the fifth to the lower part of the knee; the sixth to the lower part of the calf; and the seventh to the bottom of the heel, the heel of the bearing-leg being always exactly under the pit of the throat. But as the essence of all drawing consists in making at first a good sketch, the learner must in this particular be very careful and accurate; he ought to draw no one part perfect or exact till he see whether the whole draught be good; and when he has altered that to his mind, he may then finish one part after another as exactly as he is able.

Some artists, in copying a statue, begin with the head, which they finish, and then proceed in the same manner to the other parts of the body, finishing as they go on: but this method is a bad one: for if they make the head in the least too big or too little, the consequence is a disproportion between all the parts, occasioned by their not having sketched the whole proportionably at first. Let the learner remember, therefore, in whatever he intends to draw, first to sketch its several parts, measuring the distances and proportions between each with his finger or pencil, without using the compasses; and then judge of them by the eye, which by degrees will be able to judge of truth and proportion, and will become his best and principal guide. And let him observe, as a general rule, always to begin with the right side of the piece he is copying: for by that means he will always have what he has done before his eyes; and the rest will follow more naturally, and with greater ease: whereas if he begin with the left side, his hand and arm will cover what he does first, and deprive him of the sight of it; by which means he will not be able to proceed with so much alacrity.

With regard to the proper order and manner of proceeding in drawing the human body, he must first sketch the head; then the shoulder in the exact breadth; then draw the trunk of the body, beginning with the arm-pits (leaving the arms till afterwards), and so draw down to the hips on both sides; and be sure he observe the exact breadth of the waist. When he has done this, let him then draw that leg which the body stands upon, and afterwards the other which stands loose; then the arms, and last of all the hands. He must take notice also of the bowings and bendings that are in the body; making the part which is opposite to that which bends correspond to it. For instance: if one side of the body bend in, the other must stand out answerable to it; if the back bend in, the belly must stick out; if the knee bend out, the ham must fall in; and so of any other joint in the body. Finally, he must endeavour to form all the parts of the figure with truth, and in just proportion: not one arm or one leg bigger or less than the other; not broad Herculean shoulders, with a thin and slender waist; nor raw and bony arms, with thick and gouty legs: but let there be a kind of harmonious agreement amongst the members, and a beautiful symmetry throughout the whole figure.

SECT. V. *Of the Proportions and Measures of the Human Body.*

The centre or middle part, between the two extremes of the head and feet of a new-born child, is in the navel, but that of an adult is in the os pubis; and the practice of dividing the measures of children into four, five, or six parts, whereof the head is one, is made use of by painters and sculptors. A child of two years old has about five heads in its whole length, but one of four or five years old has near six; about the fifteenth or sixteenth year, seven heads are the proportion or measure, and the centre inclines to the upper part of the pubis. Hence it appears, as the growth of the body advances there is a gradual approach to the proportion of an adult of near eight heads in the whole length, of which, as mentioned above, the head makes one.

In conformity to these principles, the following table is constructed, exhibiting the proportions of the parts of a man and of a woman, as they were fixed by the ancients, and measured by M. Audran from the Apollo Pythius in the garden of the Vatican at Rome, and the Venus Aphroditus belonging to the family of Medicis. Supposing the figures to stand upright and duly poised on both legs, the whole height of the former is divided into 31½ parts, being 7 heads, 3 parts, and 6 minutes; and that of the latter into 31 parts, being 7 heads and 3 parts.

Length of the Head and Trunk of the Body.	*Apollo.*			*Venus.*

The other most admired antique statues differ a little from these proportions, the Laocoon measuring 7h. 2p. 3m. the Hercules 7h. 3p. 7m. the Pyramus 7h. 2p. the Antinous 7h. 2p. the Grecian shepherdess 7h. 3p. 6m. and the Mirmillo 8h. But all their other proportions are allowed to be harmonious and agreeable to the characters they represent.

The most remarkable differences of the symmetry or proportions of a man and of a woman to be observed from the table are: First, the shoulders of a man are broader, measuring two heads; and the haunches narrower, measuring 1h. 1p. 5m. whereas the shoulders of a woman measure only 1h. 3p. 8m. and the haunches measure 1h. 2p. 3m. The sternum or breast bone of a man is longer, measuring 3p. 8m. and the sternum of the woman only 3p. 3m. On the contrary, the pelvis of a man is less, measuring from the top to the bottom only 4p. whereas the pelvis of a woman measures from the top to the bottom 4p. 3m.

It is a leading principle, in which every person conversant in designing has agreed, that without a perfect knowledge of the proportions, nothing can be produced but monstrous and extravagant figures; and it is also universally admitted, that the ancient Greek and Roman sculptors attained the highest success in producing the most perfect models. Indeed, the greatest of the modern artists who have examined their figures with attention admit, that several of the ancient sculptors in some degree have excelled nature, they never having found any man so perfect in all his parts as some of their figures are. Their opportunities indeed were great: Greece abounded with beauties; and Rome being mistress of the world, every thing that was curious and beautiful was brought to it from all parts. Their motives were also powerful; religion, glory, and interest. They considered it as a kind of religious worship to give the figures of their gods so much nobleness and beauty as to be able to attract the love and veneration of the people. Their own glory was also concerned, particular honours being bestowed on those who succeeded; and for their fortune they had no further care to take when they once arrived at a certain degree of merit.

Sect. VI. *Of the different Attitudes of the Human Figure.*

If we are to represent, in a state of vigorous action, a figure such as that of Hercules, it is of importance to attend to the parts or limbs principally employed in performing that action. If the figure is standing, the foot must be placed in a right line, or perpendicular to the trunk or bulk of the body, where the centre of gravity may be supposed to fall. This centre is determined by the heel; or, if the figure is upon tiptoe, then the ball of the great toe is in the centre. The muscles of the leg which supports the body ought to be swelled, and their tendons drawn more to an extension than those of the other leg, which is only placed so as to receive the weight of the body towards that way to which the action inclines it. For example, suppose Hercules with a club striking at any thing before him towards the left side: then let his right leg be placed so as to receive the whole weight of the body, and the left loosely touching the ground with its toes. Here the external muscles of the right leg ought to be expressed very strong; but those of the left scarcely appearing more than if it were in some sedentary posture, except in the present case. The foot being extended, the muscles which compose the calf of the leg are in action, and appear very strong; though it is not meant that all the muscles of the right leg, which supports the weight of the body, ought to be expressed very strong or equally swelled, but those most tumefied which are chiefly concerned in the action or posture that the leg is then in. For example, if the leg or tibia is extended, then the extending muscles placed on the thigh are most swelled: if it be bent, then the bending muscles and their tendons appear most. The like may be observed of the whole body in general when it is put into vigorous action. The Laocoon, formerly in the Vatican garden at Rome, furnishes an example of this muscular appearance through the whole; but in the Antinous, Apollo, and other figures of the ancients, in the Vatican and other places, in postures where no considerable actions are designed, we see their muscles expressed but faintly, or scarcely to be discerned.

In general, neither the clavicles or collar bones, nor the muscles, appear so strongly in women as in men; nor will any action in which a woman uses her utmost strength occasion such swellings or risings of the muscles as to give the appearance they do in men, since besides the greater quantity of fat placed under the skin in women, their muscles are by no means so large and conspicuous.

Sect. VII. *Effects of the Exertion of the Muscles.*

It is of great importance to an artist to be acquainted with the most obvious effects of the action of those muscles which are placed externally on the human body; for these vary with every alteration of posture, and are variously enlarged and changed in their appearance by every effort that is dictated by the will.

Thus, if either of the mastoid muscles act, the head is turned to the contrary side, and the muscle which performs that action appears very plain under the skin. If the arms are lifted up, the deltoid muscles placed on the shoulders, which perform that action, swell, and make the extremities of the spines of the shoulder-blades, called the tops of the shoulders, appear indented or hollow. The shoulder-blades following the elevation of the arms, their bases incline at that time obliquely downward. If the arms are drawn down, put forwards, or pulled backwards, the shoulder-blades necessarily vary their positions accordingly. All these particulars are to be learned by consulting the life only: when being well acquainted with what then appears in every action, the artist will be able to form an adequate idea how it ought to be expressed. These circumstances are little known; and seldom enough attended to in designing.

When the cubit or fore-arm is bent, the biceps has its belly very much raised. The same happens in the triceps, when the arm is extended. The straight muscles of the abdomen appear very strong when rising from a decumbent posture. Those parts of the great serratus muscle which are received in the teeth or beginnings of the obliquus descendens muscle immediately below, are very much swelled when the shoulder on the same side is brought forwards; that serratus muscle then being employed in drawing the scapula forwards.

The long extending muscles of the trunk act alternately in walking, after this manner: if the right leg bears the weight of the body, and the left is in translation as on tiptoe, the last mentioned muscles of the back on the left side may be observed to be tumefied on the other side about the region of the loins, and so on the other side. The trochanters, or outward and uppermost heads of the thigh-bones, vary so greatly in their positions that no precise observations can explain their several appearances; but the study after the life ought to be chiefly relied on. If the thigh is extended, as when the whole weight of the body rests on that side, the glutæus or buttock muscle makes a very different appearance from what offers at another time; but if the thigh be drawn backwards, that muscle appears still more and more tumefied. When the whole leg is drawn upwards and forwards, and at the same time the foot is inclined inwards, the upper part of the sartorius muscle appears to rise very strong; in other positions of the thigh, that muscle makes a furrowing appearance in its whole progress. If a man is upon tiptoe, the extending muscles of the leg placed on the fore part of the thigh, and those of the foot that compose the calf of the leg, appear very strong, and the long peronæus makes a considerable indentation or furrowing at that time, in its progress on the outside of the leg.

SECT. VIII. *Of the Distribution of Light and Shade.*

As soon as the learner has made himself in some measure perfect in drawing outlines, his next endeavour must be to shade them properly. It is this which gives an appearance of substance, shape, distance, and distinction, to whatever bodies he endeavours to represent, whether animate or inanimate. The best rule for doing this is, to consider from what point, and in what direction, the light falls upon the objects which he is delineating, and to let all his lights and shades be placed according to that direction throughout the whole work. That part of the object must be lightest which has the light most directly opposite to it: if the light falls sideways on the picture, he must make that side which is opposite to it lightest, and that side which is farthest from it darkest. If he is drawing the figure of a man, and the light be placed above the head, then the top of the head must be made lightest, the shoulders next lightest, and the lower parts darker by degrees. That part of the object, whether in naked figures, or drapery, or buildings, that stands farthest out, must be made the lightest, because it comes nearest to the light; and the light loses so much of its brightness, by how much any part of the body bends inward, because those parts that stick out hinder the lustre and full brightness of the light from striking on those parts that fall in. Titian used to say, that he knew no better rule for the distribution of lights and shadows, than his observations drawn from a bunch of grapes. Satins and silks, and all other shining stuffs, have certain glancing reflections, exceedingly bright where the light falls strongest. The like is seen in armour, brass pots, or any other glittering metal, where you see a sudden brightness in the middle or centre of the light, which discovers the shining nature of such things. Observe also, that a strong light requires a strong shade, a fainter light a fainter shade; and that an equal balance be preserved throughout the piece, between the lights and shades. Those parts which must appear round require but one stroke in shading, and that sometimes but very faint; such parts as should appear steep or hollow require two strokes across each other, or sometimes three, which is sufficient for the deepest shade. Care must be also taken to make the outlines faint and small in such parts as receive the light; but where the shades fall, the outline must be strong and bold. The learner must begin his shadings from the top, and proceed downward, and use his utmost endeavours both by practice and observation to learn how to vary the shadings properly; for in this consists a great deal of the beauty and elegance of drawing. Another thing to be observed is, that as the human sight is weakened by distances, so objects must seem more or less confused or clear according to the places they hold in the piece. Those that are very distant must be weak, faint, and confused; those that are near and on the foremost ground, clear, strong, and accurately finished.

SECT. IX. *Of Drapery.*

In the art of clothing the figures, or casting the drapery properly and elegantly upon them, many things are to be observed. 1. The eye must never be in doubt of its object; but the shape and proportion of the part or limb, which the drapery is supposed to cover, must appear; at least so far as art and probability will permit: and this is so material a consideration, that many artists draw first the naked figure, and afterwards put the garments upon it. 2. The drapery must not sit too close to the parts of the body: but let it seem to flow round, as it were to embrace them; yet so as that the figure may be easy, and have a free motion. 3. The draperies which cover those parts that are exposed to great light must not be so deeply shaded as to seem to pierce them; nor should those members be crossed by folds that are too strong, lest by the too great darkness of their shades the limbs look as if they were broken. 4. The great folds must be drawn first, and then stroked into lesser ones: and great care must be taken that they do not cross one another improperly. 5. Folds in general should be large, and as few as possible. However, they must be greater or less according to the quantity and quality of the stuffs of which the drapery is supposed to be made. The quality of the persons is also to be considered in the drapery. If they are magistrates, their draperies ought to be large and ample; if country clowns or slaves, they ought to be coarse and short; if ladies or nymphs, light and soft. 6. Suit the garments to the body, and make them bend with it, according as it stands in or out, straight or crooked; or as it bends one way or another: and the closer the garment fits to the body, the narrower and smaller must be the folds. 7. Folds well imagined give much spirit to any kind of action; because their motion implies a motion in the acting member, which seems to draw them forcibly, and makes them more or less stirring as the action is more or less violent. 8. An artful complication of folds in a circular manner greatly helps the fore-shortenings. 9. All folds consist of two shades, and no more; which you may turn with the garment at pleasure, shadowing the inner side deeper, and the outer more faintly. 10. The shades in silk and fine linen are very thick and small, requiring little folds and a light shadow. 11. Observe the motion of the air or wind, in order to draw the loose apparel all flying one way: and draw that part of the garment that adheres closest to the body before you draw the looser part that flies off from it; lest, by drawing the loose part of the garment first, you should mistake the position of the figure, and place it improperly. 12. Rich ornaments, when judiciously and sparingly used, may sometimes contribute to the beauty of draperies. But such ornaments are far below the dignity of angels or heavenly figures; the grandeur of whose draperies ought rather to consist in the boldness and nobleness of the folds than in the quality of the stuff or the glitter of ornaments. 13. Light and flying draperies are proper only to figures in strong motion, or in the wind: but when in a calm place, and free from violent action, their draperies should be large and flowing; that by their contrast and the fall of the folds, they may appear with grace and dignity. Thus much for drapery; examples of which, as well as of human character and the passions, we have given in Plate 66; being outline sketches from Raphael's Cartoons of the blindness of Elymas the sorcerer, and of Paul preaching at Athens. See CARTOONS.

SECT. X. *Of the Effects of the Passions.*

The passions, says M. Le Brun, are motions of the soul, either upon her pursuing what she judges to be for her good, or shunning what she thinks hurtful to her; and commonly, whatever causes emotion or passion in the soul creates also some action in the body. It is, therefore, necessary for a painter to know which are the different actions in the body that express the several passions of the soul, and how to delineate them. M. Le Brun has been extremely happy in expressing many of the passions, and the learner cannot study any thing better than the examples which he has left us of them. However, as M. De Piles justly observes, it is absurd as well as impossible to pretend to give such particular demonstrations of them as to fix their expression to certain strokes, which the painter should be obliged to make use of as essential and invariable rules. This, says he, would be depriving the art of that excellent variety of expression which has no other principle than diversity of imagination, the number of which is infinite. The same passion may be finely expressed several ways, each yielding more or less pleasure in proportion to the painter's understanding and the spectator's discernment.

Though every part of the face contributes towards expressing the sentiments of the heart, yet the eye-brow, according to M. Le Brun, is the principal seat of expression, and where the passions best make themselves known. It is certain, says he, that the pupil of the eye, by its fire and motion, very well shows the agitation of the soul, but then it does not express the kind or nature of such an agitation; whereas the motion of the eyebrow differs according as the passions change their nature. To express a simple passion, the motion is simple; to express a mixed passion, the motion is compound; if the passion be gentle, the motion is gentle; and if it be violent, the motion is so too. We may observe farther, says he, that there are two kinds of elevation in the eye-brows. One, in which the eye-brows rise up in the middle; this elevation expresses agreeable sensations, and it is to be observed that then the mouth rises at the corners: another, in which the eye-brows rise up at the ends, and fall in the middle; this motion denotes bodily pain, and then the mouth falls at the corners. In laughter, all the parts agree; for the eye-brows, which fall toward the middle of the forehead, make the nose, the mouth, and the eyes, follow the same motion. In weeping, the motions are compound and contrary; for the eyebrows fall toward the nose and over the eyes, and the mouth rises that way. It is to be observed also, that the mouth is the part of the face which more particularly expresses the emotions of the heart: for when the heart complains, the mouth falls at the corners; when it is at ease, the corners of the mouth are elevated; and when it has an aversion, the mouth shoots forward, and rises in the middle.

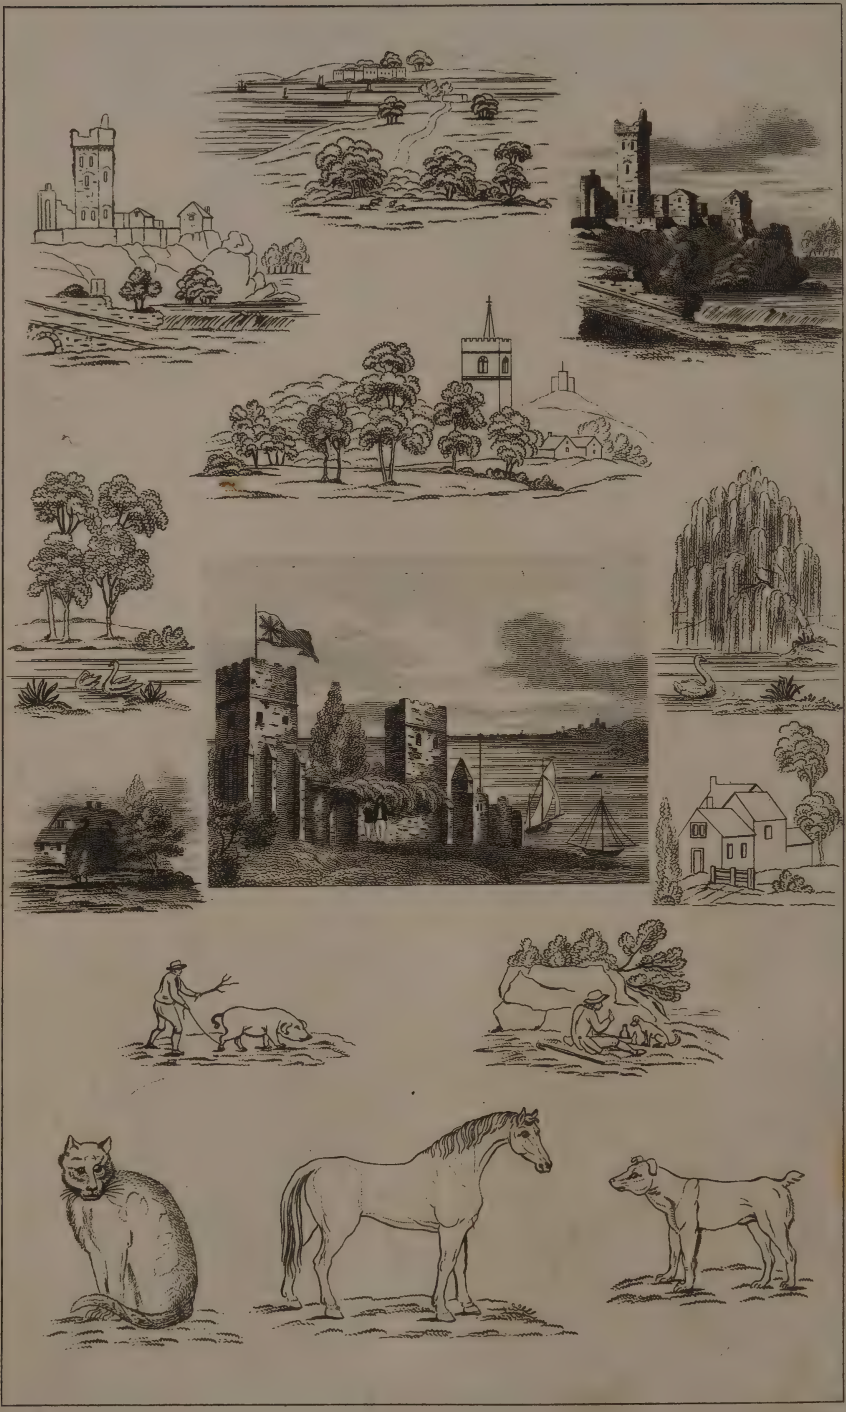
"The head (says M. De Piles) contributes more to the expression of the passions than all the other parts of the body put together. Those separately can only show some few passions, but the head expresses them all. Some, however, are more peculiarly expressed by it than others: as humility, by hanging it down; arrogance, by lifting it up; languishment, by inclining it on one side; and obstinacy, when with a stiff and resolute air it stands upright, fixed, and stiff between the two shoulders. The head also best shows our supplications, threats, mildness, pride, love, hatred, joy, and grief. The whole face, and every feature, contributes something: especially the eyes; which, as Cicero says, are the windows of the soul. The passions they more particularly discover are, pleasure, languishing, scorn, severity, mildness, admiration, and anger; to which one might add joy and grief, if they did not proceed more particularly from the eye-brows and mouth; but when those two passions fall in also with the language of the eyes, the harmony will be wonderful. But though the passions of the soul are most visible in the lines and features of the face, they often require the assistance also of the other parts of the body. Without the hands, for instance, all action is weak and imperfect; their motions, which are almost infinite, create numberless expressions; it is by them that we desire, hope, promise, call, send back: they are the instruments of threatening, prayer, horror, and praise; by them we approve, condemn, refuse, admit, fear, ask; express our joy and grief, our doubts, regrets, pain, and admiration. In a word, it may be said, as they are the language of the dumb, that they contribute not a little to speak a language common to all nations, which is the language of painting. But to say how these parts must be disposed for expressing the various passions is impossible, nor can any exact rules be given for it, both because the task would be infinite, and because every one must be guided in this by his own genius and the particular turn of his own studies."

SECT. XI. *Of drawing Flowers, Fruit, Birds, &c.*

It may not be improper for the learner now to proceed in making some attempts at drawing flowers, fruit, birds, beasts, and the like; not only as it will be a more pleasing employment, but as it is an easier task than the drawing of hands and feet, and other parts of the human body which require not only more care, but greater exactness and nicer judgment. Very few rules or instructions are requisite upon this head; the best thing the learner can do is, to furnish himself with good prints or drawings by way of examples, and with great care and exactness to copy them. If it is the figure of a beast, begin with the forehead, and draw the nose, the upper and under jaw, and stop at the throat. Then go to the top of the head, and form the ears, neck, back, and continue the line till you have given the full shape of the buttock. Then form the breast, and mark out the legs and feet, and all the smaller parts. And, last

DRAWING.

PL. 67.



Mutlow Sc. Russell Ct.

of all, finish it with the proper shadows. It is not amiss, by way of ornament, to give a small sketch of landscape; and let it be suitable and natural to the place or country of the beast you draw. Much the same may be said with regard to birds. Of these, as well as beasts and other subjects, the learner will find many examples among the plates given in this publication.

Sect. XII. *Of drawing Landscapes, Buildings, &c.*

Of all the parts of drawing, this is perhaps the most useful and necessary, as it is what every man may have occasion for at one time or another. To be able, on the spot, to take the sketch of a fine building, or a beautiful prospect; of any curious production of art, or uncommon appearance in nature; is not only a very desirable accomplishment, but a very agreeable amusement. Rocks, mountains, fields, woods, rivers, cataracts, cities, towns, castles, houses, fortifications, ruins, or whatsoever else may present itself to view on our journeys or travels in our own or foreign countries, may be thus brought home, and preserved for our future use, either in business or conversation. On this part, therefore, more than ordinary pains should be bestowed.

All drawing consists in nicely measuring the distances of each part of the piece by the eye. In order to facilitate this, let the learner imagine in his own mind, that the piece he copies is divided into squares. For example suppose or imagine a perpendicular and a horizontal line crossing each other in the centre of the picture you are drawing from; then suppose also two such lines crossing your own copy. Observe in the original, what parts of the design those lines intersect, and let them fall on the same parts of the supposed lines in the copy: we say, the supposed lines; because though engravers, and others who copy with great exactness, divide both the copy and original into many squares; yet this is a method not to be recommended, as it will be apt to deceive the learner, who will fancy himself a tolerable proficient, till he comes to draw after nature, where these helps are not to be had, and then he will perhaps find himself miserably defective in his attempts.

If he is to draw a landscape from nature, let him take his station on a rising ground, where he will have a large horizon; and mark his tablet into three divisions, downwards from the top to the bottom; and divide in his own mind the landscape he is to take, into three divisions also. Then let him turn his face directly opposite to the midst of the horizon, keeping his body fixed, and draw what is directly before his eyes upon the middle division of the tablet; then turn his head, but not his body, to the left hand, and delineate what he views there, joining it properly to what he had done before; and, lastly, do the same by what is to be seen upon his right hand, laying down every thing exactly both with respect to distance and proportion. Some examples are given in Plate 67.

The best artists of late, in drawing their landscapes, make them shoot away one part lower than another. Those who make their landscapes mount up higher and higher, as if they stood at the bottom of a hill to take the prospect, commit a great error: the best way is to get upon a rising ground, make the nearest objects in the piece the highest, and those that are farther off to glance away lower and lower, till they come almost level with the line of the horizon, lessening every thing proportionably to its distance, and observing also to make the objects fainter and less distinct the farther they are removed from the eye. He must make all his lights and shades fall one way, and let every thing have its proper motion: as trees shaken by the wind, the small boughs bending more, and the large ones less: water agitated by the wind, and dashing against ships or boats; or falling from a precipice upon rocks and stones, and spirting up again into the air, and sprinkling all about; clouds also in the air, now gathered with the winds; now violently condensed into hail, rain, and the like: always remembering, that whatever motions are caused by the wind must be made all to move the same way, because the wind can blow but one way at once. Finally, it must be observed, that in order to attain any considerable proficiency in drawing, a knowledge of perspective is absolutely necessary. See the treatise on that subject.

Drawing, in fox and stag hunting, is a term implying searching for a covert; it being equivalent, in this kind of sport, to the term trying for a hare in hare-hunting.

DRA'WINGROOM. *s.* (from *draw* and *room.*) 1. The room in which company assembles at court (*Pope*). 2. The company assembled there.

DRAWN. (participle from *draw.*) 1. Equal; where each party takes his own stake (*Addison*). 2. With a sword drawn (*Shakspeare*). 3. Open; put aside, or unclosed (*Dryden*). 4. Eviscerated (*Shakspeare*). 5. Induced as from some motive (*Spenser*).

DRA'WWELL. *s.* (*draw* and *well.*) A deep well; a well out of which water is drawn by a long cord (*Grew*).

To DRAWL. *v. n.* (from *draw.*) To utter any thing in a slow driveling way (*Pope*).

DRAY. Dra'ycart. *s.* (ꝺꞃæᵹ, Saxon.) The car on which beer is carried (*Gay*).

Dray. In natural history. A squirrel's deposit for its young; it is built in the angular branches of a tree, and resembles the nest of a magpye.

DRA'YHORSE. *s.* A horse which draws a dray (*Tatler*).

DRA'YMAN. *s.* One that attends a dray or cart (*South*).

DRAYTON, a town in Shropshire, with a market on Wednesdays. Lat. 52. 54 N. Lon. 2. 22 W.

Drayton (Michael), an English poet, born in Warwickshire in 1563. He received his education at Oxford, but never took a degree. In 1593 he published a collection of pastorals, entitled, The Shepherd's Garland, which was followed by his poems of The Barons' Wars, and England's Heroical Epistles. In 1613 he published his Poly Olbion, or a Description of England, which is very accurate. He died in 1631, and was buried in Westminster abbey. His works were re-printed in 1748, in one volume folio.

DRA'ZEL. *s.* (from *droslesse,* French.) A low, mean, worthless wench (*Hudibras*).

DREAD. *s.* (ꝺꞃæꝺ, Saxon.) 1. Fear; terrour; affright; horrour (*Tillotson*). 2. Habitual fear; awe (*Genesis*). 3. The person or thing feared (*Prior*).

Dread, says Dr. Cogan, is a degree of permanent fear; an habitual and painful apprehension of some tremendous event, which may be too remote to excite either fear, consternation, or terror. It keeps the mind in a perpetual alarm; in an eager watchfulness of every circumstance that bears any relation to the evil apprehended. It is obvious that this strong and painful affection cannot be the result or the residue of fear, in the same manner as satisfaction may be the result of joy, and melancholy of the transports of sorrow; because it is not susceptible of a retrospect. When the evil is arrived, the dread of that evil is removed; though the affection may become attached to some pernicious consequences, that may possibly follow. (*Treatise on the Passions, p.* 103.)

DREAD. *a.* (ꝺꞃæꝺ, Saxon.) 1. Terrible; frightful (*Milton*). 2. Awful; venerable in the highest degree (*Milton*).

To DREAD. *v. a.* (from the noun.) To fear in an excessive degree (*Wake*).

To DREAD. *v. n.* To be in fear (*Deut.*).

DREA'DER. *s.* One that lives in fear (*Swift*).

DREA'DFUL. *a.* (*dread* and *full.*) 1. Terrible; frightful; formidable (*Glanville*). 2. Awful; venerable (*Genesis*).

DREA'DFULLY. *ad.* Terribly; frightfully.

DREA'DFULNESS. *s.* Terribleness; frightfulness (*Hakewill*).

DREA'DLESNESS. *s.* Fearlesness; intrepidity; undauntedness (*Sidney*).

DREA'DLESS. *a.* (from *dread.*) Fearless; unaffrighted; intrepid (*Spenser*).

DREAM. *s.* (*droom*, Dutch.) 1. A phantasm of sleep; the thoughts of a sleeping man (*Dryden*). 2. An idle fancy; a wild conceit (*Shakspeare*).

To DREAM. *v. n.* (from the noun.) 1. To have the representation of something in sleep (*Tatler*). 2. To think; to imagine (*Burnet*). 3. To think idly (*Smith*). 4. To be sluggish; to idle (*Dryden*).

To DREAM. *v. a.* To see in a dream (*Dry.*).

DREA'MER. *s.* (from *dream.*) 1. One who has dreams (*Locke*). 2. An idle fanciful man; a visionary (*Shakspeare*). 3. A mope; a man lost in wild imagination (*Prior*). 4. A sluggard; an idler.

DREA'MLESS. *a.* Free from dreams (*Camden*).

DREAMS form a most interesting and curious part of the phænomena attending sleep. With respect to these, the three following questions may be proposed. First; what is the state of the mind in sleep? or, in other words, what faculties then continue to operate, and what faculties are then suspended? Secondly; how far do our dreams appear to be influenced by our bodily sensations; and in what respects do they vary, according to the different conditions of the body in health, and in sickness? Thirdly; what is the change which sleep produces on those parts of the body, with which our mental operations are more immediately connected; and how does this change operate, in diversifying, so remarkably, the phænomena which our minds then exhibit, from those of which we are conscious in our waking hours? Of these three questions, the first belongs to the philosophy of the human mind, and is that to which we shall here principally confine ourselves. The second is more particularly interesting to the medical enquirer, and may be considered in another place. (See SLEEP.) The third seems to relate to a subject which is placed beyond the reach of the human faculties.

From very careful and repeated enquiry, it appears, that in dreaming we are not conscious of being asleep: that to a person dreaming, his dreams seem realities: that though it be uncertain whether mankind are all liable to dreams, yet it is well known that they are not all equally liable to dream: that the nature of a person's dreams depends in some measure on his habits of action, and on the circumstances of his life: that the state of the health too, and the manner in which the vital functions are carried on, have a powerful influence in determining the character of a person's dreams: that in sleep and in dreaming, the senses are either absolutely inactive, or nearly so: that such concerns as we have been very deeply interested in during the preceding day, are very likely to return upon our minds in dreams in the hours of rest: that dreams may be rendered prophetic of future events; and therefore, wherever we have such evidence of their having been prophetic as we would accept on any other occasion, we cannot reasonably reject the fact on account of its absurdity; but that they do not appear to have been actually such, in those instances in which the superstition of nations, ignorant of true religion, has represented them as referring to futurity, nor in those instances in which they are viewed in the same light by the vulgar among ourselves; and, lastly, that dreaming is not a phenomenon peculiar to human nature, but common to mankind with the brutes.

According to Wolfe every dream takes its rise from some sensation, and is continued by the succession of phantasms in the mind. His reasons are, that when we dream we imagine something, or the mind produces phantasms; but no phantasm can arise in the mind, without a previous sensation: hence, neither can a dream arise without some previous sensation. He observes farther, that though it be certain *à priori*, from the nature of the imagination, that dreams must begin by some sensation, yet that it is not easy to confirm this by experience; it being often difficult to distinguish those slight sensations, which give rise to dreams, from phantasms, or objects of imagination. Yet this is not impossible in some cases, as when the weak sensation sufficient to give rise to a dream gradually becomes stronger, so as to put an end to it, as it often happens in uneasy and painful sensations. Wolf Psychol. Empir. § 123.

We have an essay on this subject by M. Formey, in the Mem. de l'Acad. de Berlin, tom. ii. p. 316. He expressly adopts Wolfe's proposition above mentioned, that every dream begins by a sensation, and is continued by a series of acts of imagination, or of phantasms; and that the cause of this series is to be found in the law of the imagination. "Si naturale somnium est, initium capere debet per legem sensationis, et continuari per legem imaginationis." Hence he concludes those dreams to be supernatural, which either do not begin by sensation, or are not continued by the law of the imagination.

This opinion is as ancient as Aristotle, who expressly asserted, that a dream is only the φαντασμα, or appearance of things, arising from the previous motions excited in the brain, and remaining after the objects are removed. Hobbes has adopted this hypothesis: he ascribes different dreams to different distempers of the body, and whimsically enough observes, that lying cold breedeth dreams of fear, and raiseth the thought and image of some fearful object. Thus he accounts for that which was in reality the waking vision of Brutus, which addressed him the night before the battle of Philippi. "I am, Brutus, thine evil genius; but thou shalt see me again near Philippi." And Mr. Locke, though he does not expressly declare how dreams are excited during sleep, seems to ascribe the perfection of rational thinking to the body; and traces their origin to previous sensations, when he says, "The dreams of sleeping men are all made up of the waking man's ideas, though for the most part oddly put together." He urges the incoherence, frivolousness, and absurdity of many of our dreams, as well as by the supposed fact that some sleep without dreaming, as objections to the notion that men think always: so Dr. Hartley explains all the phænomena of the imagination by his theory of vibrations and associations. Dreams, he says, are nothing but the imaginations or reveries of sleeping men, and they are deducible from three causes. viz. the impressions and ideas lately received, and particularly those of the preceding day, the state of the body, and particularly of the stomach and brain, and association. Obs. on Man, vol. i. § 5. p. 383, &c.

Democritus and Lucretius account for dreams, by supposing that spectres and simulacra of corporeal things, constantly emitted from them, and floating up and down in the air, come and assault the soul in sleep. Lucret. De Rer. Nat. lib. iv.

Those who have maintained the essential difference between soul and body have solved the common phænomena of dreams by the union of these two substances, and the necessary connection arising thence between ideas in the mind and certain motions in the body, or in those parts more immediately united to the soul: whilst others, who have denied the existence of matter, account for them in the same manner as for our other ideas, which may not be improperly called waking dreams.

The acute Andrew Baxter affirms, that our dreams are prompted by separate immaterial beings; an opinion which was advanced long ago by the heathens, and maintained very generally, and applied to a species of divination. He contends, that the phantasm, or what is properly called the vision, is not the work of the soul itself, and that it cannot be the effect of mechanical causes; and therefore ascribes it to separate spirits, having access to our minds, and furnishing us with ideas while we sleep. See Mr. Baxter's Essay on the Phæn. of Dreaming, in his Enquiry into the Nature of the human Soul, vol. ii. 3d edit. 1745. This theory, however, notwithstanding the great ingenuity with which it is urged, is far from being plausible. It leads us entirely beyond the limits of our knowledge; requires us to believe without evidence; is unsupported by any analogy; and creates difficulties still more inexplicable than those which it has been proposed for the purpose of removing. Until it appear that our dreams cannot possibly be produced without the interference of other spiritual agents, possessing such influence over our minds as to deceive us with fancied joys, and involve us in imaginary afflictions, we cannot reasonably refer them to such a cause. Besides, from the facts which have been stated as well known concerning dreams, it appears that their nature depends both on the state of the human body and on that of the mind. But, were they owing to the agency of other spiritual beings, how could they be influenced by the state of the body? They must be strange spiritual beings which depend in such a manner on the state of our corporeal frame; it were surely better to deny them existence at all, than to place them in such a dependence.

Professor Dugald Stewart, in endeavouring to deduce principles which shall account for the phænomena of dreams, remarks that in sleep those operations of the mind are suspended, which depend on our volition: he then says, that if the suspension of our voluntary operations in sleep be admitted as a fact, there are only two suppositions which can be advanced concerning its cause. The one is, that the power of volition is suspended; the other, that the will loses its influence over those faculties of the mind, and those members of the body, which, during our waking hours, are subjected to its authority. Now, it may be shewn that the former is not consistent with fact; whence the latter seems to follow as a necessary consequence. Hence it is inferred, that all our mental operations which are independent of our will, may continue during sleep; and that the phænomena of dreaming may, perhaps, be produced by these, diversified in their apparent effects, in consequence of the suspension of our voluntary powers. Two obvious consequences follow; 1. That when we are asleep, the succession of our thoughts, in so far as it depends on the laws of association, may be carried on by the operation of the same unknown causes by which it is produced while we are awake; and 2. that the order of our thoughts, in these two states of our mind, must be very different; inasmuch as in the one it depends solely on the laws of association; and in the other, on these laws combined with our own voluntary exertions. To evince the agreement of these conclusions with truth, Professor Stewart shews, 1st, that the succession of our thoughts in sleep is regulated by the same general laws of association, to which it is subjected while we are awake; and, 2dly, that the circumstances which discriminate dreaming from our waking thoughts, are such as must necessarily arise from the suspension of the influence of the will. This theory explains very well what many persons think the most mysterious of all the circumstances connected with dreaming, i. e. the inaccurate estimate we form of time, an inaccuracy which often gives to a single instant the appearance of days. The rapidity of thought is at all times such, that, in the twinkling of an eye, a crowd of ideas may pass before us, to which it would require a long discourse to give utterance; and transactions may be conceived, which it would require days to realize. But, in sleep, the conceptions of the mind are mistaken for realities; and therefore our estimates of time will be formed, not according to our experience of the rapidity of thought, but according to our experience of the time requisite for realizing what we conceive. For a more ample detail of this theory, see Stewart's Elements of the Philosophy of the Human Mind, pp. 328, 348, and note O, pp. 568, 577. See also this subject resumed as connected with other phænomena, and an illustration of Mr. Good's theory as contained in his translation of Lucretius, in the article SLEEP.

DREAR. *a.* (ꝺꝛeoꝛıᵹ, Saxon, dreary.) Mournful; dismal; sorrowful (*Milton*).

DRE'ARIHEAD. *s.* Horrour; dismalness (*Spenser*).

DRE'ARIMENT. *s.* (from *dreary.*) Obsolete. 1. Sorrow; dismalness; melancholy (*Spenser*). 2. Horrour; dread; terrour (*Spenser*).

DRE'ARY. *a.* (ꝺꝛeoꝛıᵹ, Saxon.) 1. Sorrowful; distressful (*Spenser*). 2. Gloomy; dismal; horrid (*Prior*).

DREDGE. *s.* A kind of net (*Carew*).

To DREDGE. *v. a.* To catch with a net (*Carew*).

DRE'DGER. *s.* One who fishes with a dredge.

DRE'GGINESS. *s.* (from *dreggy.*) Fulness of dregs or lees; foulness; feculence.

DRE'GGISH. *a.* (from *dregs.*) Foul with lees; feculent (*Harvey*).

DRE'GGY. *a.* (from *dregs.*) Containing dregs; consisting of dregs; muddy; feculent (*Boyle*).

DREGS. *s.* (ꝺꝛeꞅꞇen, Saxon.) 1. The sediment of liquors; the lees; the grounds; the feculence (*Sandys*). 2. Any thing by which purity is corrupted (*Bacon*). 3. Dross; sweepings; refuse (*Rogers*).

To DREIN. *v. n.* To empty; to drain (*Southern*).

To DRENCH. *v. a.* (ꝺꝛencan, Saxon.) 1. To wash; to soak; to steep (*Milton*). 2. To saturate with drink or moisture (*Shakspeare*). 3. To physic by violence (*Mortimer*).

DRENCH. *s.* (from the verb.) 1. A draught; a swill (*Milton*). 2. Physic for a brute (*Shakspeare*). 3. Physic that must be given by violence (*K. Charles*). 4. A channel of water.

DRENCH, or DRINK. Any medical composition prepared in a liquid form, and given to horses or cattle for the cure of diseases. Some distinction, however, is generally made between these two terms, it being the custom to say, drink for a horse, drench for a cow. They are given with a horn, sold by saddlers and collar-makers for this purpose.

DRE'NCHER. *s.* (from *drench.*) 1. One that dips or steeps any thing. 2. One that gives physic by force.

DRENT. *participle.* Drenched (*Spenser*).

DRESDEN, a town of Germany, and capital of Saxony. It is divided by the Elbe into the Old and New Town, which are joined together by a bridge 685 paces long. Both towns are surrounded by strong fortifications: however, it was taken by the king of Prussia in 1745, but was soon restored, in consequence of a peace between him and the then elector. All the houses are built of free-stone, and are almost all of the same height. There is a magnificent church for the Roman Catholics, which stands between the Elbe, the bridge, and the castle; and there are so many palaces, that it is one of the handsomest cities in Germany. Before the place where they keep guard, in the New Town, is an equestrian statue of Augustus II. looking toward Poland. Lat. 51. 0 N. Lon. 13. 50 E.

To DRESS. *v. a.* (*dresser*, French.) 1. To clothe; to invest with clothes (*Dryden*). 2. To clothe pompously or elegantly (*Taylor*). 3. To adorn; to deck; to embellish (*Clarendon*). 4. To cover a wound with medicaments (*Wiseman*). 5. To curry; to rub a horse (*Taylor*). 6. To rectify; to adjust (*Milton*). 7. To prepare for any purpose (*Mortimer*). 8. To trim; to fit any thing for ready use (*Mortimer*). 9. To prepare victuals for the table (*Dryden*).

DRESS. *s.* (from the verb.) 1. Clothes; garment; habit (*Gov. of Tongue*). 2. Splendid clothes; habit of ceremony (*Clar.*) 3. The skill of adjusting dress (*Pope*).

DRE'SSER. *s.* (from *dress.*) 1. One employed in putting on the clothes and adorning the person of another (*Dryden*). 2. One employed in regulating, trimming, or adjusting any thing (*Luke*). 3. The bench in a kitchen on which meat is drest or prepared for the table (*Swift*).

DRE'SSING. *s.* (from *dress.*) The application made to a sore (*Wiseman*).

DRE'SSINGROOM. *s.* The room in which clothes are put on (*Swift*).

DREST. *part.* (from *dress.*)

DREUX, a town in the department of Eure and Loire, and late province of Beauce, in France. It has a large manufacture of cloth. Lat. 48. 44 N. Lon. 1. 26 E.

To DRIB. *v. a.* To crop; to cut off (*Dryden*).

To DRI'BBLE. *v. n.* (from *drip.*) 1. To fall in drops (*Woodward*). 2. To fall weakly and slowly (*Shakspeare*). 3. To slaver as a child or ideot.

To Dri'bble. *v. a.* To throw down in drops (*Swift*).

DRI'BLET. *s.* (from *dribble.*) A small sum; odd money in a sum (*Dryden*).

DRI'ER. *s.* (from *dry.*) That which has the quality of absorbing moisture; a desiccative (*Bacon*).

DRIFT. *s.* (from *drive.*) 1. Force impellent; impulse (*South*). 2. Violence; course (*Spenser*). 3. Any thing driven at random (*Dryden*). 4. Any thing driven or born along in a body (*Pope*). 5. A storm; a shower (*Shakspeare*). 6. A heap or stratum of any matter thrown together by the wind. 7. Tendency, or aim of action (*Daniel*). 8. Scope of a discourse (*Tillotson*).

To Drift. *v. a.* (from the noun.) 1. To drive; to urge along (*Ellis*). 2. To throw together on heaps (*Thomson*).

Drift, Shoot, or Thrust of an arch, the push or force which it exerts in the direction of the length of the bridge. It arises from the gravitation of the stones of the arch, which, being kept from descending by the cohesion of the arch, and the resistance of the pier, exert their force in a lateral or horizontal direction. This force is the greater as the arch is lower, *cæteris paribus*.

Drift, in the veterinary vocabulary, the act of driving a common: a ceremony which takes place once, twice, or thrice a year (according to the custom of the place), to insure and continue the privilege of the lord of the manor, as well as to preserve the rights of the parishioners. The cattle upon the commons and wastes being all driven to some particular spot, are there examined, and their owners ascertained: those belonging to parishioners (or such as have right of common) are immediately liberated, and return to their former pasturage; the rest being the property of aliens, are impounded, and the owner is fined such sum as may be thought equitable by the bailiff of the manor. No owner being found, the beast (whatever it be) is called an estray; it is usually cried three times in the nearest market-towns, and if not claimed within twelve months and a day, becomes the property of the lord of the manor. This is usually called *drift of the forest*; though it as often takes place upon manors where there is no forest, as where the whole is forest land.

Drift, in mining, a passage cut out under the earth, betwixt shaft and shaft, or turn and turn; or a passage or way wrought under the earth, to the end of a meer of ground, or part of a meer.

Drift, in navigation, the angle which the line of a ship's motion makes with the nearest meridian, when she drives with her side to the wind and waves, and is not governed by the power of the helm; it also implies the distance which the ship drives on that line. A ship's way is only called drift in a storm; and when it blows so vehemently as to prevent her from carrying any sail, or at least restrains her to such a portion of sail as may be necessary to keep her sufficiently inclined to one side, that she may not be dismasted by the violent labouring produced by the turbulence of the sea.

Drift-sail, a sail used under water, veered out right ahead by sheets, as other sails are. It serves to keep the ship's head right upon the sea in a storm, and to hinder her driving too fast in a current.

To DRILL. *v. a.* (*drillen*, Dutch.) 1. To pierce any thing with a drill (*Moxon*). 2. To perforate; to bore; to pierce (*Blackmore*). 3. To make a hole (*Moxon*). 4. To delay; to put off (*Addison*). 5. To draw from step to step (*South*). 6. To drain; to draw slowly (*Thomson*). 7. To form to arms (*Hudibras*).

Drill. *s.* (from the verb.) 1. A pointed instrument with which holes are bored (*Boyle*). 2. An ape; a baboon (*Locke*). 3. A small dribbling brook; a rill (*Sandys*).

Drill, in mechanics, a small instrument for making such holes as punches will not conveniently serve for. Drills are of various sizes, and are chiefly used by smiths, turners, carpenters, and coopers.

Drill, or Drill-box, a name given to an instrument for sowing land in the new method of horse-hoeing husbandry.

Drill-sowing, a method of sowing grain or seed of any kind, so that it may all be at a proper depth in the earth, which is necessary to its producing healthful and vigorous plants. For this purpose a variety of drill-ploughs have been invented and recommended; but partly from the expence attending the purchase, partly from the complication of their structure, and partly from the attachment of the illiterate farmer to long habits, these excellent schemes for diminishing labour have not received that share of encouragement to which they seem entitled. See Husbandry.

DRIMA. In botany, a genus of the class hexandria, order monogynia. Corol inferior, campanulate, six-cleft, with revolute segments; stamens inserted on the corol; stigma capitate. Five species, all Cape plants, with white or greenish flowers, generally nodding.

To DRINK. *v. n.* pret. *drank*, or *drunk*; part. pass. *drunk* or *drunken.* (ꝺꞃıncan, Sax.) 1. To swallow liquors; to quench thirst (*Tay.*). 2. To be entertained with liquors, (*Shakspeare*). 3. To be an habitual drunkard. 4. *To* Drink *to.* To wish well to in the act of taking the cup (*Shakspeare*).

To Drink. *v. a.* 1. To swallow: applied to liquids (*South*). 2. To suck up; to absorb (*Gay*). 3. To take in by an inlet; to hear; to see (*Pope*). 4. To act upon by drinking (*South*). 5. To make drunk (*Kings*).

Drink. *s.* (from the verb.) Liquor to be swallowed (*Milton*). 2. Liquor of any particular kind (*Philips*).

DRINK-MONEY. *s.* Money given to buy liquor (*Arbuthnot*).

DRI′NKABLE. *a.* (from *drink.*) Potable.

DRI′NKER. *s.* (from *drink.*) One that drinks to excess; a drunkard (*South*).

DRINKING, is one of the animal functions, essential to the proper solution and digestion of food. Although the proportion of liquid to that of dry or solid food cannot be precisely ascertained; yet, if the constant secretion of fluids be laid down as the basis of this computation, we should, perhaps, drink double the quantity of the solid provisions we daily consume. Nevertheless, even this proportion is but too often exceeded, merely to please the artificial cravings of a corrupted palate. Thus, we no longer drink with a view to quench thirst only, but at certain hours of the day, whether we are naturally inclined, or not. Nay, we frequently meet with sots in beer, ale, spirits, wine, punch, and even tea. Excessive drink, however, though it distend and oppress the stomach, and thus impede digestion, is not nearly so pernicious as gluttony, unless the former be attended with intoxication. It however impoverishes the whole mass of the blood, by rendering it too thin and watery; so that relaxation of the urinary and other canals, at length, general debility of the system, are its necessary concomitants.

On the contrary, too little drink disposes persons of a sedentary life to indigestion; because many particles of solid food are, for want of dilution, passed unassimilated through the alimentary canal; and the blood becomes viscid, and inert in its circulation. The active and laborious should, therefore, drink more than the idle or phlegmatic; and either of these more in summer than in winter, to supply the great loss of humours exhaled by insensible perspiration.

Persons whose natural appetite is not depraved in consequence of irregular living, may easily regulate the due proportion of their drink to that of dry aliment; as, to them, thirst will be the safest guide. But those individuals who have become slaves to the libations of Bacchus are unfortunately deprived of this beneficent instinct, which is the privilege even of irrational animals.

If the moral turpitude of committing excess in drinking affords no argument to induce the habitual votary to abstain from such pernicious practice, we shall only add, that he will sooner or later feel the effects of it in painful and lingering sickness. But reasoning is in vain with those who can deliberately and habitually "take an enemy down their throat to steal away their brains;" and it is useless to expect that words should reach the consciences of those who are seared by the drinking of liquid fire. We would just venture to remind those who are comparatively moderate, that large potations are, at all times, and in every constitution, improper; that they are particularly injurious when indulged in previously to the taking of food, and especially before dinner; that all beverage is more pernicious to the healthy in a warm than in a cold state; that the human stomach should never be inundated with immoderate quantities of drink at one time; and that the most natural drink, and the most conducive to health, without exception, is pure water.

DRINO, a sea-port town of European Turkey, seated on a bay of the same name. Lat. 42. 20 N. Lon. 19. 19 E.

To DRIP. *v. n.* (*drippen,* Dutch.) 1. To fall in drops. 2. To have drops falling from it (*Prior*).

To Drip. *v. a.* 1. To let fall in drops (*Swift*). 2. To drop fat in roasting (*Walton*).

Drip. *s.* That which falls in drops (*Mortimer*).

Drip, in architecture. See Corona.

DRI′PPING. *s.* (from *drip.*) The fat which housewives gather from roast meat (*Swift*).

DRI′PPINGPAN. *s.* The pan in which the fat of roast meat is caught (*Swift*).

To DRIVE. *v. a.* pret. *drove,* anciently *drave*; part. pass. *driven,* or *drove.* (ꝺꞃıꝼan, Saxon.) 1. To produce motion in any thing by violence: as, the hammer *drives* the nail. 2. To force along by impetuous pressure (*Pope*). 3. To expel by force from any place (*Dryden*). 4. To force or urge in any direction (*Hab.*). 5. To guide and regulate a carriage (*Exodus*). 6. To make animals march along under guidance (*Addison*). 7. To clear any place by forcing away what is in it (*Dryden*). 8. To force; to compel (*Ascham*). 9. To distress; to straiten (*Spenser*). 10. To urge by violence, not kindness (*Dryden*). 11. To impel by influence of passion (*Clarendon*). 12. To urge; to press to a conclusion (*Digby*). 13. To carry on; to keep in motion (*Bacon*). 14. To purify by motion (*L'Estr.*). 15. To Drive *out.* To expel (*Knolles*).

To Drive. *v. n.* 1. To go as impelled by any external agent (*Brown*). 2. To rush with violence (*Dryden*). 3. To pass in a carriage (*Milton*). 4. To tend to; to consider as the scope and ultimate design (*Locke*). 5. To aim; to strike at with fury (*Dryden*).

To DRI′VEL. *v. n.* (from *drip.*) 1. To slaver; to let the spittle fall in drops, like a child or ideot (*Grew*). 2. To be weak or foolish; to dote (*Shakspeare*).

Dri′vel. *s.* (from the verb.) 1. Slaver; moisture shed from the mouth (*Dryden*). 2. A fool; a driveller: out of use (*Sidney*).

DRI′VELLER. *s.* (from *drivel*). A fool; an ideot; a slaverer (*Swift*).

DRI′VEN. The participle of *drive.*

DRI′VER. *s.* (from *drive.*) 1. The person or instrument who gives any motion by violence. 2. One who drives beasts (*Sandys*). 3. One who drives a carriage (*Dryden*).

DRIVING, among sportsmen, a method of taking pheasant-powts. It is thus practised: The sportsman finds out the haunts of these birds; and having fixed his nets there, he calls many of them together by a pheasant-call, imitating the voice of the dam; after this he makes a noise with his driver, which will make them run a little way forward in a cluster; and this he is to repeat till he has secured them, which an expert sportsman never fails to do, by driving them into his nets.

Driving, in metallurgy, is said of silver, when, in the operation of refining, the lead being burnt away, the remaining copper rises upon its surface in red fiery bubbles.

Driving, in the sea-language, is said of a ship, when an anchor being let fall will not hold her fast, nor prevent her sailing away with the wind or tide. The best way in this case is to let fall more anchors, or to veer out more cable; for the more cable she has out, the safer she rides. When a ship is a-hull or a-try, they say she drives to leeward.

To DRI′ZZLE. *v. a.* (*drisleu*, German.) To shed in small slow drops (*Shakspeare*).

To Dri′zzle. *v. n.* To fall in short slow drops (*Addison*).

DRI′ZZLY. *a.* (from *drizzle*.) Shedding small rain (*Dryden*).

DROGHEDA, or Tredah, a sea-port town and the capital of Louth in Ireland. In 1649 Oliver Cromwell stormed and took it, when about 4,000 men, found in arms in it, were put to the sword. It sends two members to parliament, and is 23 miles N. of Dublin. Lat. 51. 53 N. Lon. 6. 1 W.

DROIL. *s.* A drone; a sluggard.

To Droil. *v. n.* To work sluggishly and slowly; to plod (*Government of the Tongue*).

DROIT, *jus*, signifies right or law, of which some distinguish six kinds: 1. Jus recuperandi, right of recovery. 2. Jus entrandi, right of entering. 3. Jus habendi, right of having. 4. Jus retinendi, right of retaining. 5. Jus percipiendi, right of receiving. 6. Jus possidendi, right of possessing.

Droit is also the highest of all real writs; and takes its name of a writ of right from the greatest regard being shown to it, and as it has the most assured and final judgment. There are several sorts of these writs used in our law, as droit de avowson, droit de dower, droit de garde, droit patent, droit rationabili parte, and droit sur disclaimer.

DROITWICH, a town of Worcestershire, in England, noted for excellent white salt, made from the salt springs in its neighbourhood. It sends two members to parliament. Lat. 52. 15 N. Lon 1. 48 W.

DROLL. *s.* (*droler*, French.) 1. One whose business it is to raise mirth by petty tricks; a jester; a buffoon (*Prior*). 2. A farce; something exhibited to raise mirth (*Swift*).

To Droll. *v. n.* (*drôle*, French.) To jest; to play the buffoon (*Glanville*).

DRO′LLERY. *s.* (from *droll*.) Idle jokes; buffoonery (*Government of the Tongue*).

DROMEDARY, in mastiology. See Camelus.

DROMONES, in antiquity, a kind of yachts. Those who rowed them were called Dromonarii.

DROMORE, a town of Ireland, in the county of Down, and the see of a bishop. Lat. 54. 25 N. Lon. 6. 8 W.

DRONE. *s.* (ꝺꞃoen, Saxon.) (See Apis and Bee.) 1. The bee which makes no honey (*Dryden*). 2. A sluggard; an idler (*Addison*). 3. The hum, or instrument of humming.

Drone. The greatest tube of the bag-pipe: the office of which is to emit one continued deep note, as an accompanying bass to the air or tune played on the smaller pipes.

To Drone. *v. n.* (from the noun.) 1. To live in idleness; to dream (*Dryden*). 2. To give a heavy dull tone (*Dryden*).

DRONFIELD, a town in Derbyshire, with a market on Thursdays. It is situated at the edge of the Peak, in a very wholesome air. Lat. 53. 18 N. Lon. 1. 25 W.

DRO′NISH. *a.* (from *drone*.) Idle; sluggish; lazy; indolent; unactive (*Dryden*).

DRONTE, in ornithology. See Dodo.

DRONTHEIM, a city of Norway, capital of a government of the same name, with an archbishop's see, and a good harbour. Lat. 63. 26 N. Lon. 11. 9 E.

To DROOP. *v. n.* (*droef*, sorrow, Dutch.) 1. To languish with sorrow (*Sandys*). 2. To faint; to grow weak (*Roscommon*). 3. To sink; to lean downward (*Pope*).

DROOPING (cernuus). In botany. The top or end pointing to the ground. Applied to the peduncle or flower; as in bidens cernua. Different from nodding, Nutans; which see.

DROP. *s.* (ꝺꞃoppa, Saxon.) 1. A globule of moisture; as much liquor as falls at once when there is not a continual stream (*Boyle*). 2. Diamonds hanging in the ear (*Pope*).

Drop serene. *s.* (*gutta serena*, Latin.) A disease of the eye, proceeding from an inspissation of the humour (*Milton*).

To Drop. *v. a.* (ꝺꞃoppan, Saxon.) 1. To pour in drops or single globules (*Deuteronomy*). 2. To let fall (*Dryden*). 3. To let go; to dismiss from the hand, or the possession (*Watts*). 4. To utter slightly or casually (*Amos*). 5. To insert indirectly, or by way of digression (*Locke*). 6. To intermit; to cease (*Collier*). 7. To quit a master (*L'Estr.*). 8. To let go a dependant, or companion, without further association (*Addison*). 9. To suffer to vanish, or come to nothing (*Swift*). 10. To bedrop; to speckle; to variegate with spots (*Milton*).

To Drop. *v. n.* 1. To fall in drops, or single globules (*Shakspeare*). 2. To let drops fall (*Psalms*). 3. To fall; to come from a higher place (*Cheyne*). 4. To fall spontaneously (*Milton*). 5. To fall in death; to die suddenly (*Shakspeare*). 6. To die (*Digby*). 7. To sink into silence; to vanish; to come to nothing (*Addison. Pope*). 8. To come unexpectedly (*Spectator*).

DRO′PPING. *s.* (from *drop*.) 1. That which falls in drops (*Donne*). 2. That which drops when the continuous stream ceases (*Pope*).

DRO′PLET. *s.* A little drop (*Shakspeare*).

DROPS, in architecture. See Guttæ and Tryglyph.

Drops. See Medicine and Pharmacy.

DRO′PSICAL. *a.* (from *dropsy*.) Diseased with a dropsy; tending to a dropsy (*Arbuthnot*).

DRO'PSIED. *a.* (from *dropsy.*) Diseased with a dropsy (*Shakspeare*).

DROPSY. (Hydrops, from υδωρ, water.) In medicine. See the different species of this disease, ASCITES and ANASARCA: see also MEDICINE.

DRO'PWORT. See SPIRÆA.

DROPWORT (Water). See OENANTHE.

DRO'SERA. Sun-dew. In botany, a genus of the class pentandria, order pentagynia. Calyx five-cleft; petals five; capsule one celled, three or five valved; seeds numerous. Eleven species; chiefly Cape or Indian plants: but three common to the bogs and ditches of our own country: of these the sun-dew of the dispensatories is d. rotundifolia, with orbicular, radical, depressed leaves, with hairy petioles; scapes and calyxes hairy. The orbicular radical leaves which resemble a cup are fringed with hair, and secrete a limpid fluid, which has all the appearance of a dew-drop, and which is so constantly supplied, that the cup is never dried up or exhausted during the hottest day; whence the name sun-dew. The whole plant is extremely acrid, and the juice that exudes from its broken stem is sufficiently caustic to corrode the skin; whence, mixed with milk, it is often used as a cosmetic.

DROSS. *s.* (ꝺꞃoꞅ, Saxon.) 1. The recrement or despumation of metals (*Hooker*). 2. Rust; incrustation upon metal (*Addison*). 3. Refuse; leavings; sweepings; dregs; feculence; corruption (*Tillotson*).

DRO'SSINESS. *s.* (from *drossy.*) Foulness; feculence; rust (*Boyle*).

DRO'SSY. *a.* (from *dross.*) 1. Full of scorious or recrementitious parts; full of dross (*Davies*). 2. Worthless; foul; feculent (*Donne*).

DRO'TCHEL. *s.* An idle wench; a sluggard.

DROVE. *s.* (from *drive.*) 1. A body or number of cattle (*Hayward*). 2. A number of sheep driven (*South*). 3. Any collection of animals (*Milt.*). 4. A crowd; a tumult (*Dry.*).

DRO'VEN. *part.* from *drive*: not used (*Shakspeare*).

DRO'VER. *s.* He who is employed to drive cattle from one place to another, to sell.

DROUGHT. *s.* (ꝺꞃuᵹoꝺe, Saxon.) Dry weather; want of rain (*Sandys*). 2. Thirst; want of drink (*Milton*).

DROU'GHTINESS. *s.* (from *droughty.*) The state of wanting rain.

DROU'GHTY. *a.* (from *drought.*) 1. Wanting rain; sultry (*Ray*). 2. Thirsty; dry with thirst (*Philips*).

To DROWN. *v. a.* (ꝺꞃuncnian, Saxon.) 1. To suffocate in water (*King Charles*). 2. To overwhelm in water (*Knolles*). 3. To overflow; to bury in an inundation; to deluge (*Dryden*). 4. To immerge; to lose in any thing (*Davies*). 5. To lose in something that overpowers or covers (*Wotton*).

To DROWN. *v. n.* To be suffocated in the waters (*Ascham*).

DROWNING, signifies the extinction of life by a total immersion in water. In some respects there seems to be a great similarity between the death occasioned by immersion in water, and that by strangulation, suffocation by fixed air, apoplexies, epilepsies, sudden faintings, violent shocks of electricity, or even violent falls and bruises. Physicians, however, are not agreed with regard to the nature of the injury done to the animal system in any or all of these accidents. It is indeed certain, that in all the cases above mentioned, particularly in drowning, there is very often such a suspension of the vital powers as to us hath the appearance of a total extinction of them; while yet they may be again set in motion, and the person restored to life, after a much longer submersion than has been generally thought capable of producing absolute death. The length of time during which a person may remain in water without being drowned, is very unequal in different individuals; and depends as much on the temperature of the water as on the particular constitution of the subject: in general, however, there is less prospect of recovery, after having continued fifteen minutes immersed in water. In such cases, death ensues from impeded respiration, and the consequent ceasing of the circulation of the blood, by which the body loses its heat, and, with that, the activity of the vital principle. Dr. Goodwyn justly observes, that the water produces all the changes which take place in drowning, only indirectly, by excluding the atmospheric air from the lungs, as they admit but a very inconsiderable quantity of fluid to pass into them, during immersion. Hence we shall find, in the progress of this inquiry, that inflation of the lungs is one of the principal means of restoring life.

Before we describe the various methods that have been successfully adopted, for recovering drowned persons, it will be useful to advert (on the plan of Dr. Struve) to those circumstances which deserve to be duly weighed, previously to any active measures being taken on such unfortunate occasions: 1. The season and weather. 2. Length of time the person has continued under water. 3. The state of his mind when the accident happened: whether he was intoxicated, frightened, &c. 4. Constitution of the body, and whether he was in a state of perspiration. 5. The height from which he fell, and whether his head plunged foremost. 6. Depth of the water; whether it was cold or warm, sea or river water, and how he was dressed. Lastly, 7. The manner in which he was taken out, whether by the legs, and without receiving any injury, or by instruments; and whether he was rolled about in a tub, or what other methods were pursued for his restoration.

Few improvements appear to have been made in the treatment of the drowned, since this important branch of medical science was first discussed, in a popular manner, by the late Dr. Tissot; yet the names of Cullen, Goodwyn, Cogan, Hawes, and Coleman, in Britain, as well as those of Unzer, Reimarus, nd Struve, in Germany, deserve to be respectfully mentioned: from their various publications, and especially of the two last mentioned, we shall briefly state the principal rules of conduct to be observed, with respect to persons in that deplorable situation.

Symptoms of Apparent Death by Drowning.—Coldness; paleness of the whole body; the lips of a livid hue; the mouth either open or firmly closed; the tongue blue, swelled and protruded; the eye-lids closed, the eyes turned, and their pupils dilated; the face swelled and blue; the lower belly hard and inflated. The first signs of returning animation are, convulsive starting of the muscles of the face, or feet; motion of the eye-lids; a spasmodic shivering of the body.

Treatment.—1. After having been carefully taken out of the water by the arms, so as to prevent the least injury to the head and breast, the body ought to be carried to the nearest house (if possible, on a bier), with the head somewhat raised; or, in fine warm weather, the resuscitative process may with more advantage be performed in the open air, especially in sun-shine.

2. When the subject is deposited, the upper part of the body should be supported half-sitting, with the head inclining towards the right side.

3. The clothes are to be taken off without delay, but with the greatest precaution; as violent shaking of the body might extinguish the latent spark of life.

4. The mouth and nose must be cleansed from the mucus and froth, by means of a feather dipped in oil.

5. The whole body should now be gently wiped and dried with warm flannel cloths, then covered with blankets, feather-beds, hay, straw, &c. In cold or moist weather, the patient is to be laid on a mattress or bed, at a proper distance from the fire, or in a room moderately heated; but in the warm days of summer, a simple couch is sufficient.

6. If the patient be very young, or a child, it may be placed in bed between two persons, to promote natural warmth.

7. In situations where the bath cannot be conveniently procured, bladders filled with lukewarm water should be applied to different parts of the body, particularly to the pit of the stomach; or a warming-pan wrapped in flannel gently moved along the spine; or aromatic fomentations frequently and cautiously repeated.

8. As the breathing of many persons in an apartment would render the air mephitic, and thus retard, or even prevent the restoration of life, not more than five or six assistants should be suffered to remain in the room where the body is deposited.

Stimulants generally employed.—1. Moderate friction with soft, warm flannel, at the beginning, and gradually increased by means of brushes dipped in oil, till pulsations of the heart are perceptible.

2. Inflation of the lungs, which may be more conveniently effected by blowing into one of the nostrils, than by introducing air into the mouth. For the former purpose, it is necessary to be provided with a wooden pipe, fitted at one extremity for filling the nostril, and at the other for being blown into by a healthy person's mouth, or for receiving the muzzle of a pair of common bellows, by which the operation may be longer continued. At first, however, it will always be more proper to introduce the warm breath from the lungs of a living person, than to commence with cold atmospheric air. During this operation, the other nostril and the mouth should be closed by an assistant, while a third person gently presses the chest with his hands, as soon as the lungs are observed to be inflated.

3. Stimulating clysters, consisting of warm water and common salt; or a strong solution of tartar emetic; or decoctions of aromatic herbs; or six ounces of brandy, should be speedily administered. We do not consider injections of the smoke of tobacco, or even clysters of that narcotic plant, in all instances safe or proper.

4. Let the body be gently rubbed with common salt, or with flannels dipped in spirits; the pit of the stomach fomented with hot brandy; the temples stimulated with spirit of hartshorn; and the nostrils occasionally tickled with a feather.

5. Persons of a very robust frame, and whose skin after being dried assumes a rigid and contracted surface, may be put into the sub-tepid bath, of about 65°, which must be gradually raised to 75° or 80° of Fahrenheit's scale, according to circumstances; or the body carried to a brewhouse, and covered with warm grains for three or four hours: but these expedients generally require medical assistance.

6. Violent shaking and agitation of the body by the legs and arms, though strongly recommended, and supposed to have often forwarded the recovery of children and boys, appears to us a doubtful remedy, which can be practised only in certain cases.

7. Sprinkling the naked body of a drowned person with cold water; submitting it to the operation of a shower-bath, or the sudden shocks of the electric fluid; as well as whipping it with nettles, administering emetics, and blood-letting, are desperate expedients, which should be resorted to only after the more lenient means have been unsuccessfully employed.

It is, however, a vulgar and dangerous error, to suppose that persons apparently dead by immersion under water are irrecoverable, because life does not soon re-appear: hence we seriously intreat those who are thus employed in the service of humanity to persevere for three or four hours at least, in the application of the most appropriate remedies above described; for there are many instances recorded, of patients who recovered, after they had been relinquished by all their medical and other assistants.

Treatment on the Return of Life.—As soon as the first symptoms of that happy change become discernible, additional care must be taken to cherish the vital action, by the most soothing means. All violent proceedings should, therefore, be immediately abandoned, no farther stimulants applied, nor even the ears of the patient be annoyed by loud speaking, shouting, &c. At that important crisis, moderate friction only is requisite. And, if the reviving person happen to be in the bath, he may either remain there, provided his sensations be easy and agreeable, or be removed to a comfortable bed, after being expeditiously dried with warm flannels: fomentations of aromatic plants may then be applied to the pit of the stomach; bladders filled with warm water placed to the left side; the soles of the feet rubbed with salt; the mouth cleared of froth and mucus, and a little white wine, or a solution of salt in water, dropped on the tongue. But all strong stimulants, such as powerful electric shocks, strong odours of volatile salts, &c. are at this period particularly injurious. Lastly, the patient, after resuscitation, ought to be for a short interval resigned to the efforts of nature, and left, in a composed and quiescent state: as soon as he is able to swallow, without compulsion or persuasion, warm wine, or tea, with a few drops of vinegar, instead of milk, or gruel, warm beer, and the like, should be given in small doses frequently repeated.

We cannot conclude this subject without affording the reader a view of the different articles belonging to a complete chest of instruments, and other materials, employed in the various processes for recovering suspended animation from drowning. The merit of these institutions in England is due to Drs. Cogan and Hawes, the founders of the Royal Humane Society at London; but the improved arrangement of the chest now to be described, together with the choice of internal and external remedies, were made by a respectable surgeon at Deptford, Mr. Kite, in 1788, though considerably extended in 1790, by Mr. Redlich, a medical practitioner of respectability at Hamburgh. This gentleman is likewise one of the most active members of the Humane Society in that city, and has offered the following articles for sixty-five marks, or about four guineas and a half. His complete chest contains:

A small bottle of rectified spirit of wine.
Ditto, white-wine vinegar.
Ditto, sweet oil.
Ditto, white French brandy.
Ditto, volatile sal ammoniac.
Ditto, vitriolic æther.
Ditto, mustard-seed.

A machine for injecting the smoke of tobacco.

A leather tube, together with a pair of bellows, for inflating the lungs.

Another tube of leather, for introducing medicines into the stomach.

A small syringe for clearing the throat of mucus.

Three woollen covers or blankets.

Four brushes, and six woollen cloths for performing friction.

Several emetics.

Two lancets for blood-letting.

One pound of tobacco.

A roller and cushion, to be used in venæsection.

Two quills, a sponge, and some lint.

A pocket-knife.

An apparatus for striking fire.

Chamomile and elder-flowers.

Common salt:—and a printed copy of rules and directions for treating the drowned.

Conceiving that a chest containing all these articles could not be purchased in London for less than double the price above stated, beside the additional trouble of procuring them, we have borrowed this account from our respectable fellow-labourer, the editor of the Domestic Encyclopædia.

To DROWSE. *v. a.* (*droosen*, Dutch.) To make heavy with sleep (*Milton*).

To Drowse. *v. n.* 1. To slumber; to grow heavy with sleep (*Milton*). 2. To look heavy, not cheerful (*Shakspeare*).

DRO′WSIHED. *s.* Sleepiness; inclination to sleep: obsolete (*Spenser*).

DRO′WSILY. *ad.* (from *drowse.*) 1. Sleepily; heavily (*Dryden*). 2. Sluggishly; idly; slothfully; lazily (*Raleigh*).

DRO′WSINESS. *s.* (from *drowse.*) 1. Sleepiness; heaviness with sleep (*Crashaw.*) 2. Idleness; indolence; inactivity (*Bacon*).

DRO′WSY. *a.* (from *drowse.*) 1. Sleepy; heavy with sleep; lethargic (*Dryden*). 2. Heavy; lulling; causing sleep (*Addison*). 3. Stupid; dull (*Atterbury*).

To DRUB. *v. a.* (*druber*, to kill, Dan.) To thrash; to beat; to bang (*Hudibras*).

Drub. *s.* (from the verb.) A thump; a knock; a blow (*Addison*).

To DRUDGE. *v. a.* (*draghen*, to carry, Dutch.) To labour in mean offices; to toil without honour or dignity; to work hard (*Otway*).

Drudge. *s.* (from the verb.) One employed in mean labour; a slave (*Shakspeare*).

DRU′DGER. *s.* (from *drudge.*) 1. A mean labourer. 2. The drudging-box.

DRU′DGERY. *s.* Mean labour; ignoble toil; servile occupation (*Southern*).

DRU′DGING-BOX. *s.* The box out of which flour is sprinkled upon roast meat (*King*).

DRU′DGINGLY. *ad.* Laboriously; toilsomely.

DRUG. *s.* (*drogue*, French.) 1. An ingredient used in physic; a medicinal simple. (See Materia Medica, Pharmacy, &c.) 2. Any thing without worth or value; any thing of which no purchaser can be found (*Dryden*). 3. A drudge (*Shakspeare*).

To Drug. *v. a.* (from the noun.) 1. To season with medicinal ingredients (*Shakspeare*). 2. To tincture with something offensive (*Milton*).

DRUGGET, in commerce, a sort of stuff, very thin, and narrow, sometimes all wool, and sometimes half wool, and half thread; having sometimes the wale, but more usually without.

DRU'GGIST. *s.* (from *drug.*) One who sells physical drugs (*Boyle*).

DRU'GSTER. *s.* (from *drug.*) One who sells physical simples (*Atterbury*).

DRUIDS, Druides, or Druidæ, the priests or ministers of religion among the ancient Celtæ or Gauls, Britons, and Germans. Some authors derive the word from the Hebrew דרושים *derussim*, or *drussim*, which they translate *contemplatores*. Picard, Celtopæd. lib. ii. p. 58, believes the Druids to have been thus called from Druis, or Dryius, their leader, the fourth or fifth king of the Gauls, and father of Saron or Naumes. Pliny, Salmasius, Vigenere, &c. derive the name from δρυς, oak; on account of their inhabiting, or at least frequenting, and teaching in forests: or perhaps because, as Pliny says, they never sacrificed but under the oak. But it is hard to imagine how the Druids should come to speak Greek. Menage derives the word from the old British *drus*, dæmon, magician. Borel, from the Saxon *dry*, magician; or rather from the old British *dru*, or *derw*, oak, whence he takes δρυς to be derived; which is the most probable supposition.

The Druids were the first and most distinguished order among the Gauls and Britons; they were chosen out of the best families; and the honours of their birth, joined with those of their function, procured them the highest veneration among the people. The authority of the kings of Britain was greatly controlled by the Druids, who were not only the ministers of religion, but also possessed the right of making laws, of explaining and executing them. Their power, and consequently the honour paid them, was incredibly great. They were considered as the interpreters of the gods; they were exempted from all taxes and military services; and their persons were held sacred and inviolable. They were objects of such veneration, that the rage of hostile armies about to engage was not only suspended, but entirely suppressed, by their interposition. (Diodor. v. 31. Strab. iv. 197.) There was a chief Druid chosen by the suffrages of the rest; which was an office of so great dignity, that the appointment to it was sometimes determined by arms. The chief residence of the Archdruid of Gaul was at Dreux, in Pais Chartrain (*in finibus Carnutum, quæ regio totius Galliæ media habebatur*), whither all those who had law-suits came to get them determined. (Cæsar, vi. 13.) The Archdruid of Britain resided, as it is thought, in the island of Anglesey (*in Mona*), where the vestiges of his palace, and of the houses of the other Druids, who attended him, are said still to be visible. (Rowland's Mona Antiqua.) We know but little as to their peculiar doctrines; only that they believed the immortality of the soul; and, as is generally supposed, the metempsychosis; though a late author makes it appear highly probable they did not believe this last, at least not in the sense of the Pythagoreans.

They held the plant misletoe in singular veneration. Pliny relates the ceremony wherewith they gathered it every year, lib. xvi. cap. 44. They placed great confidence, also, in serpent's eggs, gathered after a peculiar manner, and under a certain disposition of the moon, described by Pliny; and imagined them effectual means for the gaining of law-suits, and procuring the good graces of princes. And hence the same author concludes it is, that the caduceus, or rod encompassed with two serpents interwoven, has been assumed as a symbol of peace. Suetonius, in his Life of Claudius, assures us, they sacrificed men; and Mercury is said to be the god to whom they offered these victims. Diod. Siculus, lib. vi. observes, it was only upon extraordinary occasions they made such offerings: as, to consult what measures to take, to learn what should befal them, &c. by the fall of the victim, the tearing of his members, and the manner of his blood gushing out. Augustus condemned the custom; and Tiberius, and Claudius, punished and abolished it.

DRUM, is a martial musical instrument in form of a cylinder, hollow within, and covered at the two ends with vellum, which is stretched or slackened at pleasure by means of small cords or sliding knots. It is beat upon with sticks. Drums are sometimes made of brass, but most commonly they are of wood. The drum is by Le Clerc said to have been an oriental invention, and to have been brought by the Arabians, or perhaps rather the Moors, into Spain.

Drums (Kettle), are two sorts of large basons of copper or brass, rounded in the bottom, and covered with vellum or goat skin, which is kept fast by a circle of iron round the body of the drum, with a number of screws to draw up and down. They are much used among the horse; as also in operas, oratorios, concerts, &c.

Drum, or Drummer, he that beats the drum; of whom each company of foot has one, and sometimes two. Every regiment has a drum-major, who has the command over the other drums. They are distinguished from the soldiers by clothes of a different fashion: their post, when a battalion is drawn up, is on the flanks, and on a march it is betwixt the divisions.

Drum of the ear. See Ear, Tympanum, and Anatomy.

To Drum. *v. n.* 1. To beat a drum; to beat a tune on a drum. 2. To beat with a pulsatory motion (*Dryden*).

To DRU'MBLE. *v. n.* To drone; to be sluggish (*Shakspeare*).

DRUMBOTE, a town of Ireland, in the county of Monaghan. Lat. 54. 10 N. Lon. 6. 31 W.

DRU'MFISH. *s.* The name of a fish (*Woodward*).

DRUMLANRIG, a town of Dumfriesshire, in the district of Nithsdale; remarkable for a wood of oak, six miles in length. Lat. 55. 25 N. Lon. 3. 31 W.

DRUM-MAJOR. *s.* (*drum* and *major.*) The chief drummer of a regiment (*Cleaveland*).

DRU'M-MAKER. *s.* He who deals in drums.

DRU'MMER. *s.* He whose office is to beat the drum (*Gay*).

Drummer, in entomology. See Blatta.

DRUMMOND (William), a Scotch poet. He was the son of sir John Drummond, of Hawthornden, and was born there in 1585. He was destined for the law, and had an education accordingly; but Parnassus had more charms for him than the courts, &c. and the law was totally abandoned. In his retirement at Hawthornden, he wrote several beautiful poems; but the death of a lady to whom he was about to be married affected him so much, that he went abroad, where he remained some years, and then returned to his own country. In his retirement he wrote his history of the seven kings of the name of James, and several pieces to promote peace and union in that turbulent time. He died in 1649, leaving a widow and three children. His works were printed in folio at Edinburgh in 1711.

DRU'MSTICK. *s.* The stick with which a drum is beaten.

DRUNK. *a.* (from *drink.*) 1. Intoxicated with liquor; inebriated (*Dryden*). 2. Drenched or saturated with moisture (*Deuteronomy*).

DRU'NKARD. *s.* (from *drunk.*) One given to excessive use of strong liquors; one addicted to habitual ebriety (*South*).

DRU'NKEN. *a.* (from *drunk.*) 1. Intoxicated with liquor; inebriated (*Bacon*). 2. Given to habitual ebriety. 3. Saturated with moisture (*Shakspeare*). 4. Done in a state of inebriation (*Swift*).

DRU'NKENLY. *ad.* (from *drunken.*) In a drunken manner (*Shakspeare*).

DRU'NKENNESS. *s.* (from *drunken.*) 1. Intoxication with strong liquor (*Taylor*). 2. Habitual ebriety (*Watts*). 3. Intoxication, or inebriation of any kind; disorder of the faculties (*Spenser*).

Drunkenness, a well known affection of the brain, occasioned by drinking too freely of intoxicating liquors. Drunkenness appears in different shapes in different constitutions: some it makes gay, some sullen, and some furious. The mischief of drunkenness consists in the following bad effects: 1. It betrays most constitutions either into extravagances of anger, or sins of lewdness. 2. It disqualifies men for the duties of their station, both by the temporary disorder of their faculties, and at length by a constant incapacity and stupefaction. 3. It is attended with expences, which can often be ill spared. 4. It is sure to occasion uneasiness to the family of the drunkard. 5. It shortens life. To these consequences of drunkenness must be added the peculiar danger and mischief of the example. "Drunkenness (says Paley) is a social festive vice. The drinker collects his circle; the circle naturally spreads; of those who are drawn within it, many become the corrupters and centres of sets and circles of their own; every one countenancing, and perhaps emulating the rest, till a whole neighbourhood be infected from the contagion of a single example. With this observation upon the spreading quality of drunkenness may be connected a remark which belongs to the several evil effects above recited. The consequences of a vice, like the symptoms of a disease, though they be all enumerated in the description, seldom all meet in the same subject. In the instance under consideration, the age and temperature of one drunkard may have little to fear from inflammations of lust or anger; the fortune of a second may not be injured by the expence; a third may have no family to be disquieted by his irregularities; and a fourth may possess a constitution fortified against the poison of strong liquors. But if, as we always ought to do, we comprehend within the consequences of our conduct the mischief and tendency of the example, the above circumstances, however fortunate for the individual, will be found to vary the guilt of his intemperance less, probably, than he supposes. Although the waste of time and money may be of small importance to you, it may be of the utmost to some one or other whom your society corrupts. Repeated or long continued excesses, which hurt not your health, may be fatal to your companion. Although you have neither wife nor child, nor parent, to lament your absence from home, or expect your return to it with terror; other families, whose husbands and fathers have been invited to share in your ebriety, or encouraged to imitate it, may justly lay their misery or ruin at your door. This will hold good, whether the person seduced be seduced immediately by you, or the vice be propagated from you to him, through several intermediate examples."

The ancient Lacedemonians used to make their slaves frequently drunk, to give their children an aversion and horror towards it. The Indians hold drunkenness a species of madness; and in their language, the same term (*ramgam*), that signifies "drunkard," signifies also a "phrenetic."

Drunkenness, by our laws, is very properly looked upon as an aggravation rather than an excuse for any crime. For the offence of drunkenness a man may be punished in the ecclesiastical court, as well as by justices of peace by statute. And by 4 Jac. I. c. 5. and 21 Jac. I. c. 7. if any person shall be convicted of drunkenness by the view of a justice, oath of one witness, &c. he shall forfeit 5s. for the first offence, to be levied by distress and sale of his goods; and for want of a distress, shall sit in the stocks six hours: and, for the second offence, he is to be bound with two sureties in 10l. each, to be of good behaviour, or to be committed. And he who is guilty of any crime through his own voluntary drunkenness, shall be punished for it as if he had been sober. It has been held that drunkenness is a sufficient cause to remove a magistrate: and the prosecution for this offence by the statute of 4 Jac. I. c. 5. was to be, and still may be, before justices of peace in their sessions by way of indictment, &c. Equity will not relieve against a bond, &c. given by a man when drunk, unless the drunkenness is occasioned through the management or contrivance of him to whom the bond is given.

DRUPA. In botany. Pericarpium farctum evalve, nucem continens. A pulpy pericarp or fruit without valves, containing a nut or stone with a kernel. As plum, apricot, peach, almond, olive, &c. Some call this sort of fruit prunus or plum. It is usually a moist succulent fruit; but sometimes dry, as the almond.

DRUPACEÆ. The thirty-eighth order in Linnéus's Fragments of a Natural Method; containing those trees which bear a drupe or plum.

DRUSES, a people of Syria, on the mountains Libanus and Antilibanus. Their language is the Arabic; and their religion peculiar to themselves, consisting of certain mysterious ceremonies, accompanied with very little, if any, zeal. They are warlike, inured to labour, are great enemies of the Turks, and have their particular princes, called Emirs.

DRUSIUS (John), a learned protestant, born at Oudenard in Flanders, in 1555. He was educated at Ghent, and Louvain; but learnt Hebrew at Cambridge. He was for some time professor of the oriental languages at Oxford; but afterwards went to Traneker, where he became professor of Hebrew, and died in 1616. He wrote several learned works; and held a vast correspondence with the learned: for, besides letters in Hebrew, Greek, and other languages, there were found 2300 Latin letters among his papers.

DRY. *a.* (ꝺꞃiᵹ, Saxon.) 1. Arid; not wet; not moist (*Bacon*). 2. Not rainy (*Addison*). 3. Not succulent; not juicy (*Shakspeare*). 4. Being without tears (*Dryden*). 5. Thirsty; athirst (*Shakspeare*). 6. Jejune; barren; plain (*B. Jon.*). 7. Hard; severe (*Hudibras*).

To DRY. *v. a.* 1. To free from moisture; to arefy; to exsiccate (*Bacon*). 2. To exhale moisture (*Dryden*). 3. To wipe away moisture (*Denham*). 4. To scorch with thirst (*Isaiah*). 5. To drain; to exhaust (*Philips*). 6. *To* DRY *up*. To deprive totally of moisture (*Woodward*).

To DRY. *v. n.* To grow dry; to lose moisture; to be drained of its moisture.

DRY ROT, a disease incident to timber used for building, such as flooring-boards, joists, wainscoting, &c. supposed to proceed from the boletus lachrymans. (See BOLETUS.) Dr. Darwin is of opinion, that the dry-rot may be entirely prevented, by soaking the timber first in lime-water, till it has absorbed as much of it as possible, and after it has become dry, immersing it in a weak solution of vitriolic acid in water, which he supposes will not only preserve it from decay for many centuries (if it be kept dry), but also render it less inflammable; a circumstance that merits considerable attention in constructing houses. In the Transactions of the Society for the Encouragement of Arts, we meet with the following account of the cause of the dry-rot in timber, and the method of preventing it, communicated by Mr. Batson, of Limehouse. He observes, that the dry-rot having taken place in one of his parlours, to such a degree as to require the pulling down part of the wainscot every third year, and perceiving that it arose from a damp, stagnated air, and from the moisture of the earth, he determined, in the month of June, 1783, to build a narrow closet next the wall through which the moisture came to the parlour. This expedient had the desired effect. But, though the rot in the parlour was totally stopped, the evil soon appeared in the closet, where fungi of a yellow colour arose in various parts. In the autumn of the year 1786 the closet was locked up about ten weeks: on opening it, numerous excrescences were observed about the lower part; a white mould was spread by a plant resembling a vine, or sea-weed; and the whole of the inside, china, &c. was covered with a fine powder of the colour of brick-dust. On cleaning out the closet, it was discovered that the disease had affected the wood so far as to extend through every shelf, and the brackets that supported them. In the beginning of the year 1789, he determined to strip the whole closet of lining and floor, not to leave a particle of the wood behind, and also to dig, and take away, about two feet of the earth in depth, and leave the walls to dry, so as to destroy the roots or seeds of the evil. When, by time, the admission of air, and good brushing, it had become properly dry and cleansed, he filled it, of sufficient height for the joists, with anchor-smith's ashes, because no vegetable will grow in them. The joists being sawed off to their proper lengths, and fully prepared, they and their plates were well charred, and laid upon the ashes; particular directions being given, that no scantling or board might be cut or planed in the place, lest any dust or shavings might drop among the ashes. The flooring-boards being very dry, he caused them to be laid close, to prevent the dust getting down, which perhaps, in the course of time, might bring on vegetation. The framing of the closet was then fixed up, having all the lower pannels let in, to be fastened with buttons only, so that, if any vegetation should arise, the pannels might with ease be taken out and examined. In some situations it might be expedient and necessary to take out a greater depth of earth; and where ashes can be had from a foundry, they may be substituted for those of anchor-smiths; but house ashes are by no means to be depended upon. At the expiration of seven years from the period of making this experiment the wainscot was removed, and the flooring-boards also taken up, when they were found entirely free from any appearance of the rot; two pieces of wood (yellow fir) which had been driven into the wall as plugs, without being previously charred, were alone affected with this disease. (*British Encyclo.*). See ROT.

DRYADS, in the heathen theology, a sort of deities, or nymphs, which the ancients thought inhabited groves and woods. They differed from the Hamadryads; these latter being attached to some particular tree, with which they were born, and with which they died; whereas the Dryades were goddesses of trees and woods in general. See HAMADRYADES.

DRYA'NDRA. In botany, a genus of the class diœcia, order monadelphia. Calyx two-leaved; petals five; stamens nine; fruit three or four grained; seeds solitary. One species only; a dwarf tree of Japan; with leaves at the end of the twigs, heart-shaped, entire, glabrous; pannicle spreading; and yellow flowers.

DRYAS. Mountain avens. In botany, a genus of the class icosandria, order polygynia. Calyx eight or ten-cleft, inferior; petals five or eight; seeds with long feathery awns; receptacle depressed. One species only; found in the mountains of our own country, and in Denmark.

DRYDEN (John), a great English poet, was born of an ancient family, at Aldwinkle, in Northamptonshire, in 1631, and educated at Westminster school, from whence he removed to Trinity college, Cambridge. In 1658 he wrote an elegy on Oliver Cromwell; and in 1660, a poem on the restoration of Charles II. His productions were now rapid, and procured him the place of poet-laureat on the death of Davenant in 1668. The same year appeared his essay on dramatic poesy, which was replied to by sir Robert Howard, and vindicated by the author. In 1669 he brought out his first play entitled, The Wild Gallant, a comedy, which met with indifferent success. He was not discouraged, however, but went on in his dramatic career, and produced a great number of plays, some of which possess considerable merit. In 1671 he was exposed to ridicule on the stage in the character of Bays, in the duke of Buckingham's comedy of The Rehearsal. In 1679 appeared an essay on satire, written by the earl of Mulgrave and Mr. Dryden. This piece contained some severe strokes on the earl of Rochester, who employed three fellows to cudgel Dryden as he came out of a coffee-house in Covent-garden. In 1681 he published his Absalom and Achitophel, which was a keen satire on the duke of Monmouth and his abettors. In 1682 he printed his poem, entitled, Religio Laici, intended for a defence of revealed religion. In 1684 he translated Maimbourg's History of the League, in which he had been employed by Charles II. on whose death he wrote his Threnodia Augustalis. On the accession of James II. he turned Roman Catholic, which laid him open to the lashes of the wits; and some divines, as Stillingfleet and Burnet, handled him severely for his apostacy. Like most converts, Dryden chose to shew his sincerity by writing in defence of his new religion: but unfortunately, he did it in such a manner, as only to bring both himself and his faith into ridicule. His poem, called the Hind and Panther, is a most ridiculous attempt to vindicate the church of Rome, which is represented by the first beast, and the church of England by the latter. This poem was answered by Montague and Prior, in a piece entitled, The Hind and Panther, transposed to the story of the Country Mouse and City Mouse. He was dismissed from the office of poet-laureat at the revolution, and was succeeded by Shadwell, whom he severely satirised in his Mac Flecnoe. In 1688 he published a translation of father Bouhour's Life of St. Francis Xavier; and in 1693 appeared his translation of Juvenal and Persius. In 1693 came out his translation of du Fresnoy's Art of Painting; and two years after his translation of Virgil. In 1698 he published his Fables, ancient and modern. He died in 1701, and was buried in Westminster-abbey, where there is a monument to his memory erected by John Sheffield, duke of Buckingham. Mr. Dryden married Lady Elizabeth Howard, daughter of the earl of Berkshire, by whom he had three sons, Charles, John, and Henry. Charles was made usher of the palace to pope Clement XI. but returning to England he was drowned near Windsor in 1704. John wrote a comedy, called the Husband his own Cuckold; and Henry became a monk.

Congreve, whose authority cannot be suspected, has given us such an account of Dryden, as makes him appear no less amiable in his private character as a man, than he was illustrious in his public one as a poet. In the former light, according to that gentleman, he was humane, compassionate, forgiving, and sincerely friendly: of an extensive reading, a tenacious memory, and a ready communication; gentle in the correction of the writings of others, and patient under the reprehension of his own deficiencies: easy of access himself, but slow and diffident in his advances to others; and of all men the most modest and the most easy to be discountenanced in his approaches either to his superiors or his equals. As to his writings, he is perhaps the happiest in the harmony of his numbers of any poet who ever lived either before or since his time, not even Mr. Pope himself excepted. His imagination is ever warm, his images noble, his descriptions beautiful, and his sentiments just and becoming. In his prose he is poetical without bombast, concise without pedantry, and clear without prolixity. His dramatic have, perhaps, the least merit of all his writings: indeed, his comedies are, most of them, particularly deserving of censure, on account of the loose sentiments and obscene expressions with which they abound. It is true, we have been reminded that he lived in an immoral age; and we have been desired to consider, that

> "Those who live to please, must please to
> live."

The apology, however, in our opinion, is not sufficiently forcible; and it comes with the least possible weight when it proceeds from those who point to the stage as the great engine of the reformation of mankind. Much interesting information respecting this great poet will be found in the elegant works of Malone and Walter Scott.

DRY'ER. *s.* (from *dry.*) That which has the quality of absorbing moisture (*Temple*).

DRY'EYED. *a.* (*dry* and *eye.*) Without tears; without weeping (*Milton*).

DRYING OIL, oil prepared by boiling with litharge, forming the basis of a vast number of paints and varnishes. See OILS FIXED.

DRY'LY. *ad.* (from *dry.*) 1. Without moisture. 2. Coldly; frigidly; without affection (*Dry.*). 3. Jejunely; barrenly (*Pope*).

DRY'NESS. *s.* (from *dry.*) 1. Want of moisture; siccity (*Bentley*). 2. Want of succulence (*Shakspeare*). 3. Want of embellishment; want of pathos; jejuneness; barrenness (*Ben Jonson.*) 4. Want of sensibility in devotion; want of ardour; aridity (*Taylor*).

DRY'NURSE. *s.* (*dry* and *nurse.*) 1. A woman who brings up and feeds a child without the breast. 2. One who takes care of another (*Shakspeare*)

To DRY'NURSE. *v. a.* To feed without the breast (*Hudibras*).

DRY'OPS. In zoology, a tribe of insects of the coleopterous genus cryptocephalus, thus named by Fabricius in his entomology. See CRYPTOCEPHALUS.

DRYPIS. In botany, a genus of the class pentandria, order tryginia. Calyx five-toothed; petals five; capsule opening transversely all round; one-seeded. One species only: found in Italy and Barbary: a shrubby plant with procumbent, four-sided stems; leaves subulate, mucronate; those of the fork lanceolate, three-toothed on each side; corols crowned.

DRY'SHOD. *a.* Without wet feet; without treading above the shoes in the water (*Sidney*).

DU'AL. *a.* (*dualis*, Latin.) Expressing the number two (*Clarke*).

DUALISM, or DITHEISM, an opinion which supposes two principles, two gods, or two independent uncreated beings, of which one is the first cause of good, the other of evil. See MANICHEES.

To DUB. *v. a.* (ꝺubban, Saxon.) 1. To make a man a knight by a blow with the sword (*Hayward*). 2. To confer any kind of dignity (*Cleaveland*).

DUB. *s.* A blow; a knock (*Hudibras*).

DUBBING, in the cocking glossary, is taking off the comb and gills from a game chick before he is turned to a master walk. The operation is performed with a penknife for the comb, and a pair of scissors for the gills: after which it is necessary to wash the parts with vinegar, or weak salt and water.

DUBHE, in astronomy, a name given to the star marked *α* in Ursa major. It is, likewise, often called the upper Pointer.

DUBIO'SITY. *s.* (from *dubious.*) A thing doubtful: not used (*Brown*).

DU'BIOUS. *a.* (*dubius*, Latin.) 1. Doubting; not settled in an opinion. 2. Uncertain; that of which the truth is not fully known (*Derham*). 3. Not plain; not clear (*Milton*). 4. Having the event uncertain (*Milton*).

DU'BIOUSLY. *ad.* (from *dubious.*) Uncertainly; without any determination (*Swift*).

DU'BIOUSNESS. *s.* Uncertainty; doubtfulness (*Broome*).

DU'BITABLE. *a.* (*dubito*, Latin.) Doubtful; uncertain; what may be doubted.

DUBITA'TION. *s.* (*dubitatio*, Latin.) The act of doubting; doubt (*Grew*).

DUBITATIVE CONJUNCTIONS. See GRAMMAR.

DUBLIN, a county of Ireland, 27 miles long, and 17 broad, having the Irish sea on the E. Kildare and East Meath on the W. and N.W. and Wicklow on the S. It sends 10 members to parliament, contains 87 parishes, 4 market towns, and 1 city.

DUBLIN, by the Saxons called Duffin, by the Welch Dinas-dulin, and in the Irish language Balacloigh; i. e. a town upon hurdles, on which the people think the city is founded, the ground being soft and quaggy. But the original words signify a walled town, particularly raised with stones. The Roman name is Eblana. This city is the metropolis of Ireland, the second city in the British dominions, and contains near 200,000 inhabitants. It is 270 miles distant from London, and 60 from Holyhead in Wales. It stands about 7 miles from the sea, at the bottom of a large bay, on the river Liffey. The river Liffey is crossed by six bridges; the sides are embanked with spacious quays, so that vessels can load and unload before the houses of the merchants. The bay is about seven miles broad, and unsafe in stormy weather, but the channel is confined for three miles on each side by a broad stone wall, for the protection of ships in the road. Vessels which draw more than seven feet cannot come up to the quay. A floating light has been erected on the north side of the harbour, to prevent accidents, and lighted every night; and, in the day-time, a flag is constantly hoisted from half flood to half ebb. The entrance into the harbour is thought to be one of the most beautiful in Europe. In this city are twenty parishes, and eighteen churches, some chapels of ease, the cathedral, and the collegiate, Christ's Church. Dublin is the see of an archbishop, erected in the year 1152; it was a bishopric in the 7th century, and, in the year 1214, the bishopric of Glandalough, which was founded in the 6th century, was incorporated with Dublin. The see of Dublin has two cathedrals, both within the city, Christ-church, founded for regular canons, and converted into a collegiate church for a dean and chapter by Henry VIII. in the year 1541, and St. Patrick, for thirteen, now twenty-two prebendaries. The university was first projected in the year 1311, but did not flourish till the reign of queen Elizabeth, who granted it a charter. James I. endowed it with large estates in the province of Ulster. Charles I. was likewise a benefactor, and, in the year 1637, granted it a new charter and statutes. It consists of a chancellor, a vice-chancellor, provost, vice-provost, twenty-two fellows, and five royal professorships of divinity, common-law, civil-law, physic, and Greek; besides these, three others were founded by sir Patrick Dun, of physic, chirurgery and pharmacy; there are likewise professorships of mathematics, oriental languages, oratory, history, and natural philosophy: the number of students is usually about 400, including seventy on the foundation. The building is noble and spacious, and consists of two quadrangles. An observatory has been erected on a rocky hill, about four miles north-west of the city. The castle, where the lord-lieutenant resides, is situated nearly in the centre of the town: it was not used as a palace, or residence of the viceroy, till the reign of Elizabeth, when it was repaired and beautified by sir Henry Sidney, lord deputy. The parliament house is a magnificent building, erected between the years 1729 and 1739, at the expence of 40,000*l.* The Royal Exchange cost likewise 40,000*l.* and was ten years building, from the year 1769 to the year 1779. The Custom-house is a magnificent building: so are the courts of justice. Other public buildings of note are the linen hall, the barracks, the theatre, the tollsell, or town-house, hospitals for invalids, for the children of soldiers and sailors, and for the reception of the aged and infirm; for lying-in women, for the blind, &c. The royal college of physicians was established in the year 1679; the royal college of surgeons in the year 1785; the academy for the advancement of science, polite literature, and antiquities, in 1786. Other societies are for soldiers' orphans; the marine society; society for promoting the linen and hemp manufacture; for improving agriculture, &c. The civil government of Dublin is executed by a lord mayor, recorder, two sheriffs, twenty-four aldermen, and a common council, formed of representatives from the twenty-five corporations. The mayor tries all offences, even capital ones, except murder and treason, and matters of property, for any sum under 20*l.* A new police, lately established by act of parliament, under a chief and three assistant commissioners and four divisional justices, who are aldermen of the city, consists of 40 horse, and 400 foot, well-armed, trained, and clothed, stationed in watch-houses, and patrolling the streets every night. Besides the silk, woollen, and worsted manufactures carried on in that quarter of the suburbs called *The Earl of Meath's Liberty*, and considerably improved within these few years, other branches of useful manufacture are establishing in different parts of the metropolis; and though the trade in Dublin has heretofore consisted chiefly in the importation of foreign commodities, yet now that the restriction of its woollen and most other goods are removed, it is hoped the daily enlargement of the export trade will cause a proportional increase of opulence. Dublin is remarkably well supplied with provisions; with coals, chiefly from Scotland and Cumberland, and with water from the Liffey, by machines curiously constructed at Island-bridge on the north, and from a fine reservoir on the south. The Phœnix Park, at the west end of the town, was formerly part of the lands of the monastery of St. John of Jerusalem. It is an extensive royal inclosure, seven miles in circuit, diversified with woodland, champain, and rising ground, and well stocked with deer; and, besides the Hibernian school, is adorned with the viceroy's beautiful villa, the seats of the principal secretary, and a few others. Lat. 53. 21 N. Lon. 6. 6½ W.

DUCAL, in general, something belonging to a duke. (See Duke.) The letters patent granted by the senate of Venice are called ducals: so also are the letters written in the name of the senate to foreign princes. The denomination of ducal is derived hence; that, at the beginning of such patents, the name of the duke or doge is written in capitals, thus, *N— Dei Gratia Dux Venetiarum*, &c. The date of ducals is usually in Latin, but the body is in Italian. A courier was despatched with a ducal to the emperor, returning him thanks for renewing the treaty of alliance, in 1716, against the Turks, with the republic of Venice.

Ducal mantle, in helminthology. See Ostrea.

DUCAT, a foreign coin, either of gold or silver, struck in the dominions of a duke; being about the same value with a Spanish piece of eight, or a French crown, or four shillings and sixpence sterling, when of silver; and twice as much, when of gold. See Money.

The Spaniards have no ducats of gold; but in lieu thereof, they make use of the silver one; which, with them, is no real species, but only a money of account like our pound. It is equivalent to eleven rials.

DUCATOON, a silver coin struck chiefly in Italy, though there are also Dutch and Flemish ducatoons. They are valued at about 4*s.* 8*d.* sterling. There is also a gold ducatoon struck and current in Holland; it is valued at about 20 florins.

DUCENARIUS, in antiquity, an officer in the Roman army who had the command of 2000 men.

DUCENTESIMA, a tax of the 200th penny, exacted by the Romans.

DUCK, in ornithology. See Anas.

Duck-bernacle, in ornithology. See Lepas.

Duck, is also used to denote, 1. A word of endearment, or fondness (*Shakspeare*). 2. A declination of the head (*Milton*). 3. A stone thrown obliquely on the water, called duck and drake (*Arbuthnot*).

To Duck. *v. n.* (from the noun.) 1. To dive under water as a duck (*Spenser*). 2. To drop the head as a duck (*Swift*). 3. To bow low; to cringe (*Shakspeare*).

To Duck. *v. a.* To put under water.

Duck Creek, a town of United America, in the state of Delaware, which carries on a considerable trade with Philadelphia: twelve miles NW. of Dover.

Duck, a lake of North America. Lon. 103. 30 W. Lat. 54. 50 N.

Duck, a river of United America, in the Tennasee government, which runs into the Tennasee, 38 miles SSW. Clarksville.

Duck Island, a small island in the Atlantic, near the coast of Main in United America. Lon. 67. 43 W. Lat. 44. 45 N.

DU'CKER. *s.* (from *duck.*) 1. A diver. 2. A cringer.

DUCKING, plunging in water, a diversion anciently practised among the Goths by way of exercise; but among the Celtæ, Franks, and ancient Germans, it was a sort of punishment for persons of scandalous lives.

Ducking is also a penalty which veteran sailors pretend to inflict on those who, for the first time, pass the tropic of Cancer, the equator, or the straits of Gibraltar, in consequence of their refusal or incapacity to pay the usual fine levied on this occasion.

Ducking-stool. See Cucking-stool.

DUCKLE'GGED. *a.* Short-legged (*Dryden*).

DU'CKLING. *s.* A young duck (*Ray*).

DU'CKMEAT. *s.* A common plant growing in standing waters; duckweed. See Lenticula.

To **DUCKO'Y.** *v. a.* (mistaken for *decoy.*) To entice to a snare (*Grew*).

Ducko'y. *s.* Any means of enticing and ensnaring (*Decay of Piety*).

DU'CKSFOOT. *s.* Black snakeroot, or may apple (*Miller*).

DU'CKWEED. *s.* Duckmeat (*Bacon*).

DUCT. *s.* (*ductus*, Latin.) 1. Guidance; direction (*Hammond*). 2. A passage through which any thing is conducted (*Arbuthnot*).

DU'CTILE. *a.* (*ductilis*, Latin.) 1. Flexible; pliable (*Dryden*). 2. Easy to be drawn out into length (*Dryden*). 3. Tractable; obsequious; complying (*Addison*).

DU'CTILENESS. *s.* (from *ductile.*) Flexibility; ductility (*Donne*).

DUCTI'LITY. *s.* (from *ductile.*) 1. Quality of suffering extension; flexibility (*Watts*). 2. Obsequiousness; compliance.

Ducti'lity. (*Geshweidikeit*, German.) The extensibility and cohesion of particles which enables a metal to be drawn out into wire without breaking. There is but a slight shade of difference between this property and that of Malleability.

The great ductility of some bodies, especially gold, is very surprising: the gold-beaters and wire-drawers furnish us with abundant proofs of this property; they every day reduce gold into lamellæ inconceivably thin, yet without the least aperture or pore discoverable, even by the microscope: a single grain of gold may be stretched under the hammer, into a leaf that will cover a house, and yet the leaf remain so compact as not to transmit the rays of light, nor even admit spirit of wine to transude. Dr. Halley took the following method to compute the ductility of gold: he learned from the wire-drawers, that an ounce of gold is sufficient to gild, that is, to cover or coat, a silver cylinder of forty-eight ounces weight, which cylinder may be drawn out into a wire so very fine, that two yards shall weigh only one grain; and consequently ninety-eight yards of the same wire, only forty-nine grains; so that a single grain of gold here gilds ninety-eight yards; and, of course, the ten thousandth part of a grain is here above one third of an inch long. And since the third part of an inch is yet capable of being divided into ten less parts visible to the naked eye, it is evident that the hundred-thousandth part of a grain of gold may be seen without the assistance of a microscope. Proceeding in his calculation, he found, at length, that a cube of gold, whose side is the hundredth part of an inch, contains 2,433,000,000 visible parts; and yet, though the gold with which such wire is coated is stretched to such a degree, so intimately do its parts cohere, that there is not any appearance of the colour of the silver underneath.

Mr. Boyle, examining some leaf-gold, found that a grain and a quarter in weight took up an area of fifty square inches; supposing therefore the leaf divided by parallel lines 100th part of an inch apart, a grain of gold will be divided into five hundred thousand minute squares, all discernible by a good eye: the same author shews, that an ounce of gold drawn out in wire would reach 155 miles and a half.

But Mr. Reaumur has carried the ductility of gold to a still greater extent. What is called gold-wire, every body knows, is only a silver one gilt. The cylinder of silver, covered with leaf-gold, they draw through the hole of an iron, and the gilding still keeps pace with the wire, stretch it to what length they can. Now Mr. Reaumur shows, that in the common way of drawing gold-wire, a cylinder of silver twenty-two inches long, and fifteen lines in diameter, is stretched to 1,163,520 feet, or is 634,692 lines longer than before, which amounts to about ninety-seven leagues. To wind this thread on silk for use, they first flatten it, in doing which it stretches at least one-seventh farther, so that the twenty-two inches are now 111 leagues; but in the flattening, instead of one-seventh, they could stretch it one-fourth, which would bring it to 120 leagues. This appears a prodigious extension, and yet it is nothing to what this gentleman has proved gold to be capable of.

Ductility of glass. We all know that, when well penetrated with the heat of the fire, the workmen can figure and manage glass like soft wax; but what is most remarkable, it may be drawn, or spun out, into threads exceedingly long and fine.

Our ordinary spinners do not form their threads of silk, flax, or the like, with half the ease and expedition the glass-spinners do threads of this brittle matter. We have some of them used in plumes for children's heads, and divers other works, much finer than any hair, and which bend and wave like hair with every wind.

Nothing is more simple and easy than the method of making them. There are two workmen employed; the first holds one end of a piece of glass over the flame of a lamp; and, when the heat has softened it, a second operator applies a glass hook to the metal thus in fusion; and, withdrawing the hook again, it brings with it a thread of glass, which still adheres to the mass: then, fitting his hook on the circumference of a wheel about two feet and a half in diameter, he turns the wheel as fast as he pleases; which, drawing out the thread, winds it on its rim, till, after a certain number of revolutions, it is covered with a skain of glass-thread.

The mass in fusion over the lamp diminishes insensibly: being wound out like a clue of silk upon the wheel; and the parts, as they recede from the flame, cooling, become more coherent to those next to them, and this by degrees: the parts nearest the fire are always the least coherent, and, of consequence, must give way to the effort the rest make to draw them towards the wheel.

The circumference of these threads is usually a flat oval, being three or four times as broad as thick: some of them seem scarcely bigger than the thread of a silk-worm, and are surprisingly flexible. If the two ends of such threads are knotted together, they may be drawn and bent, till the aperture, or space in the middle of the knot, does not exceed one-fourth of a line, or one-forty-eighth of an inch, in diameter.

Hence M. Reaumur advances, that the flexibility of glass increases in proportion to the fineness of the threads; and that, probably, had we but the art of drawing threads as fine as a spider's web, we might weave stuffs and cloths of them for wear. Accordingly, he made some experiments this way; and found that he could make threads fine enough, viz. as fine, in his judgment, as spider's thread, but he could never make them long enough to do any thing with them.

DUCTS. BILIARY. See Biliary ducts.

DUCTUS AD NASUM. See Canalis nasalis.

Ductus communis choledochus. See Choledochus ductus.

Ductus hepaticus. See Hepatic duct.

Ductus lachrymalis. See Lachrymal ducts.

Ductus lactiferi. Ductus galactoferi. The excretory ducts of the glandular substance composing the female breast. The milk passes along these ducts to the nipple.

Ductus pancreaticus. The pancreatic duct. It is white and small, and arises from the sharp extremity of the pancreas, runs through the middle of the gland towards the duodenum, into which it pours its contents by an opening common to it and the ductus communis choledochus.

Ductus salivales. The excretory ducts of the salivary glands, which convey the saliva into the mouth.

Ductus Stenonis. The Stenonian duct, which was so called after its discoverer Steno, arises from all the small excretory ducts of the parotid gland. It passes transversely over the masseter muscle, penetrates the buccinator, and opens into the mouth.

Ductus Warthonianus. The excretory duct of the maxillary glands; so named after its discoverer.

DU'DGEON. *s.* (*dolch*, German.) 1. A small dagger (*Shakspeare*). 2. Malice; sullenness; malignity (*Hudibras*).

DUDLEY, a town in Worcestershire, with a market on Saturdays, and a great manufacture of nails and other iron wares. This town contains 2,040 houses, and 10,107 inhabitants. Lat. 52. 33 N. Lon. 2. 0 W.

Dudley (Sir Robert), as he was called in England, and, as he was styled abroad, earl of Warwick and duke of Northumberland, was the son of Robert, earl of Leicester, by the lady Douglas Sheffield; and was born at Sheen in Surrey, in 1573, where he was carefully concealed, to prevent the queen's knowledge of the earl's engagements with his mother. He studied at Oxford; when his father dying, left him the bulk of his estate. He was at this time one of the finest gentlemen in England; and having a particular turn to navigation, fitted out a small squadron at his own expence, with which he sailed to the river Oroonoque, and took and destroyed nine sail of Spanish ships. In 1595 he attended the earl of Essex, and the lord high admiral of England, in their expedition against the Spaniards; when, for his gallant behaviour at the taking of Cadiz, he received the honour of knighthood. He now endeavoured to prove the legitimacy of his birth, in order to be intitled to his hereditary honours. But being overpowered by the interest of the countess dowager of Leicester, he applied for a license to travel; and being well received at the court of Florence, resolved to continue there, notwithstanding his receiving a letter of recall; on which his whole estate was seized by king James I. and vested in the crown. He discovered at the court of Cosmo II. great duke of Tuscany, those great abilities for which he had been admired in England, and was at length made chamberlain to his serene highness's consort. He there contrived several methods of improving shipping; introduced new manufactures; and by other services obtained so high a reputation, that at the desire of the archduchess, the emperor Ferdinand, in 1620, created him a duke of the holy Roman empire. He afterwards drained a vast tract of morass between Pisa and the sea; and raised Leghorn, which was then a mean, pitiful place, into a large and beautiful town, improving the haven by a mole, which rendered it both safe and commodious; and having engaged his highness to declare it a free port, he, by his influence and correspondence, drew many English merchants to settle and set up houses there, which was of very great service to his native country, as well as to the Spaniards. He was also the patron of learned men, and held a high place himself in the republic of letters. His most celebrated work is his Del Arcano del Mare, in two volumes, folio.

DUE. *a.* participle passive of *owe.* (*dû*, Fr.) 1. Owed; that any one has a right to demand (*Smalridge*). 2. Proper; fit; appropriate

(*Atterbury*). 3. Exact; without deviation (*Milton*). 4. Consequent to; occasioned by (*Boyle*).

Due. *ad.* (from the adjective.) Exactly; directly; duly (*Shakspeare*).

Due. *s.* (from the adjective.) 1. That which belongs to one; that which may be justly claimed (*Swift*). 2. Right; just title (*Milton*). 3. Whatever custom or law requires to be done (*Dryden*). 4. Custom; tribute (*Addison*).

To Due. *v. a.* To pay as due (*Shakspeare*).

DUEL, a single combat, at a time and place appointed, in consequence of a challenge. This custom came originally from the northern nations, among whom it was usual to decide all their controversies by arms. Both the accuser and accused gave pledges to the judges on their respective behalf; and the custom prevailed so far amongst the Germans, Danes, and Franks, that none were excused from it but women, sick people, cripples, and such as were under 21 years of age or above 60. Even ecclesiastics, priests and monks, were obliged to find champions to fight in their stead. The punishment of the vanquished was either death, by hanging or beheading; or, mutilation of members, according to the circumstances of the case. Duels were at first admitted not only on criminal occasions, but on some civil ones for the maintenance of rights to estates, and the like: in latter times, however, before they were entirely abolished, they were restrained to these four cases. 1. That the crime should be capital. 2. That it should be certain the crime was perpetrated. 3. That the accused be reckoned guilty by common fame. 4. That the matter be not capable of proof by witnesses.

Duel, at present, is used for single combat on some private quarrel: and it must be premeditated, otherwise it is called a rencounter.

Deliberate duelling is by the law of England a species of murder; and accordingly, it charges both the crime and punishment of murder on the principals; and, as some say, on their seconds also. (Blackst. Com. vol. iv.) And yet, so powerful is the dominion of fashion, that neither the terror of penal laws, nor reverence for religion, have been able entirely to abolish a practice unknown among the ancients, irreconcileable to any principle of reason, and totally inconsistent with the dictates of revelation.

Public opinion is not easily controlled by civil institutions; for which reason it may be questioned whether any regulations can be contrived of sufficient force to suppress or change the rule of honour which stigmatizes all scruples about duelling with the reproach of cowardice. The inadequate redress which the law of the land affords for those injuries which chiefly affect a man in his sensibility and reputation, tempts many to redress themselves: and prosecutions for such offences, by the trifling damages that are recovered, serve only to make the sufferer ridiculous. For this, however, more ought to be found. Perhaps for the army, where the point of honour is cultivated with exquisite attention and refinement, there might be established a Court of Honour, with a power of awarding those submissions and acknowledgments which it is generally the object of a challenge to obtain; and it might grow into a fashion with persons of rank of all professions to refer their quarrels to the same tribunal.

In fact, as the law now stands, duelling can seldom be overtaken by legal punishment. The challenge, appointment, and other previous circumstances, which indicate the intention with which the combatants met, being suppressed, nothing appears to a court of justice but the actual rencounter; and thus, we find, that the perpetrators of these scandalous, though fashionable crimes, elude the hands of justice, and the folly, or rather, madness, of duelling, is enlarging its dominion, whilst every friend to humanity, to religion, and to happiness, wishes to see the disgraceful practice banished from the civilized world.

Among the few published productions of the late learned and universally beloved Thomas Jones, A.M. of Trinity college, Cambridge, was a very admirable sermon against duelling. Will the reader excuse the writer of this article, if he takes this opportunity to say of Mr. Jones, that he cannot recollect any other man to whom the language in which Seneca spoke of his brother Gallio might be so justly applied?—"*Nemo omnium mortalium uni tam dulcis est, quam hic, omnibus.*"

To Duel. *v. n.* (from the noun.) To fight a single combat (*Locke*).

To Duel. *v. a.* To attack or fight with singly (*Milton*).

DU'ELLER. *s.* (from *duel.*) A single combatant (*Decay of Piety*).

DU'ELLIST. *s.* (from *duel.*) 1. A single combatant (*Suckling*). 2. One who professes to study the rules of honour (*L'Estrange*).

DUE'LLO. *s.* (Italian.) The duel; the rule of duelling (*Shakspeare*).

DUE'NNA. *s.* (Span.) An old woman kept to guard a younger (*Arbuthnot and Pope*).

DUETT, Duetto, in music, a composition expressly written for two voices or instruments, with or without a bass and accompaniments. In good duets the execution is pretty equally distributed between the two parts, and the melodies so connected, intermingled, and dependant on each other, as to lose every effect when separated, but to be perfectly related and concinnous when heard together.

DUG. *s.* (*deggio*, to give suck, Islandick.) A pap; a nipple; a teat (*Creech*).

Dug. The preterit and part. pass. of *dig*.

DUGDALE (Sir William), an eminent English historian, antiquarian, and herald, born in Warwickshire in 1605. He was introduced into the herald's office by sir Christopher Hatton; and ascended gradually through all the degrees, until he became garter principal king at arms. His chief work is the Monasticon Anglicanum, in three vols. folio; containing the charters and descriptions of all the English monasteries, adorned with engravings; in the former part of which work he was assisted by Mr. Roger Dodsworth. Nor are his Antiquities of Warwickshire less esteemed. He wrote likewise, among other things of less note, the History of St. Paul's Cathedral; a History of Embanking and Draining; a Baronage of England; and completed the second volume of sir Henry Spelman's Councils, with a second part of his Glossary. He died in 1686. His son, sir John, was Norroy king at arms, and published a Catalogue of English Nobility.

DUKE, Dux, a sovereign prince, without the title or quality of king. Such are the duke of Lorrain, of Holstein, of Savoy, of Parma, &c. The word is borrowed from the modern Greeks, who called *doucus* what the Latins call *dux*. There are also two sovereigns who bear the title of grand-duke; as the grand-duke of Tuscany, and the grand-duke of Muscovy, now called the czar or emperor of Russia. The title of great-duke belongs to the apparent heir of Russia; and the title of arch-duke is given to all the sons of the house of Austria, as also that of arch-duchess to all the daughters.

Duke, Dux, is also a title of honour or nobility, the next below princes. The dukedom, or dignity of a duke, is a Roman dignity, denominated *a ducendo*, leading or commanding. Accordingly the first dukes, *duces*, were the *ductores exercituum*, commanders of armies. Under the late emperors, the governors of provinces in war-time were intitled *duces*. In after times the same denomination was also given to the governors of provinces in time of peace.

In England, during the Saxons time, Camden observes, the officers and commanders of armies were called dukes, *duces*, after the ancient Roman manner, without any addition. After the Conqueror came in, the title lay dormant, till the reign of Edward III. who created his son Edward, first called the Black Prince, duke of Cornwall, which hath ever since been the peculiar inheritance of the king's eldest son, during the life of his father, so that he is *dux natus, non creatus*. After whom, there were more made, in such manner as that their titles descended to their posterity. They were created with much solemnity, *per cincturam gladii, cappæque, et circuli aurei in capite impositionem*. However, in the reign of queen Elizabeth, A.D. 1572, the whole order became utterly extinct; but it was revived about fifty years afterwards, by her successor, in the person of George Villiers, duke of Buckingham.

The dukes of our days retain nothing of their ancient splendour, but the coronet on their escutcheon, which is the only mark of their departed sovereignty. They are created by patent, cincture of the sword, mantle of state, imposition of a cape, and coronet of gold on the head, and a verge of gold in their hand. The eldest sons of dukes are by the courtesy of England styled marquisses, though they are usually distinguished by their father's second title, whether it be that of marquis or earl; and the younger sons lords, with the addition of their christian name, as lord James, lord Thomas, &c. and they take place of viscounts, though not so privileged by the laws of the land. A duke has the title of grace; and being written to, he is styled, in the herald's language, most high, potent, and noble prince. Dukes of the blood-royal are styled most high, most mighty, and illustrious princes.

Duke, among Hebrew grammarians, is an appellation given to a species of accents answering to our comma. See Accent.

Duke-duke, a quality given in Spain to a grandee of the house of Sylva, on account of his having several duchies from the uniting of two considerable houses in his person.

DU'KEDOM. *s.* (from *duke.*) 1. The seigniory or possessions of a duke (*Shaksp.*). 2. The title or quality of a duke.

DU'LBRAINED. *a.* (*dull* and *brain.*) Stupid; doltish; foolish (*Shakspeare*).

DULCA'MARA. (from *dulcis*, sweet, and *amara*, bitter.) The herb woody-nightshade: so called because its taste unites both these qualities. See Solanum.

DU'LCET. *a.* (*dulcis*, Latin.) 1. Sweet to the taste; luscious (*Milton*). 2. Sweet to the ear: harmonious (*Shakspeare*).

DULCIFICA'TION. *s.* (from *dulcify.*) The act of sweetening; the act of freeing from acidity, saltness, or acrimony (*Boyle*).

Dulcification. (*versussung*, Germ.) A term in chemistry, employed to express the rendering mild or diminishing the corrosive qualities of acids or alkalies by uniting them with some other substance, but not so as to neutralize them. Thus alkalies may be said to be dulcified when converted into soap; and the strong acids are often affirmed to be dulcified when chemically combined with spirits of wine: whence we have dulcified spirits of vitriol, dulcified spirits of nitre, &c.

To DU'LCIFY. *v. a.* (*dulcifier*, Fr.) To sweeten; to set free from acidity (*Wiseman*).

DULCIMER, a triangular musical instrument, strung with about fifty wires cast over a bridge at each end; the shortest, or most acute of which is eighteen inches long, and the longest, or most grave, thirty-six. It is performed upon by striking the wires with little iron rods. This name is also given by the translators of holy writ to an instrument used by the Hebrews, concerning the form, size, and tone of which there have been various conjectures, but of which nothing certain is known. (*Busby*).

DULCINO, in music, a wind instrument, a kind of small bassoon.

To DU'LCORATE. *v. a.* (from *dulcis*, Latin.) 1. To sweeten (*Bacon*). 2. To make less acrimonious (*Wiseman*).

DULCORA'TION. *s.* (from *dulcorate.*) The act of sweetening (*Bacon*).

DU'LHEAD. *s.* (*dull* and *head.*) A blockhead; a wretch foolish and stupid (*Ascham*).

DU'LIA. *s.* (δουλεια.) An inferior kind of adoration (*Stillingfleet*).

DULL. *a.* (*dwl*, Welsh; ꝺole, Saxon.) 1.

Stupid; doltish; blockish; unapprehensive; indocile (*Bacon*). 2. Blunt; obtuse (*Herbert*). 3. Unready; awkward (*Sidney*). 4. Hebetated; not quick (*Matthew*). 5, Sad; melancholy. 6. Sluggish; heavy; slow of motion (*Spenser*). 7. Gross; cloggy; vile (*Shak.*). 8. Not exhilarating; not delightful. 9. Not bright (*Shakspeare*). 10. Drowsy; sleepy.

To Dull. *v. a.* (from the adjective.) 1. To stupify; to infatuate (*Ascham*). 2. To blunt; to obtund (*Bacon*). 3. To sadden; to make melancholy. 4. To hebetate; to weaken (*Spenser*). 5. To damp; to clog (*Hooker*). 6. To make heavy, or slow of motion (*Bacon*). 7. To sully brightness (*Bacon*).

DU'LLARD. *s.* (from *dull.*) A blockhead; a dolt; a stupid fellow; a dunce (*Shakspeare*).

DU'LLY. *ad.* (from *dull.*) 1. Stupidly; doltishly (*Dryden*). 2. Slowly; sluggishly (*Bacon*). 3. Not vigorously; not gayly; not brightly; not keenly (*Hudibras*).

DU'LNESS. *s.* (from *dull.*) 1. Stupidity; weakness of intellect; indocility; slowness of apprehension (*South*). 2. Want of quick perception (*Bacon*). 3. Drowsiness; inclination to sleep (*Shakspeare*). 4. Sluggishness of motion. 5. Dimness; want of lustre. 6. Bluntness; want of edge.

DULVERTON, a town in Somersetshire, with a market on Saturdays. Lat. 51. 3 N. Lon. 3. 30 W.

DULWICH, a village in Surrey, five miles south of London. It is famous for a college founded by Edward Alleyn. See Alleyn.

DU'LY. *ad.* (from *due.*) 1. Properly; fitly (*Rogers*). 2. Regularly; exactly (*Pope*).

DUMB. *a.* (דום, ꝺumbe, Saxon.) 1. Mute; incapable of speech (*Hooker*). 2. Deprived of speech (*Dryden*). 3. Mute; not using words (*Roscommon*). 4. Silent; refusing to speak (*Dryden*). See Deaf.

DUMBARTON, the chief town of the county of the same name, is seated at the confluence of the Leven and the Clyde, with a stone bridge over the former. Its principal manufacture is glass. It has 2541 inhabitants. Lat. 56. 0 N. Lon. 4. 30 W.

DUMBARTONSHIRE, anciently called Lennox, a county of Scotland, bounded by the counties of Perth, Stirling, Lanerk, Renfrew, and Argyle. It is about 50 miles long, and 12 broad; and contains 20,710 inhabitants.

DUMBLAIN, a town of Monteith, remarkable for a battle, commonly called the battle of Sheriff-moor, between the duke of Argyle and the rebels, commanded by the earl of Mar, in 1715, in which the latter was defeated. Lat. 56. 11 N. Lon. 4. 2 W.

To DU'MBFOUND. *v. a.* (from *dumb.*) To confuse; to strike dumb (*Spectator*).

DU'MBLY. *ad.* Mutely; silently.

DU'MBNESS. *s.* (from *dumb.*) 1. Incapacity to speak. 2. Omission of speech; muteness (*Shakspeare*). 3. Refusal to speak; silence (*Dryden*).

DUMFERMLING, a town of Scotland, in the county of Fife, with some considerable manufactures of linen. It is remarkable for a royal palace, in which Charles I., king of England, was born: and it contains 9980 inhabitants. It is 13 miles N. W. of Edinburgh. Lat. 56. 5 N. Lon. 3. 27 W.

DUMFRIES, a shire of Scotland, which contains Annandale and Nithisdale. It sends one member to parliament; and contains 54,597 people.

Dumfries, the capital of the above county, is a place of pretty good trade. Lat. 55. 12 N. Lon. 3. 29 W. It has 7288 inhabitants.

DUMOSÆ. (*dumus*, a bush.) The nineteenth order in Linnéus's Fragments, in Philos. Bot. and the forty-third of the Natural Orders in Gen. Plant.

DUMP. *s.* (from *dom*, stupid, Dutch.) 1. Sorrow; melancholy; sadness (*Hudibras*). 2. Absence of mind; reverie (*Locke*).

DU'MPISH. *ad.* (from *dump.*) Sad; melancholy; sorrowful (*Herbert*).

DU'MPLING. *s.* (from *dump*, heaviness.) A sort of pudding (*Dryden*).

DUN, or Burgh, the name of an ancient species of buildings, of a circular form, common in the Orkney and Shetland islands, the Hebrides, and northern parts of Scotland. The latter term points out the founders, who at the same time bestowed on them their natal name of *borg*, a defence or castle, a Sueo-Gothic word; and the Highlanders universally apply to these places the Celtic name *dun*, signifying a hill defended by a tower, which plainly points out their use. They are confined to the countries once subject to the crown of Norway. With few exceptions, they are built within sight of the sea, and one or more within sight of the other; so that on a signal by fire, by flag, or by trumpet, they could give notice of approaching danger, and yield a mutual succour.

Dun, in the manage, a colour partaking of brown and black.

To Dun. *v. a.* (ꝺunan, Saxon, to clamour.) To claim a debt with vehemence and importunity (*Swift*).

Dun. *s.* (from the verb.) A clamorous, importunate, troublesome creditor (*Philips*).

DUNBAR, a parliament town of Scotland. To the S.W. of this town is Dunhill moor, famous for a battle fought in 1650, between Oliver Cromwell, and general Lesly, commander of the Scottish army, when the former, with about 8000 men, routed and defeated a very numerous army, killing near 6000, and taking about 10,000 prisoners. It is 25 miles E. of Edinburgh. Lat. 56. 0 N. Lon. 2. 34 W. Here are 3970 inhabitants.

DUNCAN (Daniel), a French physician, born at Montauban, in Languedoc, in 1649. His family was originally from Scotland. He received his medical education at Montpellier, where he took his doctor's degrees. He resided at Paris till the death of Colbert, who was his patron, and then went to reside on his paternal estate at Montauban; but when the persecution raged violently against the protestants in 1690, he disposed of his house and estate, and went to Geneva. He was afterwards called to the court of the landgrave of Hesse Cassel, where he remained three years, and while there wrote a treatise on the abuse of hot liquors, which was printed at Rotterdam in 1705. The king of Prussia, hearing of his merit, invited him to Berlin, where he was appointed first physician to the royal household. However he did not long remain there, but went to the Hague, from whence, in 1714, he removed to London, where he died in 1735.

DUNCAN (William), a learned writer, born at Aberdeen in 1717. He received his education in his native city, and afterwards became professor of philosophy in the Marischal college there. He died in 1760. Mr. Duncan wrote an excellent treatise on logic, and translated several of the orations of Cicero, and Cæsar's Commentaries. He published likewise an edition of Andrew Baxter's book on the Human Soul.

DUNCANNON, a fortress and town of Ireland, in the county of Wexford. Lat. 52. 16 N, Lon. 6. 46 W.

DUNCOMBE (William), younger son of John Duncombe, esq. of Stocks in Hertfordshire, in 1722 published a translation of Racine's Athalia; which was well received by the public, and has gone through three editions In 1724 he was editor of the works of Mr. Needler; in 1735, of the poems of his deceased brother-in-law, Mr. Hughes, 2 vols. 12mo; in 1737, of the miscellanies of his younger brother, Mr. Jabez Hughes, for the benefit of his widow, in one volume 8vo; and in 1745, of the works of the rev. Mr. Samuel Say, in one volume 4to. In 1726 he married the only sister of John Hughes, esq. whom he long survived. In 1734 his tragedy of Lucius Junius Brutus was acted at Drury-lane theatre. It was published in 1735, and again in 1747. The works of Horace, in English verse, by several hands, were published by him in two vols. 8vo., with notes, &c. in 1757. A second edition, in four vols. 12mo., with many imitations, was published in 1762. In 1763 he collected and republished seven Sermons by archbishop Herring, with a biographical preface. He died in 1769, aged 80.

DUNCE. *s.* A dullard; a dolt; a thickskull; a stupid, indocile animal (*Stillingfleet*).

DUNDALK, a seaport of Ireland, in the county of Louth, on a bay of the same name. This is a thriving town, and has a cambric manufacture, the only one in Ireland. Lat. 54. 12 N. Lon. 6. 17 W.

DUNDEE, a royal borough of Angusshire, with an excellent harbour. The inhabitants are computed at 26,000. Here are manufactures of glass, coarse linen, sail-cloth, cordage, thread, buckram, tanned leather, shoes, and hats; also a sugar house. The town is seated on the N. side of the Frith of Tay. Lat. 56. 30 N. Lon. 2. 55 W.

DUNDIVER, in ornithology. See MERGANSER.

DUNG, the excrement of quadrupeds, especially of the horse, which, in the manage, should be occasionally attended to, as such attention may sometimes tend to the prevention of disease. If the dung be bright in colour, uniform in shape and consistence, and not fœtid in smell, the body may be considered in a good state: on the contrary, if the dung, when voided, be hard, black, and offensive, or the parts adhere to each other by a viscid, ropy slime, they indicate internal and morbid heat. Horses in this state should be put under a course of physic without delay; for till they are thoroughly cleansed, they cannot with propriety be brought into any strong exertions whatever. Another advantage occasionally derived from an accurate inspection of the dung, is that we frequently trace out worms in cases in which, from the general appearance of the horse, no such disease could be suspected.

DUNG, in husbandry, is of several sorts, as that of horses, cows, sheep, hogs, pigeons, geese, hens, &c. See HUSBANDRY.

To DUNG. *v. a.* To manure with dung (*Dryden*).

DUNGANNON, the chief town of the county of Tyrone, in the province of Ulster, Ireland. Lat. 54. 38 N. Lon. 6. 39 W.

DUNGARVON, a seaport of Ireland, in the county of Waterford. Lat. 52. 6 N. Lon. 7. 29 W.

DUNGEON, DONJON, in fortification, the highest part of a castle built after the ancient mode; serving as a watch-tower, or place of observation: and also for the retreat of a garrison, in case of necessity, so that they may capitulate with greater advantage.

The word comes from the French, *donjon*, which signifies the same; and which Fauchet derives from *domicilium*, because the dungeon, being the strongest part of the castle, was usually the lord's apartment. Menage derives it from *dominione*, or *dominionus*, which in some ancient writings we find used in the same sense. Du-Cange derives the appellation from *duno aut colle ædificatum*, which the barbarous writers have altered into *dunjo*, *dungeo*, *dongio*, *dangio*, *domgio*, and *domnio*.

DU'NGFORK. *s.* (*dung* and *fork.*) A fork to toss out dung from stables (*Mortimer*).

DU'NGHIL. *s.* (*dung* and *hill.*) 1. A heap or accumulation of dung (*South*). 2. Any mean or vile abode (*Dryden*). 3. Any situation of meanness (*Sandys*). 4. A term of reproach for a man meanly born (*Shakspeare*).

DU'NGHIL. *a.* Sprung from the dunghil; mean; low; base; vile (*Spenser*).

DU'NGY. *a.* Full of dung; mean; vile; base; low; odious; worthless (*Shakspeare*).

DU'NGYARD. *s.* (*dung* and *yard*). The place of the dunghil (*Mortimer*).

DUNKELD, a town of Perthshire, situated amid vast rocks, partly naked, and partly wooded, under which the Tay rolls its majestic stream. It is the market-town of the neighbouring Highlands, and has a linen manufacture. Lat. 56. 35 N. Lon. 3. 36 W.

DUNKERS, in ecclesiastical history, a religious sect at Ephrata or Dunker-town, near Lancaster, in Pensylvania, which took their rise about fifty years ago, and consisting mostly of Germans. Their name is said to be derived from their mode of baptizing new converts, which is by dipping, after the manner of the baptists. Their habit is a kind of long coat or tunic, made of linen for the summer, and woollen for the winter, reaching down to the heels, with a sash or girdle round the waist; and a cap, or hood, hanging from the shoulders, resembling the dress of the Dominican friars. The men shave neither the head nor beard. The men and women have distinct habitations and governments: they have for this purpose erected two wooden buildings; in each of which there is a banqueting-room, and an apartment for public worship; so that they never meet together even at their devotions. They live chiefly on roots and vegetables, and eat no flesh, except on occasion of their love-feasts, when the brethren and sisters dine together. The Dunkers allow of no intercourse between the brethren and sisters, not even by marriage;—a regulation not very favourable to their subsistence and increase; and if any break through this restraint, and marry, they are removed from communion with the unmarried, to a place about a mile distant, called Mount Sion. Their principal tenet is said to be, that future happiness is only to be obtained by penance and mortification in this life; and that, as Jesus Christ, by his meritorious sufferings, became the redeemer of mankind in general, so each individual of the human race, by a life of abstinence and restraint, may work out his own salvation.

There is an interesting account of the Dunkers, and of the establishment at Ephrata, in Cispapina's Letters from America, published in 1791. We have only room for one extract: "I shall at present remark but one thing more, with respect to the Dunkers, and that is the peculiarity of their music. Upon a hint given by my friend, the sisters invited us into their chapel, and, seating themselves in order, began to sing one of their devout hymns. The music had little or no air or melody; but consisted of simple, long notes, combined in the richest harmony. The counter, treble, tenor, and bass, were all sung by women, with sweet, shrill, and small voices; but with a truth and exactness in the time and intonation that was admirable. It is impossible to describe to your lordship my feelings upon this occasion. The performers sat with their heads reclined, their countenances solemn and dejected, their faces pale and emaciated from their manner of living, their clothing exceedingly white and quite picturesque, and their music such as thrilled to the very soul. I almost began to think myself in the world of spirits, and that the objects before me were ethereal. In short, the impression this scene made upon my mind continued strong for many days, and I believe will never be wholly obliterated."

DUNKIRK, a considerable seaport of France, in the department of the North, and late French Flanders. It is the most important town and harbour on the whole coast, and has commonly had a great deal of commerce. By means of a sluice 42 feet wide, a bason within the town will hold 40 ships of the line always floating. Dunkirk is divided into the Old and New Town. The number of inhabitants is estimated at 80,000. Lat. 51. 2 N. Lon. 2. 28 E.

DUNLIN, in ornithology. See TRINGA.

DUNMOW (Great), a town of Essex, with a market on Saturdays, and a manufactory of bays. Lat. 51. 54 N. Lon. 0. 24 E.

DUNMOW (Little), a village in Essex, adjoining to Great Dunmow. It had once a priory; and is still famous for the custom instituted in the reign of Henry III. by Robert de Fitzwalter, and now the tenure of the manor; namely, that whatever married couple will go to the priory, and swear, kneeling upon two sharp-pointed stones in the church, that they had not quarrelled, nor repented of their marriage, within a year and a day after it took place, shall receive from the lord of the manor a flitch of bacon. Some old records mention several that have claimed and received it. It has been actually received so lately as since the year 1750, by a weaver and his wife of Coggleshal, in Essex. It has been demanded more recently still; but the ceremony being attended with a very great expence to the lord of the manor, the demand is now evaded. See BACON.

DUNN (Samuel), an English mathematician, born at Crediton, in Devonshire, where he kept a school for some years. He afterwards removed to Chelsea, where he opened a mathematical academy, and was appointed by the East-India company mathematical examiner of the officers who were candidates for their service. He wrote several mathematical treatises, and papers in the Philosophical Transactions, and died in 1792. He founded a mathematical school at his native town. His Treatise on the Planispheres is a well-known and useful publication.

DU'NNER. *s.* (from *dun.*) One employed in soliciting petty debts (*Spectator*).

DUNS (John), commonly called Duns Scotus, a famous divine of the order of St. Francis, was born at Dunstance, in Northumberland. He was educated at Oxford, from whence he went to Paris, where he acquired a great reputation as a disputant; and, according to the custom of the age, was called the *subtil doctor*. He opposed the notions of Aquinas, which produced two parties, the Thomists and the Scotists. He died at Cologne in 1308. His works were printed at Lyons in 10 vols. folio, 1639. Paul Jovius, and others, relate that Duns fell down in a fit of apoplexy, and, being supposed dead, was buried too hastily; for that he revived in his grave, and languished in a miserable manner, beating his head and arms against the sides of the coffin till he died.

DUNSTABLE (the *Magiovinium* of the Itinerary), a town of Bedfordshire, with a market on Wednesdays. The church is the remainder of a priory, and opposite to it is a farm-house, once a royal palace. Lat. 51. 59 N. Lon. 0. 29 W.

DUNSTAN (St.) archbishop of Canterbury, was born in 924, under the reign of Athelstan, who was his relation. He retired from court in disgust, and became a monk. Edmund, successor of Athelstan, drew him from his retreat, and was guided by his advice. He was made bishop of Worcester, and afterwards archbishop of Canterbury. The pope sent him the pallium, and made him legate for the holy see in England. Edwin having succeeded Edmund, Dunstan took the liberty of reproving him for his scandalous life, on which the king banished him. His exile, however, was not of long duration, and he died in the quiet possession of his archbishopric in 988. Dunstan founded the famous monastery of Glastonbury. As this prelate was the great restorer and promoter of the monastic institutions, the grateful monks, who were almost the only historians of those dark ages, have loaded him with the most extravagant praises, and represented him as the greatest wonder-worker and highest favourite of heaven that ever lived.

DUNSTER, a town in Somersetshire, with a market on Fridays, and a harbour on the Bristol channel. Lat. 51. 13 N. Lon. 3. 41 W.

DUNUM, a Celtic term, denoting a hill or eminence.

DUNWICH, a town of Suffolk, having a market on Saturdays. By far the greater part of this town has been swallowed up by the sea. It is a corporation, sends two members to parliamant, and is 99 miles N. of London. Lat. 52. 21 N. Lon. 1. 55 E.

DUO, in music, a duett.

DUODECIMALS, in arithmetic, numbers proceeding in a proportion of twelves. Or, duodecimals are numbers in that scale of notation in which each superior place is in value twelve times that of its next inferior. This way of conceiving an unit to be divided, is chiefly in use among artificers, who generally take the linear dimensions of their work in feet, inches, and twelfth parts. When artificers square their dimensions, duodecimals are multiplied into duodecimals, and the operation is popularly called cross-multiplication. The following is the rule: Under the multiplicand, write the corresponding denominations of the multiplier, as in the annexed example. Multiply each term in the multiplicand, beginning at the lowest, by the feet in the multiplier, and write the result of each under its respective term, observing to carry an unit for every twelve, from each lower denomination to its next superior. In the same manner, multiply all the multiplicand by the prime in the multiplier, and set the result of each term one place removed to the right hand of those in the multiplicand. Do the same with the seconds in the multiplier, setting the result of each term two places removed to the right hand of those in the multiplicand. Proceed in like manner with all the rest of the denominations, and their sum will give the answer required.

$$\begin{array}{rrrrr} 10f. & 4i. & 5s. & & \\ 7. & 8. & 6. & & \\ \hline 72 & 6 & 11 & & \\ 6 & 10 & 11 & 4 & \\ & 5 & 2 & 2 & 6 \\ \hline 79f. & 11i. & 0s. & 6'''. & 6^{iv}. \\ \hline \end{array}$$

Note. Artificers in general estimate the second place of the product as really inches, the third as seconds, &c. which is erroneous: the figures in the second places denote rectangles of a foot long, and an inch broad, which are to be added to the inches standing in the third place; in like manner, the fourth place are rectangles of an inch long, and one-twelfth broad; the fifth place denote square twelfths. Hence the inches in the above product are not 11, but $\overline{11 \times 12} + 0 = 132$, and the square parts are $\overline{6 \times 12} + 6 = 78$.

DUODE'CUPLE. *a.* (*duo* and *decuplus*, Lat.) Consisting of twelves (*Arbuthnot*).

DUODE'NUM. (*duodenum*, from *duodenus*, consisting of twelve.) So called, because it was supposed not to exceed the breadth of twelve fingers; but the ancients, who gave it this name, dissected only quadrupeds, or at least drew their knowledge of anatomy from the structure of quadrupeds chiefly; and hence it does not strictly apply to the human subject: the first of the small intestines.

DUPE. *s.* (*dupe*, French.) A credulous man; a man easily tricked (*Swift*).

To DUPE. *v. a.* To trick; to cheat (*Pope*).

DU PIN (Lewis Ellis), a learned French writer. He was born at Paris in 1657, and after going through a regular education, was received a doctor of the Sorbonne in 1684. About this time he commenced his Bibliotheque Universelle des Auteurs Ecclésiastiques; the title of which, in 1686, on occasion of some complaints, he was obliged to alter to Bibliotheque Nouvelle. Besides this great work, which is a body of ecclesiastical history, he wrote a great number of others, but all on theological subjects. He died at Paris in 1719.

DU'PLE. *a.* (*duplex*, Lat.) Double; one repeated.

DUPLE AND SUB-DUPLE RATIO, among mathematicians; the first applied to numbers in the ratio of 2 to 1; the last to those in the ratio of 1 to 2.

DUPLICATE RATIO, is the ratio of the squares of two quantities: thus the duplicate ratio of a to b, is the ratio of a^2 to b^2. The sub-duplicate ratio, is that of the square roots; thus the subduplicate of a to b, is $\surd a$ to $\surd b$, or $a^{\frac{1}{2}}$ to $b^{\frac{1}{2}}$.

To DU'PLICATE. *v. a.* (*duplico*, Latin.) 1. To double; to enlarge by the repetition of the first number or quantity (*Glanville*). 2. To fold together.

DU'PLICATE. *s.* Another correspondent to the first; a second thing of the same kind, as a transcript of a paper (*Woodward*).

DUPLICA'TION. *s.* (from *duplicate.*) 1. The act of doubling (*Hale*). 2. The act of folding together. 3. A fold; a doubling (*Wiseman*).

Duplication of a cube, is the finding of the side of a cube which shall be double in solidity to a given cube. This cannot be effected geometrically, as it requires the solution of a cubic equation, or requires the finding of two mean proportionals, viz. between the side of the given cube and the double of the same, the first of which two mean proportionals is the side of the double cube, as was first observed by Hippocrates of Chios.

This celebrated problem was often attempted by the ancient geometricians; being first proposed by the oracle of Apollo at Delphos: this oracle, being consulted as to the manner of stopping a plague which then raged at Athens, returned for answer, that the plague should cease when Apollo's altar, which was cubical, should be doubled. Hence this obtained the name of the Delian problem. For more on this subject, we refer to Hutton's Ozanam, vol. i. p. 340.

DU′PLICATURE. *s.* (from *duplicate.*) A fold; any thing doubled (*Ray*).

Duplicature, in anatomy, a doubling or folding of membranes, or other like parts. Such are the duplicatures of the peritonæum, of the omentum, of the pleura, &c.

DUPLI′CITY. *s.* (*duplicis*, Lat.) 1. Doubleness; the number of two (*Watts*). 2. Deceit; doubleness of heart or of tongue.

DUPONDIUS, in antiquity, a weight of two pounds, or a money of the value of two ases. See As.

DURA MATER. (from *durus*, hard, and *mater*, a mother; called *dura*, from its hardness compared with the *pia mater*, and *mater*, from its being supposed to be the source of all the other membranes.) Dura meninx. Dermatodes. A thick membrane, formed of two layers, that surrounds and defends the brain, and adheres strongly to the internal surface of the cranium. It has three considerable processes, the falciform, the tentorium, and the septum cerebelli; and several sinusses, of which the longitudinal, lateral, and inferior longitudinal are the principal.

Dura meninx. See Dura mater.

DURABI′LITY. *s.* (*durabilis*, Lat.) The power of lasting; continuance (*Hooker*).

DU′RABLE. *a.* (*durabilis*, Lat.) 1. Lasting; having the quality of long continuance (*Raleigh*). 2. Having successive existence (*Milton*).

DU′RABLENESS. *s.* Power of lasting (*Addison*).

DU′RABLY. *ad.* (from *durable.*) In a lasting manner (*Sidney*).

DURALE, or Durate′, a musical term, which is applied to whatever offends the ear by its effect.

DURAMPOUR, a town of the Deccan of Hindustan, in the province of Guzarat. Lat. 20. 32 N. Lon. 73. 14 E.

DURANCE, a river of France, which rises in the Alps, and falls into the Rhone, three miles below Avignon.

Du′rance. *s.* (from *duresse*, law French.) 1. Imprisonment; the custody or power of a jailer; a prison (*Congreve*). 2. Endurance; continuance; duration (*Dryden*).

DURA′NTA, in botany, a genus of the class didynamia, order angiospermia. Calyx five-cleft, superior; corol funnel-form, five-cleft; berry one-celled, containing four two-celled nuts. Three species; natives of the West Indies and South America: shrubs with blue flowers, and yellow fruit.

DURA′TION. *s.* (*duratio*, Latin.) 1. A sort of distance or length, the idea whereof we get from the fleeting and perpetually perishing parts of succession (*Locke*). 2. Power of continuance (*Rogers*). 3. Length of continuance (*Addison*).

Duration, as marked by certain periods and measures, is what we usually call time.

1. By observing certain appearances at regular, and seemingly equidistant periods, we get the ideas of certain lengths and measures of duration, as minutes, hours, &c. 2. By being able to repeat those measures of time, as often as we will, we come to imagine duration where nothing really endures, or exists: thus we imagine to-morrow, next year, yesterday, &c. 3. By being able to repeat such idea of any length of time, as of a minute, year, &c. as often as we will, and add them to one another, without ever coming to an end, we get the idea of eternity.

Time is to duration, as place is to space, or expansion. They are so much of those boundless oceans of eternity and immensity, as is set out, and distinguished from the rest; and thus they serve to denote the position of finite, real beings, in respect of each other in those infinite oceans of duration and space.

Duration of action, according to Aristotle, is confined to a natural day in tragedy; but the epopoeia, according to the same critic, has no fixed time.

Duration of an eclipse. See Eclipse.

Duration of plants, the continuance of their life or existence; as caducous, or quickly perishing; ephemeral, creatures of a day; annual, biennial, perennial.

DURAZZO, a town of Albania, in European Turkey, and the see of a Greek archbishop. It is 50 miles N. of Valona. Lat. 41. 54 N. Lon. 19. 19 E.

DURBY, a town of Luxemburg, in Germany, which was ceded to France in 1698. Lat. 58. 18 N. Lon. 5. 28 E.

To DURE. *v. n.* (*duro*, Latin.) To last; to continue (*Raleigh*).

DU′REFUL. *a.* (from *dure* and *full.*) Lasting; of long continuance: not in use (*Spenser*).

DU′RELESS. *a.* (from *dure.*) Without continuance; fading: not in use (*Raleigh*).

DURER (Albert), an eminent painter and engraver, born at Nuremberg in 1471. His first work was the three Graces, which was engraved in 1497. He engraved more than he painted, so that his pictures are wonderfully scarce and highly valued. In the palace at Prague is a piece by him representing Adam and Eve, and another of Christ bearing the cross. The people of Nuremberg still shew, with pride, in the senator's hall, his portraits of Charlemagne and some other emperors. However, he has gained the greatest name by his engravings, which are numerous and valuable. He was very excellent, too, in his engravings upon wood; but he was not, as has been often asserted, the first who practised that kind of engraving; since traces of it are met with more than a century before his time. The emperor Maximilian had a great regard for him, and conferred on him a pension and patents of nobility. He died at Nuremberg in 1528. Durer wrote a book on the Rules of Painting, and some other works, particularly Institutes of Geometry, published in 1532.

DURE'SSE. *s.* (French.) 1. Imprisonment; constraint. 2. (In law.) A plea used, by way of exception, by him who, being cast into prison at a man's suit, or otherwise by threats, &c. hardly used, seals any bond to him during his restraint.

D'URFEY (Thomas), a facetious English poet, born at Exeter, in 1628. He wrote a great number of plays and songs, all of which are tinged with the licentiousness of the reign of Charles II. who used to treat our bard with great familiarity. He resided frequently with the earl of Dorset at Knole, where is a portrait of him painted when he was asleep after dinner, for Tom had such an ordinary visage, that he could not bear to have his likeness taken. His ballads, &c. were printed in six vols. 12mo. under the title of Pills to purge Melancholy. He died in 1723.

DURHAM, the capital of the bishopric of Durham, with a market on Saturday, and a bishop's see. It is a considerable place, having six parish churches, besides the cathedral: it has 1054 houses, and 7530 inhabitants. It has a manufactory of shalloons, tabbies, and calamancoes. Lat. 54. 40 N. Lon. 1. 27 W.

The bishopric of Durham is deemed the richest bishopric in the kingdom; and the prebends are frequently styled the golden prebends of Durham. The diocese contains the whole counties of Durham and Northumberland, except the jurisdiction of Hexham in the latter. It hath also one parish in the county of Cumberland: making in the whole 135 parishes, whereof 87 are impropriate. The see is valued in the king's books at 2821*l.* 1*s.* 5¼*d.*, but is computed to be worth annually near 80,000*l.* The clergy's tenths amount to 385*l.* 5*s.* 6½d. It has two archdeacons, viz. of Durham and Northumberland. This see hath given to the church of Rome eight saints and one cardinal; and to the English nation one lord chief justice, five lord chancellors, three lord treasurers, one principal secretary of state, one chancellor to the university of Oxford, and two masters of the rolls.

DURHAM, a county of England, commonly called the bishopric of Durham, bounded on the N. by Northumberland, from which it is separated on the N. E. by the river Tyne; on the E. by the German ocean; on the S. and S. W. by Yorkshire and the river Tees; and on the W. by Westmorland and Cumberland. It extends 37 miles from N. to S. and 47 from E. to W. It is situated in the diocese of its own name, and contains one city, seven market-towns, and 113 parishes, but sends only four members to parliament. This county contains 28,366 houses, 183,600 inhabitants, and about 1,240,000 acres of land, one-tenth of which are uncultivated, including woodlands. The soil is very various. The chief rivers are the Were, Tees, Tyne, and Derwent. This county furnishes 492 men to the national militia.

DU'RING. *prep.* For the time of the continuance of; while any thing lasts (*Locke*).

DU'RIO, in botany, a genus of the class polyadelphia, order polyandria. Calyx five-cleft, cap-shaped, interior; petals five, small; style one; stamens in five sets, each consisting of seven; pome five-celled. One species only; an East-Indian tree, with alternate leaves; flowers in loose heads, beneath the leaves, of a yellowish white hue, and producing a large fruit.

DU'RITY. *s.* (*dureté*, French.) Hardness; firmness (*Wotton*).

DURO'GA, in botany, a genus of the class hexandria, order monogynia. Calyx superior, cylindrical, truncate; corol with a cylindrical tube and six-parted border as long as the tube; pome bristly. One species; a Surinam tree, with branches hairy at the tip; leaves terminal, opposite, obovate, very entire, pubescent above; flowers terminal, sessile, clustered; fruit rather larger than a turkey's egg, well flavoured.

DUROTRIGES, an ancient British nation, seated in that part of the country which is now called Dorsetshire. Their name is derived from the two British words *Dur*, water, and *Trigo*, to dwell; and it is no less evident that they got their name from the situation of their country which lies along the sea coast. It is not very certain whether the Durotriges formed an independent state under a prince of their own, or were united with their neighbours the Danmonii; as they were reduced by Vespasian under the dominion of the Romans, at the same time, and with the same ease, and never revolted.

DURSLEY, a town in Gloucestershire, with a market on Thursdays. It is chiefly inhabited by clothiers. Lat. 51. 40 N. Lon. 2. 23 W.

DURST. The preterit of *dare*.

DURUM, a musical term, applied to one of the tetrachords in Guido's scale.

DUSK. *a.* (*duyster*, Dutch.) 1. Tending to darkness. 2. Tending to blackness; dark-coloured (*Milton*).

DUSK. *s.* (from the adjective.) 1. Tendency to darkness; incipient obscurity (*Spectator*). 2. Darkness of colour (*Dryden*).

To DUSK. *v. a.* To make darkish.

To DUSK. *v. n.* To grow dark; to begin to lose light; to have lustre diminished.

DU′SKILY. *ad.* (from *dusky.*) With a tendency to darkness or blackness.

DU′SKISH. *a.* (from *dusk.*) 1. Inclining to darkness; tending to obscurity (*Spenser*). 2. Tending to blackness (*Wotton*).

DU′SKISHLY. *ad.* Cloudily; darkly (*Bacon*).

DU′SKY. *a.* (from *dusk.*) 1. Tending to darkness; obscure (*Prior*). 2. Tending to blackness; dark-coloured; not clear; not bright (*Newton*). 3. Gloomy; sad; intellectually clouded (*Bentley*).

DUSSELDORP, a strong town of Westphalia, in Germany. It was taken by the Hanoverian forces in 1758; but belongs at present to the elector Palatine. Lat. 51. 12 N. Lon. 6. 52 E.

DUST. *s.* (ꝺuꞅꞇ, Saxon.) 1. Earth or other matter reduced to small particles (*Bacon*). 2. The grave; the state of dissolution (*Milton*). 3. A mean and dejected state (*Samuel*).

To Dust. *v. a.* (from the noun.) 1. To free from dust. 2. To sprinkle with dust.

DU′STMAN. *s.* One whose employment is to carry away the dust (*Gay*).

DU′STY. *a.* (from *dust.*) 1. Filled with dust; clouded with dust (*Dryden*). 2. Covered or scattered with dust (*Thomson*).

DU′TCHESS. *s.* (*duchesse*, French.) 1. The lady of a duke (*Swift*). 2. A lady who has the sovereignty of a dukedom.

DU′TCHY. *s.* (*duché*, French.) A territory which gives title to a duke (*Addison*).

Du′tchy-court. *s.* A court wherein all matters appertaining to the dutchy of Lancaster are decided (*Cowell*).

DU′TEOUS. *a.* (from *duty.*) 1. Obedient; obsequious (*Prior*). 2. Obedient to good or bad purposes (*Shakspeare*). 3. Enjoined by duty: not in use (*Shakspeare*).

DU′TIFUL. *a.* (*duty* and *full.*) 1. Obedient; submissive to natural or legal superiours; reverent (*Swift*). 2. Expressive of respect; giving token of reverence; reverential (*Sidney*).

DU′TIFULLY. *ad.* (from *dutiful.*) 1. Obediently; submissively. 2. Reverently; respectfully (*Sidney*).

DU′TIFULNESS. *s.* (from *dutiful.*) 1. Obedience; submission to just authority (*Dryden*). 2. Reverence; respect (*Taylor*).

DUTLINGEN, a town of Suabia, in Germany, belonging to the duke of Wurtemburg. Lat. 48. 10 N. Lon. 9. 2 E.

DU′TY. *s.* (from *due.*) 1. That to which a man is by any natural or legal obligation bound (*Luke*). 2. Acts or forbearances required by religion or morality (*Taylor*). 3. Obedience or submission due to parents, governours, or superiours (*Decay of Piety*). 4. Act of reverence or respect (*Spenser*). 5. The business of a soldier on guard (*Clarendon*). 6. The business of war; service (*Dryden*).

Duty, in polity and commerce, signifies the impost laid on merchandises, at importation or exportation, commonly called the duties of customs; also the taxes of excise, stamp-duties, &c. See Customs, Excise, &c.

There is no task more delicate or difficult to a statesman than the laying on of duties or imposts. Experience teaches us that a very small duty laid on commodities raises the price of them considerably to the consumer, beyond the gross duty. By the fees given to officers; by trademen's loss of time in attending upon excisemen, or at custom-houses; by taking away a portion of our traders' stock for duties; and forcing them to take as great pains on one part of their stock laid out in goods, in order to live, as they would on the whole, if duty-free; by tradesmen's profits on the duty, and advances in all the hands that all taxed goods come through to the consumer: as for example, suppose there should be no other tax but that on leather, let us see how many advances that would make on the price of shoes.

The grazier lays (1) on the beast he fats, his advanced price of shoes: he sells to the butcher, who takes (2) his profit on the grazier's advanced price of the beast; and raises (3) on the hide his advanced price of shoes: he sells to the tanner, whose journeymen raise (4) their wages, on account of the advanced price of shoes; the tanner pays (5) the tax on the leather; takes (6) his profit on the before-mentioned five advances, and raises (7) his advanced price of shoes on the tanned hide: he sells to the leather-cutter, who takes (8) his profit on the before-mentioned seven advances, and raises (9) on the hide he cuts, his advanced price of shoes: he sells to the shoemaker, whose journeymen raise (10) their wages, on account of their advanced price of shoes; the shoemaker takes (11) his profit on the before-mentioned ten advances, and raises (12) on the shoes he makes the advanced price of the shoes he wears: he sells to the consumer with all these twelve advances, highly magnified beyond the bare duty.

DUVAL (Peter), geographer-royal of France, born at Abbeville, and died at Paris in 1683, aged 65. He was the nephew of the celebrated Sanson, and published a number of treatises and maps; the best known of his works is La Geographie Françoise, &c.

Duval (Nicholas), a Dutch painter, born in 1644, and died in 1732. He studied in Italy to great advantage under Pietro da Cortona, whose manner he adopted. He was greatly employed by king William III. who appointed him director of the academy at the Hague.

DUUMVIRATE, the office or dignity of the duumviri. The duumvirate lasted till the year of Rome 388, when it was changed into a decemvirate. See Decemviri.

DUUMVIRI, in Roman antiquity, a general appellation given to magistrates, commissioners, and officers, where two were joined together in the same functions. Thus, *duumviri capitales*, were the judges in criminal causes: *duumviri municipales*, two magistrates in some cities of the empire, answering to what the consuls were at Rome: *duumviri navales*, commissaries of the fleet: *duumviri sacrorum*, those who regulated the sacrifices, and kept the Sibyl's books.

DUX, in music, the name formerly given to the leading voice or instrument in a fugue (*Busby*).

DWARF. *s.* (ꝺpeoꞃᵹ, Saxon.) 1. A man below the common size of men (*Brown. Milton*). 2. Any animal or plant below its natural bulk (*L'Estrange*). 3. An attendant on a lady or knight in romances (*Spenser*). 4. It is used often by botanists in composition: as, dwarf-elder, dwarf-honeysuckle.

In the Philosophical Transactions we have well authenticated accounts of two dwarfs; one born in Norfolk, who, at the age of twenty-two, weighed no more than thirty-four pounds with all his clothes on, and whose height, including hat, wig, and shoes, was only thirty-eight inches; and another in Wales, who, at the age of fifteen, measured no more than two feet seven inches, and weighed only thirteen pounds; and who at that early period of life laboured under all the infirmities and calamities of very old age. Phil. Trans. vol. xlvi. p. 67, and vol. xlvii. p. 279.

To **DWARF.** *v. a.* To hinder from growing to the natural bulk (*Addison*).

DWA'RFISH. *s.* (from *dwarf.*) Below the natural bulk; low; small; little (*Bentley*).

DWA'RFISHLY. *ad.* Like a dwarf.

DWA'RFISHNESS. *s.* (from *dwarfish.*) Minuteness of stature; littleness (*Glanville*).

To **DWELL.** *v. n.* preterit *dwelt*, or *dwelled.* (*duelia*, Islandick, to stay.) 1. To inhabit; to live in a place; to reside; to have a habitation (*Leviticus*). 2. To live in any form of habitation (*Hebrews*). 3. To be in any state or condition (*Shakspeare*). 4. To be suspended with attention (*Smith*). 5. To continue long speaking (*Swift*).

To **DWELL.** *v. a.* To inhabit: not used (*Milton*).

DWE'LLER. *s.* (from *dwell.*) An inhabitant; one that lives in any place (*Bacon*).

DWE'LLING. *s.* (from *dwell.*) 1. Habitation; abode (*Dryden*). 2. State of life; mode of living (*Daniel*).

DWE'LLINGHOUSE. *s.* The house at which one lives (*Ayliffe*).

DWINA, the name of two large rivers; one of which rises in Lithuania, and, dividing Livonia from Courland, falls into the Baltic sea a little below Riga: the other gives name to the province of Dwina in Russia, discharging itself into the White sea, a little below Archangel.

To **DWI'NDLE.** *v. n.* (ꝺpınan, Saxon.) 1. To shrink; to lose bulk; to grow little (*Addison*). 2. To degenerate; to sink (*Swift*). 3. To wear away; to grow feeble (*Gay*). 4. To fall away; to moulder off (*Clarendon*).

DYADIC ARITHMETIC. See ARITHMETIC.

DYE, in architecture. (See DADO.) In general it denotes any cubical body. See DIE.

DYEING (Art of.) *l'art de la teinture*, French; *farbekunst*, German. The art of fixing with uniformity and permanency certain colouring materials into the fibres of wool, linen, and cotton, silk, felt, ivory, and other fibrous or filamentous substances. We shall consider this important art as briefly as possible, under the divisions of its history, theory, and process.

History of Dyeing.

Few of the arts have a claim to a higher antiquity; and still fewer of them, important as are the benefits which have been conferred upon it by recent chemistry, attained in ancient times so near an approach towards perfection. It certainly preceded painting, itself of very high antiquity, and appears to have been known in the earliest ages of the Jews, the Babylonians, and the Egyptians: and "nothing can exceed the judgment," observes Mr. Good in his Notes on Lucretius, vol. ii. p. 159, "with which they selected colours for stuffs, cottons, linens, or silks, or what answered the purpose of silks, when colours were their object in view; or the dexterity with which they applied them. These were extracted from the animal, vegetable, and mineral kingdom; and without confining themselves to cloths or silks, they dyed with equal elegance and effect, leathers, ivory, tortoise-shell, the hair of animals, woods, earths, wax, and even stones and marbles."

As soon, however, as the art of painting had attained some degree of proficiency, and the mere outline or silhouette, after having been at first filled up with an interior shade by means of the crayon (which Pliny ascribes to a Corinthian or Sicyonian artist as the inventor of this method) had been enriched by an application of the natural colours of the object intended to be delineated, the art of dyeing was united to that of painting, and the needle was as extensively employed upon colours as the pencil. "Embroidery and tapestry, in which colours were introduced," observes the author from whom we have just quoted, vol. ii. p. 51, "we know to have been of high antiquity among the Jews and Babylonians; but both these arts presuppose the existence of outlines or linear drawings, for the artist necessarily worked from a pattern. The history of Pandion, king of Athens, and of his daughter Philomela, who informed Progne of her misfortunes by describing them on tapestry, may, perhaps, be fabulous. Be this, however, as it may, we know that the fable is of very remote origin; and, as is related by Apollodorus, was probably the production of one of the Cyclic poets. According to this admirable mythologist, Philomela did not indeed paint her history, but embroidered it in characters on a veil. Yet at the period when this fable was invented, we can scarcely conceive that embroidery was confined to the exhibition of characters alone; it was unquestionably employed, and with more freedom, in the art of tracing and designing. In the time of Homer, however, we have undoubted proof of the application of tapestry to the dignity of historical subjects. Iris, in the third book of the Iliad, finds Helen occupied in representing on tapestry the evils which the Greeks and Trojans had suffered on her account in their battles. Such an undertaking, even supposing it were executed in cammeo, or with a single colour, evinces a considerable perfection of the art she was practising. But the Trojans are stated to have been also acquainted with the mode of intermixing different colours in their tapestries. When Andromache learned the death of Hector, she was at work in a retired part of her palace, and representing, in tapestry, flowers of a variety of tinctures.

Αλλ' ηγ' ἱστον υφαινε μυχω δομου ὑψηλοιο,
Διπλακα, μαρμαρεην, εν δε θρονα ποικιλλ' επασσε.

"Far in the close recesses of the dome,
Pensive she ply'd the melancholy loom;
A growing work employed her secret views,
Spotted diverse with intermingled hues."
Pope.

So Lucretius himself, as a full proof that a knowledge of the art of dyeing was common to the Romans in his early æra, lib. iv. 1023.

> Quom Babylonica, magnifico splendore, rigantur.

> "Wetting the rich and Babylonian dye."

Upon which, observes Mr. Good, "the Babylon here referred to was a city of Egypt, at no great distance from Cairo: it was universally celebrated, during its prosperity, for its very beautiful embroideries, and more particularly the richness and magnificence of its purple colour, extracted from the murex by a process peculiar to itself. In consequence of this circumstance, and at the same time of the exorbitant price charged for its introduction, it became by far the most fashionable tincture in all the tapestries, carpets, counterpanes, and sofa coverings, of the opulent and luxurious of Greece and Rome.

"The splendid and durable dye obtained from this valuable shell-fish of the old world is known by history to every one. A full account of it, however, to those who are desirous of more explicit information, may be obtained by consulting Pliny, ix. 38, who intimates that, either from a variety in the fish employed, or in the mode of manufacturing the colour, it occasionally exhibited a considerable difference of tincture, and was hence denominated rose-purple, violet-purple, hyacinth-purple. The first appears to have been held in the highest estimation; the rose, however, being rather darker in its hue than we commonly meet with it; in which case the murex was nigrantis rosæ sublucentem." Id. p. 577.

The antiquity of the art of dyeing may still farther be collected from the perfection to which this art has been carried immemorially throughout Hindustan, Ceylon, and especially China; and still more decisively so from the coloured and figured cloths, found not only in Mexico, but in Otaheite, on their first discovery. Perhaps that of Otaheite is most in point; for here, unquestionably, the web and woof were dyed antecedently to their being woven, while in the former place the cloths, skins, and barks, were for the most part painted upon, rather than imbued with the colouring materials. Yet the accuracy and perfection of the Mexicans in the art of colouring, whether by dyeing or painting, at the period in which their country was first discovered by Europeans, is truly astonishing. D'Acosta informs us, that on the arrival of the Spanish squadron on their coast, expresses were immediately sent to Montezeuma, with exact representations of the ships painted on cloth; and by means of this kind of picture-writing, he adds, they kept their records, histories, and calendars; representing things that had bodily shapes in their proper figures; and those that had none in arbitrary significant characters. From the specimens of Mexican hieroglyphics preserved in the Bodleian library, the colouring materials appear to be drawn chiefly from the mineral kingdom, and to be earths rather than animal or vegetable substances.

Theory of Dyeing.

The first explanation offered upon this subject was purely mechanical. It was observed that some colouring matters united readily with the cloth, or other substance to be dyed, and became fixed in them, without any other material being employed for this purpose; but that others would only adhere when intermixed with a third substance; and it was also observed, that the intermediate substance, thus necessary, was for the most part a salt of some kind or other; as for instance, soda or alum. And hence Hellot, an excellent observer and acute reasoner, and one of the earliest who attempted to explain the mode by which the saline material acted, asserted that it was a direct mordant, that it eroded or bit its way into the fibres to be dyed, and thus by opening or enlarging their pores, enabled the colouring matter to be deposited in them. After which these same fibres, from a degree of natural elasticity, contracted and shut in the particles of colouring matter; while the salts employed, solidifying over them, served as a kind of cement to preserve them in their place.

Insuperable objections, however, have been advanced against this and similar mechanical theories of dyeing, upon which we cannot enter in detail. We shall only observe, that it is peculiarly incompetent to explain the great difference between animal and vegetable matter in absorbing and retaining colour, and the use of mordants or intermedes, as a bond of union between the colour and the fibre to be dyed. Bergman appears to have been the first whose eminent sagacity suggested the idea, that chemical affinity was the great agent in these operations; and every subsequent research more and more confirms this opinion.

The substances commonly dyed are either of animal or vegetable origin. To the former belong wool, silk, hair, leather, and skin of all kinds; to the latter cotton, flax, and hemp. The particular chemical analysis and properties of these substances, as far as they have been examined, will be described under the respective articles. A most important and essential difference exists between the affinity for colouring matter possessed by these substances, so that a process which perfectly succeeds in dyeing wool (for example) may have no effect upon cotton, neither is there any agreement in the quantity of colouring ingredient necessary to dye each stuff.

A simple experiment of Dufay's proves this. He had a piece of cloth woven, of which the warp was wool, and the woof cotton; this was fulled, that each substance might undergo exactly the same preparation, and then passed through a scarlet vat. The wool only took the colour, but the cotton remained white after rinsing. With regard to quantity of colour, it is found that silk takes twice as much cochineal to dye it as wool does. The different force of affinity between different fibres and colouring matter, is also shewn by the more or less perfect manner in which they exhaust a coloured bath; thus, as Bergman observes, wool dyed in a weak solution of sulphat of indigo, entirely absorbs the dye, and leaves the solution colourless; whereas silk can only partially rob the sulphuric acid of the colouring matter. Generally speaking, wool has the strongest affinity for colour, taking it more easily, and retaining it more firmly; silk, and other animal matters, come next to wool cotton next, and hemp and flax last; but this is to be understood with great latitude, nor does it always happen that substances which take colour the easiest retain it the longest, besides that the previous preparation is not the same; and hence the comparison is not altogether accurate.

No exact explanation can be given of the different affinity for colour in different substances, except that the analysis of vegetable and animal matters shews a most essential difference in their component parts, and their habitudes with chemical re-agents. It is on this account, too, that the preparation which each substance receives previously to being dyed so much varies. Animal matter, especially wool, when immersed in caustic alkali, has its fibre immediately relaxed, becomes clammy, loses its natural toughness and elasticity, and at last is entirely dissolved into a soapy compound. Vegetable fibre, on the other hand, resists alkalies much longer, and is not easily dissolved; and hence in the previous cleansing and fulling of wool, alkalies are scarcely admissible, or must be used with extreme caution, whereas they may be employed with safety in the preparation of cotton and linen. Animal fibre is also much more easily affected by acids. The simple colours employed in dyeing are chiefly of animal or vegetable origin. The number of possible dyes is almost equal to that of the vegetable or insect tribes on the face of the earth, for almost all of these will make a coloured decoction with water, which is capable of tinging cloth immersed in it. Hence the variety of native dyes from indigenous plants, used in different parts of the globe by every nation, savage or civilized. A very few, however, are employed in the regular manufactories of European nations, being such as are obtained in the most abundance from countries where they form valuable articles of commerce, and whose qualities are minutely known by long and accurate observation. Of the great variety of known dyes, some (though comparatively but few) may be applied to animal or vegetable fibre, without any other preparation than that of cleansing the stuff, and immersing it in a decoction or infusion of the dye for a sufficient time. The colouring matter then unites with the fibre of the cloth with a greater or less degree of force, so as sometimes permanently to resist the effect of washing; while the bleaching power of the sun and air acts sometimes partially, sometimes scarcely at all. On the other hand, the greater number of dyes have naturally only a very feeble affinity for fibre, (though never in the same degree for animal and vegetable) and, therefore, when applied without addition, they are destroyed very speedily; but the ingenuity of man has discovered, that they may be made to unite with fibre, much more durably, by the intermede of some other substance (generally a salt with an alkaline, earthy, or metallic basis), which possesses a very strong affinity both with fibre and with colouring matter, and hence serves to bind the one to the other. These intermedes, as we have already observed, are called mordants (a term derived from an erroneous theory now abandoned), and the usual practice is first to steep the cloth or fibre in the mordant, and afterwards in the dye.

The dyes that cannot be fixed into the stuff without mordants may be termed (with Dr. Bancroft) adjective colours; those in which mordants are of no use may be called substantive colours. Madder is an adjective colour, since it is rendered much more durable by the intermede of alum, or of many other salts than when used alone. Indigo is a substantive colour, since its durability is not increased by any intermede whatever.

Another important difference in the nature of dyes is in the degree of permanence of tint, which certainly in part depends on the force of affinity with which it unites to the fibre, and partly on the intimate nature of the colouring matter, and its susceptibility of decomposition by light, air, moisture, and also by alkalies, soaps, and other substances employed in the common uses of dyed stuffs. The permanency of colour has no necessary connexion with the mode in which it is united to the substances dyed, for among the substantive, as well as the adjective colours, some are very permanent, others very fugitive, for example, of the substantive colours (or those which unite as strongly to cloth without as with mordants). Indigo is very permanent, resisting the sun, air, washing with soap, and most chemical agents. The oriental henne, which is a fine orange red, long resists the sun and air, but is altered and destroyed by soap: archil, and other of the purple lichens, is instantly altered by soap, and is soon changed by the light and air, so as only to give a very fugitive, but beautiful gloss. Of the adjective colours, madder is one of the most permanent that is known, retaining its body of colour (when well applied) under almost every circumstance. Cochineal, or wool, is nearly equally fast or permanent, but on cotton much less so. Brazil wood fades much sooner than the last, whatever mordant be applied. The selections and right application of mordants, is of infinite consequence in dyeing; and it is this subject, with its various modifications, that forms the truly scientific part of this beautiful art. Linen or cotton requires a different mordant from wool or silk; some colours adhere only to a particular mordant: the order of application, the strength, and many other smaller circumstances, all of which materially affect the beauty and durability of the colour, and the texture of the cloth, must be attended to by the artist.

Some simple experiments related by Dr. Bancroft, and which are readily repeated, will illustrate the action of mordants. A piece of cotton was impressed with various figures, with a mordant of acetited alumine, and when dry, was rinsed and cleansed in the usual way of calico-printing. It was then dyed in an infusion of saffron, and came out uniformly yellow; but on exposure to air, the whole became white. Hence it is shewn, both that the colouring matter of saffron has no strong affinity with cotton, and that alumine has no power of fixing it; and hence is useless as a mordant. The same piece was then dyed with a decoction of Brazil wood, and the whole came out coloured, but the figures printed with the aluminous solution were of a fine crimson, whereas the ground was only faintly tinged. On exposure to the sun and air for two days, the ground soon became white, and the figures also were faded; and in eight days the crimson of the latter, which had been gradually diminishing, was no longer visible. This second experiment shews that acetited alumine is a powerful mordant for Brazil wood, but still not sufficient finally to fix its colour.

The same piece was then dyed with a decoction of madder, and the whole came out coloured, but the figures deeper than the ground. On washing with bran and water, and exposure to sun and air, the ground became white, but the figures retained all their body and brightness of colour, and this time the dye was permanent, shewing in a very striking manner the strong affinity both of the alumine for the cotton, so as to remain fixed in its fibres during three successive operations, and of the alumine for the madder colour, so as to retain it permanently, in spite of the washings and bleaching, which entirely destroyed the dye of the ground.

Mordants not only fix colouring matter, but most commonly they in some degree alter the natural hue. Thus in the instance above-mentioned, the aluminous mordant changed the dull red of madder to a bright crimson; the solutions of tin not only fix the colour of cochineal in wool, but change it from a crimson to a bright scarlet: the salts of iron, which are powerful mordants, always alter the colour of dyes, changing the yellow of weld to olive brown, drab, or lead colour, according to circumstances; the red of madder to a violet brown, and, as is well known, striking a blueish black whenever the gallic acid is present. Hence a great advantage is most ingeniously made of mixing different kinds of mordants to produce varieties of shade: thus a mixture of the iron and aluminous mordant will produce with madder all the shades of pea colour, purple, and violet, with weld, brown, and olive green, and the like, so that with no more than three or four colouring materials an almost infinite variety of dyes may be produced, by a due selection and mixture of the various mordants.

Process of Dyeing.

The art of dyeing implies two distinct kinds of manufacture, plain dyeing, or dyeing in the piece, which consists of one uniform colour, diffused over the entire substance to be dyed, and calico-dyeing, or the fixing a variety of coloured patterns on an uniform ground, denominated calico-dyeing, because calico or cotton is the material usually employed for this purpose. The basis of each manufacture is nearly the same; the particular mode of application being that in which they chiefly vary. We have already pointed out the principal manipulations in the latter manufacture, under the article CALICO-PAINTING, to which we refer our readers, and shall now proceed to offer a few remarks upon plain dyeing, or dyeing in the piece.

Mordants.—We have already observed, that the selection and proper use of these intermedes is of infinite consequence in dyeing.

Almost the only substances used as mordants are earths, metallic oxyds, tan, and oil.

Of earthy mordants the most important, and most generally used, is alumina. It is used either in the state of common alum, in which it is combined with sulphuric acid, or in that of acetite of alumina.

Alum, when used as a mordant, is dissolved in water, and very frequently a quantity of tartar is dissolved along with it. Into this solution the cloth is put, and kept in it till it has absorbed as much alumina as is necessary. It is then taken out, and for the most part washed and dried. It is now a good deal heavier than it was before, owing to the alumina which has combined with it. The tartar serves two purposes; the potass which it contains combines with the sulphuric acid of the alum, and thus prevents that very corrosive substance from injuring the texture of the cloth, which otherwise might happen: the tartareous acid, on the other hand, combines with part of the alumina, and forms a tartrit of alumina, which is more easily decomposed by the cloth than alum.

Acetit of alumina has been but lately introduced into dyeing. This mordant is now prepared by pouring acetit of lead into a solution of alum; a double decomposition takes place, the sulphureous acid combines with the lead, and the compound precipitates, in the form of an insoluble powder, while the alumina combines with the acetous acid, and remains dissolved in the liquid. This mordant is employed for cotton and linen, which have a weaker affinity than wool for alumina; it answers much better than alum; the cloth is more easily saturated with alumina, and takes in consequence both a richer and a more permanent colour.

Besides alumina, lime is sometimes used as a mordant. Cloth has a strong affinity enough for it; but, in general, it does not answer so well, as it does not give so good a colour. When used, it is either in the state of lime-water, or of sulphate of lime dissolved in water.

Almost all the metallic oxyds have an affinity for cloth, but only two of them are extensively used as mordants, namely, the oxyds of tin and of iron.

The oxyd of tin was first introduced into dyeing by Kuster, a German chemist, who brought the secret to London in 1543. This period forms an æra in the history of dyeing. The oxyd of tin has enabled the moderns greatly to surpass the ancients in the fineness of their colours; by means of it alone, scarlet, the brightest of all colours, is produced.

Tin, as Proust has proved, is capable of two degrees of oxydation. The first oxyd is composed of 0.70 parts of tin, and 0.70 of oxygen; the second, or white oxyd, of 0.60 parts of tin, and 0.40 of oxygen. The first oxyd absorbs oxygen with very great facility, even from the air, and is rapidly converted into white oxyd. This fact makes it certain, that it is the white oxyd of tin alone which is the real mordant; even if the other oxyd was applied to cloth, as it probably often is, it must soon be converted into white oxyd, by absorbing oxygen from the atmosphere.

Tin is used as a mordant in three states: dissolved in nitro-muriatic acid, in acetous acid, and in a mixture of sulphuric and muriatic acids. Nitro-muriat of tin is the common mordant employed by dyers. They prepare it by dissolving tin in diluted nitric acid, to which a certain proportion of muriate of soda (common salt), or of ammonia (sal ammoniac), is added. Part of the nitric acid decomposes these salts, combines with their base, and sets the muriatic acid at liberty. It was prepared at first with nitric acid alone, but that mode was very defective, because the nitric acid very readily converts tin to white oxyd, and then is incapable of dissolving it; the consequence of which was, the precipitation of the whole of the tin. To remedy this defect, common salt, or sal ammoniac, was very soon added; muriatic acid having the property of dissolving white oxyd of tin very readily. A considerable saving of nitric acid might be obtained, by employing as much sulphuric acid as is just sufficient to saturate the base of the common salt, or sal ammoniac, employed.

When the nitro-muriat of tin is to be used as a mordant, it is dissolved in a large quantity of water, and the cloth is dipped in the solution, and allowed to remain till sufficiently saturated. It is then taken out, and washed and dried. Tartar is usually dissolved in the water along with the nitro-muriat. The consequence of this is a double decomposition: the nitro-muriatic acid combines with the potass of the tartar, while the tartareous acid dissolves the oxyd of tin. When tartar is used, therefore, in any considerable quantity, the mordant is not a nitro-muriat, but a tartrit of tin.

Iron, like tin, is capable of two degrees of oxydation; but the green oxyd absorbs oxygen so readily from the atmosphere, that it is very soon converted into the red oxyd. It is only this last oxyd which is really used as a mordant in dyeing. The green oxyd is, indeed, sometimes applied to cloth; but it very soon absorbs oxygen, and is converted into the red oxyd. This oxyd has a very strong affinity for all kinds of cloth. The permanency of the iron-spots on linen and cotton is a sufficient proof of this. As a mordant, it is used in two states; in that of sulphat of iron, (copperas), and acetit of iron. The first is commonly used for wool. The salt is dissolved in water, and the cloth dipped in it. It may be used also for cotton, but in most cases acetit of iron is preferred. It is prepared by dissolving iron, or its oxyd, in vinegar, sour beer, &c. and the longer it is kept, the more it is preferred. The reason is, that this mordant succeeds best when the iron is in the state of red oxyd. It would be better then to oxydate the iron, or convert it into rust, before using it; which might be easily done, by keeping it for some time in a moist place, and sprinkling it occasionally with water.

Tan has a very strong affinity for cloth, and for several colouring matters; it is therefore very frequently employed as a mordant. An infusion of nut-galls, or of sumach, or any other substance containing tan, is made in water, and the cloth is dipped in this infusion, and allowed to remain till it has absorbed a sufficient quantity of tan. Silk is capable of absorbing a very great proportion of tan, and by that means acquires a great increase of weight. Manufacturers sometimes employ this method of increasing the weight of silk.

Tan is often employed also, along with other mordants, in order to produce a compound mordant. Oil is also used for the same purpose, in the dyeing of cotton and linen. The mordants with which tan most frequently is combined are alumina, and oxyd of iron.

Besides these mordants, there are several other substances frequently used as auxiliaries, either to facilitate the combination of the mordant with the cloth, or to alter the shade of colour; the chief of these are, tartar, acetit of lead, common salt, sal ammoniac, sulphat or acetit of copper, &c.

Mordants not only render the dye permanent, but have also considerable influence on the colour produced. The same colouring matter produces very different dyes, according as the mordant is changed. Suppose, for instance, that the colouring matter is cochineal; if we use the aluminous mordant, the cloth will acquire a crimson colour; but the oxyd of iron produces with it a black.

In dyeing, then, it is not only necessary to procure a mordant which has a sufficiently strong affinity for the colouring matter and the cloth, and a colouring matter which possesses the wished-for colour in perfection, but we must procure a mordant and a colouring matter of such a nature, that when combined together, they shall possess the wished-for colour in perfection. It is evident too, that a great variety of colours may be produced with a single dye-stuff, provided we can change the mordant sufficiently.

The colouring matter with which the cloth is dyed does not cover every portion of its surface; its particles attach themselves to the cloth at certain distances from each other; for cloth may be dyed different shades of the same colour, lighter or darker, merely by varying the quantity of colouring matter. With a small quantity, the shade is light; and it becomes deeper as the quantity increases. Now this would be impossible, if the dye-stuff covered the whole of the cloth.

That the particles of colouring matter, even when the shade is deep, are at some distance, is evident from this well-known fact, that cloth may be dyed two colours at the same time. All those colours to which the dyers give the name of compound are in fact two different colours applied to the cloth at once. Thus cloth gets a green colour, by being first dyed blue and then yellow.

Such being the mordants chiefly employed, we shall now enter upon a consideration of the dyes chiefly communicated. In doing which we shall considerably simplify the art by observing that, innumerable as are the different colours and shades of colours communicated, they all originate from four or five primary dyes modified according to the colour intended to be produced. These primary, or simple dyes, are as follow—blue, yellow, red, black, and fawn, or as this last is sometimes called, root or brown colour.

Of Blue.—The only two substances employed in dyeing blues are woad and indigo: the former being a fecula or dried pulp made of the fermented leaves and stem of the isatis tinctoria, in its nature not unlike indigo, and very commonly used along with indigo in dyeing woollens: the latter a peculiar preparation produced by a fermentation of the leaves of the indigo fera tinctoria, and one or two varieties of the same genus; for the process by which this substance is obtained, see Indigo and Indigofera.

Indigo has a very strong affinity for wool, silk, cotton, and linen. Every kind of cloth, therefore, may be dyed with it, without the assistance of any mordant whatever. The colour thus induced is very permanent; because the indigo is already saturated with oxygen, and because it is not liable to be decomposed by those substances, to the action of which the cloth is exposed. But it can only be applied to cloth in a state of solution; and the only solvent known being sulphuric acid, it would seem at first sight, that the sulphuric acid solution is the only state in which indigo can be employed as a dye.

The sulphat of indigo is indeed often used to dye wool and silk blue; but it can scarcely be applied to cotton and linen, because the affinity of these substances for indigo is not great enough to enable them readily to decompose the sulphate. The colour given by sulphate of indigo is exceedingly beautiful; it is known by the name of Saxon blue.

One part of indigo is to be dissolved in four parts of concentrated sulphuric acid; to the solution one part of dry carbonate of potass is to be added, and then it is to be diluted with eight times its weight of water. The cloth must be boiled for an hour in a solution containing five parts of alum, and three of tartar, for every 32 parts of cloth. It is then to be thrown into a water-bath, containing a greater or smaller proportion of the diluted sulphat of indigo, according to the shade which the cloth is intended to receive. In this bath it must be boiled till it has acquired the wished-for colour.

The alum and tartar are not intended to act as mordants, but to facilitate the decomposition of the sulphat of indigo. The alkali added to the sulphat, answers the same purpose. These substances also, by saturating part of the sulphuric acid, serve in some measure to prevent the texture of the cloth from being injured by the action of the acid, which is very apt to happen in this process.

But sulphat of indigo is by no means the only solution of that pigment employed in dyeing. By far the most common method is, to deprive indigo of the oxygen, to which it owes its blue colour, and thus to reduce it to the state of green pollen; and then to dissolve it in water by means of alkalies, or alkaline earths, which in that state act upon it very readily.

Two different methods are employed for this purpose. The first of these methods is, to mix with indigo a solution of some substance which has a stronger affinity for oxygen than the green basis of indigo; green oxyd, for instance, and different metallic sulphurets. If therefore indigo, lime, and green sulphat of iron, are mixed together in water, the indigo gradually loses its blue colour, becomes green, and is dissolved; while the green oxyd of iron is converted into the red oxyd. The manner in which these changes take place is obvious; part of the lime decomposes the sulphat of iron; the green oxyd, the instant that it is set at liberty, attracts oxygen from the indigo, decomposes it, and reduces it to the state of green pollen. This green pollen is immediately dissolved by the action of the rest of the lime.

The second method is, to mix the indigo in water with certain vegetable substances, which readily undergo fermentation. During this fermentation, the indigo is deprived of its oxygen, and dissolved by means of quick-lime or alkali, which is added to the solution. The first of these methods is usually followed in dyeing cotton and linen; the second, in dyeing wool and silk.

In the dyeing of wool, woad and bran are commonly employed as vegetable ferments, and lime as the solvent of the green base of the indigo. Woad itself contains a colouring matter precisely similar to indigo; and by following the common process, indigo may be extracted from it. In the usual state of woad, when purchased by the dyer, the indigo which it contains is probably not far from the state of the green pollen. Its quantity in woad is but small, and it is mixed with a great proportion of other vegetable matter.

When the cloth is first taken out of the vat, it is of a green colour; but it soon becomes blue, by attracting oxygen from the air. It ought to be carefully washed, to carry off the uncombined particles. This solution of indigo is liable to two inconveniences: first, it is apt sometimes to run too fast into the putrid fermentation; this may be known by the putrid vapours which it exhales, and by the disappearing of the green colour. In this state it would soon destroy the indigo altogether. The inconvenience is remedied by adding more lime, which has the property of moderating the putrescent tendency. Secondly, sometimes the fermentation goes on too languidly. This defect is remedied by adding more bran or woad, in order to diminish the proportion of quick-lime.

Silk is dyed light-blue by a ferment of six parts of bran, six of indigo, six of potass, and one of madder. To dye it of a dark blue, it must previously receive what is called a ground-colour; a red dye-stuff, called archil, is used for this purpose.

Cotton and linen are dyed blue by a solution of one part of indigo, one part of green sulphat of iron, and two parts of quick-lime.

Of Yellow.—This colour is obtained amongst ourselves, from a variety of vegetable materials; the extractive part of most plants, indeed, affording a yellow, or a yellowish hue. Weld (roseda luteola), is the substance chiefly employed; next to this old fustic (the bois jaune of the French, or morus tinctoria of the Linnéan system); next to this quercitron bark (quercus nigra of Linnéus), first introduced into this country as a dye by Dr. Bancroft, though in common use for this purpose in the countries in which it is indigenous. These three constitute our chief yellows. Besides which, however, we shall just mention that our dyers have occasionally recourse to young fustic, or Venice sumach (the fustet of the French, or rhus cotinus of Linnéus); saw-wort (serratula tinctoria); dyer's broom (genista tinctoria); Avignon, or French berry (graine d'Avignon); and American golden rod (solidago Canadensis).

Upon these we shall observe, that the greater part of them give a very fugitive colour, and especially the French berry; and that the colour of none of them can be made perfectly fast.

Yellow colouring matters, therefore, have too weak an affinity for cloth to be employed without the use of mordants: and hence cloth, before it is dyed yellow, is always prepared by combining some mordant or other with it. The mordant most commonly employed for this purpose is alumina. Oxyd of tin is sometimes used when very fine yellows are wanting. Tan is often employed as a subsidiary to alumina, and in order to fix it more copiously on cotton and linen. Tartar is also used as an auxiliary, to brighten the colour; and muriat of soda, sulphat of lime, and even sulphat of iron, in order to render the shade deeper.

The yellow dyed by means of fustic is more permanent, but not so beautiful as that given by weld, or quercitron. As it is permanent, and not much injured by acids, it is often used in dyeing compound colours, where a yellow is required. The mordant is alumina. When the mordant is oxyd of iron, fustic dyes a good permanent drab colour.

Weld and quercitron bark yield nearly the same kind of colour: but as the bark yields colouring matter in much greater abundance, it is much more convenient, and upon the whole, cheaper than weld. It is probable, therefore, that it will gradually supersede the use of that plant. The method of using each of these dye-stuffs is nearly the same.

Wool may be dyed yellow by the following process: Let it be boiled for an hour or more with about one-sixth of its weight of alum, dissolved in a sufficient quantity of water. It is then to be plunged, without being rinsed, into a bath of warm water, containing in it as much quercitron bark as equals the weight of the alum employed as a mordant. The cloth is to be turned through the boiling liquid, till it has acquired the intended colour. Then a quantity of clean powdered chalk, equal to the hundredth part of the weight of the cloth, is to be stirred in, and the operation of dyeing continued for eight or ten minutes longer. By this method a pretty deep and lively yellow may be given, fully as permanent as weld yellow.

For very bright orange or golden yellow, it is necessary to have recourse to the oxyd of tin as a mordant.

For producing bright golden yellows, some alum must be added along with the tin.

In order to give the yellow that delicate green shade, so much admired for certain purposes, tartar must be added in different proportions, according to the shade.

By adding a small proportion of cochineal, the colour may be raised to a fine orange, or even an aurora.

Silk may be dyed different shades of yellow, either by weld or quercitron bark, but the last is the cheapest of the two. The proportion should be from one to two parts of bark, to twelve parts of silk, according to the shade. The bark, tied up in a bag, should be put into the dyeing vessel, while the water which it contains is cold; and when it has acquired the heat of about 100°, the silk, having been previously alumed, should be dipped in, and continued till it assumes the wished-for colour. When the shade is required to be deep, a little chalk or pearl-ash should be added towards the end of the operation.

The best method of dyeing cotton and linen yellow is with a mordant, consisting of acetit of alumina, prepared by dissolving one part of acetit of lead, and three parts of alum, in a sufficient quantity of water, heating the solution to the temperature of 100°. The cloth should be soaked in the dye for two hours, and then hung out and dried; when the soaking and drying should be repeated; after which it is to be barely wetted with lime-water, and then dried once more: the number of repetitions of the entire process is to depend upon the brightness of the dye required. The dyeing bath is prepared by putting twelve or eighteen parts of quercitron bark (according to the brightness required) tied up in a bag, into a sufficient quantity of cold water. Into this the cloth is to be plunged, and turned round in it for an hour, while its temperature is gradually raised to about 120°. It is then to be advanced to a boiling heat, and the cloth allowed to remain in it after that only a few minutes. If it be kept long at a boiling heat, the yellow will acquire a shade of brown.

Of Red.—The materials employed for this colour are lac or kermes, cochineal, archil, madder, carthamus, and Brazil-wood.

The first is the secretion of an insect of the coccus genus, and the second is the dried substance of another species of the same genus. Both these are used very largely by the dyers of India, and especially in Bangalore, as is also the carthamus. The mordant they employ is a ley, made of a solution of impure soda and quick-lime; and the colours they produce, though differing in the peculiar tint, according to the material made use of, are in almost every instance deeply bright and beautiful. Among ourselves, alum is more commonly employed, especially in the two former instances; it brightens the colour of the decoction, and produces a crimson precipitate. Muriat of tin gives a copious fine red precipitate.

Archil is a paste formed of a species of lichen, pounded and kept moist for some time with stale urine.

Madder is the root of the RUBIA TINCTORUM, for which see that article.

Carthamus is the flower of the carthamus tinctorius, which is cultivated in the southern parts of Europe, and thrives nearly as well as in India. It contains two colouring matters; a yellow, which is soluble in water, and a red, insoluble in water, but soluble in alkaline carbonats. The red colouring matter of carthamus, extracted by carbonat of soda, and precipitated by lemon juice, constitutes the rouge employed by ladies as a paint. It is first ground, however, with a certain quantity of talc.

Brazil-wood is the trunk of a species of cæsalpinia, indigenous to America and the West Indies, for which see CÆSALPINIA. Its decoction offers a very fine red colour.

Woollen stuffs, of a coarser description, are dyed red with madder; but fine cloth is almost exclusively dyed with cochineal, though the colour it receives from lac or kermes, if less bright, is more durable. All our old tapestries owe their enduring scarlets to this material. Brazil-wood is scarcely used, except as an auxiliary; the colour which it imparts to wool is fugitive.

Dr. Bancroft recommends a method of dyeing scarlet, in which a much smaller portion of cochineal produces an equal effect. He conceived scarlet, from his experiments, to be a compound colour, caused by about three-fourths of crimson of rose colour, and one-fourth of pure bright yellow. He therefore supposed that when the natural crimson of the cochineal is made scarlet, by the usual process, a fourth of the colouring matter of the cochineal must be changed from its natural crimson to a yellow colour, by the action of the solution of tin. For this reason he introduced a bright yellow dye into the bath with the cochineal, and reduced the quantity of this more expensive ingredient. He also found that a mixture of two pounds of sulphuric acid, with about three pounds of muriatic acid, poured on fourteen ounces of granulated tin, with exposure to heat, produced a solution of tin, that had twice the effect of the common nitro-muriatic solution, at less than a third of the expense, and which raised the colours more, without producing a yellow shade. For the yellow dye Dr. Bancroft used quercitron bark. His process for dyeing scarlet, by the use of this substance, and the above preparation of tin, is as follows:

An hundred pounds of cloth are to be put into a tin vessel, nearly filled with water, in which about eight pounds of the murio-sulphuric solution of tin have been previously mixed. The liquor is made to boil, and the cloth is turned through it by the winch for a quarter of an hour in the usual manner. The cloth is then taken out, and four pounds of cochineal, with two pounds and a half of quercitron bark in powder, put into the bath and well mixed. The cloth is then returned into the liquor, which is then made to boil, and the operation is continued, as usual, till the colour be duly raised, and the dyeing liquor exhausted, which will usually happen in about fifteen or twenty minutes; after which the cloth may be taken out and rinsed as usual. In this method the labour and fuel necessary for the second bath are saved; the operation is finished in much less time; all the tartar will be saved, as well as two-thirds of the expense of the solvent for the tin, and, at least, one-fourth of the cochineal usually employed; and the colour produced will not be inferior, in any respect, to that dyed with so much more expense and trouble in the ordinary way; and, moreover, looks much better than it by candle-light.

A rose colour may be readily and cheaply dyed by the above process, by only omitting the quercitron bark.

Crimson is produced either by dyeing the wool this colour at once, or by first dyeing it scarlet, and then changing the shade to that required. To dye crimson by a single process, a solution of two ounces and a half of alum, and an ounce and half of tartar, are employed in the boiling for every pound of the stuff, for each of which also an ounce of cochineal is to be afterwards used in dyeing it. It is customary to employ solution of tin, but in smaller proportion than for dyeing scarlet. To render the crimson deeper, and give it more bloom, archil and potash are frequently used, but this bloom is extremely fugacious.

To produce a crimson from a scarlet, the alkalies, alum, and earthy salts, are used, all of which have this effect. Crimson is the natural colour of the cochineal, and to produce it from a stuff dyed scarlet, the stuff is boiled for an hour in a solution of alum, the strength of which is to be regulated by the depth of shade required.

Silks may be coloured by madder, by means of a mixt mordant of alum and solution of tin; but after all, the hues are seldom sufficiently bright, though by this mode they obtain durability; and hence cochineal and carthamus are usually had recourse to.

Crimson produced on silk by cochineal is called grain crimson, to distinguish it from a colour called false crimson, dyed with Brazil wood. For the grain crimson, the silk being well cleansed from soap at the river, is to be immersed for a night in alum liquor of the full strength; it is then to be washed, and twice beetled at the river. The bath is prepared by filling a long boiler two-thirds with water, to which is added, when it boils, from half an ounce to two ounces of powdered white galls for every pound of silk. When it has boiled for a few moments, from two to three ounces of cochineal, powdered and sifted, are put in for every pound of silk, and afterwards one ounce of tartar for every pound of cochineal. When the tartar is dissolved, one ounce of solution of tin is added for every ounce of tartar. Macquer recommends this solution of tin to be made by dissolving six ounces of fine grain tin, with two ounces of sal ammoniac, in a pound of nitric acid, diluted with twelve ounces of water. When these ingredients are mixed together, the boiler is to be filled with cold water, the proportion of which, for every pound of silk, is about eight or ten quarts. In this bath the silk is to be immediately immersed, and turned on the winch till it appears of an uniform colour; the fire is then increased, and the bath is kept boiling for two hours, taking care to turn the silk occasionally; the fire is afterwards put out, and the silk immersed in the bath, where it is suffered to remain a few hours longer; it is then taken out, washed at the river, twice beetled, and dried.

To obtain other shades of red, the above processes must be varied. If, after the silk has been wrung out of the solution of tin, it is steeped for a night in a cold solution of alum, in the proportion of one ounce to a quart of water, wrung, dried, then washed and boiled with cochineal, it will appear of a pale poppy colour. But a fine poppy-red may be procured by steeping it twelve hours in the solution of tin, diluted with eight parts of water, then leaving it all night in the solution of alum, after which it is to be washed, dried, and passed through two baths of cochineal, taking care to add to the second bath a small quantity of sulphuric acid.

The colour that comes nearest to scarlet has been produced on silk, by first dyeing it crimson, and then dyeing it with carthamus, and afterwards submitting it to a yellow bath without heat. The colour thus given is very fine, but the dye of carthamus is not permanent. In Dr. Bancroft's process, the silk is soaked for two hours in a solution of tin, in the murio-sulphuric acid, after which it is wrung out and dried partially. It is then to be dyed in a bath prepared with four parts of cochineal, and three of quercitron bark. In this way a colour approaching to scarlet is obtained. To give the colour more body, the immersion may be repeated in the solution of tin, and in the dyeing bath: the brightness of the scarlet is increased by the addition of carthamus. A lively rose colour is produced by omitting the quercitron bark, and dyeing with the cochineal alone.

Cotton may be dyed scarlet, by means of murio-sulphat of tin, cochineal, and quercitron bark, used as for silk, but the colour is too fading to be of any value.

Of Black.—The substances employed to give a black colour to cloth are, red oxyd of iron, and tan. These two substances have a strong affinity for each other; and when combined assume a deep black colour, not liable to be destroyed by the action of air or light.

Logwood is usually employed as an auxiliary, because it communicates lustre, and adds considerably to the fullness of the black. It is the wood of the hæmatoxylon, a native of several of the West India islands, and of that part of Mexico which surrounds the bay of Honduras. It yields its colouring matter to water. The decoction is at first a fine red, bordering on violet; but if left to itself, it gradually assumes a black colour. Acids give it a deep red colour; alkalies a deep violet, inclining to brown; sulphat of iron renders it as black as ink, and occasions a precipitate of the same colour.

Cloth, before it receives a black colour, is usually dyed blue: this renders the colour much fuller and finer than it would otherwise be. If the cloth be coarse, the blue dye may be too expensive; in that case, a brown colour is given, by means of walnut-peels.

The proportions used by the English dyers are, for every hundred pounds of woollen cloth, dyed first of a deep blue, about five pounds of sulphat of iron, five pounds of galls, and thirty of logwood. They begin with galling the cloth, and then pass it through the decoction of logwood, to which the sulphat of iron has been added.

Some recommend fine cloths to be fulled with soap-suds; but this operation requires an experienced workman to cleanse the cloth perfectly of the soap. Many advise to give the cloth a dip in a bath of weld when it comes from the fulling mill, which they say softens it, and fixes the black. Lewis says, the weld bath is totally useless when the cloth has been treated with soap-suds, though in other cases it may be of advantage. He ascribes its effects entirely to the alkali with which the dyers commonly prepare its decoction.

The leaves of the uva ursi may be employed instead of galls. They must be carefully dried in autumn, so that they may remain green. When they are to be used, 100 pounds of wool are boiled for two hours with sixteen pounds of sulphat of iron, and eight of tartar: the day following, the cloth is to be rinsed as after aluming: 150 pounds of uva ursi are then to be boiled in water for two hours, and after their being taken out, a little madder is to be added to the liquor, at the same time putting in the cloth, which is to remain there an hour and a half, or an hour and three quarters, after which it is to be rinsed in water. This process gives a pretty good black to blue cloth, but only a deep brown to white: the madder and tartar are supposed by Lewis to be useless.

Silk is dyed black by a process not very different from that used in dyeing cloth. It imbibes tan freely; which is given to it at the pleasure of the artist, by allowing the silk to remain a longer or shorter time in the decoction. Not less than sixty pounds of silk are commonly dyed at one operation; and a considerable degree of harshness is produced in the dyeing: it is afterwards plunged into a strong solution of soap in water, in which it remains for about a quarter of an hour; after which it is wrung out and dried.

It is by no means easy to give a full black to linen or cotton; and still less so a durable black, the colour generally yielding to the action of soap. The cloth, previously dyed blue, is to be steeped for twenty-four hours in a decoction of nut-galls. Then prepare a bath, containing an acetite of iron, formed by saturating acetous acid with brown oxyd of iron; into this bath plunge the cloth in small quantities at a time, and work it with the hand for a quarter of an hour; then wring it out and air it again; after which let it be again worked in the bath, and once more wrung out and aired. These alternate processes are to be repeated till the requisite colour is procured: a decoction of alder bark is usually mixed with the liquor containing the nut-galls.

Of Brown, or Fawn Colour, Buff, and Nankeen.—Various substances, and of easy acquisition, are employed to give a brown, or fawn-coloured ground. Santal, or saunders wood, was formerly employed; birch, alder bark, and sumach, are occasionally used; but the more common is a decoction of walnut peels, or walnut root.

Santal, or saunders wood, is much inferior to walnut shells; because, if used in too large a quantity, it stiffens, and consequently injures the wool. It is in general mixed with galls, sumach, and alder bark, without which its colour could not be extracted: and though it yields very little with alum and tartar, it is nevertheless used in large quantities, on account of the solidity of its colour, which is naturally a yellow-reddish brown.

The best of the different ingredients employed in dyeing fawn-colours is the bark or rind of the walnut-tree. Its shades are uncommonly fine; its colours solid; and it renders the wool dyed in it flexible and soft. A cauldron half full of water is placed over the fire; and as soon as it grows warm, bark is added in proportion to the quantity of stuffs intended to be dyed, and the lightness or depth of the shades required. It is then boiled for about a quarter of an hour, when the cloths, being previously moistened with warm water, are immersed, frequently turned, and well stirred, till they have sufficiently imbibed the colour. They are aired, dried, and dressed in the usual manner.

Next to the rind or bark, the root of the walnut-tree, is the best dye for a fawn-colour: it also affords a variety of shades, similar to those produced by the bark, for which it is frequently substituted. The root, however, requires a different process: a cauldron is filled about three parts full of river-water, into which the root is immersed, after being tied up in a bag. When the liquor is very hot, the wool or stuff is plunged into it, repeatedly turned, and occasionally aired. The lighter stuffs are next to be dipped, till the colour is completely extracted. During this operation, proper care should be taken to prevent the liquor from boiling, as in such case the piece first immersed would imbibe the whole of the colour.

The process of dying with the bark of alder is nearly the same as that pursued with walnut roots: the boiling of it is at first not very material, as this drug very freely communicates its colour. It is chiefly used for worsteds, imparting shades darkened with copperas; and for wool that is not required to be very dark, as it equally withstands the effects of the sun and rain.

Sumach possesses nearly the same properties as the bark or rind of the walnut-tree; its colour is not so deep, somewhat inclining to green, but is solid and permanent. Where dark colours are required, sumach is frequently substituted for nut-galls, in which case a greater proportion becomes necessary. These different substances, however, are not unfrequently mingled together, and, as they are of a similar nature, and differ only in degree, it is easy to obtain various shades.

Of derivative or compound Colours.—Every one knows that a great multiplicity of colours is imparted to cloths and silks besides those we have just taken notice of. All these, however, proceed from a mixture or modification of the above dyes, which on this account, as we have already remarked, are denominated primitive or simple dyes. Of these compound dyes, we shall notice a few of the principal.

Of Green.--This under the dyer's, as often under the painter's hands, is a mixture of blue and yellow, the shade varying according to the prevalence of either of the compound parts: whence we have sea-green, grass-green, pea-green, and a variety of others. The blue is generally first employed as a dye, and afterwards the yellow; for it is a well known fact, that the yellow is much more apt to separate in the blue vat, than the blue in the yellow vat. When sulphat of indigo is employed, it is usual, however, to mix all the ingredients together, and to dye the cloth at once: it is this dye that produces the Saxon or English green.

Violet, Purple, and Lilac.—These are all mixtures of blue and red; and depend upon the different shade produced by the proportion of the one colour to the other. Wool, cotton, and linen, are first dyed blue; and the two last are then galled and soaked in a decoction of logwood; but a more permanent colour is given by means of oxyd of iron; they are then dyed scarlet in the usual manner. By means, however, of cochineal mixed with the sulphat of indigo, the process may be performed at once. Silk is first dyed crimson by means of cochineal, and then dipped into the indigo vat.

Orange.—This is a mixture of yellow and red.

Olive.—If blue be added to the above mixture of yellow and red, the result will prove an olive colour. Wool may be dyed orange, by first dyeing it scarlet, and then yellow. If first dyed with madder, the produce will be cinnamon colour. Silk is dyed orange by means of carthamus, cinnamon colour by logwood, Brazil wood, and fustic, mixed together. Cotton and linen are rendered cinnamon-hued by means of weld and madder; and olive-hued by being passed through a blue, yellow, and finally a madder-vat.

Greys, Drabs, and dark Browns.—These are all mixtures of black with other colours. If cloth be previously combined with brown oxyd of iron, and afterwards dyed yellow with quercitron bark, the result will be a drab of different shades, according to the proportion of mordant employed. When the proportion is small, the colour has a tendency to olive or yellow; on the contrary, the drab may be deepened or saddened, as the dyers term it, by mixing a little sumach with the bark.

DYER (John), an English poet, born in 1700, at Aberglasney in Caermarthenshire, and educated at Westminster school. He was bred to the law under his father, but that profession he abandoned for painting. To perfect himself he went to Italy, where he projected his beautiful poem, entitled, The Ruins of Rome, which he published in 1740. He had before favoured the public with an elegant descriptive piece called Grongar Hill. Not long after his return he entered into orders, and obtained the living of Calthorp, in Leicestershire, which he exchanged in 1757 for Belchford in Lincolnshire. He also had the rectory of Coningsby in the same county, to which was afterwards added Kirkby-on-Bane. In 1757 appeared the Fleece, a poem, which possesses great merit. He died the year following, and was buried at Coningsby. Mr. Dyer left a widow and four children.

DYER'S BROOM, in botany. See GENISTA.

DYER'S WEED. See GENISTA and RESEDA.

DYING. (the participle of *die*.) Expiring, giving up the ghost.

DYNAMICS. (from δυναμις, power.) Is that branch of mechanics which has for its object the action of forces on solid bodies, when the result of that action is motion; and in which, since all motion occupies some portion of time, we introduce time into our investigations. This department of science presents a wide and varied field of discussion, and when viewed in its full extent it exhibits many questions of considerable difficulty: we shall not attempt to give the whole of these, as such a procedure would draw us far beyond the limits which must be assigned to this part of the work.

The sum of the material particles of which a body is composed, is what we denote by the word *mass*. This mass depends on the volume of the body and that which we call density. We have already observed (art. DENSITY) that density is directly as the quantity of matter, and inversely as the magnitude of the body: but it will not be improper to deduce concisely the general theorem which comprises this relation. To this end it must be considered that as all bodies are penetrated with a great number of void spaces or pores, their quantity of matter is not proportional to their volume; but under the same volume there will be more or less matter as the particles are nearer or further asunder; and we say that a body has a greater or less density, according as there subsists a greater or less proximity between its moleculæ. Thus we say a body is more dense than another when in an equal volume the former contains more matter than the latter: we say, on the contrary, that it is less dense or more rare (for density and rarity are reciprocal qualities) when in an equal volume it comprises less matter. The density serves, therefore, to judge of the number of material particles when the volume is known: thus we may regard the density as representing the number of equal moleculæ in a determinate volume; as when, for example, we say that gold is 19 times denser than water, we wish to be understood that gold contains 19 times the number of particles that water does in the same space.

Since we represent the density as expressing the number of moleculæ in a determinate volume which we assume as the unit of magnitude; it is obvious that to obtain the mass, or the total number of moleculæ, of any body of which the magnitude is known, we must take the rectangle of the density and magnitude. Thus, if we represent generally the body or mass by B, its volume or magnitude by M, and its density by D, we shall have $B = MD$: whence it will be easy to compare the masses, the magnitudes, and the densities of bodies.

In similar bodies the masses are as the densities and cubes of the diameters, or depths, or lengths, or of any like linear dimensions. Hence, if L denote the lineal dimension, we readily deduce these general proportions:

$$B \propto MD \propto DL^3.$$

$$M \propto \frac{B}{D} \propto L^3.$$

$$D \propto \frac{B}{M} \propto \frac{B}{L^3}.$$

$$L \propto \sqrt[3]{\frac{B}{D}} \propto \sqrt[3]{M}.$$

Force, according to our definition, is that which causes a change in the state of a body; or, it is that which either moves or tends to move a body: forces are no further known to us than by their effects; it is only, therefore, by the effect any force produces that we can measure it. Now the effect of a force is to give to every material particle of a body a certain velocity; if, therefore, all the parts of a body receive the same velocity, as we suppose here, the effect of the moving cause has for its measure the product of the velocity, into the number of moleculæ moved, or the product of the velocity and mass: a force therefore is proportional to the velocity which it can impress on a known mass, and that mass conjointly.

Def. Momentum, or quantity of motion, is the rectangle of the mass of a body and its velocity. See FORCE.

Consequently, forces are measured by the quantities of motion they are capable of producing.

Thus, if F denote the motive or moving force, B the body moved, and V the velocity imparted to it, we have $F \propto BV$. From this we deduce $V \propto \frac{F}{B}$, and $B \propto \frac{F}{V}$: therefore, 1. The velocity of a body in motion, is as the moving force directly, and the mass inversely. 2dly, The body or mass is as the moving force directly, and the velocity inversely.

If now two bodies be represented by B, and b, the forces by which they are moved by F, and f, and the velocities imparted to them by V, and v, we have $F \propto BV$, and $f \propto bv$. Let B be supposed equal to b, then will $F \propto V$, and $f \propto v$: hence, when the masses are equal, the moving forces are as the velocities. Again, supposing $V=v$, we have $F \propto B$ and $f \propto b$: therefore, when the velocities are equal, the moving forces are as the masses. Lastly, making $F=f$, we have $\frac{1}{V} \propto B$, and $\frac{1}{v} \propto b$: consequently, when the moving forces are equal, the velocities are in the inverse ratio of the masses.

On Motion, uniform and variable.—The motion of a physical point, or of a body, is uniform, when it moves always in the same manner, or when it passes over equal spaces in any equal intervals of time whatever. This motion, the most simple of all, and the most easy to conceive, probably exists in no part of nature, but is only a pure abstraction of the mind: it is, notwithstanding, important to consider it, because were it not for obstructions, motions in general would be uniform, and because it conduces greatly to the analysis of all other motions.

That affection of motion which we call velocity being measured by the space uniformly described in a given time, is in fact a measure of motion itself, and is that which characterises each species of uniform motion: it is customary in mathematical discussions to fix upon a small period of time, a second, for example, as a unit, and to call the velocity of a moving body at any instant the space which the body would describe uniformly during a unit of time.

Hence it follows, that in the uniform motion of a body the spaces run over are proportional to the times employed. For if it describe V feet in one second, it will describe 2V feet in two seconds, 3V feet in three seconds, and TV feet in T seconds, T being any number whole or fractional. This being granted, we may now state a proposition from which the whole doctrine of uniform motions will readily flow.

Prop. When bodies have different uniform motions, the spaces described are proportional to the times and velocities jointly.

Let V and v be the velocities of the two bodies B and b, T and t the times of their motions, S and s the spaces described, likewise let s' be the space described by b in the time T:

$$\text{Then } S : s' :: V : v$$
$$s' : s :: T : t$$

And, comp. $S : s :: TV : tv$. That is $S \propto TV$.

Cor. 1. The velocity is as the space divided by the time: for the preceding expression gives $V \propto \frac{S}{T}$. Or, since the same will hold in any corresponding indefinitely minute portions of the space and time, we shall have $V = \frac{S}{T}$.

Cor 2. The velocities of two bodies moving uniformly are directly as the spaces and inversely as the times: for we have $V : v :: \frac{S}{T} : \frac{s}{t}$.

Cor. 3. In equal times the velocities are proportional to the spaces run over: for $T=t$ gives $V : v :: S : s$.

Cor. 4. If the velocities are equal, the spaces passed over are proportional to the times: for $V=v$, gives $St=sT$, or $S : s :: T : t$.

Cor. 5. If the spaces passed over are equal, the velocities are reciprocally as the times: for when $S=s$, we have $V : v :: \frac{1}{T} : \frac{1}{t} :: t : T$.

Cor. 6. Since the areas of rectangles are in the ratio compounded of the ratios of their sides, if the bases represent the velocities of two motions, and altitudes the times, the areas will represent the spaces described.

Cor. 7. Since it has been shewn that the forces which give motion to bodies are proportional to their quantities of motion and these to the rectangles of the masses and velocities, that is, $F \propto Q \propto BV$; we may, by combining this with the present proposition, have the following formulæ of relation of the six quantities, force F, momentum or quantity of motion Q, mass or quantity of matter B, time T, space S, and velocity V; the forces being supposed instantaneous or impulsive, and the motions uniform:

$$F \propto Q \propto BV \propto \frac{BS}{T}.$$

$$Q \propto F \propto BV \propto \frac{BS}{T}.$$

$$B \propto \frac{F}{V} \propto \frac{Q}{V} \propto \frac{FT}{S} \propto \frac{QT}{S}.$$

$$T \propto \frac{S}{V} \propto \frac{BS}{F} \propto \frac{BS}{Q}.$$

$$S \propto TV \propto \frac{TF}{B} \propto \frac{TQ}{B}.$$

$$V \propto \frac{S}{T} \propto \frac{F}{B} \propto \frac{Q}{B}.$$

Scholium. We have before said that we know nothing more of forces than by their effects in moving bodies: we call those equal forces, however different they may be in their nature, which give to bodies equal momenta, or which when the bodies are equal give to them equal velocities; and we say that forces are greater or less when they give to bodies greater or less momenta, or when they impress upon equal bodies greater or less velocities. Therefore when different forces act upon equal bodies, the forces are, *cæteris paribus*, proportional to the velocities imparted: the velocity then being proportional to the force, these two quantities may be represented the one by the other, and all which we have established on the composition and resolution of forces may be applied to the composition and resolution of velocities. Hence it might seem unnecessary to give here the demonstration of the most extensive proposition, as it relates to velocities and directions; but since it may be proved satisfactorily in small compass, and admits of two or three useful deductions, we are unwilling to omit it.

Prop. The simultaneous action of two impulsive forces P, P′, on a body A, which would impress upon it separately the velocities V, V′, in the directions AC, AC′, will cause that body to move uniformly over the diagonal of the parallelogram whose sides are in the directions of those forces.

Imagine that the body A (fig. 1. Pl. 55.) is placed on a plane ACC′ which moves uniformly in the direction AC′ with such a velocity as in each unit of time will carry it over a space equal to the line AC′: it is certain that this body considered with relation to the plane on which it is placed has no motion; yet if a spectator fixed immoveably out of that plane observes the body A, he will attribute to it a motion equal and parallel to that of the plane. Now, if we conceive that any impulsive force whatever, P, acts upon the body A in the direction PAC, and impresses upon it such a velocity that in a unit of time it would pass over a space equal to AC, there can be no

doubt that if the body were acted upon by this force only it would be found at the point C at the termination of the unit of time. But since in consequence of the motion of the plane, the line AC advances towards C′B by a motion uniform and parallel, so that it would really coincide with C′B at the end of a unit of time, it is obvious that the point C will then coincide with the point B, and that, of consequence, the body A which partakes of the motion of the plane ought to be found in B at the end of the first unit of time. We may prove, in like manner, that at the end of any part or multiple whatever, T, of this unit, the body A, animated with the same velocity AC, ought to run over a proportional space $Ac = T \times AC$, while the common motion constrains the line Ac, to pass parallel to itself over a distance $Acc' = T \times AC'$. This line coincides, therefore, with $c'b$, and consequently b is the place of the body A at the end of the time T. And it is manifest that all the points b, b, that may be determined by the same reasoning, are found on the same diagonal AB, since $Ac : cb :: AC : CB$. The body A, therefore, actually describes the diagonal AB. But besides this, its motion along this line must be uniform: for $Ab : AB :: Ac : AC :: T \times AC : AC :: T : 1$; that is to say, Ab is to AB as the time employed in passing through Ab to that occupied in passing over AB. Consequently the motion of the body A along the diagonal AB is uniform. Since a body at rest on a moveable plane has the same motion as the plane, it is clear that if the plane were at rest, but that the body moved uniformly according to the right line P′AC′, with the velocity AC′ equal to that which would be impressed upon it by the force P′, and received at the point A from the force P a velocity AC in the direction PAC, it would describe uniformly the diagonal AB of a parallelogram formed upon the sides AC, AC′, which represent the velocities of the body in those respective directions, while the diagonal AB represents its new velocity. Q.E.D.

We may likewise shew that, if a body be acted on by two similar variable forces (for the same time) whose directions and magnitudes are expressed by the adjacent sides of a parallelogram concurring in the body, it will describe the diagonal of the parallelogram.

Let the forces act by impulses, at the beginning of equal particles of time, and let Ac', $c'C'$ $C'c'$, and Ac, cC, $C'c$, be the relative magnitudes of corresponding impulses. Then by the action of the two first impulses the body will, by the preceding article, describe the diagonal Ab; and by the next two the diagonal bB, of the parallelogram dd', whose sides bd', bd, are equal and parallel to the representatives of those new impulses: but the forces are similar, therefore the parallelograms cc' dd', are similar; and, having parallel sides and a common point b, they exist about the same diagonal AB. The same may be shewn for a third pair of impulses; and so on, *ad libitum*. Let now the particles of time be evanescent and the forces incessant, and the same demonstration will obtain.

Cor. If the forces by which the body is urged in the directions AC, AC′, be not similar, it will move in some curve line, whose nature will depend on the relation of the forces. Of this many instances will occur as we proceed.

There remains another general theorem, which it will not be amiss to exhibit in this place, viz. If a number of bodies is moving in any manner whatever, and an equal force acts on each particle of matter in the same or parallel directions, their relative motions will not be affected.

The motion of any body A (fig. 2. Pl. 55.) with respect to another moving body B, is compounded of the real motion of A and the opposite to the real motion of B: for, let A move uniformly from A to C, while B moves uniformly from B to D; draw AE equal and parallel to BD, join AB, EC, DC, and ED. The motion of A with regard to B consists in its change of position and distance. If while A had described AE, B described BD, there would be no change of relative place or distance: but A is now at C, and DC is its new direction and distance: therefore, the relative or apparent motion of A is EC. Let the parallelogram ACFE be completed: then it is evident that the motion EC is compounded of EF, which is equal and parallel to AC, the real motion of A; and of EA, the equal and opposite to BD, the real motion of B.

Now let the motions of A and B sustain the same change; let the equal and parallel motions AG, BH, be compounded with the motions AC and BD; or, suppose forces to act at once on A and B, in the parallel directions AG, BH, and with equal intensities: on either supposition the resulting motions will be AC′, BD′, the diagonals of the parallelograms AGC′C, and BHD′D. Then constructing the figure as before, we see that the relative motion is E′C′, and that it is equivalent to EC both with respect to magnitude and direction.

Here we may again remark the constant analogy between the composition of motions and that of forces. In the former the relative motions of things are not changed, whatever common motion be compounded with them all: and in the latter the relative motions and actions are not changed by any external force, however considerable, when equally exerted on all the moleculæ in parallel directions.

By means of this it is that we account for the circumstance of the evolutions of a fleet in a uniform current being the same, with relation to the several ships, and produced by the same means, as in still water: also that the motions and operations in a ship, sailing smoothly and regularly along, are performed in the same manner as though the vessel were at rest: and again universally, of all bodies included in a given space (for instance, those on the surface of the earth,) their motions amongst themselves will be the same, their congress the same, the force of their percussion the same, and all their mutual operations, whether the space they occupy is at rest, or whether it moves in a trajectory compounded of the diurnal and annual motions about the centre of the solar system; or lastly, whether these are combined with a motion about some far more distant centre of force.

II. *On Motions uniformly varied.*—A body which has received only a single impulsion will, according to the first law of motion, persevere in its motion with the same velocity and in the same direction it had at the first instant: but if it receives a new impulsion, either in the same direction or in a direction contrary to the first, it will then move with a velocity equal to either the sum or the difference of the two velocities which it received successively. If, therefore, we conceive that at successive intervals of time the body receives new impressions, either in the same or contrary directions, it will be transferred to different parts of space with a varied or unequal motion; its velocity will be different at the commencement of each interval of time. In variable motions the velocity undergoing repeated changes, it is usual to estimate it at any time whatever by the space it is capable of passing over during a unit of time, if its motion for that interval continued the same as at the instant where we would consider the velocity. Or in variable motions, the velocity of a body at any determinate instant is the space which it would run over in every unit of time, if at that instant the action of the power ceased, and the motion became uniform. Or, again, taking an infinitely minute interval of time, we may call the velocity of a moving body for that instant, the ratio of the infinitely little space described in that minute interval to its duration, or rather, the ultimate ratio of those two quantities.

Defs. We call in general any force which acts on a body so as to make it vary its motion an accelerating force: when, in equal intervals of time, it acts equably, or the velocity undergoes equal mutations, we call it a constant or uniform accelerating force, or a constant retarding force, according as it tends to augment or diminish the actual velocity of the moving body.

When a single body is acted upon by a constant force there are four quantities which become the objects of mechanical consideration, viz. the space described, the time of description, the velocity acquired, and the force which produces it; any three of which being given, the other may be ascertained. But when different forces act upon bodies of different masses, these are two additional quantities for consideration, making in the whole six kinds of magnitudes which affect the discussion.

Prop. The velocities generated in equal bodies by the action of constant forces are in the compound ratio of the forces and times of acting.

For, when the times are the same the velocities generated each instant are as the forces of acceleration, and consequently the velocities generated at the end of equal times are as those forces; and if the forces are the same the velocities generated are as the times wherein the forces act; because, when the force is given equal velocities are generated in equal times, and consequently the whole velocities acquired are as the times wherein the given force acts: wherefore, both times and accelerating forces being different, the velocities generated will be as the forces and times of action, jointly.

Cor. 1. The momenta generated in unequal bodies are also conjointly as the forces and their times of action. This is evident, because momenta in unequal bodies may be substituted for proportional velocities in equal bodies, throughout the whole reasoning.

Cor. 2. The momenta lost or destroyed in any times are likewise conjointly as the retarding forces and their times of action. For, whatever momenta any force generates in a given time would an equal force destroy in an equal time, by acting in a contrary direction.

And the same is true of the increase or decrease of motion, by forces that either conspire with, or oppose, the motions of bodies.

Cor. 3. The velocities generated or destroyed in any times are directly as the forces and times, and reciprocally as the bodies or masses. For, since the compound ratios of the bodies and their velocities are as those of the forces and times, the velocities are as the forces and times divided by the bodies.

Prop. In motions uniformly accelerated, when the force and body are given, the space described during a certain time is the half of that which the body, moving uniformly with the last acquired velocity, would describe in an equal time.

Since the velocities are as the times of description, when the body and force are given, the velocities which a given body is found to have successively for the duration of each consecutive interval form an arithmetical progression, $g, 2g, 3g$, &c. of which the last term is gt or v, the number of terms being t, that is to say, being marked by the number of solicitations of the accelerating force. And since each of the velocities is nothing else than the space which the body would describe uniformly during the corresponding interval, the total space described during the time t will therefore be the sum of the terms of this arithmetical progression; which, because g and v are the extremes and t the number of terms, will be expressed by $\frac{1}{2}t(g+v)$. Or if s be the total space described by the body, then will $s=\frac{1}{2}t(g+v)$. Conceive now that the accelerating force acts (as by hyp.) without intermission, or, which comes to the same, imagine that the time t is divided into an indefinite number of infinitely small parts, or instants, and that at the beginning of each instant the accelerating force gives an impulsion to the body. Then g being infinitely minute in relation to v, which is the velocity acquired during the indefinite number of instants denoted by t, must be omitted in the equation $s=\frac{1}{2}t(g+v)$, which will become simply $s=\frac{1}{2}tv$, the space actually described.

This granted, imagine that at the end of the time t the accelerating force ceases to act; then, by the first axiom, the body will persevere in its motion with the velocity v it has acquired: but in uniform motions the spaces described are as the times and velocities jointly, therefore the body moving with the velocity v, during the time t, will describe a space $s'=tv$; which is evidently double the space $\frac{1}{2}tu$, described by the body in an equal time, by the constant action of the accelerating force. Q.E.D.

Prop. The spaces described by a body uniformly accelerated are as the squares of the times.

Since the velocities acquired increase as the time expired, if φ be the velocity at the end of one second, then the velocity acquired after a number t of seconds will be φt; thus we have $v=\varphi t$. The equation $s=\frac{1}{2}vt$, found in the preceding article, becomes therefore $s=\frac{1}{2}\varphi t^2$. If, in like manner, we represent another space by S, which is described by uniform acceleration during the time T, we shall have $S=\frac{1}{2}\varphi T^2$. Hence we see that $s : S : : \frac{1}{2}\varphi t^2 : \frac{1}{2}\varphi T^2 : : t^2 : T^2$. Q.E.D.

Cor. 1. Because the velocities acquired are as the times, we have also the spaces described as the squares of the velocities.

Cor. 2. Therefore either the velocities or the times are as the square roots of the spaces described from the commencement of the motion.

Cor. 3. All that has been shewn here applies equally to motions uniformly retarded; provided that by the times we mean those which are to elapse before the extinction of the velocity, and by the spaces those which remain to be described until the body is brought to rest. Similar propositions have, therefore, been applied to the motions of balls resisted by banks of earths, blocks of wood, &c. See Dr. Hutton's Select Exercises, and Atwood on Motion.

Cor. 4. The velocity φ which will be acquired at the end of a second is that which the accelerating force can generate in a second chosen as a unit of time; it is therefore a measure of the accelerating force, and may of course be safely substituted for that force in any of our subsequent investigations.

Scholium. We may now exhibit general theorems for resolving all problems relating to motions uniformly accelerated or retarded. In order to this, put B= any body or mass, F= the force acting constantly upon it, T= the time of its action, V= the velocity generated (or lost) in the time T, S= the whole space described, Q= the momentum or quantity of motion, at the end (or beginning) of the time: then the fundamental relations are $S \propto TV$, $Q \propto BV$, $Q \propto FT$, from which and the propositions and corollaries just laid down, we have—

$$B \propto \frac{Q}{V} \propto \frac{FT}{V} \propto \frac{QT}{S} \propto \frac{FT^2}{S} \propto \frac{FT^3}{QS} \propto \frac{Q^2}{FS} \propto \frac{Q^2}{FTV} \propto \frac{FS}{V^2}.$$

$$Q \propto BV \propto FT \propto \frac{BS}{T} \propto \frac{FS}{V} \propto \frac{FT^2V}{S} \propto \sqrt{BFS} \propto \sqrt{BFTV}.$$

$$F \propto \frac{Q}{T} \propto \frac{BV}{T} \propto \frac{QV}{S} \propto \frac{QS}{T^2V} \propto \frac{Q^2}{BTV} \propto \frac{BV^2}{S} \propto \frac{BS}{T^2}.$$

$$V \propto \frac{S}{T} \propto \frac{FT}{B} \propto \frac{Q}{B} \propto \frac{QS}{FT^2} \propto \frac{FS}{Q} \propto \frac{Q^2}{BFT} \propto \sqrt{\frac{FS}{B}} \propto \sqrt{\frac{F^2ST}{Q^2}}.$$

$$S \propto TV \propto \frac{FT^2}{B} \propto \frac{QT}{B} \propto \frac{FT^2V}{Q} \propto \frac{QV}{F} \propto \frac{Q^2}{BF} \propto \frac{Q^2V}{F^2T} \propto \frac{BV^2}{F}.$$

$$T \propto \frac{S}{V} \propto \frac{Q}{F} \propto \frac{BV}{F} \propto \frac{BS}{Q} \propto \sqrt{\frac{BS}{F}} \propto \sqrt{\frac{QS}{FV}} \propto \frac{Q^2}{BFV}.$$

When any quantities are given, or their relations to some fixed quantities of the same kind known, they are to be left out in the general theorems: thus, if the body be proportional to the force, we shall have $S \propto TV \propto F'T^2 \propto \frac{V^2}{F^1}$, where $F^1 = \frac{F}{B}$.

As it is sometimes necessary to consider the effect of accelerating forces upon bodies already in motion, it will be worth while to deduce a general formula for that purpose. To this end let g represent, as above, the velocity due to the acceleration during each unit of time, gt will then be the total velocity acquired at the end of the time t: then, if we denote by v the velocity which the body has at the commencement of the time, and by V the velocity at the end of the time t, we have $V = v + gt$. But $V = \frac{\dot{s}}{\dot{t}}$, both in uniform and variable motions, the force or corresponding velocity being supposed constant for the indefinitely small time $\dot{t}$. Therefore $\frac{\dot{s}}{\dot{t}} = v + gt$, and taking the correct fluents, we have

$$\text{(IV.)}\quad S = s + vt + \tfrac{1}{2}gt^2.$$

Here the constant quantity s evidently represents the initial space, viz. the distance between the point of departure and that in relation to which we consider the several positions of the moving body: for $t = o$, gives $S = s$.

The general equation given in the last article may be readily constructed: for it is plain, from the theory of conic sections, that its locus is a common parabola. For, changing S into $x + a$, and t into $y + b$, we have

$$x + a = s + vy + vb + \tfrac{1}{2}g(y + b)^2.$$

Then determining the constant quantities a and b, by the equations

$$v + bg = o, \text{ and } a = s + vb + \tfrac{1}{2}gb^2.$$

We thence find $b = -\frac{v}{g}$, $a = s - \frac{v^2}{2g}$ and the equation (IV.) in the last article will become $y^2 = \frac{2}{g}x$, which is an equation of a parabola whose parameter is $\frac{2}{g}$.

Now the nature of the motion being supposed given, and the constant quantities s, v, g, being known, if AE (fig. 6. Pl. 55.) is the line passed over by the moveable body, and we take $AB = s$, the initial space B will be the point of departure. Here it results from the preceding values of a and b, that if we make $CA = -\frac{v}{g}$, $CD = s - \frac{v^2}{2g}$, and then construct on DF as an axis a parabola DMmm', whose vertex is D, and parameter $\frac{2}{g}$, it will be the curve required; or that in which the ordinates AP, Ap, &c. will represent the times, and the corresponding abscissas PM, pm, &c. the spaces.

If we draw a tangent BR to the point B of the parabola, it will form with AT an angle RBN, of which the tangent will be $= v$. Moreover, if we set off from any point P in AT, the axis of the times, two consecutive seconds, or units of time, Pp, pp', and draw to the corresponding points M, m, of the locus, the tangents Mr, mr' we shall have $nr = v + gt$, $n'r' = v + g(t + 1)$, and consequently $n'r' - nr = g$. Or, we may find the length of g by another method: for, since $PM = s + vt + \frac{1}{2}gt^2$, and $pm = s + v(t + 1) + \frac{1}{2}g(t + 1)^2$, therefore $mn = v + gt + \frac{1}{2}g$; but $nr = v + gt$, whence $mr = \frac{1}{2}g$, and $2mr = g$.

Cor. When $s = o$, A coincides with B: and when $v = o$, B coincides with D, and RN vanishes.

III. *Variable Motions in general.*--When a moving body is subjected to the energy of a force which acts on it without interruption, but in a different manner at each instant, the motion is called in general, variable motion. We have instances of variable motions in the unbending of springs: although the velocity continues to be augmented, yet the degrees by which the augmentation proceeds are diminishing. It is the same with regard to the degrees by which the motion of a ship arrives at uniformity: the action of the wind on the sails diminishes in proportion as the vessel acquires greater velocity, because the action of the wind varies as the difference between its velocity and that of the sail on which it acts.

The different natures of constant and variable accelerating forces, and their corresponding motions, have been illustrated by Dr. Hutton in the following manner. "Let two weights, W, w, be connected by a thread passing over a pulley at A, B, or C (figs. 3, 4, 5, Pl. 55.); and let the weight W descend perpendicularly down, while it draws the smaller weight w up the line AD, or BE, or CF, the first being a straight inclined plane, and the other two curves, the one convex, and the other concave to the perpendicular. Then the small weight w will always make some certain resistance to the free descent of the large weight W, and that resistance will be constantly the same in every part of the plane AD, the difficulty to draw it up being the same in every point of it, because every part of it has the same inclination to the horizon, or to the perpendicular; and consequently the accession to the velocity of the descending weight W will be always equal in equal times; that is, in this case W descends by a uniformly accelerating force. But in the two curves BE, CF, the resistance or opposition of the small weight w will be constantly altering as it is drawn up the curves, because every part of them has a different inclination to the horizon, or to the perpendicular: in the former curve the direction becomes more and more upright, or nearer perpendicular, as the small weight w ascends, and the opposition it makes to the descent of W becomes more and more, and consequently the accession to the velocity of W will be always less and less in equal times; that is, W descends by a decreasing accelerating force; but in the latter curve CF, as w ascends, the direction of the curve becomes less and less upright, and the opposition it makes to the descent of W becomes always less and less; and consequently the accession to the velocity of W will be always more and more in equal times; that is, W descends by an increasing accelerating force. So that although the velocity continually increases in all these cases, yet whilst it increases in a constant ratio to the times of motion, in the plane AD; the velocity increases in a less ratio than the time it ascended by BE, and in a greater ratio than the time increases in the other curve CF."

The principles necessary for the determination of the circumstances of variable motions are easily deducible from what has been done with respect to uniform motions, and those which are uniformly accelerated or retarded; as will be seen in the next proposition.

Prop. To find the fundamental equations which apply to variable motions.

In whatever manner any motion is varied, if we consider it with relation to evanescent instants, we may conceive its velocity to be invariable during any such indefinitely minute interval. But when the motion is uniform the velocity is expressed by the quotient of the space s, described during the interval of time t, divided by that time: Therefore, when the velocity is only uniform for the evanescent instant $\dot t$, the velocity must be expressed by the indefinitely small space $\dot s$, described during this instant, divided by the instant itself. We have, therefore,

$$\text{(I.)} \ldots v=\frac{\dot s}{\dot t}, \text{ or } \dot s=v\dot t.$$

The equation $v=\varphi t$ which expresses the relation of the velocities to the times, in motions uniformly accelerated, gives $\varphi=\frac{v}{t}$; that is to say, when the accelerating force, or rather the quantity φ by which it is measured, is constant, it has for its expression the quotient of the velocity v, which it generates during a certain time t, divided by that time: therefore, if the accelerating force φ acts differently at each instant, we imagine it to be constant only for the evanescent instant $\dot t$, in which it would generate the velocity $\dot v$, and consequently,

$$\text{(II.)} \ldots \varphi=\frac{\dot v}{\dot t}, \text{ or } \dot v=\varphi\dot t.$$

In the equation $v=\varphi t$ we understand φ to denote the velocity that the accelerating force generates in the moving body during a determinate unit of time, as a second, by an action continued and always equal. In the equation $\dot v=\varphi\dot t$ we ought to understand the same thing. But it is necessary to observe, that the accelerating force being supposed variable, the quantity φ, which represents the velocity which it would be capable of generating if it acted as a constant accelerating force during a second, is different for every instant of its motion. Thus we easily conceive that when the accelerating force becomes smaller, the velocity which it will be capable of generating in a second, by its action repeated uniformly during each instant of this second, must be smaller, and *vicè versâ.*

The two preceding equations readily furnish a third, which may often be advantageously adapted; for, from the equation $\dot s=v\dot t$, we deduce $\dot t=\frac{\dot s}{v}$: substituting this value of $\dot t$ in the equation $\dot v=\varphi\dot t$, we readily find

$$\text{(III.)} \ldots \varphi\dot s=v\dot v, \text{ or } \varphi=\frac{v\dot v}{\dot s}.$$

Again, employing the same equations, since $\dot v=\varphi\dot t$, and $v\dot t=\dot s$, we have by multiplication $v\dot t\dot v=\varphi\dot t\dot s$; whence, striking out $\dot t$, there remains $v\dot v=\varphi\dot s$. But $v\dot v=\frac{1}{2}(vv)^{\cdot}$, consequently,

$$\text{(IV.) } \varphi\dot s=\tfrac{1}{2}(vv)^{\cdot}.$$

In the reasoning by which we found the equations $\dot v=\varphi\dot t$, we have considered the velocity as increasing. If, therefore, cases arise in which the velocity diminishes, its fluxion will become negative, and the equations $\dot v=\varphi\dot t$, and $\varphi\dot s=v\dot v$, in order to accommodate them to all cases which may arise, must be written with the double sign: viz. $\pm\dot v=\varphi\dot t$, and $\varphi\dot s=\pm v\dot v$, the superior sign obtaining when the motion is accelerated, and the lower one when it is retarded.

The equation $\dot s=v\dot t$, or $v=\frac{\dot s}{\dot t}$, being fluxed, gives $\dot v=\left(\frac{\dot s}{\dot t}\right)^{\cdot}$: if this value be substituted for $\dot v$ in the equation $\varphi\dot t=\pm\dot v$, it will become

$$\text{(V.)} \ldots \varphi\dot t=\pm\left(\frac{\dot s}{\dot t}\right)^{\cdot}.$$

And this equation must be employed when $\dot t$ is supposed variable: but if we imagine, as it is often right to do, that $\dot t$ is constant, we have $\varphi t^2=\pm\frac{\ddot s}{\dot t}$; wherefore

$$\text{(VI.)} \ldots \varphi\dot t^2=\pm\ddot s, \text{ or } \varphi=\frac{\ddot s}{\dot t^2}.$$

Scholium. According to whatever law the motions of bodies may be varied, we may construct curves as loci of the equations which comprise the relations of the times and spaces: but since there will be as many kinds of curves as there may arise equations comprising the law of the variations, it will be impossible to attend to them minutely here. All, therefore, that will be remarked in this place is, that when the motion is accelerated, the corresponding curve will present its convexity to the axis of the time; while, if the motion is retarded, the concavity of the curve will be presented to that axis: and if in any instant whatever the motion becomes uniform, the curve will then degenerate into a right line, which will be a tangent to that point of the curve which corresponds with the instant of time in which the uniformity of the motion commences.

Having now deduced the chief formulæ in variable motions, it remains for us to present an example or two of their use and application.

I. Suppose that a material point, or very small globe, placed at A (fig. 7. Pl. 55.) is solicited by two forces; the one tending to make it move from A towards B, with a motion uniformly varied; the other tending, on the contrary, to push it back from A towards D: the circumstances of the motion of the globule are required, on the supposition that the repulsive power impresses upon it an accelerating force varying inversely as the distance from the point B. Let AB$=a$, AN$=s=$the space passed over at the end of the time t; the accelerating force which arises from the repulsion from A towards D will be$=\frac{m}{a+s}$, m being a constant quantity depending upon the law according to which the repulsive force acts. Lastly, let $g=$ the constant accelerating force which arises from the impulsion of the moving point from A towards D. The force accelerating the motion which we consider as being the difference of these two forces, we have by the equation (VI.) which gives

$$\frac{\ddot{s}}{\dot{t}^2}=\frac{m}{a+s}-g.$$

To find the fluent of this equation, we must multiply by $\dot{s}$, whence will arise $\frac{\dot{s}}{\dot{t}}\times\dot{\left(\frac{\dot{s}}{\dot{t}}\right)}=v\dot{v}=\frac{m\dot{s}}{a+s}-g\dot{s}$; and consequently, by a well-known form, $\frac{1}{2}v^2=m\text{H}{\cdot}\text{L}{\cdot}(a+s)-gs+\text{C}$. Where, since at the point A we have $v=0$, and $s=0$, we conclude that $\text{C}=-m\text{H}{\cdot}\text{L}{\cdot}a$. Therefore,

$$v=\pm\sqrt{(2m\text{H}{\cdot}\text{L}{\cdot}\frac{a+s}{a}-2gs)}.$$

This equation determines the velocity that the moving body has when it has run over the space s: here if we put for v its value $\frac{\dot{s}}{\dot{t}}$ and find the corresponding fluent, we shall obtain the time t in terms of the space: but this is sometimes attended with considerable difficulty.

The problem just resolved finds its application in a case which we shall now state: if a heavy body, as a piston, is forced into a cylinder or vertical tube BD, open only at the extremity D, which the piston closely fits, and if the part AB is full of a compressed elastic fluid, or of an expansive vapour; then, not considering the friction of the piston against the sides of the tube, it is obvious that this piston will be subjected to the action of gravity which tends to make it descend, and impresses a constant and accelerating force g, and at the same time to the repulsive force of the elastic fluid: but this fluid having less spring as it is less compressed, viz. as the piston is further distant from the extremity B, the accelerating force thence arising varies inversely as the distance of the moveable piston from the bottom of the tube.

We have an example of this species of motion in the balls of guns, and pieces of cannon, driven by the inflammation of the powder: this produces instantaneously a great quantity of an aeriform fluid, of which the respulsive force is inversely as the space in which it is contained. We here neglect the consideration of the weight of the ball, since it has but little effect upon the velocity up to the mouth of the piece, the weight being nothing in theory when the axis of the piece is horizontal. We therefore make $g=0$, or, which amounts to the same, we consider at the commencement of the calculation the accelerating force as$=\frac{m}{a+s}$: consequently,

$$v=\sqrt{2m\text{H}{\cdot}\text{L}{\cdot}\frac{a+s}{a}}.$$

Making s to equal the distance of the point A from the orifice, this equation gives us the velocity with which the ball issues from the piece.

If the weight of the powder, and of the ball, be taken into the computation, it will of course become more intricate: the general principle, however, is still the same. These particulars, with other minutiæ affecting the investigation, are considered by Dr. Hutton, in a solution which may be seen in his Select Exercises.

II. Let there be at D (fig. 7.) a material point, or globule, solicited by an accelerating force varying inversely as the square of the distance of the moveable from the point B; it is required to find the equation of its motion.

Put BD$=a$, DN$=s=$the space passed over at the end of the time t: when the globule has arrived at N, its distance from B will be $a-s$, and the accelerating force is $\frac{m}{(a-s)^2}$, m being again a constant quantity which depends upon the nature of this force; viz. its magnitude at a unit of distance from the centre of attraction. Here, then, we have from the equation vi.

$$\frac{\ddot{s}}{\dot{t}^2}=\frac{m}{(a-s)^2}$$

Multiplying, as before, by $\dot{s}$ we obtain $\frac{\dot{s}}{\dot{t}}\times\dot{\left(\frac{\dot{s}}{\dot{t}}\right)}=v\dot{v}=\frac{m\dot{s}}{(a-s)^2}$; whence $v^2=\frac{2m}{a-s}+\text{C}$. Supposing that at the origin D the globule were not animated with any velocity, we should have at the same time $s=0$, and $v=0$; therefore $\text{C}=-\frac{2m}{a}$. Substituting this, and reducing, we have

$$v=\sqrt{\frac{2m}{a}}\times\sqrt{\frac{s}{a-s}}.$$

Now, to obtain from this equation of the relations between v and s that which obtains between s and t, we must substitute $\frac{\dot{s}}{\dot{t}}$ for v: then taking the reciprocal of the expression, multiplying by $\dot{s}$, and the quantity affected with the radical by

$a-s$, we have $\dot{t}=\sqrt{\frac{a}{2m}}\times\frac{a-s}{\sqrt{as-s^2}}\dot{s}$, where the last factor is equivalent to $\frac{\frac{1}{2}a-s}{\sqrt{as-s^2}}\dot{s}+\frac{1}{2}a\times\frac{\dot{s}}{\sqrt{as-s^2}}$. The first term has for its fluent $\sqrt{as-s^2}$: that of the second is found by transforming s into $\frac{1}{2}a-z$; it is then $\frac{1}{2}a\times$ arc $\left(\cos.=\frac{2z}{a}\right)$: consequently $t=\sqrt{\frac{a}{2m}}\times\left\{\sqrt{as-s^2}+\frac{1}{2}a.\ \text{arc}\left(\cos.=\frac{a-2s}{a}\right)\right\}$ This requires no correction, because s ought to be nothing at the same time that t is.

The preceding values of v and t resolve the problem proposed in the most general manner, comprising all the particular circumstances of the motion: we remark, for example, that $s=a$, gives $\pi\ \infty$, and $t=\sqrt{\frac{a}{2m}}\times\frac{1}{2}a\pi$, where π is the circumference of the circle whose diameter is unity: the first of these expressions indicates that the velocity of the moving point is infinite at the centre of attraction; which is natural to conceive, because the force is so much the more intense as the moveable is nearer the centre, the second expression is proportional to $a\sqrt{a}$, or $a^{\frac{3}{2}}$; whence it follows, that the times employed by two bodies in descending from repose to the centre of attraction are respectively as the square roots of the cubes of the heights fallen from.

In the case where bodies fall by their own gravity towards the earth, the attracting body being considered as a point with regard to the distance s, we shall have $m=32\frac{1}{6}$ and $t=735398\ a\sqrt{\frac{2a}{m}}$.

III. It is required to determine the circumstances of velocity, time, and space, with relation to a body which moves from quiescence in consequence of an attracting force which varies directly as the distance from the centre of force.

Let the point from which the body commences its motion be P (fig. 8.) and let PC $=a$, its distance from C the centre of force; let $v=$ the velocity at any variable distance AC $=s$, and at any distance d from c let f be the force compared with that unit of force whose representative is m. Then, by the nature of the problem, it will be $d:s::f:\frac{ft}{d}$, the force at the distance s, compared with unity, or $\frac{mfs}{d}$ will be that force with respect to the measure m, corresponding with ϕ in our equation iii. Hence, since v increases as s decreases, we shall have

$$v\dot{v}=-\frac{mfs}{d}\dot{s}.$$

This equation gives us $v^2=-\frac{mf}{d}s^2+\text{C}$. Here when $v=0$, $s=a$, and $0=-\frac{mf}{d}a^2+\text{C}$; therefore $\text{C}=\frac{mf}{d}a^2$; and consequently $v^2=\frac{mf}{d}\times(a^2-s^2)$, and $v=\sqrt{\frac{mf}{d}}\times\sqrt{a^2-s^2}$. Hence then, if with centre C and radius CP, the quadrant PDB be described, and at the point A, whose distance from C is $=s$, the ordinate AD be drawn, because $\text{AD}=\sqrt{\text{CD}^2-\text{CA}^2}=\sqrt{a^2-s^2}$, we shall have $v=\text{AD}\sqrt{\frac{mf}{d}}$.

In order to find t, we must adopt the equation (1) or $\dot{t}v=-\dot{s}$, whence arises $\dot{t}=-\frac{\dot{s}}{v}=\sqrt{\frac{d}{mf}}\times\frac{-\dot{s}}{\sqrt{a^2-s^2}}$. Now, if $z=$ arc PD, we have $\dot{z}:-\dot{s}::a:\sqrt{a^2-s^2}$; therefore $\frac{-\dot{s}}{\sqrt{a^2-s^2}}=\frac{\dot{z}}{a}$, and consequently $\dot{t}=\frac{\dot{z}}{a}\sqrt{\frac{d}{mf}}$: the fluent of this expression is $t=\frac{z}{a}\sqrt{\frac{d}{mf}}=\frac{\text{PD}}{\text{CP}}\sqrt{\frac{d}{mf}}$; which wants no correction, because when $t=0$, $z=0$. So that while the velocity of any point A is as the corresponding sine AD, the time of descent to that point is as the arc PD. When A arrives at C we have $t=\frac{\text{PDB}}{\text{PC}}\sqrt{\frac{d}{mf}}=\frac{1}{2}\pi\sqrt{\frac{d}{mf}}$, for the time of falling to the centre. Hence, from whatever altitude CP the body begins to fall towards the centre, its whole time of descent will be the same, $\frac{\text{PDB}}{\text{PC}}$ being in all cases $=\frac{1}{2}\pi=1{\cdot}570796$, a constant quantity.

Cor. If a body be acted upon by a force which is every where as the distance from C, the time of its descent to that centre from any point P is to the time in which it would descend through that same space, if impelled by half the first force uniformly continued, as the circumference of a circle to four diameters. For, on the first supposition the time is as the quadrantal arc PB; and on the latter the time is as 2PC; and PB : 2PC :: circumf. : 8PC or 4 diameters.

On the supposition that the earth were a homogeneous sphere, the force of attraction to which any body below its surface would be subjected varies as the distance from the centre: if, therefore, a perforation were made in a right line from the surface to the centre, the circumstances of a body falling from the surface will be determined from the preceding investigation. In this case d, the distance at which the effects of the force are known, would be $=20935200$ feet, and f the effect of gravity compared with unity, or mf, compared with the assumed measure m, would be represented by $32\frac{1}{6}$ feet, the velocity acquired by a falling body after one second. Hence, when the body has fallen to C, we shall have $v=\text{CB}\sqrt{\frac{mf}{d}}=d\sqrt{\frac{mf}{d}}=\sqrt{mfd}=25950$ feet, or $4{\cdot}9148$ miles per second, for its velocity there: and $t=1{\cdot}570796\sqrt{\frac{d}{mf}}=1267\frac{1}{4}^{s}=21^{m}7\frac{1}{4}^{s}$, for the time of falling to the centre.

We close the subject of variable motions with observing that if the velocity v be as any power n of s the space described, the time may be found by the method of fluxions: for, since v is as sn, and $\dot{t}$ as $\frac{\dot{s}}{v}$, it will also be as $\frac{\dot{s}}{s^n}$, consequently $t = \frac{s^{1-n}}{1-n} + C$, the correction. The application of this theorem to any cases which the student wishes to pursue must be left to his own industry.

IV. *Principle of M. D'Alembert.*—We shall here explain briefly the nature and application of a very fertile principle, first presented to the world by M. D'Alembert in his Dynamique. The general proposition is this:

Prop. In whatever manner several bodies change their actual motions, if we conceive that the motion which each body would have in the succeeding instant, if it were quite free, is decomposed into two others, of which one is the motion which it really takes in consequence of their mutual actions, the second must be such, that if each body were impelled by this force alone (that is, by the force which would produce this second motion,) all the bodies would remain in equilibrio.

This is evident: for if these second constituent forces are not such as would put the system in equilibrio, the other constituent motions could not be those which the bodies really take in consequence of their mutual action, but would be changed by the first.

The use of this proposition will appear from the following examples.

1. Let there be three bodies B, B′, B″, and let the forces F, F′, F″, act upon them, so as to give them the velocities v, v', v'', in any directions whatever, producing the quantities of motion. Bv, B′v', B″v'', which we may call F, F′, F″, because the momenta are the proper measures of the moving forces. Let us further suppose that by striking each other, or being any way connected with each other, they cannot take these motions F, F′, F″, but really take the motions $f, f' f''$. It is obvious that we may consider the motion F impressed upon the body B to be composed of the motion f which it really takes, and of another motion ϕ. In like manner F′ may be resolved into f' which it actually takes, and another ϕ'; and again F″ into f'' and ϕ''. The motions will be the same whether B be acted upon with the force F, or the constituent forces f and ϕ; whether B′ be acted upon by F′, or by f' and ϕ'; and B″ by the force F″, or the component forces f'' and ϕ''. Now, by the supposition, the bodies actually take the motions f, f', f'': therefore the motions ϕ, ϕ', ϕ'', must be such as will not derange the motions f, f', f'': that is to say, if the bodies had only the motions ϕ, ϕ', ϕ'', impressed upon them they would destroy each other, and the system would remain at rest.

II. *Motions upon double inclined planes.*—Let AC, CB (fig. 9. Pl. 55.), represent two inclined planes of equal altitudes, set back to back at DC, the angles of elevation being DAC$=e$, and DBC$=e'$; and let the two weights W, W′, united by a thread WCW′ passing over the pulley C, act the one upon the other. Then, calling w, w', their masses, or their weights, let us determine the circumstances of their motion.

At the end of the time t, w will have a velocity v, and gravity would impress upon it in the instant $\dot{t}$ following a new velocity $= g \,.\, \text{sin.}\, e \,.\, \dot{t}$ provided the weight w were then entirely free: but, by the disposition of the system, $\dot{v}$ will be the velocity which obtains in reality. Then estimating the spaces in the direction CW, as the body W′ moves with an equal velocity but in a contrary sense, it is obvious that the decomposition may be made as follows. At the end of the time $t+\dot{t}$ we have for the velocity impressed upon

$$\text{W} \ldots\ldots v+g \,.\, \text{sin.}\, e \,.\, \dot{t} \;\; \text{where} \begin{cases} v+\dot{v} \ldots \text{effective velocity from C towards A.} \\ g \,.\, \text{sin.}\, e \,.\, \dot{t}-\dot{v} \;\text{velocity destroyed.} \end{cases}$$

$$\text{W} \ldots\ldots -v+g \,.\, \text{sin.}\, e' \,.\, \dot{t}, \;\; \text{where} \begin{cases} -v-\dot{v} \ldots\ldots \text{effective velocity from C towards B.} \\ v+g \,.\, \text{sin.}\, e \,.\, \dot{t} \ldots \text{velocity destroyed.} \end{cases}$$

If, therefore, gravity impresses, during the time $\dot{t}$, upon the masses w, w', the respective velocities $g \,.\, \text{sin.}\, e \,.\, \dot{t}-\dot{v}$, and $g \,.\, \text{sin.}\, e' \,.\, \dot{t}+\dot{v}$, the system will be in equilibrio. The quantities of motion being therefore equal, we have

$$w \,.\, g \,.\, \text{sin.}\, e \,.\, \dot{t} - w\dot{v} = w' \,.\, g \,.\, \text{sin.}\, e' \,.\, \dot{t} + w' \dot{v}.$$

Whence we deduce for the effective accelerating force

$$(\text{I.}) \ldots \phi = \frac{\dot{v}}{\dot{t}} = \frac{w \,\text{sin.}\, e - w' \,\text{sin.}\, e'}{w+w'} \times g.$$

Thus it appears that the motion is uniformly varied: and we readily find

$$(\text{II}) \ldots v = \frac{w \,\text{sin.}\, e - w' \,\text{sin.}\, e'}{w+w'} g \,.\, t.$$

$$(\text{III.}) \ldots s = \frac{w \,\text{sin.}\, e - w' \,\text{sin.}\, e}{w+w'} \,.\, \tfrac{1}{2}gt^2.$$

Such are the equations from which the conditions of the motion are determined. If the two planes are vertical, then is $e=e'=\frac{1}{2}\pi$; by means of which we may find the values that are applicable in the subsequent example.

III. *Motion on the fixed pulley.*—The weights P and W are united by a thread running over the pulley; the force of gravity g which solicits them cannot produce its entire effect, because its action upon the body P$=w$ counteracts its effect upon the other body W$=w'$. At the end of the time $t+\dot{t}$, the velocity of w, in the direction from A to P, will be $v+\dot{v}$, instead of $v+g\dot{t}$, which it would have had if the weight had become free at the end of the time t: thus $g\dot{t}-\dot{v}$ will be the velocity destroyed. In like manner, w' having the same velocity, but in a contrary direction, will have the velocity $-(v+\dot{v})$ instead of $-(v+g\dot{t})$, which it would have had, if at the end of the time t the connection of the two bodies ceased; so that $g\dot{t}+\dot{v}$ will be the velocity destroyed. Then, as in the preceding example, making the momenta equal, we find for the effective accelerating force

$$(1.) \ldots\ldots \phi = \frac{\dot{v}}{\dot{t}} = \frac{w-w'}{w+w'} \times g.$$

This being an expression for a constant accelerating force, we conclude, as in the former instance, that the motion is uniformly varied, and that the circumstances of motion and of velocity may be found by the equations

$$(2.)\ldots v=\frac{w-w'}{w+w'}gt.$$

$$(3.)\ldots s=\frac{w-w'}{2w+2w'}gt^2.$$

In this investigation we have neglected the inertia of the string and the pulley.

In finding the equations (2.) (3.) above, we supposed that each body began to move from quiescence at a point taken for the origin of the spaces denoted by s. But suppose this is not the case, and that we impress upon w an initial velocity of V carrying it downward. This velocity must be parted between the two masses w, w', according to the same law as if w struck the body w' at rest with the velocity V: thus, the velocity common to the two weights would be $\frac{wV}{w+w'}$. We have this value for the velocity at the end of the time $t=0$; therefore

$$(4.)\ldots v=\frac{wV+(w-w')gt}{w+w'}.$$

From this we readily obtain s in terms of t: and the time may be determined by the equation $wV=(w-w')gt$.

IV. *Motion on the Axis in Peritrochio.*—Let the weight P (fig. 10.) be denoted by w, and the weight W by w'; to determine the circumstances of the motion. Let the radius of the wheel $=$R, that of the axle $=r$: the velocity of w at the end of the time t will be $v+\dot{v}$, instead of $v+g\dot{t}$, as in the former cases; that of w' will manifestly be to that of w in the ratio of R to r; it will, therefore, be $-\frac{r}{R}(v+\dot{v})$ instead of being $-\frac{r}{R}(v+g\dot{t})$: the velocities lost are therefore $g\dot{t}-\dot{v}$ and $g\dot{t}-\frac{r}{R}v$. Then making the momenta equal with respect to the axe EF, we find

$$(i.)\ldots\phi=\frac{\dot{v}}{\dot{t}}=\frac{R^2w-Rrw'}{R^2w+r^2w'}\times g.$$

Consequently, the motion is uniformly accelerated in this case likewise. So that we readily deduce the equations for the motion of w or P.

$$(ii.)\ldots v=\frac{R^2w-Rrw'}{R^2w+r^2w'}gt.$$

$$(iii.)\ldots s=\frac{R^2w-Rrw'}{R^2w+r^2w'}.\tfrac{1}{2}gt^2.$$

And the velocity and space, with respect to w', will be

$$(iv)\ldots V=\frac{Rrw-r^2w'}{R^2w+r^2w'}gt.$$

$$(v.)\ldots S=\frac{Rrw-r^2w'}{R^2w+r^2w'}.\tfrac{1}{2}gt^2.$$

Thus much is here offered on the application of M. D'Alembert's principle: the further use of it may appear in some subsequent articles of this work.

V. *Motion of a system of bodies.*—This branch of our subject, embraced in all its generality, would of itself fill volumes: we must content ourselves with presenting here a cursory sketch of the spirit of the principal methods, without entering into the minutiæ of the calculus.

When a body receives an impulsion according to a direction which passes through its centre of gravity, all its parts move with an equal velocity. If such direction pass beside that point, the several parts of the body have unequal velocities, and from that inequality of velocities there results a rotatory motion of the body about its centre of gravity, at the same time that this centre is transported with the velocity which it would have taken if the direction of the impulsion had passed through such point. This case is analogous to that of the earth and other planets. Thus, to explain the double motion of rotation and of translation of the earth, it suffices to suppose that it received primitively an impulsion, the direction of distance from its centre of gravity, a distance indeed, which, on the hypothesis of the homogeneity of our planet, is nearly the hundred and sixtieth part of its radius.

An impulsion given to a homogeneous sphere according to a direction which passes not through its centre, causes it to turn constantly about the diameter perpendicular to the plane drawn through its centre and through the direction of the force impressed. New forces which solicit all its points, and of which the resultant passes through its centre, alters not the parallelism of its axis of rotation. It is thus that the axis of the earth always continues very nearly parallel to itself in its revolution about the sun.

If a body have any figure whatever, its axis of rotation may vary at every instant. The enquiry into these variations, whatever the forces may be which act upon the bodies, is the most interesting problem in the mechanics of hard bodies, by reason of its connection with the precession of the equinoxes and the libration of the moon. In the solution of it, mathematicians have been led to this curious and useful result, namely, that in every body there exists three axes respectively perpendicular, about which it may turn uniformly, when it is not solicited by extraneous forces; these have, therefore, been named principal axes of rotation.

A body, or a system of heavy bodies, of whatever figure, oscillating about a fixed horizontal axis, forms a compound pendulum. In nature there exists no other, and the simple pendulums commonly spoken of are no other than pure geometrical conceptions, proper to simplify the objects. It is easy to refer to them compound pendulums whereof all the points are firmly and invariably connected. If we multiply the length of the simple pendulum, whose oscillations are of the same duration as those of the compound pendulum, by the entire mass of this latter pendulum, and by the distance of its centre of gravity from the axis of oscillation; the product will be equal to the sum of the products of each molecule of the compound pendulum, by the square of its rerespective distance from the same axis. It is by means of this rule, found by Huyghens, that the experiments on compound pendulums have ascertained the length of the simple pendulum which beats seconds. See Pendulum.

Imagine a pendulum making very small oscillations in the same plane, and suppose that at the moment when it is most distant from the vertical, a small force is impressed upon it perpendicular to the plane of its motion, it will describe an ellipse about the vertical line. To represent its motion we may conceive a fictitious pendulum which continues to oscillate as the real pendulum would have done had not the new force been impressed upon it, while this latter pendulum oscillates on each side of the ideal pendulum, as if this pendulum were immoveable and vertical. Thus, the motion of the real pendulum is the result of two oscillations which exist together, and which it is easy to determine.

This method of considering the minute oscillations of bodies may be extended to any system whatever. If we suppose the system deranged by small impulsions from its state of equilibrium, and that afterwards it receives new impulsions; it will oscillate with respect to the successive states which it would have taken in virtue of the first impulsions, in the same manner as it would oscillate with regard to its state of equilibrium if the new impulses had been impressed upon it solely in that state. The very minute oscillations of a system of bodies, however compound they are, may therefore be considered as being formed of simple oscillations perfectly similar to those of the pendulum. In effect, if we conceive the system very little deranged from its state of equilibrium, in such manner that the force which solicits each body tends to reduce it to the point which it would occupy in that state, and moreover is proportional to its distance from that point; it is clear that this will obtain during the oscillation of the system, and that at every instant the velocities of the different bodies will be proportional to their distances from the position of equilibrium: they will, therefore, all arrive at the same instant at that position, and will oscillate in the same manner as a single pendulum. But the state which we have attributed to the system is not single. If we remove one of these bodies from its position of equilibrium, and enquire the position of the other bodies, to accord with the preceding conditions, we shall arrive at an equation of a degree equal to the number of bodies in the system, moveable respectively; which will give so many simple oscillations as there are in number of such bodies. Conceive the system to have the first of these oscillations; and at any instant whatever, remove mentally all the bodies from their position proportionally to the quantities that relate to the second simple oscillation. By virtue of the coexistence of the oscillations, the system will oscillate with regard to the successive states it would have occupied by the first simple oscillation, as it would have oscillated by the second alone, about its state of equilibrium: its motion, therefore, will be constituted by the two first simple oscillations. We may, in like manner, combine with this motion, the third simple oscillation; and by continuing thus to combine all these oscillations in the most general manner, we shall represent all the possible motions of the system.

Hence results an easy mean of ascertaining the absolute stability of its equilibrium. If in all the positions relative to each simple oscillation, the forces that solicit the bodies tend to reduce them to the state of equilibrium, that state will be stable; on the contrary, we shall have a relative stability, if in some of those positions the forces tend to remove the body from that state.

It is manifest that this mode of contemplating the very minute motions of a system may be extended even to fluids, the oscillations of which are the results of simple oscillations existing simultaneously, and frequently of an infinite number of them.

We have a sensible example of the coexistence of minute oscillations in waves. When we agitate slightly a point of the surface of quiescent water, we see circular waves forming and extending around that point. Agitating the surface in another point, new waves are formed and intermingle with the former: yet they are superposed to the surface agitated by the former waves, as they would have been disposed over that surface had it been tranquil, in such manner that we can distinguish them perfectly in their intermixture. What the eye perceives relatively to waves, the ear traces with respect to sounds or to undulations of the air, which are propagated simultaneously without affecting each other, and thus make very distinct impressions.

This principle of the coexistence of simple oscillations, for which we are indebted to Daniel Bernoulli, is one of those general results which interest by the facility which they give to the imagination of representing phenomena and their successive changes. We may easily deduce from it the analytic theory of the minute oscillations of a system. They depend on linear differential equations, the complete integrals of which are the sum of the particular integrals. Thus, the simple oscillations, superposed some over others to form the motion of a system, are like the particular integrals which they represent, and which are combined together to form the complete integral. It is pleasing to follow thus in the phenomena of nature, the intellectual verities of analysis. This correspondence, of which the system of the world furnishes numerous examples, constitutes one of the greatest charms attached to mathematical speculations.

The method of referring the laws of motion to those of equilibrium by the principle of D'Alembert, already explained, is very luminous and general. It remained, however, to combine with this principle that of the virtual velocities, to give to mechanics all the perfection of which it appeared susceptible. Lagrange has accomplished this, and has thereby reduced the determination of the motion of any system of bodies, to the integration of differential equations. The most simple manner of forming these equations is in brief this:

If we imagine three fixed axes respectively perpendicular, and at any instant whatever we decompose the velocity of each material point of a system of bodies, into three others parallel to those axes, we may consider each partial velocity as being uniform for that instant; we may next conceive at the end of the instant, the point animated, in a direction parallel to one of those axes, by three velocities, namely, by its velocity in that instant, by the little variation which it would receive in the succeeding instant, and by that same variation applied in a contrary direction. The two first of these velocities exist in the subsequent instant; the third must therefore be destroyed by the forces that solicit the point, and by the action of the other points of the system. Thus, by conceiving the instantaneous variations of the partial velocities of each point of the system, applied to such point, in a contrary direction; the system must be in equilibrio in virtue of all those variations and of the animating forces. The principle of virtual velocities furnishes the equations of that equilibrium; and by combining them with those which represent the connection of the parts of the system, we shall have the differential equations of the motion of each of those points.

The consideration of the differential equations of the motion of a system of bodies has led to the discovery of several very useful general principles of mechanics, and which are indeed an extension of those previously developed relative to the motion of a point.

A material point moves uniformly in a right line, if it do not experience the operation of extraneous causes. In a system of bodies which act upon one another, without experiencing the action of exterior causes, the common centre of gravity moves uniformly in a right line, and its motion is the same as if, all the bodies being supposed concentred at that point, all the forces which animate them were immediately applied there; so that the direction and the quantity of their resultant remain constantly the same.

The radius vector of a body solicited by a force directed towards a fixed point describes areas proportional to the times. (See CENTRAL FORCES.) If we suppose a system of bodies acting upon each other in any manner whatever and solicited by a force directed towards a fixed point; if from this point we draw to all of them radii vectores, which we project upon an invariable plane passing through that point, the sum of the products of the mass of each body, by the area traced by the projection of its radius vector, is proportional to the time. In this consists the principle of the conservation of areas.

If there be no fixed point towards which the system is attracted; and the system is subject to no other than the mutual action of its parts; we may then assume any point we please for the origin of the radii vectores.

The product of the mass of a body by the area described by the projection of its radius vector, during a unit of time, is equal to a projection of the entire force of that body multiplied by the perpendicular demitted from the fixed point upon the direction of the force thus projected; this latter product is the moment of the force to cause the system to turn about that axis of that system, which, passing through the fixed point, is perpendicular to the plane of projection; the principle of the conservation of areas, therefore, is reducible to this, that the sum of the moments of the finite forces to produce a rotation of the system about any axis whatever, (a sum which in the state of equilibrium is nothing) is constant in the state of motion. Presented in this shape, the principle applies to all possible laws between the force and the velocity.

The product of the mass of a body by the square of its velocity, is by most continental philosophers called *living force.* When a body moves over a curve or a surface without experiencing any foreign action, its living force is always the same, since its velocity is constant: if the bodies of a system experience no other actions than their mutual tractions and pressures, either immediately or through the intervention of bars and inextensible cords without elasticity, the living force of she system is constant, even in the case where several of these bodies are constrained to move over curve lines or surfaces. This is the principle of the conservation of living forces (*vires vivæ*); a principle which extends to all possible laws between the force and the velocity, if we designate by living force of a body, double the integral of the product of its velocity, by the differential of the finite force with which it is animated.

In the motion of a point solicited by any forces whatever, the variation of the living force is equal to twice the sum of the products of the mass of the point, by each of the accelerative forces, multiplied respectively by the elementary quantities whereby the point is advanced towards their origins. In the motion of any system whatever, the double of the sum of all these products is the variation of the living force of the system.

Conceive that in the motion of a system, all the bodies were at the same instant in the position where they would be in equilibrium by virtue of the various accelerating forces; the variation of the living force will there be nothing, by the principle of virtual velocities; the living force, therefore, will then be at its maximum or at its minimum. If the system were moved only by one of its simple oscillations, the bodies on quitting the situation of equilibrium would tend to return thither, if the equilibrium be stable; the velocity would therefore diminish in proportion as they receded farther, and of consequence, the living force would be a maximum in that position; but it would be a minimum if the equilibrium were not stable, the bodies on being removed from the position relative to that state having a tendency to recede farther. Hence we may conclude that if the living force is constantly a maximum when the bodies arrive at the same instant at the position of equilibrium, whatever may be their velocity, the equilibrium is stable; and that, on the contrary, there is neither absolute nor relative stability, if the living force in that position of the system is constantly a minimum.

Lastly, it may be remarked that the sum of the integrals of the product of each finite force of the system, by the element of its direction (a sum which in the state of equilibrium is nothing), is a minimum in the state of motion. This constitutes the principle of the least action, a principle which differs from those of the uniform motion of the centre of gravity, of the conservation of areas and of living forces, in this, that those principles are true integrals of the differential equations of the motion of bodies; while in that of the least action, it is only a singular combination of the same equations.

We must here make a remark respecting the extension of these several principles: that of the uniform motion of the centre of gravity, and the principle of the conservation of areas, subsist even in the case where, by the mutual action of the bodies, they experience sudden changes in their motions, which renders these principles of essential service in numerous circumstances: but the principle of the *Conservatio virium vivarum*, and that of the least action, require that the variations in the motions of the system shall be made imperceptibly.

If the system experience rapid changes, by the mutual action of the bodies, or by meeting with obstacles; the living force receives at each of these changes a diminution equal to the sum of the products of each body by the square of its velocity destroyed, by conceiving its velocity previous to the change, decomposed into two, the one which subsists, the other which is annihilated, and of which the square is evidently equal to the sum of the squares of the variations which the change causes to be experienced by the velocity when decomposed into directions parallel to any three axes whatever respectively perpendicular to each other.

All these principles would still subsist with regard to the relative motion of the bodies of a system, if they were subjected to a general motion, and at the same time common to the foci of the forces which we suppose fixed. They have placed, likewise, in the relative motion of bodies on the earth.

Whatever be the motion of the system and the variations it undergoes through the mutual action of its parts; the sum of the products of each body, by the area traced by its projection about the common centre of gravity, on a plane which, passing through that point, continues always parallel to itself, is constant. The plane on which this sum is a maximum retains a parallel situation during the motion of the system: the same sum is nothing with respect to every plane which, passing through the centre of gravity, is perpendicular to that of which we have been speaking; and the squares of the three similar sums relative to any three planes drawn through the centre of gravity and respectively perpendicular, are equal to the square of the maximum sum. The plane corresponding to this sum possesses farther this remarkable property, namely, that the sum of the projections of the areas traced by bodies one about another, and multiplied respectively by the product of the masses of the two bodies which are united by each radius vector, is a maximum on that plane and on all those which are parallel to it. We may therefore hence ascertain, at every instant, a plane which, passing through any one of the points of the system, retains always a parallel situation; and, since by referring thither the motion of the bodies, two of the arbitrary constant quantities of that motion will disappear, and thus simplify the calculus, it is natural to choose this plane for that of the co-ordinates, and to fix the origin at the centre of gravity of the system.

For more on this subject connected with Dynamics, see the articles Force, Projectiles, Rotation, &c. And the reader who wishes to investigate the subject profoundly should peruse the Mecanique Philosophique of Prony, the Mecanique Analytique of Lagrange, and the Mecanique Celeste of Laplace: we regret that it is not in our power to refer to any English work for similar information.

DY′NASTY. *s.* (δυναςεια.) Government; sovereignty (*Hale*).

Dynasty, among ancient historians, a race or succession of kings in the same line or family.

DYSÆ, in mythology, inferior goddesses among the Saxons, being the messengers of the great Woden, whose province it was to convey the souls of such as died in battle to his abode, called *valhall*, i. e. the hill of slaughter; where they were to drink with him and their other gods, *cerevisiæ*, or a kind of malt liquor, in the sculls of their enemies. The Dysæ conveyed those who died a natural death to *Hela*, the goddess of hell, where they were tormented with hunger, thirst, and every kind of evil.

DYSÆSTHESIÆ. (*dysæsthesia*, δυσαισθησιὰ; from δυς, difficulty, and αισθανομια, to feel or perceive.) The senses injured or destroyed by the imperfections of the organs. It is an order in the class locales of Cullen's nosological arrangement. See Nosology.

DYSART, a borough in Fifeshire, which has a considerable trade in coal, and is seated upon the Frith of Forth. Lat. 56. 9 N. Lon. 3. 6 W.

DYSCINESIÆ, (*dyscinesia*, δυσκινησια; from δυς, bad, and κινεω, to move.) Motion impeded, or depraved, from an imperfection of the affected organ. An order in the class locales of Cullen's nosology. See Nosology.

DISCOPHOSIS. (δυσκοφωσις; from δυς, difficulty, and κωφοω, to be deaf.) Defect in the sense of hearing: dysecœa, paracœa.

DY′SCRASY. *s.* (δυσκρασια.) An undue mixture of elements in the blood or nervous juice; a distemperature (*Floyer*).

DYSECŒA. (*dysecœa*, δυσηκοια; from δυς, difficult, and ακοη, hearing.) Hearing diminished or destroyed. A genus of disease in the class locales and order dysæsthesiæ of Cullen, containing two species: dysecœa organica, which arises from wax in the meatus, injuries of the membrane, or inflammation and obstruction of the tube; dysecœa atonica, when without any discernible injury of the organ. See Nosology.

DYSENTERY. (*dysenteria*, δυσεντερια; from δυς, difficulty, and εντερα, the bowels.) Flux. A genus of disease in the class pyrexiæ, and order profluvia of Cullen's nosology. It is known by contagious pyrexia; frequent griping stools; tenesmus; stools, chiefly mucous, sometimes mixed with blood, the natural fæces being retained or voided in a hardened state; loss of appetite, and nausea.

DYSLOCHIA. (*dyslochia*, δυσλοχια; from δυς, difficulty, and λοχια, the lochia.) A suppression of the lochia. It is thus called by Sagar: but should rather be Allochia.

DYSMENORRHŒA. (δυσμηνορροια.) Dyscatamenia; difficult or painful menstruation.

DISODIC. (δυσωδης; from δυς, bad, and οδω, to smell.) Fetid; foul of smell.

DYSOPIA. (*dysopia*, δυσοπια; from δύς, bad, and ωψ, an eye.) Sight depraved, requiring one certain quantity of light, one particular distance, or one position. A genus of disease in the class locales, and order dysæsthesiæ of Cullen, containing the five following species: 1. Dysopia tenebrarum, requiring objects to be placed in a strong light. 2. Dysopia luminis, objects only discernible in a weak light. 3. Dysopia dissitorum, in which distant objects are not perceived. 4. Dysopia proximorum, in which objects too near are not perceived. 5. Dysopia lateralis, in which objects are not seen, unless placed in an oblique position.

DYSOREXIA. (*dysorexia*, δυσορεξια; from δυς, bad, and ορεξις, appetite.) Depraved or deficient appetite. An order of diseases in the class locales of Cullen's nosology. See Nosology.

DYSPEPSIA. (δυσπεπσια; from δυς, bad, and πεπτω, to concoct.) Want of appetite, accompanied by nausea, vomiting, flatulence, heartburn, costiveness, and pain in the stomach, with other symptoms of debility in the organ of digestion. It is symptomatic of schirrus, ulcer, poison, worms, chlorosis, pregnancy, gout, nephritis, &c. It is arranged by Cullen in the class neurosis, and order adynamiæ.

DYSPERMATISMUS. (*dyspermatismus*, δυσπερματισμος; from δυς, bad, and σπερμα, seed.)

Slow or impeded emission of semen during coition. A genus of disease in the class locales, and order epischesis of Cullen.

DYSPHAGIA. (δυσφαγια; from δυς, difficulty, and φαγω, to eat.) Difficulty of digestion: dispepsy.

DYSPHONIA. (*dysphonia*, δυσφωνια; from δυς, bad, and φων, the voice.) A difficulty of speaking.

DYSPNŒA. (*dyspnœa*, δυσπνοια; from δυς, difficult, and πνεω, to breathe.) Continual difficult respiration, without sense of stricture, and accompanied with cough through the whole course of the disease. A genus of disease in the class neuroses, and order spasmi of Cullen.

DYSTHANATOS. (from δυς, and ϑανατος, dying.) A word used by the ancient writers, sometimes to signify any disease which occasions a painful and slow death, and sometimes for the person dying in such a lingering manner.

DYSTHYMIA. (δυσθυμια; from δυς, bad, and θυμος, the mind.) A morbid affection of the mind or sensorium.

DYSURIA. (*dysuria*, δυσȣρια; from δυς, difficult, and ȣρον, urine.) Difficulty and pain in discharging the urine. A genus of disease in the class locales, and order epischesis of Cullen, containing six species: 1. Dysuria ardens, a sense of heat, without any manifest disorder of the bladder. 2. Disuria spasmodia, from spasm. 3. Dysuria compressionis, from a compression of the neighbouring parts. 4. Dysuria phlogistica, from violent inflammation. 5. Dysuria calculosa, from stone in the bladder. 6. Dysuria mucosa, from an abundant secretion of mucus.

DYTISCUS. In zoology, a genus of the class insecta, order coleoptera. Antennas setaceous; feelers six, filiform; hind legs formed for swimming, fringed on the inner side, and nearly unarmed with claws. A hundred and forty-seven species; with few exceptions all of them inhabitants of Europe; and nearly fifty natives of England. It is an aquatic genus, and is seldom seen in flight but in the evening. The following species are the most worthy of notice, for which see Nat. Hist. Pl. LXXII.

1. D. marginalis. Black; edge round the thorax and outer margin at the shells yellow. It inhabits our own country; is one of the largest of the species, usually measuring something more than an inch in length. It is generally found, and not unfrequently, in stagnant waters; as is also its larva, which is of a very extraordinary shape, and utterly unlike the future insect. The larva has more resemblance indeed to the shrimp tribe, and has, by mistake, been actually described by Mouffet, Aldrovandus, and others, as a species of this apterous insect, under the name of squilla aquatica. It measures when full grown about two inches and a half in length, and is of a pale yellowish brown colour, highly transparent. This larva is of a most ferocious disposition, committing great ravages not only among the weaker kinds of water insects, as well as water newts, tadpoles, &c. but even among fishes, of which it destroys very frequently great numbers in a season. The chrysalis resembles that of the scarabæus: and when at the point of sustaining this change the larva betakes itself to the banks of the water it inhabits, and forms for itself a hollow oval in the soft earth clay which constitute the banks. The change is effected in a few days: yet the ferocious and warlike disposition of the animal still accompanies it; it will bite when caught, or thrust into the fingers a sharp spine, with which it is at this time armed, so as to produce no small degree of pain.

2. D. cinereus. Cinereous; edge of the shells and half the thorax yellow; head black; antennas yellow; mouth yellow; body beneath black, with yellow spots on the sides. Found also in the stagnant waters of our own country. The insect and its larva considerably smaller than the last species; but possessing the same general properties and dispositions.

DYVOUR, in Scotch law, is used in the same sense as the English use the term bankrupt.

E.

E, the second vowel, and fifth letter of the alphabet. The letter E is most evidently derived from the old character Ǝ in the ancient Hebrew and Phœnician alphabets, inverted by the Greeks to this position E, and not from the Hebrew He ה. It is formed by a narrower opening of the larynx than the letter A; but the other parts of the mouth are used nearly in the same manner as in that letter.

It has a long and short sound in most languages. The short sound is audible in *bed, fret, den*, and other words ending in consonants: its long sound is produced by a final *e*, or an *e* at the end of words; as in *glebe, here, hire, scene, sphere, interfere, revere, sincere*, &c. in most of which it sounds like *ee*; as also in some others by coming after *i*, as in *believe, chief, grief, reprieve*, &c. and sometimes this long sound is expressed by *ee*, as in *bleed, beer, creed*, &c. Sometimes the final *e* is silent, and only serves to lengthen the sound of the preceding vowel, as in *rag, rage, stag, stage, hug, huge*, &c. The sound of *e* is obscure in the following words, *oxen, heaven, bounden, fire, massacre, maugre*, &c. E is the most frequent vowel in the English language; for it not only is used like the rest, but has the peculiar quality of lengthening the foregoing vowel, as *căn, cāne*; *măn, māne*.

E*a* has the sound of *e* long.

E in Latin was mostly pronounced *ei*; hence the Romans in three cases of the plural number of the third declension wrote many words indifferently in *is, es*, or *eis*, as *partis, partes*, or *parteis*.

The Greeks have their long and short *e*, which they call *epsilon* and *eta*. The French have at least six kinds of *e*'s: the Latins have likewise a long and short *e*; they also write *e* instead of *a*, as *dicem* for *dicam*, &c. and this is no doubt the reason why *a* is so often changed into *e* in the preter tense, as *ago, egi*; *facio, feci*, &c.

As a numeral, E stands for 250, according to the verse,

E, quoque ducentos et quinquaginta tenebit.

In music it denotes the tone *e-la-mi*. In the kalendar it is the fifth of the dominical letters; and in sea-charts it distinguishes all the easterly points: thus, E. alone denotes East; and E. by S. and E. by N. East by South, and East by North.

EACH, *pron.* (elc, Saxon.) 1. Either of two (*Dryden*). 2. Every one of any number (*Milton*).

To Each the correspondent word is *other*.

EAD, and Eading, denote happiness; *Eadgar*, happy power (*Camden*).

EAGER. *a.* (eaᵹoꞃ, Saxon.) 1. Struck with desire; ardently wishing (*Dryden*). 2. Hot of disposition; vehement; ardent; impetuous (*Hooker. Sprat*). 3. Quick; busy (*Addison*). 4. Sharp; sour; acid (*Shakspeare*). 5. Keen; severe; biting (*Bacon*). 6. Brittle; inflexible (*Locke*).

EA'GERLY. *ad.* (from *eager.*) 1. With ardour of desire (*Stepney*). 2. Ardently; hotly (*Shakspeare*). 3. Keenly; sharply (*Knolles*).

EA'GERNESS. *s.* (from *eager.*) 1. Ardour of inclination (*Rogers*). 2. Impetuosity; vehemence; violence (*Dryden*).

EAGLE, in ornithology. See Falco.

Eagle, in heraldry, is accounted one of the most noble bearings in armoury; and, according to the learned in this science, ought to be given to none but such as greatly excel in the virtues of generosity and courage, or for having done singular services to their sovereigns; in which cases they may be allowed a whole eagle, or an eagle naissant, or only the head or other parts thereof, as may be most conformable to their exploits. The eagle has been borne, by way of ensign or standard, by several nations. The first who seem to have assumed the eagle are the Persians, according to the testimony of Xenophon. Afterwards, it was taken by the Romans; who, after a great variety of standards, at length fixed on the eagle, in the second year of the consulate of C. Marius: till that time, they used indifferently wolves, leopards, and eagles, according to the humour of the commander. The Roman eagles, it must be observed, were not painted on a cloth or flag; but were figures in relievo, of silver or gold, borne on the tops of pikes; the wings being displayed, and frequently a thunder-bolt in their talons. Under the eagle on the pike, were piled bucklers, and sometimes crowns. Thus much we learn from the medals.

Eagle, in astronomy. See Aquila.

The Arabian name for eagle, i. e. Nasr, is applied to several stars, as Nasr sohail, the eagle of Canopus, &c.

Eagle, in architecture, is a figure of that bird anciently used as an attribute of Jupiter, in the capital and friezes of the columns of temples consecrated to that god.

Eagles, a name found very frequently in the ancient histories of Ireland, and used to express a sort of base money that was current in that kingdom in the first years of the reign of Edward the first, that is, about the year 1272. There were, besides the eagles, lionines, rosades, and many other coins of the same sort, named according to the figures they were impressed with.

EAGLE (White), is a Polish order of knighthood, instituted in 1325, by Uladislaus V. on marrying his son Casimire with a daughter of the great-duke of Lithuania.

EAGLE (Black), was a like order, instituted in 1701, by the elector of Brandenburgh, on his being crowned king of Prussia.

EAGLE-FLOWER. See BALSAMINE.

EAGLE-STONE. See FERRUM TUBAQUOSUM.

EA'GLE-EYED. *a.* (from *eagle* and *eye.*) Sharp-sighted as an eagle (*Howel*).

EA'GLE-SPEED. *s.* (*eagle* and *speed.*) Swiftness like that of an eagle (*Pope*).

EAGLET, a diminutive of eagle, properly signifying a young eagle. In heraldry, when there are several eagles on the same escutcheon, they are termed eaglets.

EA'GRE. *s.* (*æger*, in Runick, is the ocean.) A tide swelling above another tide (*Dryden*).

EA'LDERMAN. *s.* (ealꝺeꞃman, Saxon.) Alderman.

EAME. *s.* (eam, Saxon.) Uncle (*Fairfax*).

EAOOWE, one of the Friendly Isles, in the S. Pacific Ocean, discovered by Tasman in 1643, and by him named Middleburgh. The land gently rises to a considerable height, presenting a beautiful prospect of extensive meadows, adorned with tufts of trees, and intermixed with plantations. Lat. 21. 24 S. Lon. 174. 30 W.

EAR. *s.* (eaꞃe, Saxon.) 1. The whole organ of hearing (*Derham*). 2. The part of the ear that stands prominent (*Shakspeare*). 3. Power of judging of harmony (*Richardson*). 4. The head; or the person (*Knolles*). 5. The highest part of a man; the top (*L'Estrange*). 6. The privilege of being readily and kindly heard; favour (*Ben Jonson*). 7. Disposition to like or dislike what is heard; judgment (*Denham*). 8. Any prominence from a large body, raised for the sake of holding it (*Taylor*). 9. The spike of corn; that part which contains the seeds (*Mortimer*). 10. *To fall together by the* EARS. To fight; to scuffle; to quarrel (*More*). 11. *To set by the* EARS. To make strife; to make to quarrel (*Addison*). On some of these acceptations we must enlarge, as below.

EAR (*auris*,) in anatomy and physiology, the organ of hearing; situated on the opposite sides of the head, and in the human subject is divided into external and internal ear. The *auricula*, commonly called the ear, constitutes the external, and contains several eminences and depressions, as the *helix, antihelix, tragus, antitragus, concha auriculæ, scapha, and lobulus.* The external auditory passage, containing the wax, proceeds from its middle down to the membrane of the tympanum which divides the external from the internal parts of this organ. Behind the membrana tympani is an irregular cavity, the cavity of the tympanum, in which are four little bones, the malleus, incus, stapes, and os orbiculare; and four openings, consisting of the Eustachian tube, mastoid sinus, fenestra ovalis, and fenestra rotunda. The tympanum is terminated by the labyrinth. The labyrinth is the remaining part of the internal ear, consisting of the cochlea, vestibulum, and semicircular canals. The arteries of the ear are the external and internal auditory. The veins empty themselves into the external jugulars. The muscles of the ear are divided into three classes: the common, proper, and internal. The common muscles are, attollens aurem, anterior auris, and retrahentes auris, which move the whole ear. The proper are, helicis major, helicis minor, tragicus, antitragicus, and transversus auris; these affect the part only to which they are connected. The muscles of the internal ear are, laxator tympani, tensor tympani, and stapedius, which belong to the ossicula auditus. The nerves of the external ear are branches of the nervus auditorius durus, and those of the internal ear are branches of the nervus auditorius mollis.

The organ of hearing, however, in different animals is very differently constituted. In several, and especially in some fishes, the bones of the ear are placed on the outside of the cranium: in others, as the frog, for example, the vestible or entrance into the organ is from the mouth. In man, indeed, it is partly so, for such is the termination of the Eustachian tube.

EAR, as figuratively used by musicians, implies that sensible, clear, and true perception of musical sounds, by which they are offended at dissonance and pleased with harmony. To have an ear is to be capable of distinguishing the true intonation from the false, to be sensible of metrical precision, and to feel all the nicer changes of artificial combination.

EAR-TRUMPET, or HEARING TRUMPET, an instrument which assists the hearing of persons dull of that faculty. This kind of instruments are formed of tubes, with a wide mouth, and terminating in a small canal, which is applied to the ear. The form evidently shews how they conduce to assist the hearing; for the greater quantity of the weak and languid pulses of the air being received and collected by the large end of the tube, are reflected to the small end, where they are collected and condensed; thence entering the ear in this condensed state, they strike the tympanum with a greater force than they could naturally have done from the ear alone.

There is, however, a method of communicating sounds to the deaf, with better success than by the common ear trumpets, which instruments, at length, entirely destroy the sense of hearing; this is effected by means of a cylindrical rod or tube of ivory, or any similar hard substance; the rod may be from 6 to 12 inches long or more, and from a quarter to half an inch in diameter; if it be made hollow throughout, one end, which is to be placed in the mouth between the front teeth, ought to have a much smaller aperture than the other extremity. This tube is well calculated to assist those deaf persons, who enjoy the music of a harpsichord, or other instrument. Dr. Willich, who gives this method in his Lectures on Diet and Regimen, knew a gentleman who was quite deaf, but with the assistance of a cylinder, such as here described, was enabled to hear the softest notes distinctly, and to enjoy all the pleasures of music.

Ears of a horse constitute much of his beauty, and are in some respects indicative of his disposition. If they are small, soft, and fine, curving inward in a small degree at the point, perfectly erect, and spirited in action, they give the animal a very noble, majestic, and commanding aspect: on the contrary, when a horse points his ears forwards; or instead of keeping them firm is perpetually working with them like a hog, he discovers either a mischievous intention, or a timidity that will induce him to start at every unusual or sudden object. Horses of this description are seldom remarkable for the safety of their eyes. A purchaser cannot be too circumspect in his examination of the ear before he completes his bargain. Horses having coarse, long, foul ears, set on too low, and hanging down on the sides, are called mule, or lop-eared horses; and if of good form or valuable in other respects, are in general cropped to improve their appearance. The greater part of the racing stock of old Herod, one of the best stallions ever bred in England, were foul, long, and wide in their ears, a character which is still to be seen in almost the whole of his progeny.

Trimming the ears on the inside is a very common practice, and adds considerably to the neatness and cleanliness of the head and appearance; but care should be taken never to let it be done during rainy weather, sharp and severe winds, or in the winter season; dreadful colds, as well as dangerous diseases, have often been produced by these means, without knowing from what cause the ill effect has been derived. The operation of trimming should be performed in dry, open, mild weather, and with scissars in preference to the flame of a candle; which, with the additional use of the twitch, only serves to put the poor animal to a double degree of unnecessary misery. After the ears are trimmed, they may be rubbed over on the inside with a small quantity of fresh butter, or a piece of fine linen moistened with olive oil.

EARED, in botany, auritus, auriculatus, (*auris*, an ear). Having an appendage like a little ear. Exemplified in the leaf, leaflet, and frond. Aurita folia: cordata ceterum, sed angulis prominentibus rotundatis. Eared, or more properly ear-shaped, leaves are cordate or heart-shaped, but have the corners prominent and rounded.

The diminiutives earlet and earletted seem scarcely necessary.

EA'RLESS. *a.* (from *ear.*) Wanting ears (*Pope*).

EA'RRING. *s.* (*ear* and *ring.*) Jewels set in a ring, and worn at the ear (*Sandys*).

EA'RSHOT. *s.* Reach of the ear (*Dryden*).

EA'RWAX. *s.* The cerumen or exudation which smears the inside of the ear (*Ray*).

EA'RWIG. *s.* (eaꝛe and ƿıȝȝa, Saxon.) 1. A sheathwinged insect. 2. A whisperer; a prying informer.

EA'RWITNESS. *s.* (*ear* and *witness.*) One who attests, or can attest any thing as heard by himself (*Hooker*).

To EAR. *v. a.* (*aro*, Latin.) To plow; to till (*Shakspeare*).

To Ear. *v. n.* (from *ear.*) To shoot into ears.

EARL, an English title of honour, or degree of nobility, next below a marquis, and above a viscount. Earls were anciently attendants or associates of the king in his councils, and martial expeditions; much as comites, counts, were of the magistrates of Rome, in quality of deputies, to execute their offices for them.

Hence, also, earls are called, in Latin, *comites*; in French, *comtes*, counts, &c. The Germans call them *graves*, as landgrave, markgrave, palsgrave, &c. The Saxons, *ealdormen*; the Danes, *eorlas*; and the English, *earls*.

An Earl is created by cincture of sword, mantle of state put upon him by the king, a cap and a coronet put upon his head, and a charter in his hand.

Originally, the title earl always died with the man. William the Conqueror first made it hereditary; giving it in fee to his nobles, and annexing it to shires or counties. For the support of the state thereof, he allotted the third penny out of the sheriff's court, issuing out of all pleas of the shire from which the earl took his title. But, of later days, the matter is much altered.

Earls are now created by patent, without any authority over, or particular relation to, their counties; and without any profit arising thence, except some annual stipend out of the exchequer, for honour-sake. The number of earls being of late much increased, and no more counties being left for them, several of them have made choice of some eminent part of a county, as Holland, Craven, &c. Others of some town, as Exeter, Bristol, &c. And others, of some village, or their own seat, park, &c. as Godolphin, Bolton, &c.

Earl marshal. See Marshal.

EA'RLDOM. *s.* (from *earl.*) The seigniory of an earl (*Spenser*).

EA'RLINESS. *s.* (from *early.*) Quickness of any action with respect to something else (*Sidney*).

EARLSTONE, a town in Berwickshire, seated on the river Leader, 35 miles S. E. of Edinburgh.

EA'RLY. *a.* (æꝛ, Saxon, before.) Soon with respect to something else (*Smith*).

Ear'ly. *ad.* Soon; betime (*Waller*).

EARN, or Earn Lough, a great lake in the county of Fermanah, in Ireland. It covers nearly one-third part of the county.

To Earn. *v. a.* (eaꝛnian, Saxon.) 1. To gain as the reward or wages of labour, or any performance (*Swift*). 2. To obtain as a consequence of action (*Shakspeare*).

EA'RNEST. *a.* (eaꞃneꞅꞇ, Saxon.) 1. Ardent in any affection; warm; zealous; importunate (*Hooker*). 2. Intent; fixed; eager (*Duppa*). 3. Serious; importunate (*Hooker*).

EA'RNEST. *s.* (from the adjective.) 1. Seriousness; a serious event, not a jest; reality, not a feigned appearance (*Shakspeare*). 2. (*ernitz*, *penge*, Danish.) Pledge; handsel; first fruits (*Smalridge*). 3. The money which is given in token that a bargain is ratified. With us, the person who gave it is in strictness obliged to abide by his bargain; and in case he decline it, is not discharged upon forfeiting his earnest, but may be sued for the whole money stiuplated.

EA'RNESTLY. *ad.* (from *earnest.*) 1. Warmly; affectionately; zealously; importunately; intensely (*Smalridge*). 2. Eagerly; desirously (*Shakspeare*).

EA'RNESTNESS. *s.* (from *earnest.*) 1. Eagerness; warmth; vehemence (*Addison*). 2. Solemnity; zeal; seriousness (*Atterbury*). 3. Solicitude; care; intenseness (*Dryden*).

EARSH. *s.* (from *ear*, to plow.) A plowed field: not in use (*May*).

EARTH. *s.* (eoꞃð, Saxon.) 1. One of the four elements of which the ancient philosophers thought the whole system of nature was composed; terrene matter. 2. The terraqueous globe; the world (*Locke*). 3. Different modifications of terrene matter. 4. This world opposed to other scenes of existence (*Shakspeare*). 5. The inhabitants of the earth (*Genesis*). 6. Country; distinct region (*Dryden*). 7. (from *ear*, to plow.) The act of turning up the ground in tillage (*Tusser*).

To **EARTH.** *v. a.* (from the noun.) 1. To hide in earth (*Dryden*). 2. To cover with earth (*Evelyn*).

To **EARTH.** *v. n.* To retire under ground (*Tickel*).

The EARTH, in astronomy and geography, this terraqueous globe or ball, which we inhabit, consisting of land and sea.

Figure of the Earth.—The ancients had various opinions as to the figure of the earth; some, as Anaximander and Leucippus, held it cylindrical, or in form of a drum: but the principal opinion was, that it was flat; that the visible horizon was the bounds of the earth, and the ocean the bounds of the horizon; that the heavens and earth above this ocean were the whole visible universe; and that all beneath the ocean was Hades: and of this same opinion were also some of the Christian fathers, as Lactantius, St. Augustine, &c. See Lactan. lib. 3. cap. 24; St. Aug. lib. 16, de Civitate Dei; Aristotle de Cœlo, lib. 2, cap. 13.

Such of the ancients, however, as understood any thing of astronomy, and especially the doctrine of eclipses, must have been acquainted with the round figure of the earth; as the ancient Babylonian astronomers, who had calculated eclipses long before the time of Alexander, and Thales the Grecian, who predicted an eclipse of the sun. It is now, indeed, agreed on all hands, unless, perhaps, by the most vulgar and ignorant, that the form of the terraqueous globe is spherical, or very nearly so.

It is an allowed principle in optics, that amongst objects at equal distances (supposing them to be equally illuminated, and that there are no intervening obstacles) those which are of the greatest bulk may be the most clearly discerned, and *vicè versa*; and that some objects of considerable magnitude may be very conspicuous, whilst smaller objects of similar materials, at an equal distance, on the same plane, cannot be seen. Now, it is frequently observed by mariners when they approach the shores of countries, wherever situated, that the points of high rocks, steeples of churches, and other thin but lofty objects, come in sight much sooner than houses and other buildings and objects, of greater magnitude but less height. In like manner, by persons on the shore, the masts and rigging of an approaching ship are discerned some time before the hull and lower parts of the vessel, though much larger, come into view. Seamen, it is well known, frequently discover distant lands from the tops of a ship's masts, long before they are visible to those who stand upon deck. These circumstances, and many others of a similar nature, immediately suggest the idea that the earth is not a vast plane interspersed with hills, dales, and seas, but of some curvilinear figure, the convexity of which rises up and prevents the prospect of distant objects. And since circumstances alike both in kind and degree have thus been observed on all known parts of the earth, it is natural to infer that it is in the shape of a solid of regular and equal curvature, or that it is a sphere.

To these observations we must likewise add, that several navigators have sailed quite round the earth; not in an exact circle, it is true, for this the winding of the shores would not admit of; but going in and out as the shores happened to lie, they have held on the same course, and arrived at their native country on a different side from that on which they first began their voyage: thus Ferdinand Magellan, setting out on the west side of Spain, continued shaping his course westward, till he returned home on the south-eastern side of Spain; and thus, also, have Drake, Dampier, Cooke, and others, circumnavigated the earth: and when, in addition to all these facts, it is recollected, that all the rules of navigation are conformable to the opinion of the earth being nearly globular, and that these rules never lead the mariner into material error, even in the longest and most complicated voyages; these well-known circumstances, without adducing others, though others equally or more forcible might be adduced, (as from eclipses, levelling, &c.) must sufficiently establish the belief in the mind of every impartial and competent judge, that the earth deviates but very little in its form from that of a sphere. See ASTRONOMY.

The natural cause of this sphericity of the globe is, according to sir Isaac Newton, the great principle of attraction, which the Creator has stamped on all the matter in the universe; and by which all bodies, and all the parts of bodies, mutually attract one another. And the same is the cause of the sphericity of the drops of rain, quicksilver, &c.

What the earth loses of its sphericity by mountains and valleys, is nothing considerable; the highest eminence being scarce equivalent to the minutest protuberance on the surface of an orange. Its difference from a perfect sphere, however, is more considerable in another respect, by which it approaches nearly to the shape of an orange, or to an oblate spheroid, being a little flatted at the poles, and raised about the equatorial parts, so that the axis from pole to pole is less than the equatorial diameter. What gave the first occasion to the discovery of this figure of the earth, were the observations of some French and English philosophers in the East Indies, and other parts, who found that pendulums, the nearer they came to the equator, performed their vibrations slower: from whence it follows, that the velocity of the descent of bodies by gravity is less in countries near to the equator; and, consequently, that those parts are farther removed from the centre of the earth, or from the common centre of gravity. See the History of the Royal Academy of Sciences, by Du Hamel, pp. 110, 156, 206; and l'Hist. de l'Acad. Roy. 1700 and 1701. This circumstance put Huygens and Newton upon finding out the cause, which they attributed to the revolution of the earth about its axis. If the earth were in a fluid state, its rotation round its axis would necessarily make it put on such a figure, because the centrifugal force being greatest towards the equator, the fluid would there rise and swell most; and that its figure really should be so now, seems necessary, to keep the sea in the equinoctial regions from overflowing the earth about those parts. See this curious subject well treated by Huygens, in his discourse De Causa Gravitates, p. 154, where he states the ratio of the polar diameter to that of the equator, as 577 to 578. And Newton, in his Principia, first published in 1686, demonstrates, from the theory of gravity, that the figure of the earth must be that of an oblate spheroid generated by the rotation of an ellipse about its shortest diameter, provided all the parts of the earth were of an uniform density throughout, and that the proportion of the polar to the equatorial diameter of the earth would be that of 689 to 692, or nearly that of 229 to 230, or as ·9956522 to one.

This proportion of the two diameters was calculated by Newton in the following manner: Having found that the centrifugal force at the equator is $\frac{1}{289}$th of gravity, he assumes, as an hypothesis, that the axis of the earth is to the diameter of the equator as 100 to 101, and thence determines what must be the centrifugal force at the equator to give the earth such a form, and finds it to be $\frac{4}{506}$ths of gravity: then, by the rule of proportion, if a centrifugal force equal to $\frac{4}{505}$ths of gravity would make the earth higher at the equator than at the poles by $\frac{1}{100}$th of the whole height at the poles, a centrifugal force that is the $\frac{1}{289}$th of gravity will make it higher by a proportional excess, which by calculation is $\frac{1}{228}$th of the height at the poles; and thus he discovered that the diameter at the equator is to the diameter at the poles, or the axis, as 230 to 229. But this computation supposes the earth to be every where of an uniform density; whereas if the earth is more dense near the centre, then bodies at the poles will be more attracted by this additional matter being nearer; and therefore the excess of the semi-diameter of the equator above the semi-axis, will be different. According to this proportion between the two diameters, Newton farther computes, from the different measures of a degree, that the equatorial diameter will exceed the polar by 34 miles and $\frac{1}{6}$.

In opposition to the deductions of Newton, Messrs. Cassini, both father and son, M. Mairan, and M. J. Bernouilli, attempted to prove that the earth was an oblong spheroid; and many positive assertions were made in contradiction of the opinion of that great philosopher. But in 1735 two companies of mathematicians were employed, one for a northern, and another for a southern expedition, the result of whose observations and measurement plainly proved that the earth was flatted at the poles. See DEGREE.

The proportion of the equatorial diameter to the polar, as stated by the gentlemen employed on the northern expedition for measuring a degree of the meridian, is as 1 to 0·9891; by the Spanish mathematicians as 266 to 265, or as 1 to 0·99624; by M. Bouguer as 179 to 178, or as 1 to 0·99441.

Indeed, if in any case fair reasoning from the nature of things could be allowed to determine, independent of experiment, the decision on this ground would be completely in favour of Newton. For it is easy to shew, that if the earth were of an oblong spheroidical figure, the axis of its revolution would either go through one of its short diameters, or be continually changing, unless the said axis exactly coincided with the longer axis of the figure. Thus: suppose such an oblong figure as *Aa* (fig. 5. Pl. 5.) fixed to the axis P*p* at the centre C, but capable of moving freely round it towards either P or *p*, yet so as to be obliged to move with the axis when it turned round. Suppose now, the poles P, *p*, to be fixed, and the body, thus constituted, to be turned swiftly round the axis *p*P: then, if the angle ACP be oblique, and the figure AD*a*E oblong, the parts AC and C*a* will acquire a centrifugal force, which must necessarily enlarge the angle *p*CA till it becomes a right angle. Besides this, a velocity will be generated in the motion, while A is going towards the perpendicular C*c*, which will cause it to proceed farther, as to B, with a motion which will then be retarded till the centrifugal force is sufficient to send it back again the contrary way: and thus it will continue to move like the oscillations of a pendulum; until, at length, a little motion being lost at each oscillation, the oblong figure AD*a*E will move quietly about its less axis DE coinciding with *p*P. That *Aa* could never exactly coincide with P*p* in the earth is more than probable, because the unequal distribution of sea and land, besides the phænomena of the tides, must make the axis of its gravity, and consequently that of its revolution, to differ from the axis of the oblong spheroid, if the earth had such a figure: without considering that every earthquake would also notice an equilibrium, which once lost, could never be recovered again. (*Phil. Transac. No.* 388.)

In the new Petersburgh Acts, for the years 1788 and 1789, are accounts and calculations of experiments relative to this subject by Mr. Krafft. These experiments were made at different times and in various parts of the Russian empire. This gentleman has collected and compared them, and drawn the proper conclusions from them: thus he infers that the length x of a pendulum that swings seconds in any given latitude λ and in a temperature of 10 degrees of Reaumur's thermometer, may be determined by this equation:

$x = 439{\cdot}178 + 2{\cdot}321$ sine ${}^2\lambda$, lines of a French foot,

or $x = 39{\cdot}0045 + 0{\cdot}206$ sine ${}^2\lambda$, in English inches, in the temperature of 53 of Fahrenheit's thermometer.

This expression nearly agrees, not only with all the experiments made on the pendulum in Rússia, but also with those of Mr. Graham in England, and those of Mr. Lyons in 79° 50′ north latitude, where he found its length to be 431·38 lines. It also shews the augmentation of gravity from the equator to the parallel of a given latitude λ: for,

putting g for the gravity under the equator, G for that under the pole, and y for that under the latitude λ, M. Krafft finds
$y = (1 + 0{\cdot}0052848 \text{ sine } ^2\lambda)\, g$; and therefore $G = 1{\cdot}0052848\, g$.

From this proportion of gravity under different latitudes, the same author infers that, in case the earth is a homogeneous ellipsoid, its oblateness must be $\frac{1}{191}$; instead of $\frac{1}{230}$, which ought to be the result of this hypothesis: but on the supposition that the earth is a hetereogeneous ellipsoid, he finds its oblateness, as deduced from these experiments, to be $\frac{1}{297}$; which agrees with that resulting from the measurement of some of the degrees of the meridian. This confirms an observation of M. De la Place, that, if the hypothesis of the earth's homogeneity be given up, then theory, the measurement of degrees of latitude, and experiments with the pendulum, all agree in their result with respect to the oblateness of the earth. See Memoires de l'Acad. 1783, p. 17.

The different lengths of pendulums vibrating in different latitudes in any assumed unit of time reduced to the same temperature, and to the level of the sea, afford another means of appreciating the exact figure of the earth. M. Laplace has lately given a method to ascertain the ellipse generating the terrestrial spheroid, so that the two following conditions shall be fulfilled: 1st. That the sum of the errors committed in the measures from the second pendulum shall be nothing. 2. That the sum of those errors, all taken positively, shall be a minimum.

In order to this, let a', a'', a''', &c. represent the length of the second's pendulum; make k', k'', k''', &c. the squares of the sines of the corresponding latitudes; and suppose that the lengths of the pendulum are expressed by the formula $z + ky$. Calling x', x'', x''', &c. the errors of the observations, we shall have the following equations:

$$\left.\begin{array}{l} a' - z - k'y = x' \\ a'' - z - k''y = x'' \\ a''' - z - k'''y = x''' \\ \ldots\ldots\ldots\ldots \\ a^{(n)} - z - k^{(n)}y = x^{(n)} \end{array}\right\}(A)$$

If these equations be added together, and their sum divided by their number n, we shall, by making the quotient equal to zero, find a result of the form

$$o = A - z - Ky. \quad (B)$$

Such is the condition that must be satisfied when the sum of the errors is nothing.

Now if this equation be subtracted from each of the equations (A), we shall obtain new equations of the following form:

$$\left.\begin{array}{l} b' - q'y = x' \\ b'' - q''y = x'' \\ b''' - q'''y = x''' \;\ldots\; \&c. \end{array}\right\}(O)$$

Form the series of quotients $\frac{b'}{q'}$, $\frac{b''}{q''}$, $\frac{b'''}{q'''}$, &c, and dispose them according to the order of their magnitude, neglecting the signs, and commencing with the greatest: represent these quotients, thus arranged, by

$$h',\ h'',\ h''',\ \&c. \ldots (P)$$

and observe in what order they correspond with the first members of the equations (O).

This done, to obtain the value of y, which reduces to a minimum the sum of the errors all taken positively, we must add the quantities h', h'', h''', &c. until their sum begins to surpass the half sum of all those quantities: thus, calling F that sum, we must determine r in such manner that we shall have

$$\left.\begin{array}{l} h' + h'' + h''' \ldots + h^{(r)}\ 7\ \tfrac{1}{2}F \\ h' + h'' + h''' \ldots\ldots h^{(r-1)} \angle\ \tfrac{1}{2}F \end{array}\right\}(2)$$

and then will $y = h^{(r)}$; because, according to the method actually practised, it is requisite to make the error nothing relative to the length of the pendulum which corresponds to that of the equations (O), of which the first member equal to zero gives that value of y. Then we shall have z by means of the equation $z = A - Ky$. Laplace, applying this kind of analysis to the fifteen principal determinations of the length of the pendulum in different latitudes, finds

$$y = 0{\cdot}0056724 \ldots z = 0{\cdot}99676.$$

Now, it is demonstrated, in No. 34 of the Mécanique Céleste, tome ii. that the compression of the earth is equal to $\frac{5}{2}$ of the ratio of the centrifugal force to gravity *minus* the value of y: whence, this ratio being $\frac{1}{289}$, it follows that the compression, taking the minor axis of the earth for unit, is

$$a = 0{\cdot}00865 - y = \frac{1}{335{\cdot}78};$$

a result which accords remarkably with the ellipticity deduced from the measures in France and at the equator.

The length λ of the centesimal-second's pendulum, expressed in metres for any latitude L, agreeably to the above compression, is

$$\lambda = 0^{m}_{\cdot}739502 + 0{\cdot}^{m}\,004208 \sin^2 L.$$

See also Conn. des Tems, an. 1816, pa. 314.

We shall now give some idea of the analytical processes, by which the figure of the earth is deduced from actual measurements of degrees. If the earth be an ellipsoid of revolution, then all the meridians will be ellipses, whose minor axes will be the axis of the poles, and the major equal that of the equator: calling the former b, the latter a, and denoting by y and x the rectangular co-ordinates, which are respectively parallel to them, the equation of those meridians will be

$$a^2y^2 + b^2x^2 = a^2b^2.$$

Their radius of curvature R will be expressed by

$$R = \frac{[a^4 - x^2(a^2 - b^2)]^{\frac{3}{2}}}{a^4 b},$$

and very small arcs measured on meridians may be considered as appertaining to the osculatory circle, whose radius is R.

Observations make known the abscissa x; but we may deduce it from the latitude, when the radius drawn from the centre of the spheroid to the point in question is known: for, naming r that radius, and φ the latitude, or the angle formed by r, with the major axis, we have

$$x = r \cos \varphi$$

and from thence

$$R = \frac{[a^4 - r^2\,(a^2 - b^2) \cos {}^2\varphi]^{\frac{3}{2}}}{a^4 b}$$

Suppose, now, that $\frac{a-b}{b} = \alpha$, then will α be the compression of the spheroid; and it may be considered as a very small fraction, of which all powers superior to the first may be neglected. Hence we may deduce

$$a=b(1+\alpha)$$

$$a^2-b^2=b^2[(1+\alpha)^2-1]=2b^2\alpha.$$

If α were nothing, the ellipsoid would become a sphere, and r would be always equal to a. If these differ, it can only be proportionally to the compression of the ellipse; and consequently the difference will always be very small, and of the same order as α. But the radius r in the expression of R, is always multiplied by a^2-b^2 or by $2b^2\alpha$: thus, provided we may neglect the square of α, it is unnecessary to have regard to the difference between r and a, and we may substitute a for r. Then will

$$R=\frac{[a^2-(a^2-b^2)\ \cos{}^2\phi]^{\frac{3}{2}}}{ab}.$$

Or, substituting for a its value, and retaining only first powers of α,

$$R=b\frac{(1+2\alpha\sin{}^2\phi)^{\frac{3}{2}}}{1+\alpha}.$$

Developing the numerator of this expression by the binomial theorem, it will become

$$=1+3\alpha\sin{}^2\phi+\ \&c.$$

and by the ordinary division

$$\frac{1}{1+\alpha}=1-\alpha+\&c.$$

These two expressions being multiplied together, and retaining only the first powers of α, we shall have, ultimately,

$$R=b[1-\alpha\ (1-3\ \sin{}^2\phi)].$$

In this expression the only variable quantity is $\sin\phi$. If the compression became evanescent, we should have $R=b$, the meridians would become circles, and all the radii of curvature would be respectively equal. In the case we are considering, they differ from each other by the term $3\alpha b\sin{}^2\phi$; where the sine of the angle ϕ, which is the latitude, augments constantly from the equator to the pole. We see, therefore, that the radii of curvature go on increasing in the same direction proportionally to the square of the sine of the latitude: and as the arcs which correspond to the same number of degrees in different circles are proportional in length to the radii of those circles, it follows that the degrees of the meridian augment, likewise, from the equator to the pole, in the same ratio.

Considering now the arc of a degree measured upon the spheroid in the latitude ϕ, and representing it by c. R being the radius of curvature, $2\pi R$ will be the circumference of the circle of which the arc c measures a degree. We shall have, therefore,

$$360c=2\pi R,\ \text{or}\ \ R=\frac{360c}{2\pi}.$$

Then the preceding equation will become,

$$\frac{360c}{2\pi}=b\ [1-\alpha\ (1-3\ \sin{}^2\phi)].$$

Let c' be an arc of another degree measured in latitude ϕ'; we shall have in like manner

$$\frac{360c'}{2\pi}=b\,[1-\alpha(1-3\ \sin{}^2\phi')].$$

Dividing these equations, member by member, we obtain

$$\frac{c}{c'}=\frac{1-\alpha\ (1-3\sin{}^2\phi)}{1-\alpha\,(1-3\ \sin{}^2\phi')};$$

an equation which contains no other unknown quantity than the compression α; and which, as the terrestrial ellipsoid differs so little from a sphere, may be still farther simplified, by expanding and neglecting the square of α; whence we have

$$\frac{c}{c'}=1-3\ \alpha\,(\sin{}^2\phi-\sin{}^2\phi');$$

or, finally,

$$\alpha=\frac{c'-c'}{3c'\,(\sin{}^2\phi'-\sin^2\phi)}.$$

This formula applied to the degree measured at the equator by Bouguer, and that of France measured by Delambre and Mechain, gives

$$\alpha=\frac{1}{334}$$

$$b=3261443\ \text{toises},\ a=3271208\ \text{toises};$$

$$\text{and}\ a-b=9765\ \text{toises}.$$

The degree measured at Quito, with the degree measured recently in Lapland by Svanberg, gives $\alpha=\frac{1}{309\cdot4}$. The compression deduced from the theory of gravity as applied to the latest observations of Burg, Maskelyne, &c. is $\alpha=\frac{1}{305\cdot05}$. Svanberg's observations compared with Bouguer's give $\alpha=\frac{1}{334\cdot295}$; or, allowing for refraction, agreeably to Prony's method, $\frac{1}{329\cdot246}$. Svanberg's, compared with the degree of Delambre and Mechain, gives $\alpha=\frac{1}{307\cdot405}$. This degree, compared with the late East Indian degree of Major Lambton, gives $\alpha=\frac{1}{307\cdot167}$. The most probable compression in the opinion of Svanberg, is $\frac{1}{323}$ or $\frac{1}{324}$; which he obtains by a diminution of 14 metres from the degree of Peru, an augmentation of 24^m to that of India, and of 2^m to the French degree. See our articles DEGREE and ELLIPTICITY.

Mr. Professor Playfair, in vol. v. of the Edinburgh Trans. enters into the enquiry why, considering the care with which observations have been made, they do not agree more nearly in the results. Among the causes of this inconsistency, besides unavoidable mistakes and the imperfections of instruments, the professor mentions local irregularities in the direction of gravity, particularly those occasioned by the attraction of mountains. "There are," says he, "no doubt, situations, in which the measurement of a small arch might, from this cause, give the radius of curvature of the meridian *infinite*, or even *negative*." Another kind of local irregularity is that arising from the unequal density of the materials under the surface of the earth, and not far from it: errors thus produced might amount to 10″ or 12″. And this cause of error is the more formidable not only because it may go to a great extent, but because there is not any visible mark by which its existence can always be distinguished. The professor also justly observes, that in order to avoid any material error in determining the figure of the earth, the arches measured should be large, consisting each of several degrees, as an error would then be rendered inconsiderable, by being spread out over a greater interval. We refer to Mr. Playfair's paper for some ingenious formulas for ascertaining the proportion of the earth's axes, from different kinds of admeasurement. The reader may also consult bishop Horsley's Tracts; Robertson's Navigation; the papers of Williams, Dalby, and Mudge, in the Philosophical Transactions, relative to the Trigonometrical Survey; Nicholson's Journal, Nos. 29, 31, N. S.; Svanberg, Exposition des Operations faites en Lapponie, &c.; Delambre, &c. Base du Système Métrique décimal; Puissant, Geodosie, Topographie, Hutton's Course, vol. iii. &c. in several of which the principal geodesic operations and analytic formula are explained with considerable perspicuity.

Changes of the Earth.—Mr. Boyle suspects that there are great, though slow, internal changes in the mass of the earth. He argues from the varieties observed in the change of the magnetic needle, and from the observed changes in the temperature of climates. But as to the latter, there is reason to doubt that he could not have diaries of the weather sufficient to direct his judgment. Boyle's Works abr. vol. i. p. 292, &c.

Magnetism of the Earth.—The notion of the magnetism of the earth was started by Gilbert; and Boyle supposes magnetic effluvia moving from one pole to the other. See his Works abr. vol. i. p. 285, 290.

Dr. Knight also thinks that the earth may be considered as a great loadstone, whose magnetical parts are disposed in a very irregular manner; and that the south pole of the earth is analogous to the north pole in magnets, that is, the pole by which the magnetical stream enters. See MAGNET and MAGNETISM.

He observes, that all the phenomena attending the direction of the needle, in different parts of the earth, in great measure correspond with what happens to a needle, when placed upon a large terrella; if we make allowances for the different dispositions of the magnetical parts, with respect to each other, and consider the south pole of the earth as a north pole with regard to magnetism. The earth might become magnetical by the iron ores it contains, for all iron ores are capable of magnetism. It is true, the globe might notwithstanding have remained unmagnetical, unless some cause had existed capable of making that repellent matter producing magnetism move in a stream through the earth.

Magnitude and Constitution of the Earth.—This has been variously determined by different authors, both ancient and modern. The usual way has been, to measure the length of one degree of the meridian, and multiply it by 360, for the whole circumference. (See DEGREE.) Diogenes Laertius informs us, that Anaximander, a scholar of Thales, who lived about 550 years before the birth of Christ, was the first who gave an account of the circumference of the sea and land; and it seems his measure was used by the succeeding mathematicians till the time of Eratosthenes. (See ERATOSTHENES.) Aristotle, at the end of lib. ii. De Cœlo, says, the mathematicians who have attempted to measure the circuit of the earth, make it 40,000 stadiums: which it is thought is the number determined by Anaximander.

The results of many other measurements are upon record; from the mean of all which, the following dimensions may be taken as near the truth:

the circumference	25000 miles,
the diameter	7957¾ miles,
the superficies	198944206 square miles,
the solidity	263930000000 cubic miles.

Also the seas and unknown parts of the earth, by a measurement of the best maps, contain 160522026 square miles; the inhabited parts 38922180: of which Europe contains 4456065; Asia, 10768823; Africa, 9654807; and America, 14110874. If the earth be considered as a spheroid, the axes may be stated at about 7950 and 7977 miles respectively.

The terraqueous globe is distinguished into three parts or regions, viz. 1st, The external part or crust, being that from which vegetables spring and animals are nourished. 2d, The middle, or intermediate part, which is possessed by fossils, extending farther than human labour ever yet penetrated. 3d, The internal or central part, which is utterly unknown to us, though by many authors supposed of a magnetic nature; by others, a mass or sphere of fire; by others, an abyss or collection of waters, surrounded by the strata of earth; and by others, a hollow, empty space, inhabited by animals, that have their sun, moon, planets, and other conveniences within the same. But others divide the body of the globe into two parts, viz. the external part, called the cortex, including the internal, which they call the nucleus, being of a different nature from the former, and possessed by fire, water, or more probably by a considerable portion of metals, as it has been found, by calculation, that the mean density of the whole earth is near double the density of common stone. See Hutton's determination of it, Philos. Trans. 1778, p. 781.

The external part of the globe either exhibits inequalities, as mountains and valleys; or it is plane and level; or dug in channels, fissures, beds, &c. for rivers, lakes, seas, &c. These inequalities in the face of the earth most naturalists suppose have arisen from a rupture or subversion of the earth, by the force either of the subterraneous fires or waters. In this part of the earth there appear various strata, supposed the sediments of several floods; the waters of which, being replete with matters of divers kinds, as they dried up, or oozed through, deposited these different matters, which in time hardened into strata of stone, sand, coal, clay, &c. See GEOLOGY.

Motion of the Earth.—It is now universally agreed that, besides the small motion of the earth which causes the precession of the equinoxes, the earth has two great and independent motions; viz. the one by which it turns round its own axis, in the space of twenty-four hours nearly, and causing the continual succession of day and night; and the other an absolute motion of its whole mass in a large orbit about the sun, having that luminary for its centre, in such manner that its axis keeps always parallel to itself, inclined in the same angle to its path, and by that means causing the vicissitudes of seasons, spring, summer, autumn, winter.

It is indeed true that, as to sense, the earth appears to be fixed in the centre, with the sun, stars, and heavens, moving round it every day; and such doubtless would be considered as the true nature of the motions in the rude ages of mankind, as they are still by the rude and unlearned. But to a thinking and learned mind, the contrary will soon appear. We shall not adduce many arguments in support of this position. It is manifest, from constant observation, that either the earth is at rest, and all the heavenly bodies perform their revolutions daily in circles parallel to each other, their several centres falling in the axis of the earth or heavens; or, that these celestial bodies, or the greater part of them, are at rest, and the earth revolves daily about one of its diameters as an axis. But that the first of these is highly improbable, may be thus shewn: Both the theory and practice of mechanics teach us, that forces are directed to some central body on which they physically depend; that the force of gravity decreases inversely as the square of the distances from its centre; and that when various bodies in a system revolve, their motions are performed about their common centre of gravity: the heavenly bodies are at widely different distances from the earth (varying from about forty millions of miles, to an almost infinitely greater distance); and all these bodies, on this supposition, must move round the earth, or its axis produced, in twenty-four hours; and, besides this, the fixed stars, as appears by the precession of the equinoxes, have another motion round the axis of the ecliptic in about 25920 years: so that, if the earth be fixed, an innumerable multitude of bodies (for such telescopic observations shew the stars to be) are daily moved with wonderful rapidity by forces directed to innumerable imaginary points on which they cannot possibly depend; and those forces must increase exactly in proportion to the distance from the imaginary centres, or they cannot all revolve in the same time; this is directly contradictory to the established laws of motion and gravity, and is, therefore, inadmissible. This is sufficient to prove the reality of the earth's diurnal motion; and as to the annual motion, the discovery of the aberration of light establishes this point beyond controversy.

The nature and effects of the earth's diurnal rotation are traced out under the word DIURNAL. But while the earth is thus turning on its axis, it is at the same time carried by its proper motion in its orbit round the sun, as one of the planets, namely, between the orbits of Venus and Mars, having the orbits of Venus and Mercury within its own, or between it and the sun, in the centre, and those of Mars, Jupiter, Saturn, &c. without or above it; which are therefore called superior planets, and the others the inferior ones. This is called the annual motion of the earth, because it is performed in a year, or 365 days 6 hours nearly; or rather 365 days, 5 hours, forty-nine minutes, from any equinox or solstice to the same again, making the tropical year; but from any fixed star to the same again, as seen from the sun, in 365 days, 6 hours, 9 minutes, which is called the sidereal year. The figure of this orbit is elliptical, having the sun in one focus, the mean distance being about 95 millions of miles. This annual motion is so performed, that the earth's axis is every where parallel, or in the same direction in every part of the orbit; by which means it happens, that at one time of the year the sun enlightens more of the north polar parts, and at the opposite season of the year, more of the southern parts, thus shewing all the varieties of seasons, spring, summer, autumn, and winter. See SEASONS.

The direction of the earth's motion, in its orbit, is upward in the morning, westward at noon, downward in the evening, and eastward at midnight. Therefore, if a body were projected from its surface to arrive at the sun, it must not be towards his disk, for its motion would then be compounded with the annual motion of the earth. But if a ball were projected eastwards at noon, upwards in the evening, or westward at midnight, with a velocity equal to that of the earth in its orbit, it would be at rest in the solar system, and the earth would immediately abandon it. Upon the earth's return a year afterwards, it would meet with the body at rest, were it not for the sun's attraction; but by its force, the ball would in about 64½ days fall into the body of the sun. (*Woolsey's Celestial Companion*, p. 13.)

Age of the Earth.—On this subject there have been many different opinions, and many warm disputes. Aristotle thought the earth was eternal; and Parmenides, Pythagoras, and the Chaldeans, were of the same opinion: but the generality of philosophers, as well as divines and historians, have always held an origin of it; though where to fix that origin, is the difficulty. The different systems of the chronology of the Greeks, the Egyptians, the Jews, the Hebrew text, and the Septuagint version of Scaliger, of Pezron, of sir Isaac Newton, &c. to say nothing of the Chinese annals, leave the point much embarrassed.

Some have proposed to trace up the antiquity of the earth, by an observation of the saltness of the sea; others, by observing the elevation of the bottom of the sea, or the growth of its strata. But these methods must from their nature be very precarious and unsatisfactory. Others, again, as Recupero, suggest an argument for the very great age of the earth, from observations on the lava of Ætna: but sir W. Hamilton proves very clearly that this kind of argument is fallacious.

The French have found in Egypt, on some ancient monuments, different figures of the zodiac, which, supposing them to be originally formed when the heavens had a corresponding position, tended to give to the earth a much higher origin than our received chronology attributes to it. According to some philosophers, we must go back from the present period 15,000 years; and even then we shall only arrive at the time in which the figures of the zodiac were contrived: but the world may have undergone many previous revolutions.

With all the semblance of sagacity and truth which accompanies this mode of argument, nothing can be more unphilosophical than the inference. Is it not an admitted fact, that one of the first efforts of astronomers, after their science had attained a certain degree of perfection, was to draw from it such modes of arrangement and calculation as might be useful in adjusting the current time; and that the period from which they supposed their account to set out was in a great measure arbitrary, depending on the multiplication of cycles into each other, counting backward from any position of the heavenly bodies in the then current age, to the period in which these bodies (according to their tables) must have stood in a position fitting the purpose they had in view?

Besides, the evidence adduced in different papers in the Asiatic Researches amount almost to a demonstration that, excepting a period which accords very well with the Scripture accounts, the whole Bramin chronology of myriads of years is merely a clumsy astronomical fiction, which at first was not even intended to deceive.

We may also state here another well known fact,—that it was long a favourite opinion with astrologers, that all the planets must have been in conjunction in the first scruple of the sign Aries when the world was made; because then, according to them, was the proper time to begin a year! Others might have been for a different arrangement, i. e. a differently constructed zodiac; but whichever had the greatest number of suffrages at any period, can never prove any thing as to the point in question.

The strongest argument in favour of the extreme age of the world has been derived from the Chinese chronology. Now, a remarkable period marked in their annals, as occurring almost at the very origin of their history, is described as attended by a conjunction of the sun, moon, and several planets. Cassini, the celebrated French astronomer, anxious to know the truth of this, calculated backwards, and thence discovered an error of several hundred years in the Chinese chronology; for he satisfactorily proved that such an extraordinary conjunction of the planets did actually happen on the 25th of February, 2012 years before Christ: that is, in the fourth century after the general deluge, in the days of Noah and his sons, a little after the birth of Abraham. So that the boasted antiquity of the Chinese chronology is compelled, by proofs of its own recording, to contract itself within the compass of the Mosaic history, and to come in establishment of the veracity of the sacred records.

But we shall not enter farther into this discussion; for we are convinced that no arguments have yet been advanced by the most ingenious opponents of the received chronology, which afford sufficient reasons to justify our abandoning it.

Earth, in chemistry. While the philosopher has employed this term to express the entire mass of which the globe we inhabit consists, or as a name by which to distinguish this globe from the other planets that constitute the solar system, the chemist has, in almost all ages, given it a different and more restrained signification; and has selected it to denote some particular and elemental substance, of which the great mass of the terrestrial globe, and perhaps of matter in general, is composed. Under the different systems of philosophy in ancient Greece, these elements, or elemental substances, differed very materially in number: Pythagoras, and especially his renowned scholar Empedocles, resolved them into four, and hereby established a system, which has never been altogether subverted to the present hour; these four elements being fire, air, earth, and water. Other Grecian philosophers, however, supposed only one, two, or three, of these four, to be strictly elemental, and the remainder to issue by a variation in the structure or combination of the elemental parts: while Epicurus denied that any of these substances were strictly elemental, and contended that each equally flowed, like every other compound body, from a mere peculiarity in the combination or structure of the common and primary or elemental atoms, which constitute the basis of the visible world. See Corpuscular system.

This part of the Epicurean theory has at length obtained a complete triumph. Yet the term earth is still retained in chemistry, to signify a certain class, not indeed of elemental, but of compound bodies; the composition of which, however, has hitherto resisted all analysis; whence such substances may be still regarded as comparatively simple; and are peculiarly characterised in modern chemistry by the phrase undecompounded bodies. Earth, in this sense of the term, is no longer opposed to water, to air, or even to fire, in the precise idea of it understood by the Greek philosophers, for these are all compound bodies, easily capable of decomposition; the opposites of earth, in modern chemistry, are sulphur, carbon, metals, light, oxygen, hydrogen, azot, caloric, and various other substances, regarded as simple, not merely because they have not hitherto been analysed, but because no phænomenon hitherto observed indicates them to be compounds.

The mineralogist, who is often guided, in a very considerable degree, by the external and more obvious characters of a substance, usually exhibits a very long catalogue of earths in his general classification, in consequence of a variation in these characters. For earths, regarded in this point of view, see the article Mineralogy. The chemist, on the contrary, who confines himself almost entirely to the constituent principles of a substance, as they appear upon minute and patient analysis, very considerably reduces the number, in his own mode of arrangement; and the whole of the earths we are yet acquainted with, in a chemical view of the subject, are reducible to nine, and consist of the following:

Lime	Alkaline.
Magnesia,	
Barytes,	
Strontian,	
Alumina,	Proper.
Glycina,	
Zirconia,	
Silica,	
Yttria,	

All these agree in the following characters, which agreement alone entitles them to the chemical denomination of earths.

1. They are all insoluble in water, or nearly so; or at least they become insoluble when combined with carbonic acid.

2. They have little or no taste or smell; at least when combined with carbonic acid.

3. They are fixed, incombustible, and incapable while pure of being altered by the fire.

4. Their specific gravity does not exceed 4.9.

5. When pure, they are capable of assuming the form of a white powder.

6. They are not altered when heated with combustibles.

These earths are divided into two classes, alkaline earths, and proper earths: the first four in the above catalogue appertain, as we have there marked them, to the former class; the last five to the latter class. And it would be more scientific that this latter class alone should be denominated earths, as in that case the distinguishing characters would apply to each without any modification whatever.

Alkaline earths have a very near resemblance to fixed alkalies, and seem to form the connecting link between these and the proper earths. They are distinguished by the property of giving a green colour to vegetable blues, and of neutralizing acids. Proper earths, on the contrary, do not alter vegetable blues, and are incapable of neutralizing acids.

If such an arrangement were generally adopted, and it has been partially adopted by Fourcroy, genuine or chemical earths would then be thus characterized. They are infusible, and insoluble in water, and have neither taste nor smell: they exhibit neither acid nor alkaline characters: they combine with acids, and with alkalies either pure or carbonated: they have no action on metallic substances, and are incapable of assuming the reguline form.

A considerable stir was made a few years ago in Hungary, by the pretended metallization of several of the earths by M. M. Ruprecht and Tondi, till their experiments were repeated by Klaproth and others, and shown to be entirely fallacious. The chemists first mentioned took a small quantity of any earth, barytes for example, and having beaten it up with a little water and charcoal, smeared it on the inside of a Hessian crucible; the cavity was then filled with powdered charcoal, and at the top of all was placed a layer of bone ash; a cover being then luted on, the crucible was exposed for three quarters of an hour to a blast furnace, in which it was heated almost to a state of pasty fusion. When the contents of the crucible were examined, the barytes was found in part melted with the earth of the crucible, and containing from two to four per cent. of brittle metallic globules, which were supposed to have originated from a decomposition of part of the barytes. These globules, however, on analysis by Klaproth, proved to be nothing more than phosphuret of iron; the metallic part doubtless originating from the iron contained in the earth of the crucible, and the phosphorus from the bone ash by means of the charcoal. That this is the true explanation of the appearance is evident from another experiment of Klaproth, in which he repeated the process of Ruprecht, only substituting a porcelain for a Hessian crucible; but the earth of this crucible contained no iron, and there was not the slightest appearance of metallic globules in the barytes which it contained. Further, the experiment was again repeated in a Hessian crucible, only leaving out the barytes, and the globules made their appearance as plentifully as when the barytes was present.

Earths, in mineralogy, one of the classes of which this science is composed: divided into different orders and genera, according to the different systems of different mineralogists. In the original system of Linnéus, they merely form an order of the class fossils; but this is the only system in which they are thus introduced; and in Gmellin's improvement of the Linnéan arrangement, which is that we have preferred to follow, they are restored to their common rank. See Mineralogy.

Earth (Absorbent). See Absorbents.

Earth (Aluminous). Earth which contains alum. This is found in several parts of England, Scotland, and many other places. See Alumen.

Earth (Animal calcareous). This term is applied to crabs' claws, &c. which are calcareous earth, and obtained from the animal kingdom.

Earth (Bolar). See Bole.

Earth (Heavy). See Baryte.

Earth (Japan). See Catechu.

Earth (Mineral calcareous). Calcareous earths which are obtained from the mineral kingdom, as stalactites, spars, and marbles. The term is applied in opposition to those obtained from animals.

Earth nut. See Pig nut.

Earth (Sealed). *Terra sigillata.* Little cakes of bolar earths, which are stamped with impressions. They were formerly in high estimation as absorbents, but now fallen into disuse.

Earth, in sporting language: a fox beating his pursuers when hunted, and taking refuge under ground, is said to have earthed, or gone to earth. Some of these earths are situate in old chalk pits, forming such different channels and ramifications amidst the roots of trees in woods and coppices, that it is impossible to dig the animal out of them; but where there is the least probability of success, it is never relinquished; upon the principle, that the hounds are entitled to blood after a good chase.

EA'RTHBOARD. *s.* The board of the plough that shakes off the earth (*Mortimer*).

EA'RTHBORN. *a.* (*earth* and *born.*) 1. Born of the earth; terrigenous (*Prior*). 2. Meanly born (*Smith*).

EA'RTHBOUND. *a.* (*earth* and *bound.*) Fastened by the pressure of the earth (*Shakspeare*).

EA'RTHEN. *a.* (from *earth.*) Made of earth; made of clay (*Wilkins*).

Earthen-ware, for the process of making, see Pottery.

EA'RTHFLAX. *s.* (*earth* and *flax.*) A kind of fibrous fossil (*Woodward*).

EA'RTHINESS. *s.* The quality of containing earth; grossness.

EA'RTHLING. *s.* (from *earth.*) An inhabitant of the earth; a mortal; a poor frail creature (*Drummond*).

EA'RTHLY. *a.* (from *earth.*) 1. Not heavenly; mean; vile; sordid (*Milton*). 2. Belonging only to our present state; not spiritual (*Hooker*). 3. Corporeal; not mental (*Pope*).

EARTHQUAKE, in natural history, a vehement shake, or agitation of some considerable place or part of the earth, from natural causes, attended with a terrible noise like thunder, and frequently with an eruption of water or fire, or else of smoke or winds.

Earthquakes are the greatest and most formidable phænomena of nature. Aristotle and Pliny distinguish two kinds with respect to the manner of the shake, viz. a tremor and a pulse: the first being horizontal, in alternate vibrations, compared to the shaking of a person in an ague; the second perpendicular, up and down; which latter kind are also called by Aristotle, βρασσαι, from the resemblance of their motion to that of boiling.

Historians and philosophers relate numerous instances of the dreadful and various effects of earthquakes: from which we shall select only two. The first is the description of the earthquake at Calabria, in the year 1638: it happened whilst the celebrated father Kircher was on his journey to visit mount Ætna; and we shall present the account in his language.

"Having hired a boat (says he), in company with four more (two friars of the order of St. Francis, and two seculars), we launched from the harbour of Messina, in Sicily; and arrived, the same day, at the promontory of Pelorus. Our destination was for the city of Euphæmia, in Calabria; where we had some business to transact, and where we designed to tarry for some time. However, Providence seemed willing to cross our design; for we were obliged to continue three days at Pelorus, on account of the weather; and though we often put out to sea, yet we were as often driven back. At length, wearied with the delay, we resolved to prosecute our voyage; and, although the sea seemed more than usually agitated, we ventured forward. The gulph of Charybdis, which we approached, seemed whirled round in such a manner, as to form a vast hollow, verging to a point in the centre. Proceeding onward, and turning my eyes to Ætna, I saw it cast forth large volumes of smoke, of mountainous sizes, which entirely covered the island, and blotted out the very shores from my view. This, together with the dreadful noise, and the sulphurous stench which was strongly perceived, filled me with apprehensions that some more dreadful calamity was impending. The sea itself seemed to wear a very unusual appearance: they who have seen a lake in a violent shower of rain, covered all over with bubbles, will conceive some idea of its agitations. My surprise was increased, by the calmness and serenity of the weather; not a breeze, not a cloud, which might be supposed to put all nature thus into motion. I therefore warned my companions, that an earthquake was approaching; and after some time, making for the shore with all possible diligence, we landed at Tropæa, happy and thankful for having escaped the threatening dangers of the sea.

"But our triumphs at land were of short duration; for we had scarcely arrived at the Jesuits' college in that city, when our ears were stunned with a horrid sound resembling that of an infinite number of chariots driven fiercely forward; the wheels rattling, and the thongs cracking. Soon after this, a most dreadful earthquake ensued; so that the whole tract upon which we stood seemed to vibrate, as if we were in the scale of a balance, that continued wavering. This motion, however, soon grew more violent; and being no longer able to keep my legs, I was thrown prostrate upon the ground. In the mean time, the universal ruin round me redoubled my amazement. The crash of falling houses, the tottering of towers, and the groans of the dying, all contributed to raise my terror and despair. On every side of me, I saw nothing but a scene of ruin; and danger threatening wherever I should fly. I commended myself to God, as my last great refuge. At that hour, O how vain was every sublunary happiness! wealth, honour, empire, wisdom, all mere useless sounds, and as empty as the bubbles in the deep! Just standing on the threshold of eternity, nothing but God was my pleasure; and the nearer I approached I only loved him the more. After some time, however, finding that I remained unhurt, amidst the general concussion, I resolved to venture for safety; and running as fast as I could, I reached the shore, but almost terrified out of my reason. I did not search long here, till I found the boat in which I had landed; and my companions also, whose terrors were even greater than mine. Our meeting was not of that kind, where every one is desirous of telling his own happy escape: it was all silence, and a gloomy dread of impending terrors.

"Leaving this seat of desolation, we prosecuted our voyage along the coast; and the next day came to Rochetta, where we landed, although the earth still continued in violent agitations. But we had scarcely arrived at our inn, when we were once more obliged to return to the boat; and, in about half an hour, we saw the greater part of the town, and the inn at which we had set up, dashed to the ground, and burying the inhabitants beneath the ruins.

"In this manner proceeding onward in our little vessel, finding no safety at land, and yet, from the smallness of our boat, having but a very dangerous continuance at sea, we at length landed at Lopizium, a castle midway between Tropæa and Euphæmia, the city to which, as I said before, we were bound. Here, wherever I turned my eyes, nothing but scenes of ruin and horror appeared; towns and castles levelled to the ground; Strombalo, though at sixty miles distance, belching forth flames in an unusual manner, and with a noise which I could distinctly hear. But my attention was quickly turned from more remote to contiguous danger. The rumbling sound of an approaching earthquake, which we by this time were grown acquainted with, alarmed us for the consequence; it every moment seemed to grow louder, and to approach nearer. The place on which we stood now began to shake most dreadfully, so that being unable to stand, my companions and I caught hold of whatever shrub grew next to us, and supported ourselves in that manner.

"After some time, this violent paroxysm ceasing, we again stood up, in order to prosecute our voyage to Euphæmia, which lay within sight. In the mean time, while we were preparing for this purpose, I turned my eyes towards the city, but could see only a frightful dark cloud, that seemed to rest upon the place. This the more surprised us, as the weather was so very serene. We waited, therefore, till the cloud had passed away: then turning to look for the city it was totally sunk. Wonderful to tell! nothing but a dismal and putrid lake was seen where it stood. We looked about to find some one that could tell us of its sad catastrophe, but could see no person. All was become a melancholy solitude; a scene of hideous desolation. Thus proceeding pensively along, in quest of some human being that could give us a little information, we at length saw a boy sitting by the shore, and appearing stupified with terror. Of him, therefore, we inquired concerning the fate of the city; but he could not be prevailed on to give us an answer. We entreated him, with every expression of tenderness and pity, to tell us; but his senses were quite wrapt up in the contemplation of the danger he had escaped. We offered him some victuals, but he seemed to loath the sight. We still persisted in our offices of kindness; but he only pointed to the place of the city, like one out of his senses; and then running up into the woods, was never heard of after. Such was the fate of the city of Euphæmia: and as we continued our melancholy course along the shore, the whole coast, for the space of two hundred miles, presented nothing but the remains of cities; and men scattered, without a habitation, over the fields. Proceeding thus along, we at length ended our distressful voyage, by arriving at Naples, after having escaped a thousand dangers both at sea and land."

The great and almost universal earthquake which happened on the 1st of November, 1755, affords a dreadful example of the chief attendants of these striking phænomena, on which account the reader shall be presented with the following description of it.

At Lisbon, in Portugal, its effects were most severe. In 1750, there had been a sensible trembling of the earth felt in that city: for four years afterwards, there had been an excessive drought; insomuch that some springs, formerly very plentiful of water, were dried and totally lost. The predominant winds were north and north-east, accompanied with various, though very small, tremors of the earth. The year 1755 proved very wet and rainy; the summer cooler than usual; and for forty days before the earthquake, the weather was clear, but not remarkably so. The last day of October, the sun was obscured, with a singular gloominess in the atmosphere. The 1st of November, early in the morning, a thick fog arose, which was soon dissipated by the heat of the sun; no wind was stirring; the sea was calm; and the weather as warm as in June or July in this country. At thirty-five minutes after nine, without the least warning, except a rumbling noise not unlike the artificial thunder in our theatres, a most dreadful earthquake shook, by short but quick vibrations, the foundations of all the city, so that many buildings instantly fell. Then, with a scarce perceptible pause, the nature of the motion was changed, and the houses were tossed from side to side, with a motion like that of a waggon violently driven over rough stones. The second shock laid almost the whole city in ruins, with prodigious slaughter of the people. The earthquake lasted in all about six minutes. At the moment of its beginning, some persons on the river, near a mile from the city, heard their boat make a noise as if it had run aground, though they were then in deep water; and at the same time they saw the houses falling on both sides of the river. The bed of the river Tagus was in many places raised to its surface. Ships were driven from their anchors, and jostled together with great violence; nor did their masters know whether they were afloat or aground. A large new quay sunk to an unfathomable depth, with several hundreds of people who were upon it; nor was one of the dead bodies ever found. The bar was at first seen dry from shore: but suddenly the sea came rolling in like a mountain; and about Belem castle the water rose fifty feet almost in an instant. About noon there was another shock; when the walls of several houses that yet remained were seen to open from top to bottom more than a quarter of a yard, and afterwards closed again so exactly that scarce any mark of the injury was left.

At Colares, about twenty miles from Lisbon, and two miles from the sea, on the last day of October, the weather was clear, and uncommonly warm for the season. About four o'clock in the afternoon there arose a fog, which came from the sea, and covered the valleys; a thing unusual at that season of the year. Soon after, the wind changing to the east, the fog returned to the sea, collecting itself, and becoming exceeding thick. As the fog retired, the sea rose with a prodigious roaring. The first of November, the day broke with a serene sky, the wind continuing at east; but about nine o'clock the sun began to grow dim; and about half an hour after was heard a rumbling noise like that of chariots, which increased to such a degree, that it became equal to the explosions of the largest cannon. Immediately a shock of an earthquake was felt, which was quickly succeeded by a second and third; and at the same time several light flames of fire issued from the mountains, resembling the kindling of charcoal. In these three shocks, the walls of the buildings moved from east to west. In another situation, from whence the sea-coast could be discovered, there issued from one of the hills called the Fojo, a great quantity of smoke, very thick, but not very black. This still increased with the fourth shock, and afterwards continued to issue in a greater or less degree. Just as the subterraneous rumblings were heard, the smoke was always observed to burst forth at the Fojo; and the quantity of smoke was always proportioned to the noise. On visiting the place from whence the smoke was seen to arise, no signs of fire could be perceived near it.

At Oporto (near the mouth of the river Douro) the earthquake began about forty minutes past nine. The sky was very serene; when a dreadful hollow noise like thunder, or the rattling of coaches at a distance, was heard, and almost at the same instant the earth began to shake. In the space of a minute or two, the river rose and fell five or six feet, and continued to do so for four hours. It ran up at first with so much violence, that it broke a ship's hawser. In some parts the river opened, and seemed to discharge vast quantities of air; and the agitation in the sea was so great about a league beyond the bar, that air was supposed to have been discharged there also.

St. Ube's, a sea-port town about twenty miles south of Lisbon, was entirely swallowed up by the repeated shocks and the vast surf of the sea. Huge pieces of rock were detached at the same time from the promontory at the west end of the town, which consists of a chain of mountains, containing fine jasper of different colours.

The same earthquake was felt all over Spain, except in Catalonia, Arragon, and Valencia. At Ayamonte (near where the Guadiana falls into the bay of Cadiz), a little before ten o'clock on the 1st of November, the earthquake was felt; having been immediately preceded by a hollow rushing noise. Here the shocks continued for fourteen or fifteen minutes, damaged almost all the buildings, throwing down some, and leaving others irreparably shattered. In little more than half an hour after, the sea and river, with all the canals, overflowed their banks with great violence, laying under water all the coasts of the islands adjacent to the city and its neighbourhood, and flowing into the very streets. The water came on in vast black mountains, white with foam at the top, and demolished more than one half of a tower at the bar named De Canala. In the adjacent strands every thing was irrecoverably lost; for all that was overflowed sunk, and the beach became a sea, without the least resemblance of what it was before. Many persons perished; for although they got aboard some vessels, yet part of these foundered; and others being forced out to sea, the unhappy passengers were so terrified, that they threw themselves overboard. The day was serene, and not a breath of wind stirring.

At Cadiz, some minutes after nine in the morning, the earthquake began, and lasted about five minutes. The water of the cisterns under ground washed backwards and forwards, so that a great froth arose. At ten minutes after eleven, a wave was seen coming from the sea, at eight miles distance, at least sixty feet higher than usual. It dashed against the west part of the town, which is very rocky. Though these rocks broke a great deal of its force, it at last came upon the city walls, beat in the breast-work, and carried pieces of the building of eight or ten ton weight to the distance of forty or fifty yards. When the wave was gone, some parts that are deep at low water, were left quite dry; for the water returned with the same violence with which it came. At half an hour after eleven came a second wave, and after that four other remarkable ones; the first at ten minutes before twelve; the second half an hour before one; the third ten minutes after one; and the fourth ten minutes before two. Similar waves, but smaller, and gradually lessening, continued with uncertain intervals till the evening.

At Gibraltar, the earthquake was not felt till after ten. It began with a tremulous motion of the earth, which lasted about half a minute. Then followed a violent shock; after that, a trembling of the earth for five or six seconds; then another shock was not so violent as the first, which gradually went off as it began. The whole lasted about two minutes. Some of the guns on the battery were seen to rise, others to sink, the earth having an undulating motion. Most people were seized with giddiness and sickness, and some fell down; others were stupefied; and many that were walking or riding felt no motion in the earth, but were sick. The sea rose six feet every fifteen minutes; and then fell so low, that boats and all the small craft near the shore were left aground, as were also numbers of small fish. The flux and reflux lasted till next morning, having decreased gradually from two in the afternoon. At Madrid, the earthquake came on the same time as at Gibraltar, and lasted about six minutes.

In Africa, the earthquake was felt almost as severely as it had been in Europe. Great part of the town of Algiers was destroyed. At Arzilla (a town in the kingdom of Fez), about ten in the morning, the sea suddenly rose with such impetuosity, that it lifted up a vessel in the bay, and dropped it with such force on the land, that it was broke to pieces; and a boat was found two musket-shots within land from the sea. At Fez and Mequinez, great numbers of houses fell down, and a multitude of people were buried in the ruins. At Morocco, by the falling down of a great number of houses, many people lost their lives: and at Salle, a great deal of damage also was done. At Tangier, the earthquake began at ten in the morning, and lasted ten or twelve minutes. At Tetuan, the earthquake began at the same time, but lasted only seven or eight minutes. There were three shocks so extremely violent, that it was feared the whole city would be destroyed.

In the city of Funchal, in the island of Madeira, a shock of this earthquake was first perceived at thirty-eight minutes past nine in the morning. It was preceded by a rumbling noise in the air, like that of empty carriages passing hastily over a stone pavement. The observer felt the floor immediately to move with a tremulous motion, vibrating very quickly. The shock continued more than a minute; during which interval, the vibrations, though continual, were weakened and increased in force twice very sensibly. The increase after the first remission of the shock was the most intense. The noise in the air accompanied the shock during the whole of its continuance, and lasted some seconds after the motion of the earth had ceased; dying away like a peal of distant thunder rolling through the air. At three quarters past eleven, the sea, which was quite calm, it being a fine day, and no wind stirring, retired suddenly some paces; then rising with a great swell without the least noise, and as suddenly advancing, overflowed the shore, and entered the city. It rose fifteen feet perpendicularly above the high-water mark, although the tide, which flows there seven feet, was then at half ebb. The water immediately receded; and after having fluctuated four or five times between high and low water-mark, it subsided, the sea remaining calm as before. In the northern part of the island the inundation was more violent, and the sea there retiring above one hundred paces at first, and suddenly returning, overflowed the shore, forcing open doors, breaking down the walls of several magazines and storehouses, leaving great quantities of fish ashore, and in the streets of the village of Machico. All this was the effect of one rising of the sea, for it never afterwards flowed high enough to reach the high-water mark. It continued, however, to fluctuate here much longer before it subsided than at Funchal; and in some places farther to the westward, it was hardly, if at all, perceptible.

These were the phænomena with which this remarkable earthquake was attended in those places where it was violent. The effects of it, however, reached to an immense distance; and were perceived chiefly by the agitations of the waters, or some slight motion of the earth. The utmost boundaries of this earthquake to the south are unknown; the barbarity of the African nations rendering it impossible to procure any intelligence from them, except where the effects where dreadful. On the north, however, we are assured, that it reached as far as Norway and Sweden. In the former, the waters of several rivers and lakes were violently agitated. In the latter, shocks were felt in several provinces, and all the rivers and lakes were strongly agitated, especially in Dalecarlia. The river Dala suddenly overflowed its banks, and as suddenly retired. At the same time a lake at the distance of a league from it, and which had no manner of communication with it, bubbled up with great violence. At Fahlun, a town in Dalecarlia, several strong shocks were felt.

In many places of Germany the effects of the earthquake were very perceptible; but in Holland, the agitations were still more remarkable. At Alphen on the Rhine, between Leyden and Woerden, in the afternoon of the first of November, the waters were agitated to such a violent degree, that buoys were broken from their chains, large vessels snapped their cables, smaller ones were thrown out of the water upon the land, and others lying on land were set afloat. At Amsterdam, about 11 in the forenoon, the air being perfectly calm, the waters were suddenly agitated in their canals, so that several boats broke loose; chandeliers were observed to vibrate in the churches; but no motion of the earth, or concussion of any building, was observed. At Haerlem, in the forenoon, for near four minutes together, not only the water in the rivers, canals, &c. but also all kinds of fluids in smaller quantities, as in coolers, tubs, backs,

&c. were surprisingly agitated, and dashed over the sides, though no motion was perceptible in the vessels themselves. In these small quantities also the fluid apparently ascended prior to its turbulent motion; and in many places, even the rivers and canals rose 12 inches perpendicularly.

The agitation of the waters was also perceived in various parts of Great Britain and Ireland. At Barlborough in Derbyshire, between 11 and 12 in the forenoon, in a boat-house, on the west side of a large body of water called Pibley Dam, supposed to cover at least thirty acres of land, was heard a surprising and terrible noise; a large swell of water came in a current from the south, and rose two feet on the sloped dam-head at the north end of the water. It then subsided; but returned again immediately, though with less violence. The water was thus agitated for three quarters of an hour; but the current grew every time weaker and weaker, till at last it entirely ceased.

At Busbridge in Surrey, at half an hour after 10 in the morning, the weather being remarkably still, without the least wind, in a canal near 700 feet long, and 58 feet broad, with a small spring constantly running through it, a very unusual noise was heard at the east end, and the water there observed to be in great agitation. It raised itself in a heap or ridge in the middle; and this heap extended lengthwise about 30 yards, rising between two or three feet above the usual level. After this, the ridge heeled or vibrated towards the north side of the canal with great force, and flowed above eight feet over the grass walk on that side. On its return back into the canal, it again ridged in the middle, and then heeled with yet greater force to the south side, and flowed over its grass walk. During this latter motion, the bottom on the north side was left dry for several feet. This appearance lasted for about a quarter of an hour, after which the water became smooth and quiet as before. During the whole time the sand at the bottom was thrown up and mixed with water; and there was a continual noise like that of water turning a mill. At Cobham in Surrey, Dunstall in Suffolk, Earsy Court in Berkshire, Eatonbridge in Kent, and many other places, the waters were variously agitated.

At Eyam-bridge, Derbyshire, (in the Peak) the overseer of the lead mines sitting in his writing-room about 11 o'clock, felt a sudden shock, which very sensibly raised him up in his chair, and caused several pieces of plaster to drop from the sides of the room. The roof was so violently shaken, that he imagined the engine shaft had been falling in. Upon this he immediately ran to see what was the matter, but found every thing in perfect safety. At this time two miners were employed in carting, or drawing along the drifts of the mines, the ore and other materials to be raised up at the shafts. The drift in which they were working was about 120 yards deep, and the space from one end to the other 50 yards or upwards. The miner at the end of the drift had just loaded his cart and was drawing it along; but he was suddenly surprised by a shock, which so terrified him, that he immediately quitted his employment, and ran to the west end of the drift to his partner, who was not less terrified than himself. They durst not attempt to climb the shaft, lest that should be running in upon them: but while they were consulting what means they should take for their safety, they were surprised by a second shock more violent than the first; which frightened them so much, that they both ran precipitately to the other end of the drift. They then went down to another miner who worked about 12 yards below them. He told them that the violence of the second shock had been so great, that it caused the rocks to grind one upon another. His account was interrupted by a third shock, which, after an interval of four or five minutes, was succeeded by a fourth; and, about the same space of time after, by a fifth; none of which were so violent as the second. They heard, after every shock, a loud rumbling in the bowels of the earth, which continued about half a minute, gradually decreasing, or seeming to remove to a greater distance.

At Shireburn castle, Oxfordshire, a little after ten in the morning, a very strange motion was observed in the water of a moat which encompasses the house. There was a pretty thick fog, not a breath of air, and the surface of the water all over the moat as smooth as a looking-glass, except at one corner, where it flowed into the shore, and retired again successively, in a surprising manner. In what manner it began to move is uncertain, as nobody observed the beginning of its motion. The flux and reflux, when seen, were quite regular. Every flood began gently; its velocity increased by degrees, when at last it rushed in with great impetuosity, till it had attained its full height. Having remained for a little time stationary, it then retired, ebbing gently at first, but afterwards sinking away with great swiftness. At every flux, the whole body of water seemed to be violently thrown against the bank; but neither during the time of the flux nor that of the reflux did there appear even the least wrinkle of a wave on the other parts of the moat. Lord Parker, who had observed this motion, being desirous to know whether it was universal over the moat, sent a person to the other corner of it, at the same time that he himself stood about 25 yards from him, to examine whether the water moved there or not. He could perceive no motion there, or hardly any: but another, who went to the north-east corner of the moat, diagonally opposite to his lordship, found it as considerable there as where he was. His lordship imagining, that in all probability the water at the corner diagonally opposite to where he was would sink as that by him rose, he ordered the person to signify by calling out when the water by him began to sink, and when to rise. This he did; but to his lordship's great surprise, immediately after the water began to rise at his own end, he heard his voice calling that it began to rise with him also; and in the same manner he heard that it was sinking at his end, soon after he perceived it to sink by himself. A pond just below was agitated in a similar manner; but the risings and sinkings of it happened at different times from those at the pond where lord Parker stood.

At White Rock in Glamorganshire, about two hours ebb of the tide, and near three quarters after six in the evening, a vast quantity of water rushed up with a prodigious noise; floated two large vessels, the least of them above 200 tons; broke their moorings, drove them across the river, and had like to have overset them. The whole rise and fall of this extraordinary body of water did not last above ten minutes, nor was it felt in any other part of the river, so that it seemed to have gushed out of the earth at that place.

Similar instances occurred at Loch Lomond and Loch Ness in Scotland. At Kinsale in Ireland,

and all along the coast to the westward, many similar phenomena were observed.

Shocks were also perceived in several parts of France; as at Bayonne, Bourdeaux, and Lyons; and commotions of the waters were observed at Angoulesme, Bleville, Havre de Grace, &c. but not attended with the remarkable circumstances above mentioned.

These are the most striking phenomena with which the earthquake of November 1, 1755, was attended on the surface of the earth. Those which happened below ground cannot be known but by the changes observed in springs, &c. which were in many places very remarkable.—At Colares, on the afternoon of the 31st of October, the water of a fountain was greatly decreased: on the morning of the first of November it ran very muddy; and after the earthquake, returned to its usual state both as to quantity and clearness. On the hills numbers of rocks were split; and there were several rents in the ground, but none considerable. In some places where formerly there had been no water, springs burst forth, which continued to run.—Some of the largest mountains in Portugal were impetuously shaken as it were from their foundation; most of them opened at their summits, split and rent in a wonderful manner, and huge masses of them were thrown down into the subjacent valleys.—From the rock called Pedra de Alvidar, near the hill Fojo, a kind of parapet was broken off, which was thrown up from its foundation in the sea.—At Varge, on the river Macaas, at the time of the earthquake, many springs of water burst forth, some spouted to the height of 18 or 20 feet, throwing up sand of various colours, which remained on the ground. A mountainous point, seven or eight leagues from St. Ube's, cleft asunder, and threw off several vast masses of rock. —In Barbary, a large hill was rent in two: the two halves fell different ways, and buried two large towns. In another place a mountain burst open, and a stream issued from it as red as blood. At Tangier, all the fountains were dried up, so that there was no water to be had till night.—A very remarkable change was observed on the medicinal waters of Toplitz, a village in Bohemia famous for its baths. These waters were discovered in the year 762; from which time the principal spring of them had constantly thrown out hot water in the same quantity, and of the same quality. On the morning of the earthquake, between 11 and 12 in the forenoon, the principal spring cast forth such a quantity of water, that in the space of half an hour all the baths ran over. About half an hour before this great increase of the water, the spring flowed turbid and muddy; then having stopped entirely for a minute, it broke forth again with prodigious violence, driving before it a considerable quantity of reddish ochre. After this it became clear, and flowed as pure as before. It still continues to do so; but the water is in greater quantity, and hotter, than before the earthquake. At Angoulesme in France, a subterraneous noise like thunder was heard; and presently after the earth opened, and discharged a torrent of water mixed with red sand. Most of the springs in the neighbourhood sunk in such a manner, that for some time they were thought to be quite dry. In Britain, no considerable alteration was observed in the earth, except that, near the lead mine above-mentioned in Derbyshire, a cleft was observed about a foot deep, six inches wide, and 150 yards in length.

At sea, the shocks of this earthquake were felt most violently. Off St. Lucar, the captain of the Nancy frigate felt his ship so violently shaken, that he thought she had struck the ground; but, on heaving the lead, found she was in a great depth of water. Captain Clarke from Denina, in N. lat. 36. 24. between nine and ten in the morning, had his ship shaken and strained as if she had struck upon a rock, so that the seams of the deck opened, and the compass was overturned in the binnacle. The master of a vessel bound to the American islands, being in N. lat 25°, W. lon. 40°, and writing in his cabin, heard a violent noise, as he imagined, in the steerage; and while he was asking what the matter was, the ship was put into a strange agitation, and seemed as if she had been suddenly jerked up and suspended by a rope fastened to the mast-head. He immediately started up with great terror and astonishment; and looking out of the cabin window, saw land, as he took it to be, at the distance of about a mile. But coming upon the deck, the land was no more to be seen, but he perceived a violent current cross the ship's way to the leeward. In about a minute, this current returned with great impetuosity, and at a league's distance he saw three craggy-pointed rocks throwing up waters of various colours resembling fire. This phenomenon, in about two minutes, ended in a black cloud, which ascended very heavily. After it had risen above the horizon, no rocks were to be seen; though the cloud, still ascending, was long visible, the weather being extremely clear.—Between nine and ten in the morning, another ship 40 leagues west of St. Vincent was so strongly agitated, that the anchors which were lashed, bounced up, and the men were thrown a foot and half perpendicularly up from the deck. Immediately after this, the ship sunk in the water as low as the main chains. The lead showed a great depth of water, and the line was tinged of a yellow colour, and smelt of sulphur. The shock lasted about ten minutes, but they felt smaller ones for the space of 24 hours.

Such were the phenomena of this very remarkable and destructive earthquake, which extended over a tract of at least four millions of square miles.

To explain the phenomena of earthquakes various hypotheses have been invented. Till lately, those of modern philosophers were much the same with those of the ancients. Anaxagoras supposed the cause of earthquakes to be subterraneous clouds bursting out into lightning, which shook the vaults that confined them. Others imagined, that the arches, which had been weakened by continual subterraneous fires, at length fell in. Others derived these accidents from the rarefied steam of waters heated by some neighbouring fires; and some, among whom was Epicurus, and several of the Peripatetic school, ascribed these terrible accidents to the ignition of certain inflammable exhalations.

This last hypothesis has been adopted by many of the most celebrated moderns, as Gassendus, Kircher, Schottus, Varenius, Des Cartes, Du Hamel, Honorius, Fabri, &c. The philosopher last mentioned indeed supposed, that waters prodigiously rarefied by heat might sometimes occasion earthquakes. The others supposed, as their hypothesis necessarily requires, that there are many and vast cavities under ground which have a communication with one another: some of which abound with waters; others with vapours and exhalations, arising from inflammable substances, as nitre, bitumen, sulphur, &c. These combustible exhalations they supposed to be kindled by a subterraneous spark, or by some active flame gliding through a narrow fissure from without, or by the fermentation of some mixture; and when this happened they must necessarily produce pulses, tremors, and ruptures at the surface, according to the number and diversity of the cavities, and the quantity and activity of the inflammable matter. This hypothesis is illustrated by a variety of experiments, such as mixtures of iron-filings and brimstone buried in the earth, gunpowder confined in pits, &c. by all which a shaking of the earth will be produced.

Though none of these hypotheses were sufficient for explaining the phenomena of earthquakes in a satisfactory manner, one or other of them continued to be adopted by almost all philosophers till the year 1749. In the month of March in that year, an earthquake was felt at London and several other places in Britain. Dr. Stukeley, who had been much engaged in electrical experiments, began to suspect that phenomena of this kind ought to be attributed not to vapours or fermentations generated in the bowels of the earth, but to electricity. In a paper published by him on this subject he rejects all the above-mentioned hypotheses for reasons which appear to be very convincing and decisive; and on comparing all circumstances, he concludes that an earthquake is a shock of the same kind as those which commonly occur in electrical experiments.

This hypothesis indeed is much confirmed by the phenomena attending earthquakes; particularly those of 1749 and 1750 which gave rise to his publication. The weather, for five or six months before, had been uncommonly warm; the wind south and south-west, without rain; so that the earth must have been in a state peculiarly ready for an electrical shock. The flat county of Lincolnshire had been under an exceeding great drought. The uncommonness of the first of these circumstances, he remarks, is the reason why earthquakes are less frequently experienced in the northern than in the southern regions of the world, where the warmth and dryness of the air, so necessary to electricity, are more usual: and the latter shows how fit the dry surface was for an electrical vibration; and (which is of great importance) that earthquakes reach but little below the surface of the earth. Before the earthquake at London, all vegetables had been uncommonly forward; and electricity is well known to quicken vegetation. The aurora borealis had been frequent about that time; and just before the earthquake, had been twice repeated in such colours as had never been seen before. It had also removed southerly, contrary to what is common in England; so that the Italians, and those among whom earthquakes were frequent, actually foretold the earthquake. The year had been remarkable for fire-balls, lightning, and coruscations; and these are rightly judged to be meteors of an electrical nature. In these circumstances of the earth and air, nothing, he says, is wanting to produce an earthquake, but the touch of some non-electric body; which must necessarily be had *ab extra* from the region of the air or atmosphere. Hence he infers, that if a non-electric cloud discharge its contents upon any part of the earth, in that highly electrical state, an earthquake must necessarily ensue. As the discharge from an excited tube produces a commotion in the human body, so the discharge of electric matter from the compass of many miles of solid earth must needs be an earthquake; and the snap from the contact, the horrid uncouth noise attending it. As to the manner in which the earth and atmosphere are put into this state, which prepares them to receive such a shock, and whence the electric matter comes, the doctor does not pretend to determine; but thinks it as difficult to be accounted for as magnetism, gravitation, and many other secrets of nature.

The same hypothesis was advanced by Signor Beccaria, without knowing any thing of Dr. Stukeley's discoveries. But this learned Italian imagined the electric matter which occasions earthquakes to be lodged deep in the bowels of the earth, agreeably to his hypothesis concerning lightning. Dr. Priestley also, in his History of Electricity, contends for the agency of the electrical fluid in the production of earthquakes; and from the doctrines advanced by Stukeley and Beccaria, frames a third hypothesis of his own.

All these, it is true, agree in the main; but if a particular solution of the phenomena is required, perhaps every one of them will be found deficient; nor shall we in this place, therefore, enter minutely into the arguments which each of these learned philosophers has brought in support of his opinion.

Besides the earthquakes above described, of which the cause seems to depend particularly on a collection of electric matter in the bowels of the earth, there are others frequently felt in the neighbourhood of volcanos, which are plainly owing to the efforts of the burning matter to discharge itself. These however are but slight, and seldom extend to any considerable distance from the burning mountain. For a particular account of them, see the article Volcano.

EA'RTHSHAKING. *a.* (*earth* and *shake.*) Having power to shake the earth, or to raise earthquakes (*Milton*).

EARTH-STOPPER, in fox-hunting, a man whose department is to visit and stop the strongest earths in the district intended to be hunted on the following day. This is usually effected between the hours of ten at night and four in the morning, by means of bushes, brambles, earth, &c. to furnish which he is provided with a hand-bill, spade, candle and lanthorn, a hardy rough poney, and terriers. It is also his business to re-open the earths after the sport of the day, that the foxes may not fall victims to other modes of destruction.

EA'RTHWORM. *s.* (*earth* and *worm.*) 1. A worm bred under ground (*Bacon*). 2. A mean sordid wretch (*Norris*).

Earthworm. Lumbricus terrestris. Vermis terrestris. These reptiles are supposed to possess a diuretic and anti-spasmodic virtue, with which views they are occasionally employed in foreign countries. See Lumbricus.

EA'RTHY. *a.* (from *earth.*) 1. Consisting of earth (*Wilkins*). 2. Partaking of earth; terrene (*Milton*). 3. Inhabiting the earth; terrestrial (*Dryden*). 4. Relating to earth (*Dryden*). 5. Not mental; gross; not refined (*Shakspeare*).

EASE. *s.* (*aise*, French.) 1. Quiet; rest; undisturbed tranquillity (*Davies*). 2. Freedom from pain (*Temple*). 3. Rest after labour; intermission of labour (*Swift*). 4. Facility, not difficulty (*Dryden*). 5. Unconstraint;

freedom from harshness, formality, or conceits (*Pope*).

To Ease. *v. a.* (from the noun.) 1. To free from pain (*Locke*). 2. To assuage; to mitigate (*Dryden*). 3. To relieve from labour, or any thing that offends (*Locke*).

EASEL, among painters, the frame on which the canvas is fixed, whereon portraits, landscapes, &c. are painted.

Easel-pieces, a denomination given by painters to such pieces as are contained in frames, in contradistinction from those painted on ceilings, &c.

EA'SEFUL. *a.* (*ease* and *full.*) Quiet; peaceable; fit for rest (*Shakspeare*).

EA'SEMENT. *s.* (from *ease.*) Assistance; support; relief from expenses (*Swift*).

Easement, in law, a privilege or convenience which one neighbour has of another, whether by charter or prescription, without profit; such are a way through his lands, a sink, or the like. These, in many cases, may be claimed.

EA'SILY. *ad.* (from *easy.*) 1. Without difficulty (*Prior*). 2. Without pain; without disturbance (*Temple*). 3. Reality; without reluctance (*Dryden*).

EA'SINESS. *s.* (from *easy.*) 1. Freedom from difficulty (*Tillotson*). 2. Flexibility; compliance; readiness (*Hooker*). 3. Freedom from constraint; not effort; not formality (*Rosc.*). 4. Rest; tranquillity; ease (*Ray*).

EASING, in the sea language, signifies the slackening of a rope, or the like: thus, to ease the bow-line or sheet, is to let them go slacker; to ease the helm, is to let the ship go more large, more before the wind, or more larboard.

EAST, one of the four cardinal points of the world, being that point of the horizon where the sun is seen to rise when in the equinoctial. The word *east* is Saxon. It is frequently used to denote the regions of the world which lie easterly of Europe: as Tartary, China, &c.

East Indies. See India.

East India company. See Company.

EASTER, a festival of the Christian church, observed in memory of our Saviour's resurrection. The Greeks call it *pascha*, (πασχα) the Latins *pascha*, an Hebrew word (פסח) signifying passage, applied to the Jewish feast of the passover. It is called Easter in English, from the goddess Eostre, worshipped by the Saxons with peculiar ceremonies in the month of April. The Asiatic churches kept their Easter upon the very same day the Jews observed their passover, and others on the first Sunday after the first full moon in the new year. This controversy was determined in the council of Nice: when it was ordained that Easter should be kept upon one and the same day, which should always be a Sunday, in all Christian churches in the world; namely, the Sunday which falls upon or after the first full-moon after March 21st, or the vernal equinox.

In order to find Easter at any time, find the *epact* for the year proposed, and if it be less than 24 subtract it from 74; but if it be 24, it must be taken from 73; or if the epact be 24 and the golden number between 12 and 19, the epact must be taken from 73, and the remainder will be Easter limit, or the day of the paschal full moon. If the limit do not exceed 31, the day of the full moon will be in March; but if it exceeds 31, it will be in April; the Sunday after which full-moon will be Easter-day.

To find Easter according to the New or Gregorian Style, till the year 1900 *exclusive.*

Gold. Num.	Paschal full moon.	Sund. letter.
14	March 21	C
3	22	D
	23	E

	14	F
9	15	G
	16	A
17	17	B
6	18	C

Look for the golden number of the year in the first column of the table, against which stands the day of the paschal full moon; then look in the third column for the Sunday letter, next after the day of the full moon, and the day of the month standing against that Sunday letter is Easter-day. When the full moon happens on a Sunday, then the next Sunday after is Easter-day.

For example: for the year 1790, the golden number is 5; against which stands March the 30th, and the next Sunday letter, which is C, below that, stands opposite April 4, which is therefore the Easter-day for the year 1790.

Though the Gregorian calendar be much preferable to the Julian, it is yet not without its defects. It cannot, for instance, keep the equinox fixed on the 21st of March, but it will sometimes fall on the 19th, and sometimes on the 23d. Add, that the full moon happening the 20th of March, might sometimes be paschal; yet it is not allowed as such in the Gregorian computation; as, on the contrary, the full moon of the 22d of March may be allowed for paschal, which it is not.

It may here be observed, that the paschal full moons are, or ought to be, calculated for the longitude of Jerusalem; and that the day on which the full moons are reckoned, are astronomical days, ending at noon: on these accounts it was that, in 1798, Easter Sunday was kept on the 8th of April; whereas if the common mode of computation had been used, it would have fallen upon April 1st.

Easter Island, an island in the South sea, of a triangular form. It was visited by captain Cook in 1774; and is about 10 or 12 leagues in circuit, having an iron-bound shore: it affords neither safe anchorage, fresh-water, nor wood for firing. Lat. 27. 5 S. Lon. 109. 46 W.

EASTON, a town of Pennsylvania, capital of the county of Northampton. Lat. 40. 21 N. Lon. 75. 17 W.

EA'STERLY. *a.* (from *east.*) 1. Coming from the parts toward the east (*Raleigh*). 2. Lying toward the east (*Grant*). 3. Looking toward the east (*Arbuthnot*).

EA'STERN. *a.* (from *east.*) 1. Dwelling or found in the east; oriental (*Thomson*). 2. Lying or being toward the east (*Addison*). 3. Going toward the east (*Addison*). 4. Looking toward the east.

EA'STWARD. *ad.* (*east* and *toward.*) Toward the east (*Brown*).

EA'SY. *ad.* (from *ease.*) 1. Not difficult (*Hooker*). 2. Quiet; at rest; not harassed (*Smalridge*). 3. Free from pain (*Milton*). 4. Complying; unresisting; credulous (*Dryden*). 5. Ready; not unwilling (*Dryden*). 6. Free from want of more (*Swift*). 7. Not constrained; not formal (*Pope*).

To **EAT.** *v. a.* preterit *ate* or *eat*; part. *eat* or *eaten.* (eꞇan, Saxon.) 1. To devour with the mouth (*Exodus*). 2. To consume; to corrode (*Tillotson*). 3. To swallow back; to retract (*Hakewill*).

To **Eat.** *v. n.* 1. To go to meals; to feed (*Matthew*). 2. To take food (*Locke*). 3. To be maintained in food (*Proverbs*). 4. To make way by corrosion (*South*).

EA'TABLE. *a.* (from *eat.*) That may be eaten.

Ea'table. *s.* Any thing that may be eaten (*King*).

EA'TER. *s.* (from *eat.*) 1. One that eats any thing (*Abbot*). 2. A corrosive.

EATH. *a.* (eað, Saxon.) Easy; not difficult (*Spenser*).

Eath. *ad.* Easily (*Spenser*).

EA'TINGHOUSE. *s.* (*eat* and *house.*) A house where provisions are sold ready dressed (*L'Estrange*).

EATON. See Eton.

Eaton's styptic, in medicine, French brandy highly impregnated with calcined green vitriol.

EAU-DE-LUCE. See Spiritus ammoniæ succinatus.

Eau-de-luce is prepared in the following manner: ten or twelve grains of white soap are dissolved in four ounces of rectified spirit of wine; after which the solution is strained. A dram of rectified oil of amber is then added, and the whole filtrated: with this solution should be mixed such a proportion of the strongest volatile spirit of sal-ammoniac, in a crystal glass bottle, as will, when sufficiently shaken, produce a beautiful milk-white liquor. If a kind of cream should settle on the surface, it will be requisite to add a small quantity of the spirituous solution of soap. Those who may wish to have this liquor perfumed may employ lavender or Hungary water instead of the spirit of wine.

This composition is, however, seldom obtained in a genuine state when purchased at the shops. Its use, as an external remedy, is very extensive; for it has not only been employed for curing the bites of vipers, wasps, bees, gnats, ants, and other insects, but also for burns, and even the bite of a mad dog, though not always with uniform success. Besides, it affords one of the safest stimulants in cases of suffocation from mephitic vapours, and in that state of apoplexy which is termed *serous*, as likewise after excessive intoxication, and in all those paralytic complaints where the vessels of the skin, or the muscular fibre, require to be excited into action. Nevertheless, it ought to be used with due precaution.

Mr. Nicholson, in his Journal, has related the following experiments, made to procure this liquid. He considers mastic as a principal ingredient, and the great secret by which the milkiness has been communicated to it.

One dram of the rectified oil of amber was dissolved in four ounces of the strongest ardent spirit of the shops; its specific gravity being ·840 at 60 degrees of Fahrenheit. A portion of the clear spirit was poured upon a larger quantity of fine powdered mastic than it was judged could be taken up. This was occasionally agitated without heat; by which means the gum resin was for the most part gradually dissolved. One part of the oily solution was poured into a phial, and to this was added one part of the solution of mastic. No opacity or other change appeared. Four parts of strong caustic volatile alkali was then poured in, and immediately shaken. The fluid was of a dense opake white colour, affording a slight ruddy tinge when the light was seen through a thin portion of it. In a second mixture, four parts of the alkali were added to one of the solution of mastic; it appeared of a less dense and more yellowish white than the former mixture. More of the gum resinous solution was then poured in; but it still appeared less opake than that mixture. It was ruddy by transmitted light. The last experiment was repeated with the oily solution instead of that of mastic. The white was much less dense than either of the foregoing compounds, and the requisite opacity was not given by augmenting the dose of the oily solution. No ruddiness or other remarkable appearance was seen by transmitted light. These mixtures were left at repose for two days; no separation appeared in either of the compounds containing mastic; the compound consisting of the oily solution and alkali be.

came paler by the separation of a cream at the top.

It appears, therefore, that the first of these three mixtures, subject to variation of the quantity of its ingredients, and the odorant additions which may be made, is a good eau-de-luce.

In a subsequent number of the same journal, we have the following recipe by one of the author's correspondents, who had often proved its value by experience. "Digest ten or twelve grains of the whitest pieces of mastic, selected for this purpose, and powdered, in two ounces of alcohol; and when nearly dissolved, add twenty grains of elemi. When both the resins are dissolved, add ten or fifteen drops of rectified oil of amber, and fifteen or twenty of essence of bergamot; shake the whole well together, and let the fæces subside. The solution will be of a pale amber colour. It is to be added, in very small portions, to the best aqua ammoniæ puræ, until it assumes a milky whiteness, shaking the phial well after each addition, as directed by Macquer. The strength and causticity of the ammoniac are of most essential consequence. If upon the addition of the first drop or two of the tincture, a dense opake coagulated precipitate is formed, not much unlike that which appears on dropping a solution of silver into water slightly impregnated with common salt, it is too strong, and must be diluted with alcohol. A considerable proportion of the tincture, perhaps one to four, ought to be requisite to give the liquor the proper degree of opacity."

Eau-de-rabel. This is composed of one part of sulphureous acid to three of rectified spirit of wine. It is much used in France in the cure of gonorrhœas, leucorrhœa, &c.

EAVES. *s.* (eꝼeꞅe, Saxon.) The edges of the roof which overhang the house (*Woodward*).

To EA'VESDROP. *v. a.* (*eaves* and *drop.*) To catch what comes from the eaves; to listen under windows (*Shakspeare*).

EAVES-DROPPERS, such persons as stand under the eaves, or walls, and windows of an house, by night or day, to hearken after news, and carry it to others, and thereby cause strife and contention in the neighbourhood. They are called evil members of the commonwealth by the stat. of West. 1, c. 33. They may be punished either in the court-leet by way of presentment and fine, or in the quarter-sessions by indictment and binding to good behaviour.

EBB. *s.* (ebba, Saxon.) 1. The reflux of the tide toward the sea (*Addison*). 2. Decline; decay; waste (*Roscommon*).

To Ebb. *v. a.* (from the noun.) 1. To flow back toward the sea (*Shakspeare*). 2. To decline; to decay (*Halifax*).

EBDOME, in antiquity, a festival kept on the 7th of every lunar month, in honour of Apollo.

EBENUS, in botany, ebony-tree. See Amerimnum ebenus, and Ebony.

EBERBACH, a town of Germany, in the palatinate of the Rhine, remarkable for its wine. Lat. 49. 26 N. Lon. 8. 56 E.

EBION, the founder of a sect called after his name in the first century. He was a disciple of Cerinthus, and his successor. He improved upon the errors of his master, and engrafted upon them new opinions of his own. He began to preach in Judea, but taught in Asia, and even at Rome. It is imagined that St. John wrote his gospel with a view to the refutation of this heresy, and that of Cerinthus.

EBIONITES, in church history, heretics of the first century, so called from their leader Ebion. They held the same errors with the Nazarenes, united the ceremonies of the Mosaic institution with the precepts of the gospel, observed both the Jewish sabbath and Christian Sunday, and in celebrating the Eucharist, made use of unleavened bread. They abstained from the flesh of animals, and even from milk. In relation to Jesus Christ, some of them held that he was born, like other men, of Joseph and Mary, and acquired sanctification only by his good works. Others of them allowed that he was born of a virgin, but denied that he was the word of God, or had any existence before his human generation. They said, he was, indeed, the only true prophet; but yet a mere man, who by his virtue had arrived at being called Christ, and the son of God. They also supposed that Christ and the devil were two principles, which God had opposed to each other. Of the New Testament they only received the gospel of St. Matthew, which they called the gospel according to the Hebrews. See the article Nazarenes.

EBONY, a valuable wood, produced from a plant of which authors have given very different accounts, and concerning which they have been exceedingly undecided. The real tree, however, from which this wood is obtained, is the amerimnum ebenus of the West Indies; for the generic character of which, see Amerimnum. This wood is exceedingly hard and heavy, susceptible of a very fine polish, and hence often used for inlaid work and toys. The species affords several varieties, which yield a wood of different colours; chiefly, however, black, red, and green. The first is of most estimation: it is a tall tree, with dark coloured bark, and dark green, myrtiform leaves. Since the discovery of giving a fine black hue to other woods, ebony has been in far less frequent employment than formerly. Green ebony is the produce of a variety less lofty, and of a more bushy form, with smooth, bright, green leaves. This wood, like the preceding, is used as an inlay; and also affords a good green dye.

EBORACUM, in ancient geography, a famous city of the Brigantes in Britain; in the British language Caer-effroc, now York.

EBRA'CTEATE. In botany, raceme or peduncle is so called, when without any bracte or floral leaf; as in cistus guttatus.

EBRI'ETY. *s.* (*ebrietas*, Latin.) Drunkenness; intoxication by strong liquors (*Brown*).

EBRILLADE, in the manage, a check of the bridle which the horseman gives to the horse, by a jerk of one rein, when he refuses to turn. An ebrillade differs from a saccade; the latter being made with both reins at once, and the former with only one. Most people confound these two words under the general name of a check, or jerk of the bridle, called in French *coup de bride.* It is a chastisement, and no aid, and is disused in the schools.

EBRIO'SITY. *s.* (*ebriositas*, Lat.) Habitual drunkenness (*Brown*).

EBRIZIUS COLOR, in old writers, a fine yellow.

EBRO, a river of Spain, which rises in the mountains of Asturia, on the confines of Old Castile, and runs into the Mediterranean, a little below Tortosa, in Catalonia.

EBULLI'TION. *s.* (*ebullio*, Latin.) 1. The act of boiling up with heat. 2. Any intestine motion (*Bacon*).

Ebullition consists in the change which a fluid undergoes from a state of liquidity to that of an aeriform fluid or gass, in consequence of the application of heat, which dilates and converts it into vapour.

EBULUS. (*ebulus*, from *ebulio*, to make boil: so called, because of its use in purifying the humours of the body.) Dwarf elder, or danewort. The root, interior bark, leaves, flowers, berries, and seeds of this herbaceous plant, Sambucus ebulus; cyniestrifidis, stipulis foliaceis, caule herbaceo, of Linnéus, have all been administered medicinally, in moderate doses, as resolvents and deobstruents, and, in larger doses, as hydragogues. The plant is chiefly employed by the poor of this country, amongst whom it is in common use as a purgative.

ECA'LCARATE, in botany, a corol, without any spur, or spur-shaped nectary. As in Wolfenia.

ECATÆA, in antiquity, statues erected to the goddess Hecate. The Athenians and Stratonicensians had an annual solemnity in honour of this goddess, which was called Ecatesia.

ECAVESSADE, in the manage, is used for a jerk of the cavesson.

ECBOLE, a term in the ancient Greek music, signifying a change in the enharmonic genus, by the accidental elevation of a chord, or string, five dieses above its ordinary pitch.

ECCE'NTRICAL. Ecce'ntric. *a.* (*eccentricus*, Latin.) 1. Deviating from the centre. 2. Not having the same centre with another circle (*Newton*). 3. Not terminating in the same point (*Bacon*). 4. Irregular; anomalous (*King Charles*).

ECCENTRI'CITY. *s.* (from *eccentric.*) 1. Deviation from a centre. 2. The state of having a different centre from another circle (*Holder*). 3. Excursion from the proper orb (*Wotton*).

Eccentricity, in astronomy. See Excentricity.

ECCHYMA. (εκχυμα, from εκχυω, to pour out.) In medicine, a fiery pustule, appearing suddenly all over the body.

ECCHYMO'MA. (*ecchymoma*, εκχυμωμα, an extravasation of blood.) Ecchymosis. Extravasation. Contusion. A black and blue swelling, either from a bruise or extravasation of blood. A genus of disease in the class locales, and order tumores of Cullen.

ECCHYMO'SIS. (*ecchymosis*, from εκχυω, to pour out.) See Ecchymoma.

ECCLAIRCI'SSEMENT. *s.* (Fr.) Explanation; the act of clearing up an affair by verbal expostulation (*Clarendon*).

ECCLESHALL, a town in Staffordshire, with a market on Friday. Lat. 53. 2 N. Lon. 2. 9 W.

ECCLESIASTES, one of the books of the Old Testament; thus called, by a Greek word, signifying preacher; because the author in it declaims, or preaches, against the vices and vanities of the world. This is Mariana's judgment: Grotius thinks otherwise; taking the book to derive its appellation from its being a collection of the fine sentences and reflections on the vanity of the things of our earth, &c. from the word קהל, which signifies to amass or collect, συναθροιζειν. Some Hebrew doctors, supposing the same etymon, think it to have been thus called on account of its amassing a great deal of wisdom: others, because the author's aim is to assemble and call together all such as are willing to consult their safety, and avoid the dangers of the world, which is the opinion of Gejerus. Lastly, others, with Calovius, deduce it from his assembling them about him, as a preacher assembles his auditors.

There are different sentiments as to the author of this book: the most common is, that it is Solomon's, who is supposed to have wrote it towards the close of his life, to give tokens of his penitence to posterity.

There appears no reason for denying this book to Solomon, but several for ascribing it to him. As 1. The title of the book, which asserts its author to be the son of David, and king of Jerusalem. 2. Several passages in the book, which agree to no body but that prince, as chap. i. ver. 12. chap. vii. ver. 25. chap. xii. ver. 9, &c. and, 3. The constant tradition of the ancient Jews and Christians.

ECCLESIA'STIC. *s.* A person dedicated to the ministries of religion (*Burnet*).

ECCLESIA'STICAL. Ecclesia'stic. *a.* (*ecclesiasticus*, Lat.) Relating to the church; not civil (*Hooker. Swift*).

Ecclesiastical courts. In the time of the Anglo-Saxons, judge Blackstone observes, there was no sort of distinction between the lay and the ecclesiastical jurisdiction: the county-court was as much a spiritual as a temporal tribunal: the rights of the church were ascertained and asserted at the same time, and by the same judges, as the rights of the laity. For this purpose the bishop of the diocese, and the alderman, or in his absence the sheriff of the county, used to sit together in the county-court, and had there the cognizance of all causes as well ecclesiastical as civil; a superior deference being paid to the bishop's opinion in spiritual matters, and to that of the lay-judges in temporal. At length, by the artifices of the court of Rome, with whose views this rational and moderate plan was inconsistent, spiritual causes were prohibited from being tried in the secular courts. But king Henry I. at his accession, among other restorations of the laws of king Edward the Confessor, revived this of the union of the civil and ecclesiastical courts; which was, according to sir Edward Coke, only a restitution of the ancient law of England. This, however, was ill relished by the popish clergy, who, under the guidance of that arrogant prelate archbishop Anselm, very early disapproved of a measure that put them on a level with the profane laity, and subjected spiritual men and causes to the inspection of the secular magistrates: and, therefore, in their synod at Westminster, 3 Hen. I. they ordained, that no bishop should attend the discussion of temporal causes: which soon dissolved this newly effected union. And when, upon the death of king Henry I. the usurper Stephen was brought in and supported by the clergy, we find one article of the oath which they imposed upon him was, that ecclesiastical persons and ecclesiastical causes should be subject only to the bishop's jurisdiction. And as it was about that time that the contest and emulation began between the laws of England and those of Rome, the temporal courts adhering to the former, and the spiritual adopting the latter, as their rule of proceeding; this widened the breach between them, and made a coalition afterwards impracticable; which probably would else have been effected at the general reformation of the church.

Ecclesiastical courts are various; as the ARCHDEACON'S, the CONSISTORY, the Court of ARCHES, the PECULIARS, the PREROGATIVE, and the great court of appeal in all ecclesiastical causes, viz. the Court of DELEGATES. See those articles.

As to the method of proceeding in the spiritual courts, says Blackstone, it must in the first place be acknowledged to their honour, that though they continue to this day to decide many questions which are properly of temporal cognizance, yet justice is in general so ably and impartially administered in those tribunals (especially of the superior kind), and the boundaries of their power are now so well known and established, that no material inconvenience at present arises from this jurisdiction still continuing in the ancient channel. And, should any alteration be attempted, great confusion would probably arise, in overturning long-established forms, and new-modelling a course of proceedings that has now prevailed for seven centuries.

The proceedings in the ecclesiastical courts are regulated according to the practice of the civil and canon laws; or rather to a mixture of both, corrected and new-modelled by their own particular usages, and the interposition of the court of common law. For, if the proceedings in the spiritual court be ever so regularly consonant to the rules of the Roman law, yet if they be manifestly repugnant to the fundamental maxims of the municipal laws, to which, upon principles of sound policy, the ecclesiastical process ought in every state to conform (as if they require two witnesses to prove a fact, where one will suffice at common law); in such cases, a prohibition will be awarded against them. But under these restrictions, the ordinary course of proceeding is first, by citation, to call the party injuring before them. Then by libel (*libellus*, a little book), or by articles drawn out in a formal allegation, to set forth the complainant's ground of complaint. To this succeeds the defendant's answer upon oath; when if he denies or extenuates the charge, they proceed to proofs by witnesses examined, and their depositions taken down in writing by an officer of the court. If the defendant has any circumstances to offer in his defence, he must also propound them in what is called his defensive allegation, to which he is entitled in his turn to the plaintiff's answer upon oath, and may from thence proceed to proofs as well as his antagonist. The canonical doctrine of purgation, whereby the parties were obliged to answer upon oath to any matter, however criminal, that might be objected against them (though long ago overruled in the court of chancery, the genius of the English law having broken through the bondage imposed on it by its clerical chancellors, and asserted the doctrines of judicial as well as civil liberty), continued till the middle of the last century to be upheld by the spiritual courts; when the legislature was obliged to interpose, to teach them a lesson of similar moderation. By the statute of 13 Car. II. c. 12. it is enacted, that it shall not be lawful for any bishop, or ecclesiastical judge, to tender or administer to any person whatsoever the oath usually called the oath *ex officio*, or any other oath whereby he may be compelled to confess, accuse, or purge himself of any criminal matter or thing, whereby he may be liable to any censure or punishment. When all the pleadings and proofs are concluded, they are referred to the consideration, not of a jury, but of a single judge; who takes information by hearing advocates on both sides, and thereupon forms his interlocutory decree or definitive sentence, at his own discretion: from which there generally lies an appeal, in the several stages mentioned in the articles above referred to; though if the same be not appealed from him in fifteen days, it is final by the statute 25 Hen. VIII. c. 19.

ECCLESIASTICAL CORPORATIONS, are where the members that compose them are spiritual persons. They were erected for the furtherance of religion, and perpetuating the rights of the church. See CORPORATIONS.

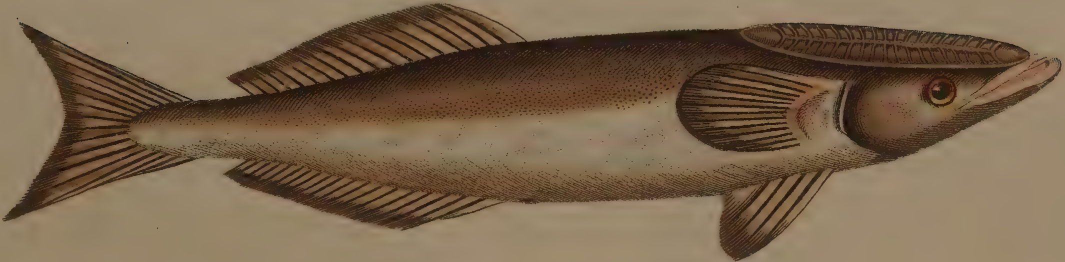
ECCLESIASTICUS, an apocryphal book, composed by Jesus the son of Sirach, and admitted by the Romish church into the canon of the Old Testament.

It is frequently cited by the abbreviation *Ecclus*. to distinguish it from the *Ecclesiastes*, which is cited by *Eccles*.

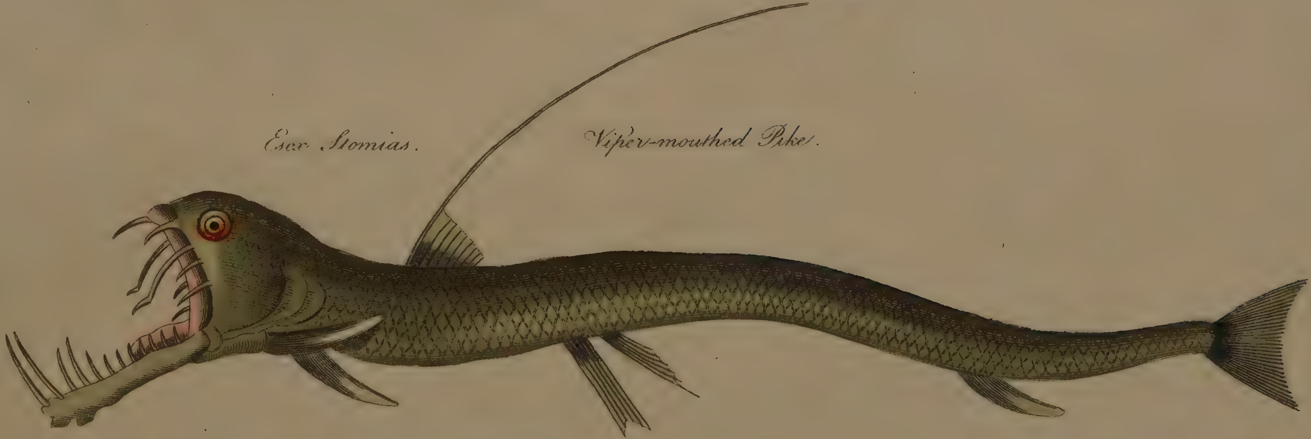
NATURAL HISTORY.

PL. LXXXVI.

Echineis Remora. Remora or Sucking fish.

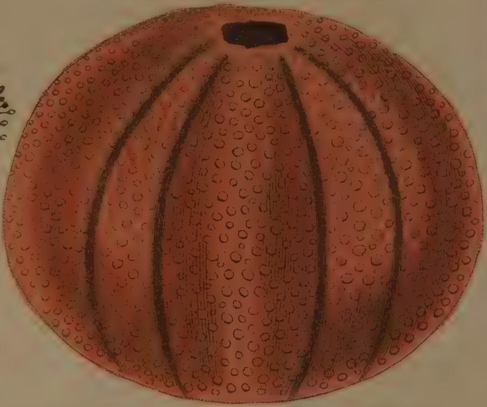


Esox Stomias. Viper-mouthed Pike.

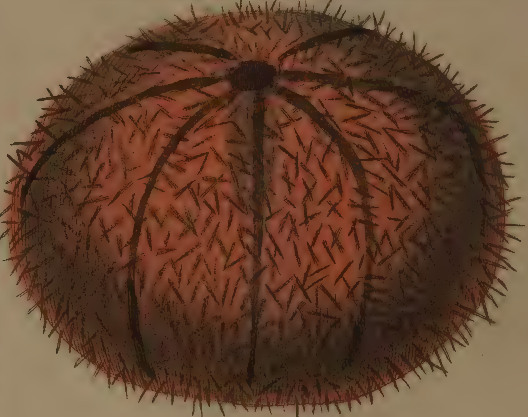


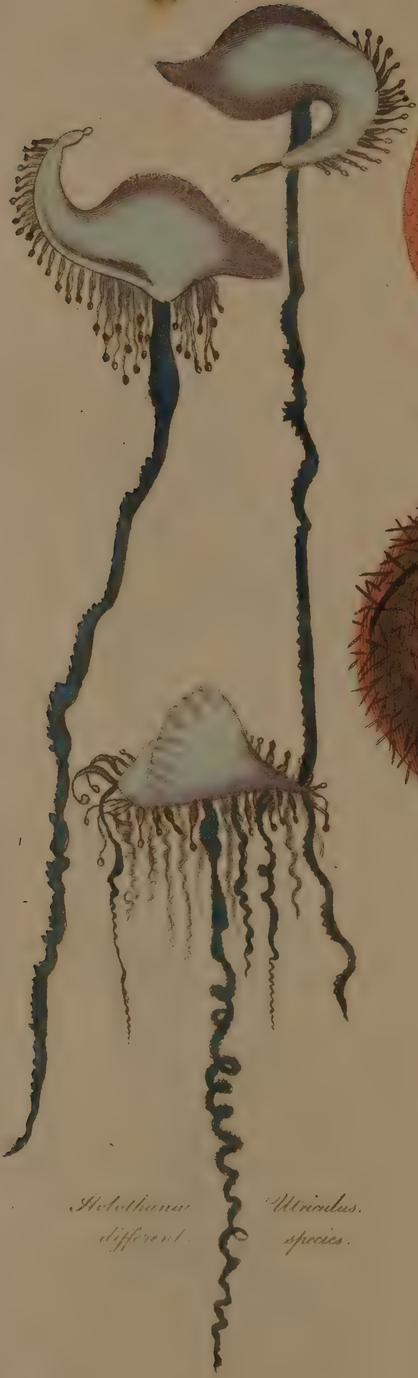
London, Published by Geo. Kearsley. Fleet Street April 1st 1810.

Echinus Esculentus with spines rubbed off.



Echinus Esculentus or Common Sea Urchin.





Holothuria Utriculus.
different species.

[illegible] by [illegible]

Fa. Calmet regards the book of Ecclesiasticus as composed under the pontificate of Onias III. son of Simon, and the reign of Antiochus Epiphanes, king of Syria. He adds; that neither the author of the Latin translation, nor the time when it was made, is known; but being quoted regularly by all the ancient fathers, there is no doubt of its being very ancient. He takes it to have been done by the translator of the book of Wisdom.

E′CCLISIS. (εκκλισις, from εκκλινω, to turn aside.) A luxation or dislocation.

ECCOPRO′TICS. (*eccoprotica, medicamenta*, εκκοπρωτικα; from εκ, and κοπρος, dung.) Opening medicines, whose operation is very gentle: such as manna, senna, &c.

ECCRINO′LOGY. (from εκκρινω, to secrete, and λογος, a discourse.) A treatise on the secretory system.

ECCRI′SIS. (from εκκρινω, to secrete.) A secretion of any kind.

ECDICI, in antiquity, patrons of cities.

E′CDORA. (from εκδερω, to excoriate.) In medicine, *intertrigo*, or excoriation.

ECHAPE. In veterinary science, a horse got between a stallion of one breed or country and a mare of another.

ECHEIA, the harmonic vases used by the Greeks and Romans in their theatres, for the purpose of augmenting the sound of the voices of the actors. These vessels were tuned in the harmonical proportions of fourths, fifths, and eighths, with their replicates, and were placed in cells, or niches, between the seats of the spectators. (*Busby*).

ECHI′NEIS. In zoology, a genus of the class pisces, order thoracica. Head flat, naked, depressed; above flat; margined, and transversely streaked or grooved; gill membrane with ten rays; body naked. Three species; of which the one most worthy of note is e. remora, or sucking fish; with forked tail, and head with eighteen streaks accuminate on the fore-part; mouth large, lower jaw longer than the upper; teeth small, rough like a rasp; tongue broad, thin, loose, and, like the palate, beset with small teeth; eyes small, pupil large, iris silvery; vent near the tail; fins small, covered with a thick skin; tail semilunar. Inhabits the Mediterranean and Pacific Seas; from twelve to eighteen inches long: adheres so firmly to the sides of vessels and the larger fishes by its head, that it is often removed with great difficulty; and was by the ancients supposed to have a power of retarding or arresting a ship to which it thus adhered in the midst of its motion. Flesh not eaten. See Nat. Hist. Pl. LXXXVI.

ECHI′NATE. Echinated. In botany, an echinated pericarp. Beset with prickles like a hedgehog (εχινος.) As in datura stramonium. Prickly is the proper translation of *aculeatus*, and synonym of aculeate.

ECHINITES, in oryctology. See Helmintholitus.

ECHINO′PHORA. Sea Parsnip. Bristly Parsnip. In botany, a genus of the class pentandria, order digynia: involucel turbinate, one-leafed, six-cleft; flowers of the margins, male pedicelled; the central one female; seeds immersed in the involucel. Two species.

1. E. spinosa: found on the sandy shores of England, with leaflets subulate-spinous, trifid or entire.

2. E. tenuifolia, with cut, unarmed leaves; and flowers in small umbels, with a short prickly involucre: found on the sea-coast of Apulia.

ECHINOPS. Globe-thistle. In botany, a genus of the class syngenesia, order polygamia segregata. Calyx many-leaved, reflected; calycle one-flowered; florets tubular, all hermaphrodite; receptacle bristly; seeds naked or downy. Six species; natives of the Levant or south of Europe. Some are annual, others perennial plants.

ECHINORY′NCHUS. In zoology, a genus of the class vermes, order intestina. Body round, proboscis cylindrical, retractile, and crowned with hooked prickles. These worms are generally found very firmly fixed to the viscera of various animals, generally the intestines; and often remain on the same spot during the whole life of the animal. They are mostly gregarious, and are easily distinguished from the tænia by their round inarticulate body. Forty-eight species, infesting mammals, birds, reptiles, and fishes. The longest and largest, e. gigas, is found in the intestines of swine, especially such as have been fattened in sties: it measures from a foot to a foot and a half in length. The rest vary from an inch to an inch and half, to eleven and twelve inches, according to the animal they infest.

ECHINUS. Sea-hedgehog. Sea-urchin. In zoology, a genus of the class vermes, order molusca. Body roundish, covered with a bony sutured crust, and generally furnished with moveable spines; mouth placed beneath, and mostly five-valved. These worms are all of them inhabitants of the sea; and many of them have often been found in a fossile state; many are esculent; and they are generally armed with five sharp teeth; the pores are furnished with a retractile tentacle or feeler to each, by which the animal affixes itself to any object, and stops its motion. The spines are connected with the outer skin by very strong ligaments, and are the instruments of motion. A hundred and eight species, of which thirteen or fourteen have been found on our own coasts, or dug in a fossile state out of our own chalky or flinty soils; they may be thus subtribuated.

A. Vent vertical; tentacles every where simple.

B. Vent placed beneath; mouth without tentacles.

C. Vent lateral; mouth with pencilled tentacles.

The species most esteemed as an esculent, and thence denominated e. esculentus, is subglobular; with ten avenues of pores, the spaces between covered with small tubercles supporting the spines; body reddish or yellowish; spines short, of a violet colour; losing their colour and falling off the dead animal; pores in about three rows; tubercles surrounded with a circle of less ones: vent closed with a coriaceous membrane covered with spines. Inhabits the seas of Europe and India; and constituted the most savoury dish in the entertainment of Lentulus, when he was appointed priest of Mars.

The e. vulgaris, or common echinus, found perpetually in a fossile state, in numberless varieties of forms, is not now traced in a living state. In make it is orbicular; with ten avenues, two of them always near each other.

Echinus, in architecture, a member, or ornament, near the bottom of the Ionic, Corinthian, and Composite capitals; which, from its circular form or contour, is called by the English, quarter round, or *boultin*; and from its being usually carved, or cut with figures of eggs, &c. is called also by the Latins, *ovum*, by the Italians, *ovolo*, the French *œuf*, and the English *eggs* and *anchors*.

ECHI'TES. In botany, a genus of the class pentandria, order monogynia. Corol twisted, funnel-form, with the throat naked; follicles two, long, straight; seeds crowned with long down. Twenty-one species; chiefly natives of the West Indies and South America. One species, E. Corymbosa, secretes a resinous juice, which has some resemblance to the caoutchouc or elastic gum; whence some naturalists have regarded e. corymbosa as the real caoutchouc-tree, but this is an error: the true caoutchouc being obtained from the Siphonia elastica: which see.

E'CHIUM. Viper's Bugloss. In botany, a genus of the class pentandria, order monogynia. Corol irregular with the throat naked; stigma cloven. Twenty-seven species; chiefly Cape plants, but many from the east; and two, e. italicum, and e. vulgare, indigenous to the sandy hills or wastes of our own country. The last is said to be peculiarly grateful to bees; its stem is tubercled, bristly; stem-leaves lanceolate, bristly; spikes lateral with deflected hairs. Few quadrupeds appear fond of it, and some refuse it.

ECHO, or Eccho, a sound reflected or reverberated from a solid concave body, and so repeated to the ear. The word is formed from the Greek ηχος, *sound*, which comes from the verb ηχεω, *sono*. The ancients being wholly unacquainted with the true cause of the echo, ascribed it to several causes sufficiently whimsical. The poets, who were not the worst of their philosophers, imagined it to be a person of that name metamorphosed, and that she affected to take up her abode in particular places; for they found, by experience, that she was not to be met with in all.

Almost all modern philosophers, till very lately, have ascribed the formation of echoes to a reflection of sound, similar to that experienced by light when it falls on a polished body; but, as D'Alembert observes, this explanation is false; if it were not, a polished surface would be necessary for the production of an echo; but it is well known that this is not the case. Echoes are frequently heard opposite t old walls, which are far from being polished near shapeless masses of rock, and in the neighbourhood of forests, and even of clouds. This reflection of sound, therefore, is not of the same nature as that of light. It is evident, however, that the formation of an echo can be ascribed only to the repercussion of sound; for echoes are never heard, but when sound is intercepted and made to rebound by one or more obstacles.

To produce an echo, it should seem that a kind of concameration or vaulting were necessary, in order to collect, and by collecting to heighten and increase, and afterwards reflect, the sound; as we find is the case in reflecting the rays of light, where a concave mirror is required. In effect, as often as a sound strikes perpendicularly on a wall, behind which is any thing of a vault or arch, or even another parallel wall; so often will it be reverberated in the same line, or other adjacent ones. For an echo to be heard, therefore, it is necessary the ear be in the line of reflection: and for the person who made the sound to hear its echo, it is necessary he be perpendicular to the place which reflects it.

Sound, it is known, is propagated in every direction by the vibration of the particles of the air; but if any column of air rests against some obstacle that prevents the direct movement of the elastic globules, which serve as the vehicle of sound, it must rebound in a contrary direction, and striking the ear, if it meets with one in the line of repercussion, convey to it a repetition of the same sound, provided the original sound does not affect that organ at the same instant.

But we are taught by experience that the ear does not distinguish the succession of two sounds, unless there be between them the interval of at least one twelfth of a second; for during the most rapid movement of instrumental music, each measure of which cannot be estimated at less than a second, twelve notes are the utmost that can be comprehended in a measure, to render the succession of the sounds distinguishable; consequently the obstacle, which reflects the sound, must be at such a distance, that the reverberated sound shall not succeed the direct sound till after one twelfth of a second; and as sound moves at the rate of about 1142 feet in a second, and consequently about 95 feet in the twelfth of a second, it thence follows that, to render the reverberated sound distinguishable from the direct sound, the obstacle must be at the distance of no less than about 48 feet.

There are single and compound echoes. In the former only one repetition of the sound is heard; in the latter, there are 2, 3, 4, 5, &c. repetitions. We are even told of echoes that can repeat the same word 40 or 50 times.

Single echoes are those where there is only one obstacle; but double, triple, or quadruple echoes, give us reason to suppose several obstacles disposed in such a manner, that the different reflected sounds strike the ear at times sensibly different.

Some echoes repeat several words in succession; but this is not astonishing, and must always be the case when a person is at such a distance from the echo, that there is sufficient time to pronounce several words before the repetition of the first has reached the ear.

Travellers and natural historians have furnished us with many accounts of echoes, which repeat words very often, or have some singularity. Misson, in his description of Italy, speaks of an echo in the vineyard of Simonetta, which repeated the same word 40 times. At Milan is an echo which reiterates the report of a pistol 56 times; and, if the report is very loud, upwards of 60 reiterations may be counted. The celebrated echo at Woodstock, in Oxfordshire, repeats the same sound 50 times. But the most singular echo we have yet heard of is one near Rosneath, a few miles from Glasgow. If a person placed at a proper distance from this echo plays 8 or 10 notes of a tune with a trumpet, they are faithfully repeated by the echo, but a third lower: after a short silence, another repetition is heard, in a tone still lower; and another short silence is followed by a third repetition in a tone a third lower. (*Despiau's Amusements*).

Echoes have been applied to the purpose of measuring inaccessible distances. Thus, Dr. Derham, standing upon the banks of the Thames, opposite to Woolwich, observed that the echo of a single sound was reflected back from the houses in three seconds; consequently the sum of the direct and reflex rays must have been 1142 × 3 = 3426 feet, and the half of it, or 1713 feet, the breadth of the river in that place.

Echo, in architecture, a name given to such kinds of vaults and arches as are erected for the purpose of producing artificial echoes. For these, parabolic and elliptical figures are generally chosen.

Echo, in music, the repetition of some part of an air in a very low, soft, manner, in imitation of a real echo.

Echo, in poetry, a kind of composition wherein the last words or syllables of each verse contain some meaning, which being repeated apart, answers to some question or other matter contained in the verse, as in this beautiful one from Virgil:

Crudelis mater magis, an puer improbus ille?
Improbus ille puer, crudelis tu quoque mater.

The elegance of an echo consists in giving a new sense to the last words; which reverberate, as it were, the motions of the mind, and by that means affect it with surprise and admiration.

Echo, in fabulous history, a daughter of the Air and Tellus, who chiefly resided in the vicinity of the Cephisus. She was once one of Juno's attendants, and became the confidant of Jupiter's amours. Her loquacity, however, displeased Jupiter; and she was deprived of the power of speech by Juno, and only permitted to answer to the questions which were put to her. Pan had formerly been one of her admirers, but he never enjoyed her favours. Echo, after she had been punished by Juno, fell in love with Narcissus. (*Ovid*).

To **Echo.** *v. n.* 1. To resound; to give the repercussion of a voice (*Shakspeare*). 2. To be sounded back (*Blackmore*).

To **Echo.** *v. a.* To send back a voice; to return what has been uttered (*D. of Piety*).

ECHOMETRE. (from the Greek.) A graduated scale for measuring the duration of sounds, and determining the relations of their intervals.

ECKIUS (John), an eminent and learned divine, professor in the university of Ingoldstadt, memorable for the opposition he gave to Luther, Melancthon, Caralostadius, and other leading Protestants in Germany. He wrote many polemical tracts; and among the rest, a Manual of Controversies, printed in 1535, in which he discourses upon most of the heads contested between the Protestants and Papists. He was a man of uncommon learning, parts, and zeal, and died in 1543.

ECLA'MPSIS. (from εκλαμπω, to shine.) The sparkling and flashing lights which strike the eyes of epileptic patients.

ECLA'T. *s.* (French.) Splendour; show; lustre (*Pope*).

ECLE'CTIC. *a.* (εκλεκτικος.) Selecting; choosing at will (*Watts*).

Eclectic, Eclectici, a name given to some ancient philosophers, who, without attaching themselves to any particular sect, took what they judged good, and solid, from each. Hence their denomination; which in the original Greek signifies, *that may be chosen*, or *that chooses*; of the verb εκλεγω, *I choose.*

Laertius notes, that they were also, for the same reason, denominated *analogetici*; but that they call themselves *Philalethes*, i. e. lovers of truth.

The chief, or founder, of the electici, was one Potamon, of Alexandria, who lived under Augustus and Tiberius; and who, weary of doubting of all things with the Sceptics and Pyrrhonians, formed the eclectic sect; which Vossius calls the eclective.

Towards the close of the second century a sect arose in the Christian church under the denomination of Eclectics, or modern Platonics. They professed to make truth the only object of their enquiry, and to be ready to adopt, from all the different systems and sects, such tenets as they thought agreeable to it. However, they preferred Plato to the other philosophers, and looked upon his opinions concerning God, the human soul, and things invisible, as conformable to the spirit and genius of the Christian doctrine. One of the principal patrons of this system was Ammonius Saccas, who at this time laid the foundation of that sect, afterwards distinguished by the name of the new Platonics, in the Alexandrian school. This philosopher was born of Christian parents, and educated in the Christian faith, and probably never deserted the outward profession of this religion; though Porphyry maintains, in opposition to the testimony of Eusebius, that in maturer life he became a pagan; and Fabricius, who is followed by Dr. Lardner, alleges that there were two persons of the same name, the one a heathen philosopher, and the other a Christian writer. Those who are desirous of acquainting themselves with the grounds of these opposite opinions may consult Fabricius's Bibl. Græc. lib. iv. cap. 26. p. 159; Lardner's Collection of Jewish and Heathen Testimonies, vol. iii. p. 195, &c. and Mosheim, De Rebus Christianorum ante Const. Mag. p. 281, &c.

It was evidently the design of Ammonius to reconcile and unite all sects, philosophical and religious, and to inculcate a doctrine that should comprehend all, the Christians not excepted, in one common profession. For this purpose he maintained, that the great principles of all philosophical and religious truth were to be found, equally, in all sects; that they differed from each other only in their method of expressing them, and in some opinions of little or no importance; and that, by a proper interpretation of their respective sentiments, they might easily be united into one body. Accordingly, all the gentile religions, and even the Christian, were to be illustrated and explained by the principles of this universal philosophy; and the fables of the priests were to be removed from paganism, and the comments and interpretations of the disciples of Jesus from Christianity. In conformity to this plan he insisted, that all the religious systems of all nations should be restored to their original purity, and reduced to their primitive standard, viz. the ancient philosophy of the East, preserved uncorrupted by Plato; and he affirmed that this project was agreeable to the intentions of Jesus Christ, whose sole view, in descending upon earth, was to set bounds to the reigning superstition, to remove the errors that had blended themselves with the religions of all nations, but not to abolish the ancient theology from which they were derived. He therefore adopted the doctrines which were received in Egypt concerning the universe, and the Deity, considered as constituting one great whole, concerning the eternity of the world, the nature of souls, the empire of Providence, and the government of the world by dæmons. He also established a system of moral discipline, which allowed the people in general to live according to the laws of their country, and the dictates of nature, but required the wise to exalt their minds by contemplation. This system, so plausible in its first rise, but so comprehensive and complying in its progress, has been the source of innumerable errors and corruptions in the Christian church. At its first establishment it is said to have had the approbation of Athenagoras, Pantænus, and Clemens the Alexandrian, and of all who had the care of the public school belonging to the Christians at Alexandria. It was afterwards adopted by Longinus, the celebrated author of the treatise on the Sublime, Plotinus, Herennius, Origen, Porphyry, Jamblichus the disciple of Porphyry, Sopater, Edisius, Eustathius, Maximus of Ephesus, Priscus, Chrysanthius the master of Julian, Julian the Apostate, Hierocles, Proclus, and many others, both pagans and Christians. Mosheim's Eccl. Hist. vol. i. p. 136, &c. &c. See PLATONISM.

ECLECTICS were also a certain set of physicians among the ancients, of whom Archigenes, under Trajan, was the chief, who selected from the opinions of all the other sects that which appeared to them best and most rational.

ECLE'GMA. *s.* (εκ and λειχειν.) A form of medicine made by the incorporation of oils with syrups (*Quincy*).

ECLIPSAREON, in astronomy, an instrument invented by Mr. Ferguson for exhibiting the time, progress, quantity, and duration of solar eclipses, at all parts of the earth. See Phil. Trans. vol. 48. p. 520; Ferguson's Astron. 8vo. p. 426.

ECLIPSE. (from εκλειψις, of εκλειπω, *deficio*, I fail.) In astronomy, a privation of the light of one of the luminaries, by the interposition of some opaque body, either between it and the eye, or between it and the sun.

The ancients had frightful ideas of eclipses; supposing them presages of the most dismal events, Plutarch assures us, that at Rome it was not allowed to talk publicly of any natural causes of eclipes. They made a great noise with brazen instruments, and raised loud shouts, during eclipses of the moon; as thinking, thereby, to ease her in labour: whence Juvenal, speaking of a talkative woman, says, "Una laboranti poterit succurrere lunæ." Others attributed the eclipse of the moon to the arts of magicians, who, by their enchantments, plucked her out of heaven, and made her skim over the grass. The natives of Mexico keep fast, during eclipses; and particularly their women, who beat and abuse themselves; drawing blood from their arms, &c. They imagine the moon has been wounded by the sun, in some quarrel between them.

The Hindus entertain strange ideas respecting the cause of an eclipse. They say that Rahoo, one of the asoors, stole a draught of the amceta, at the churning of the ocean, and was discovered in the act by the sun and moon, who immediately revealed it to the soors. He was instantly cut in two by Narian: after which his head flew to the heavens, and continues to this day, endeavouring to eat the sun and the moon in revenge for telling of the theft. This causes the eclipse! When the eclipse begins, the people begin to shout and drum to frighten him away, lest he should swallow the luminary. In 1797, during an eclipse, one of Mr. Fountain's servants (the missionary) told him very seriously, he remembered when a boy, that Rahoo had swallowed the moon; but the people made such a great noise while he was getting the last bit into his mouth, that he was forced to let it go again. (Biblical Magazine, No. 8.)

The opinions of the Chinese with regard to eclipses are very similar to those of the Hindus, and had, probably, the same origin. A knowledge of the nature of eclipses, and of the superstitious notions entertained of them, was of considerable advantage to Christopher Columbus, when, in 1493, he was driven on the island of Jamaica, and distressed for want of provisions, was refused relief; but having threatened them with a plague, and foretelling an eclipse, as a token of it, which happened according to his prediction, the barbarians were so terrified, that they strove who should be the first in bringing supplies, throwing them at his feet, and imploring forgiveness.

Eclipses are divided, with respect to the objects eclipsed, into eclipses of the sun, of the moon, and of the satellites: and with respect to circumstances, into total, partial, annular, and central. A total eclipse, is one in which the whole disc of the luminary is darkened; a partial one, is when only a part of the disc is darkened; in an annular eclipse, the whole is darkened, except a ring or annulus, which appears round the dark part, like an illuminated border; and in a central eclipse, the centres of the two luminaries, and that of the earth, are in one and the same right line.

Every planet and satellite is illuminated by the sun; and casts a shadow towards that point of the heavens which is opposite to the sun. This shadow is nothing but a privation of light in the space hid from the sun by the opaque body that intercepts his rays.

When the sun's light is so intercepted by the moon, that to any place of the earth the sun appears partly or wholly covered, he is said to undergo an eclipse; though, properly speaking, it is only an eclipse of that part of the earth where the moon's shadow or penumbra falls. When the earth comes between the sun and moon, the moon falls into the earth's shadow; and having no light of her own, she suffers a real eclipse from the interception of the sun's rays. When the sun is eclipsed to us, the moon's inhabitants, on the side next the earth, see her shadow like a dark spot travelling over the earth, about twice as fast as its equatorial parts move, and the same way as they move. When the moon is in an eclipse, the sun appears eclipsed to her, total to all those parts on which the earth's shadow falls, and of as long continuance as they are in the shadow.

Lunar eclipses may be readily conceived after referring to fig. 6. Pl. 5. where S is the sun, E the earth, and M or M the moon: they only happen at the time of full moon; because it is only then the earth is between the sun and moon: nor do they happen every full moon, because of the obliquity of the moon's path with respect to the sun's; but only in such full moons as happen either at the intersection of those two paths, called the moon's nodes, or very near them, viz. when the moon's latitude, or distance between the centres of the earth and moon, is less than the sum of the apparent semi-diameters of the moon and the earth's shadow.

The chief circumstances in lunar eclipses are here mentioned: 1. All lunar eclipses are universal, or visible in all parts of the earth which have the moon above their horizon, and are every where of the same magnitude and duration. 2. In all lunar eclipses, the eastern side (or the left-hand side, as we look towards her from the north) is what first immerges into the shadow, and emerges again; for the proper motion of the moon being swifter than that of the earth's shadow, the moon approaches it from the west, overtakes and passes through it with the moon's east side foremost, leaving the shadow behind, or to the westward. 3. Although total eclipses of the longest duration happen in the node, yet there may be total eclipses within a small distance of the nodes, namely, within that distance where the moon's latitude is equal to the apparent semidiameter of the earth's shadow, minus the semidiameter of the moon's disc, but in these situations the duration of total darkness will be short; whereas in central eclipses it will continue nearly two hours. 4. If the earth had no atmosphere, the moon, when she was totally eclipsed, would be invisible; but as the earth has an atmosphere, some of the light from the sun will be refracted thereby, and transmitted to the moon, on which account the moon will be visible at that time, and appear of a dull red colour. Lastly, she grows sensibly paler and dimmer, before entering into the real shadow; owing to a penumbra which surrounds that shadow to some distance.

Astronomy of lunar eclipses, or the method of calculating their times, places, magnitudes, and other phenomena.—The first preliminary is to find the length of the earth's conical shadow. This may be found either from the distance between the earth and sun, and the proportion of their diameters, or from the angle of the sun's apparent magnitude at the time. Thus, suppose the semi-axis of the earth's orbit 95,000,000 miles, and the eccentricity of the orbit 1,377,000 miles, making the greatest distance 96,377,000 miles, or 24,194 semidiameters of the earth; and the sun's semidiameter being to the earth's, as 112 to 1; then as AD : BE :: DB : EC, that is, 111 : 1 :: 24194 : 218 semidiamers of the earth = EC the length of the earth's shadow. Otherwise, suppose the angle AES, or the sun's apparent semidiameter, be 15′ 56″, and the angle BAE, or the sun's parallax, 8·6″, then is their difference, or the angle ACE = 15′ 47·4″; hence, as tang. 15′ 47·4″ : radius :: BE or 1 : 218 nearly = CE, the same distance as before. Hence, as the moon's least distance from the earth is scarce 56 semidiameters, and the greatest not more than 64, the moon, when in opposition to the sun, in or near the nodes, will fall into the earth's shadow, and will be eclipsed, as the length of the shadow is almost four times the moon's distance.

2. *To find the apparent semidiameter of the earth's shadow, in the place where the moon passes through it, at any given time.*—Add together the sun and moon's parallaxes, and from the sum subtract the apparent semidiameter of the sun; so shall the remainder be the apparent semidiameter of the shadow at the place of the moon's passage. For example, the 28th of April, 1790, at midnight, the moon's parallax is 61′ 9″, to which add 8·6″, or 9″, for the sun's parallax, from the sum 61′ 18″ take 15′ 56″, the sun's apparent semidiameter, and the remainder 45′ 22″ is the semidiameter of the shadow at the place where the moon passes through at that time. N. B. Some omit the sun's parallax, as of no consequence; but increase the apparent semidiameter of the shadow by one whole minute, for the shadow of the atmosphere; which would give the semidiameter of the shadow, in the case above, 46′ 13″.

3. There must also be had, the true distance of the moon from the node, at the mean opposition; also the true time of the opposition, with the true place of the sun and moon, reduced to the ecliptic; likewise the moon's true latitude at the time of the true opposition; the angle of the moon's way with the ecliptic, and the true horary motions of

the sun and moon: from which all the circumstances of her eclipse may be computed by common arithmetic and trigonometry.

To construct an eclipse of the moon.—Let EW (fig. 7. Pl. 5. part iv.) be a part of the ecliptic, and C the centre of the earth's shadow, through which draw perpendicular to EW the line CN towards the north, if the moon have north latitude at the time of the eclipse, or CS southward, if she have south latitude. Make the angle NCD equal to the angle of the moon's way with the ecliptic, which may be always taken at 5° 35′ on an average, without any sensible error; and bisect this angle by the right line CF; in which line it is that the true equal time of opposition of the sun and moon falls, as given by the tables.

From a convenient scale of equal parts, representing minutes of a degree, take the moon's latitude at the true time, and set it from C to G, on the line CF; and through the point G, at right angles to CD, draw the right line HKGLI for the path of the moon's centre. Then is L the point in the earth's shadow, where the moon's centre is at the middle of the eclipse; G the point where her centre is at the tabular time of her being full; and K the point where her centre is at the instant of her ecliptic opposition: also I the moon's centre at the moment of immersion, and H her centre at the end of the eclipse. With the moon's semidiameter as a radius, and the points I, L, H, as centres, describe circles for the moon at the beginning, middle, and end of the eclipse. Finally, the length of the line of path IH, measured on the same scale, will serve to determine the duration of the eclipse, viz. by saying, as the moon's horary motion from the sun is to IH : : 1 hour or 60 m. to the whole duration of the eclipse.

To compute a lunar eclipse.—This will be very easy from the foregoing construction. For, 1st, in the triangle CGL, right-angled at L, there are given the hypothenuse CG = the moon's latitude at the time of full moon, and the angle GCL = the half of 5° 35′; to find the legs CL and LG.—2d. In the right-angled triangle CHL or CIL, are given the leg CL, and CH or CI, the sum of the semidiameters of the moon and the earth's shadow; to find LH or LI, half the difference of the sun's and moon's motions during the time of the eclipse.—3d. As the difference of the horary motions of the luminaries is to one hour, or 60 min. : : HL to the semiduration of the eclipse, and : : GL to the difference between the opposition and middle of the eclipse; this last therefore taken from the time of full moon, gives the time of the middle of the eclipse; from which subtracting the time in LI, or semiduration before found, gives the beginning of the eclipse; or add the same, and it gives the end of it.—Lastly, from CO the semidiameter of the shadow, take CL, leaves LO; to which add LP, the moon's semidiameter, when necessary, gives OP the quantity eclipsed.

Note.—When the moon's distance from the node exceeds 12°, there can be no eclipse of the moon: or, more accurately, the limit is from $10\frac{1}{2}$ and $12\frac{1}{30}$ degrees, according to the distances of the sun, earth, and moon.

Solar eclipses may be understood, as to their nature and cause, by referring to fig. 8. Pl. 5, where S is the sun, M the moon; and CD the earth, *rmso* the moon's conical shadow, travelling over a part of the earth CoD, and making a complete eclipse to all the inhabitants residing in that track, but nowhere else; excepting that for a large space around it there is a fainter shade, included within all the space *r*CD*s*, which is called *penumbra*.

Solar eclipses happen only when the moon is in conjunction with the sun, that is at the new moon, and also in the nodes, or near them, the limit being about 17° on each side a node: such eclipses only happening when the latitude of the moon, viewed from the earth, is less than the sum of the apparent semidiameters of the sun and moon. In the nodes, when the moon has no visible latitude, the occultation is total: with some continuance when the disk of the moon in perigee appears greater than that of the sun in apogee, and its shadow is extended beyond the surface of the earth: and total without continuance, when the point of the moon's shadow barely covers the earth. Lastly, out of the nodes, but within the limits, the eclipses are partial.

Other circumstances of solar eclipses are the following: 1. An eclipse of the sun does not appear the same in all parts of the earth where it is seen, but is in some total or annular, while in others it is partial. 2. A solar eclipse does not happen at the same time in all places where it is seen; but appears more early to the western parts, and more late to the eastern, as the motion of the moon beyond the sun, and consequently of her shadow, is from west to east. 3. An eclipse of the sun begins on the western side, and ends on the eastern. 4. No eclipse of the sun happens to all places where the sun is visible; for the penumbra does at no time cover a hemisphere of the earth. 5. The position of the cusps of the horns of the unobscured part of the sun's disc may be easily found in the middle of the eclipse; for the line which joins them is parallel to the moon's apparent way. 6. The middle of a solar eclipse will not be at the same time in all places on the same meridian; for the parallax of longitude will be different in different latitudes. 7. The excess of the apparent semidiameter of the moon above that of the sun in a total eclipse is so small, that total darkness seldom continues more than four minutes in the latitude of London. 8. In most solar eclipses the moon's disc is covered with a faint light, which is attributed to the reflection of the light from the illuminated part of the earth. 9. In total eclipses of the sun, the darkness is sometimes so great as to render visible the planets above the horizon, and stars of the second magnitude. In such eclipses the moon's limb is seen surrounded with a ring which appears much brighter and whiter near the moon's body than at a distance from it; this ring in all respects resembles the appearance of an enlightened atmosphere viewed from a distance; but whether it belongs to the moon or the sun is not entirely decided, though it is generally supposed that it belongs to the former.

The limits of a solar eclipse would be determined after the same manner as those of a lunar one, if the moon's parallax were insensible; but because the parallax is considerable, the method is rather altered. 1. Add together the apparent semidiameters of the luminaries, both in apogee and perigee; this gives 33′ 16″ for the greatest sum, and 30′ 31″ for the least. 2. Since the parallax diminishes the northern latitude, and augments the southern, let the greatest parallax in latitude be added to the former sums, and also subtracted from them; the sum or difference will in each case give the latitude beyond which there can be no eclipse; this latitude being given, the distance from the node is readily determined, and is found to be from 16½° to 18⅓°, according to circumstances, for the limit, beyond which there can be no solar eclipse. Or, for this purpose M. Cassini gives the following directions: "Find the time of the mean conjunction, and at that time find the sun's mean longitude, also the longitude of the moon's node; and if the difference of these be less than 21°, there *may* be an eclipse; but if the difference be less than 15°, there *must* be one."

To calculate edifices of the sun.—First, find the mean new moon, and thence the true one; with the place of the luminaries for the apparent time of the true one. 2. For the apparent time of the true new moon, compute the apparent time of the new moon observed. 3. For the apparent time of the new moon seen, compute the latitude seen. 4. Thence determine the digits eclipsed. 5. Find the times of the greatest darkness, immersion, and emersion. 6. Thence determine the beginning and ending of the eclipse.

To determine the duration of a solar eclipse.—Find the horary motion of the moon from the sun, for one hour before the conjunction, and another hour after; then say, as the former horary motion, to the seconds in an hour, so are the scruples of half duration (found as in a lunar eclipse) to the time of immersion; and as the latter horary motion, to the same seconds, so are the same scruples of half duration, to the time of emersion. Then, adding the times of immersion and emersion together, the aggregate is the total duration.

The moon's apparent diameter, when largest, exceeds the sun's when least, only 2′ of a degree; and at the greatest solar eclipse that can happen at any time and place, the total darkness cannot continue any longer than whilst the moon is moving through this 2′ from the sun in her orbit, which is about 4 minutes of time: for the motion of the shadow on the earth's disc is equal to the moon's motion from the sun, which, on account of the earth's rotation on its axis towards the same way, or eastward, is about 30½ minutes of a degree every hour, at a mean rate; but so much of the moon's orbit is equal to 30½ degrees of a great circle on the earth, because the circumference of the moon's orbit is about 60 times that of the earth; and therefore the moon's shadow goes 30½ degrees, or 1830 geographical miles in an hour, or 30½ miles in a minute.

To determine the beginning, middle, and end, of a solar eclipse.—From the moon's latitude, for the time of conjunction, find the arch GL (fig. 7. Pl. 5.) or the distance of the greatest obscurity. Then say, as the horary motion of the moon from the sun, before the conjunction, is to 1 hour; so is the distance of the greatest darkness, to the interval of time between the greatest darkness and the conjunction. Subtract this interval, in the 1st and 3d quarter of the anomaly, from the time of the conjunction; and in the other quarters, add it to the same; the result is the time of the greatest darkness. Lastly, from the time of the greatest darkness subtract the time of incidence, and add it to the time of emersion; the difference in the first case will be the beginning; and the sum, in the latter case, the end of the eclipse.

To find the digits eclipsed.—Add the apparent semi-diameters of the luminaries into one sum, from which subtract the moon's apparent latitude, the remainder shews the scruples, or parts of the diameter eclipsed. Then say, as the semidiameter of the sun, to the scruples eclipsed; so are 6 digits, or 360 scruples, to the digits, &c. eclipsed.

A very ingenious method of constructing and calculating solar eclipses was first given by Mr. Flamstead in vol. i. of sir Jonas Moore's System of Mathematics: the same method in substance is given by Dr. Keill, M. de la Caille, Mr. Ferguson, and Mr. Vince, in their respective treatises on Astronomy; a still simpler method is given by M. Delambre in his Astronomy, lately published.

The following is a sketch of an analytical method for the computation of eclipses. We refer all the points which we have to consider, to three axes respectively perpendicular, according to the method adopted by the generality of modern mathematicians. We shall take for axes of the letters y, the line drawn from the centre of the earth to that of the luminary eclipsed, which we shall call in general *the planet*; for axes of the letters $\varkappa$, a line perpendicular to the former in the plane of the ecliptic; and for axes of the letters z, a third line perpendicular to both the others. The positive y, y, &c. will be directed towards the planet; the x, $\varkappa$, &c. positive to the left, according to the order of the signs; the z, z, &c. positive above the plane of the ecliptic, towards the boreal pole.

Following the example of Dionis du Séjour, we shall conceive a plane perpendicular to the axes of the y, y, &c. to pass through the centre of the moon; which we shall call the plane of projection; and upon it we shall determine the apparent place of the centre of the planet viewed from the place of the observer. This done, nothing will be more easy than to compute the apparent distance of the luminaries.

1. Call ϕ the longitude of the planet, ψ its latitude, ϕ' the longitude of the moon, ψ' its latitude, X, Y, Z, co-ordinates; taking for unity its distance from the earth, we shall easily obtain by a simple transformation of co-ordinates:

$$X=\sin(\phi'-\phi)\cos\psi'.$$
$$Y=\sin\psi'\sin\psi+\cos\psi'\cos\psi\cos(\phi'-\phi).$$
$$Z=\sin\psi'\cos\psi-\cos\psi'\sin\psi\cos(\phi'-\phi).$$

It will appear as we proceed how we may pass to the value of Y. As to those of X and Z, we may at once give them this form:

$$X=\sin(\phi'-\phi)-2\sin(\phi'=\phi)\sin^2\tfrac{1}{2}\psi':$$
$$Z=\sin(\psi'-\psi)+2\sin^2\left(\frac{\phi'-\phi}{2}\right)\sin\psi\cos\psi':$$

which approximate very nearly to the following values:

$$X=(\phi'-\phi)-2(\phi'-\phi)\sin^2\tfrac{1}{2}\psi$$
$$Z=(\psi'-\psi)+2\sin^2\left(\frac{\phi'-\phi}{2}\right)\sin\psi.$$

And as the terms of the second order will be always very small, they may be exhibited in little tables easy to compute: or, indeed table 95 at the end of vol. i. of Lalande's Astronomy will answer the purpose.

2. If we put ϱ for the radius of the earth passing through the place of the observer; α the angle which it makes with the plane of $\varkappa z$; β the angle which its projection on the same plane makes with the axis of Z; $\varkappa$, y, z, the co-ordinates of the place of the observer; we shall have, by known formulæ,

$$\varkappa=\varrho\cos\alpha\sin\beta$$
$$z=\varrho\cos\alpha\cos\beta$$
$$y=\varrho\sin\alpha;$$

and it is sufficiently obvious that, of the two angles α and β, the first expresses the altitude of the planet above the horizon; and the second, the parallactic angle formed by the vertical and the circle of latitude.

3. If we conceive a visual ray drawn from the eye of the observer to the centre of the planet, denoting by ξ and ζ the co-ordinates of the point where it cuts the plane of projection, respectively parallel to the axes of the x, x, &c. and of the z, z, &c., and by R the distance of the planet from the earth; we shall easily obtain

$$\xi=\frac{R-Y}{R-y}x,$$

$$\zeta=\frac{R-Y}{R-y}z,$$

But, representing by p the horizontal parallax of the moon, π that of the planet, we have, manifestly,

$$\varrho=p,$$

$$R=\frac{1}{\pi};$$

substituting therefore these values, as well as those of x, y, and z; supposing also $Y=1$; and neglecting in the denominator the very minute term $\pi \sin \alpha$; we shall find

$$\xi=(p-\pi)\cos\alpha\sin\beta$$

$$\zeta=(p-\pi)\cos\alpha\cos\beta;$$

expressions extremely simple.

If, therefore, we call l the line which unites the centre of the moon, and the apparent place of the centre of the planet upon the plane of projection, we shall have,

$$l=\sqrt{[(X-\xi)^2+(Z-\zeta)^2]}.$$

Now, this line may be considered perpendicular to the visual ray from the observer; while, on the other hand, the distance of this latter from the plane of projection is equal to $Y-y$. The apparent distance of the centres is, therefore, expressed by

$$\frac{l}{Y-y}.$$

Farther, let D be the horizontal semi-diameter of the moon; then $\frac{D}{Y-y}$ will be its semi-diameter augmented in the ratio of its altitude. Let, also, Δ be the semi-diameter of the planet; then will the sum of their apparent semi-diameters be

$$\frac{D}{Y-y}+\Delta.$$

Now, when this sum is equal to the apparent distance of the centres, the eclipse will be either at its commencement or at its end. We shall have, therefore, for each of those two instants:

$$\frac{l}{Y-y}=\frac{D}{Y-y}+\Delta;$$

or, by clearing the equation of fractions, supposing $Y=1$, and substituting for y its value, there results,

$$l=D+\Delta-p\Delta\sin\alpha.$$

But the term $p\,\Delta\sin\alpha$ can never exceed 15″. It may, therefore, be exhibited in a small table; and thus the whole is reduced, at length, to calculating the quantity L, which expresses the apparent distance of the centres, measured upon the plane of projection.

That the advantages of this method may the more easily be seen, we shall reduce it to a kind of epitome by which it may readily be compared with that given by M. Cagnoli, (at p. 423 of his Trigonometry) the best analytical method yet published.

Suppose that we wish to ascertain whether an eclipse has commenced at any given instant:

We find for that instant,

The longitude of the planet	φ
Its latitude	ψ
Its right-ascension	e
Its declination	η
Its angle of position	θ
Its horizontal parallax	π
Its semi-diameter at the horizon	Δ
The longitude of the moon	φ'
Its latitude	ψ'
Its horizontal paralax	p
Its semidiameter at the horizon	D
The geocentric latitude of the place of the observer	λ
The right ascension of medium celi	m

Then make,

$$\text{Sin } \alpha=\sin\lambda\sin\eta+\cos\lambda\cos\eta\cos(m-e).$$

$$\text{Sin } S=\frac{\cos\lambda\sin(m-e)}{\cos\alpha}.$$

$$\beta=S-\theta.$$

$$\zeta=(p-\pi)\cos\alpha\cos\beta.$$

$$\xi=\zeta\tan\beta.$$

$$X=\varphi'-\varphi-2(\varphi'-\varphi)\sin^2\tfrac{1}{2}\psi'.$$

$$Z=\psi'-\psi+2\sin^2\tfrac{1}{2}(\varphi'-\varphi)\sin\psi.$$

(The terms of the second order vanish in eclipses of the sun; and in other cases may be exhibited in little tables.)

$$\text{Tan } M=\frac{Z-\zeta}{X-\xi}$$

$$l=\frac{X-\xi}{\cos M}$$

Take the sum $D+\Delta$ of the horizontal semi-diameters: in solar eclipses subtract the small quantity $p\Delta\sin\alpha$, which may be shewn in a little table, the remainder compared with the value of L will shew if the eclipse is commenced.

The number of eclipses of both luminaries cannot be fewer than two, nor more than seven, in one year; the most usual number is four, and it is rare to have more than six. The reason is obvious; for the sun passes by both the nodes of the moon's orbit but once in a year, unless he pass by one of them in the beginning of the year, in which case he will pass by the same again a little before the end of the year; because the nodes retrograde about 19⅓ degrees every year, and therefore the sun will come to either of them about 173 days after the other, for he will have to move $180°-\frac{19\frac{1}{3}°}{2}$, which will occupy nearly 173 days. And if neither node be within 17° of the sun at the time of new moon, the sun will be eclipsed; and at the subsequent opposition, the moon will be eclipsed in the other node, and come round to the next conjunction before the former node be 17° beyond the sun, and eclipse him again. When three eclipses happen about either node, the like number commonly happens about the opposite one; as the sun comes to it in 173 days afterwards, and 6 lunations contain only 4 days more. Thus there may be two eclipses of the sun, and one of the moon, about each of the nodes. But when the moon changes in either of the nodes, she cannot be near enough the other node at the next full, to be eclipsed; and in 6 lunar months afterwards she will change near the other node; in which case there cannot be more than two eclipses in a year, both of the sun. Speaking generally, there will be more solar than lunar eclipses, as they will nearly bear the proportion of their limits, viz. about 4 to 3. But more lunar than solar eclipses are seen at any given place; because a lunar eclipse is visible on a whole terrestrial hemisphere at once, whereas a solar eclipse is visible only on a portion of a hemisphere.

Period of eclipses, is the space of time after which the same eclipses return again. The moon's nodes move backwards $19\frac{1}{3}$° every year, therefore they would shift through all the points of the ecliptic in eighteen years and 225 days; and this would be the regular period of the return of eclipses, if any complete number of lunations were performed in it, without a fraction; but this is not the case. However, in 223 mean lunations, after the sun, moon, and nodes, have been once in a line of conjunction, they return so nearly to the same state again, that the same node which was in conjunction with the sun and moon at the beginning of these lunations will be within 28′ 12″ of the line of conjunction, when the last of these lunations is completed; and in this period there will be a regular return of eclipses, till it be repeated about forty times, or in about 720 years, when the line of the nodes will be 28′ × 40 from the conjunction; and will, consequently, be beyond the ecliptic limits: this is called the Plinian period or Chaldean saros; it contains, according to Dr. Halley, 18 Julian years 11 days 7 hours 43 minutes 20 seconds; or, according to Mr. Ferguson, 18^y 11^d 7^h 42^m 44^s. In an interval of 557^y 21^d $18^h 11^m$ 51^s, in which there are exactly 6890 mean lunations, the conjunction or opposition coincides so nearly with the node, as not to be distant more than 11′. If, therefore, to the mean time of any solar or lunar eclipse, we add this period, and make the proper allowance for the intercalary days, we shall have the mean time of the return of the same eclipse. This period is so very near, that in 6000 years it will vary no more from the truth, as to the restitution of eclipses, than $8\frac{1}{4}$ minutes of a degree.

The use of eclipses.—In astronomy, eclipses of th moon determine the spherical figure of the earth; they also shew that the sun is larger than the earth, and the earth than the moon. Eclipses also, that are similar in all circumstances, and that happen at considerable intervals of time, serve to ascertain the period of the moon's motion. In geography, eclipses discover the longitude of different places; for which purpose those of the moon are the more useful because they are more often visible, and the same lunar eclipse is of equal magnitude and duration at all places where it is seen. In chronology, both solar and lunar eclipses serve to determine exactly the time of any past event.

Eclipses of the Satellites. See SATELLITES OF JUPITER.

To ECLIPSE. *v. a.* (from the noun.) 1. To darken a luminary (*Creech*). 2. To extinguish; to put out (*Shakspeare*). 3. To cloud: to obscure (*Calamy*). 4. To disgrace (*Clarendon*).

ECLIPTA, in botany, a genus of the class syngenesia, order polygania superflua. Receptacle chaffy, downless; florets of the centre five-cleft. There are seven species; natives of the East or West Indies: and perhaps one or two indigenous to our own country.

ECLI'PTIC. *a.* Something belonging to eclipses; as ecliptic limits, the greatest distances from the nodes at which the sun or moon can be eclipsed. This limit for lunar eclipses is between $10\frac{1}{2}$ and $12\frac{1}{30}$°; and, for solar eclipses, between $16\frac{1}{2}$ and $18\frac{1}{3}$; as stated in some of the preceding articles.

ECLIPTIC. *s.* In astronomy, a great circle of the sphere, supposed to be drawn through the middle of the zodiac. It is sometimes called the *via solis*, or sun's path, being the track which he appears to describe among the fixed stars; though, more properly, it is the apparent path of the earth, as viewed from the sun, and thence called the heliocentric circle of the earth. It obtained the name ecliptic, because all eclipses of the sun and moon happen when the moon is in or near a node where her path intersects this circle.

Upon the ecliptic are marked and counted the twelve celestial signs, Aries, Taurus, &c. and upon it the longitudes of planets and stars are reckoned. It is situated obliquely with respect to the equator, and cuts it in two points, viz. the beginning of Aries and Libra, which are directly opposite to each other; and, accordingly, we find the sun twice every year in the equator; and all the rest of the year, either on the north or south side thereof. The ecliptic is a great circle of the sphere, bisected by the horizon; consequently, the arch of the ecliptic, intercepted between the horizon and the meridian, is a quadrant. And again, the solstitial points of the ecliptic, i. e. those most remote from the equator, are a quadrant distant from the equinoctial points.

Obliquity of the Ecliptic, is the angle which it makes with the equator at their intersection. This obliquity may be found in the following manner: about the time of the summer solstice observe the sun's meridian altitude with the utmost care, for several days successively: from the greatest altitude observed, subtract the height of the equator; and the remainder is the greatest declination, which is the solstitial point. Or, it may be found by observing the meridian altitude of the sun's centre on the days of the summer and winter solstice; the difference of those altitudes will be the distance of the tropics; and half that distance will be the obliquity of the ecliptic.

This obliquity is now about 23° 27′ 58″; but it is variable. According to the observations of Pytheas, at Marseilles, made rather more than 300 years before the Christian æra, the obliquity was then 23° $49\frac{1}{2}$′. Albategnius, about the year 880, found it to be 23° 35′, or, by correcting for parallax and refraction, 23° 35′ 40″. Almæon, the son of Almansor the Arabian, made it 23° 33′ 30″ in 1140. Tycho Brahe, in 1587, found it to be 23° 29′ 30″. Mr. Flamsteed, in 1689, 23° 28′ 56″. Condamine, at Quito, in 1716, made it 23° 28′ 24″. Dr. Maskelyne, in 1769, determined it at 23° 28′ 10″. By a comparison with the most early and accurate observations, it appears that the diminution of the obliquity, is on the average about the rate of 50″ in a century, or half a second in a year.

This change in the obliquity of the ecliptic is wholly owing to the actions of the planets, and particularly Venus and Jupiter, upon the earth. According to La Grange, whose theory is admirable, the annual change of obliquity is variable, and has its limits. About 2000 years ago, he thinks it was at the rate of 38″ in 100 years; that it is now, and will be for 400 years to come, 56″ per century; but 2000 years hence, 49″ per century. After a very long period, the change of obliquity will vary from a diminution to an increase: and thus the obliquity of the ecliptic will vary alternately from greater to less, and from less to greater; the variations never exceeding 2°; as already observed in the *History of Astronomy*.

Ecliptic, in geography, an imaginary great circle on the terrestial globe, not only answering to, but falling upon, the plane of the celestial ecliptic.

Poles of the Ecliptic, are the two opposite points of the sphere, which are each everywhere equally distant from the ecliptic quite around, or 90° distant from it. The distance of the poles of the ecliptic from the poles of the equator, or of the world, is always equal to the varying distance of the obliquity of the ecliptic.

ECLOGUE, in poetry, a small elegant composition in a simple natural style. The word takes its derivation from the Greek εκλογη, choice, so that, according to the etymology, an eclogue should be a choice or select piece.

The eclogue, in its primary intention, is the same thing with the idyllium; but custom has likewise made some difference between them, and appropriated the name eclogue to pieces wherein shepherds are introduced; and idyllium to those written like eclogues, but without shepherds in them. The eclogue is properly an image of the pastoral life; therefore she matter is low, and its genius humble. Its business is to describe the loves, sports, piques, jealousies, intrigues, and other adventures of shepherds; so that its character must be simple, the wit easy, the narration short; the thoughts ingenious, the manners innocent, the language pure; the verse flowing, the expressions plain, and all the discourse natural. The models in this sort of poetry are Theocritus and Virgil; who both have some eclogues of a lofty character: the eclogue, therefore, occasionally raises its voice. Yet M. Fontenelle esteems it a fault in some modern poets to have put matter of high concern in their eclogues, and made their shepherds sing the praises of kings and heroes.

E'CLYSIS. (εκλυσις, dissolution.) A dissolution or universal faintness.

ECONO'MICAL. Econo'mick. *a.* (from *economy*.) 1. Pertaining to the regulation of a household (*Davies*). 2. Frugal (*Wotton*).

ECO'NOMY. *s.* (οικονομια.) 1. The management of a family (*Taylor*). 2. Distribution of expence (*Dryden*). 3. Frugality; discretion of expence (*Swift*). 4. Disposition of things; regulation (*Hammond*). 5. The disposition or arrangement of any work (*Ben Jonson*). 6. System of matter; distribution of every thing to its proper place (*Blackmore*).

Economy (Political). See Political.

ECMARTYRIA, in antiquity, a kind of second-hand evidence admitted in the Athenian courts.

ECOUTE, in the manage, a pace or motion of a horse, when he rides well upon the hand and the heels, is compactly put upon his haunches, and bears or listens to the heels or spurs; and continues duly balanced between the heels, without throwing to either side. This takes place when a horse has a fine sense of the aids of the hand and heel.

ECPHORA, in architecture, the projecture, or the right line intercepted between the axis and the outermost surface of a member or moulding.

ECPHRA'CTICS. (from εκφρασσω, to remove obstructions.) Deobstruents; medicines which remove obstructions.

ECPY'CTICS. (from εκπυκαζω, to condense.) Incrassants: medicines that render the fluids more solid.

E'CSTACY. *s.* (εκστασις.) 1. Any passion in which the thoughts are absorbed, and in which the mind is for a time lost (*Suckling*). 2. Excessive joy; rapture (*Prior*). 3. Enthusiasm; excessive elevation and absorption of the mind (*Milton*). 4. Excessive grief or anxiety: not in use. 5. Madness; distraction: not in use (*Shakspeare*).

E'CSTASIED. *a.* (from *ecstacy*). Ravished; filled with enthusiasm.

ECSTASIS. (from εξιστημι, to be delirious.) An ecstacy, delirium, or trance.

ECSTA'TIC. Ecsta'tical. *a.* (εκστατικος.) 1. Ravished; rapturous; elevated beyond the usual bounds of nature (*Stillingfleet.*) 2. Raised to the highest degree of joy (*Pope*). 3. Tending to external objects (*Norris*).

ECSTATICI, in Grecian antiquity, a sort of diviners, who were cast into trances or ecstacies, in which they lay like dead men, or persons asleep, deprived of all sense or motion, but after some time, returning to themselves, they gave strange relations of what they had seen and heard.

ECTHESIS, in church history, a confession of faith, in the form of an edict, published in the year 639, by the emperor Heraclius, with a view to pacify the troubles occasioned by the Eutychian heresy in the eastern church. The same prince revoked it, on being informed that pope Severinus had condemned it, as favouring the Monothelites; declaring at the same time that Sergius, patriarch of Constantinople, was the author of it.

ECTHLIPSIS, among Latin grammarians, a figure of prosody, whereby the *m* at the end of a word, when the following word begins with a vowel, is elided, or cut off, together with the vowel preceding it, for the sake of the measure of the verse; thus they read *mult' ille*, for *multum ille*.

ECTO'PIÆ. (*ectopia*, εκτοπια, from εκτοπος, out of place.) Parts displaced. It constitutes an order in the class locales of Cullen's nosology.

ECTRO'PIUM. (*ectropium*, εκτροπιον, from εκτρεπω, to invert.) An extraversion of an eyelid, so that its internal surface is outermost.

ECTYPE, among antiquarians, an impression of a medal, seal, or ring, or a figured copy of an inscription, or other ancient monument.

ECU, or Escu, a Spanish crown. See Money.

ECYA, an episcopal town of Spain, in Andalusia. It contains twenty convents, and about 9000 inhabitants. Lat. 37. 39 N. Lon. 4. 27 W.

ECZE'MIA. Ecze'sma. (from ἐκζέω, to boil.) Heat eruptions: spring flushes: æstus volatilis, or feu-volant. It is a term that has been hitherto used by medical writers rather generally, to express every kind of cutaneous heat eruption, than restricted to any particular species.

EDA'CIOUS, *a.* (*edacitas*, Lat.) Eating; voracious; ravenous; greedy.

EDA'CITY. *s.* (*edacitas*, Lat.) Voracity; ravenousness; greediness; rapacity (*Bacon*).

EDDA, in antiquities, is a system of the ancient Icelandic or Runic mythology, containing many curious particulars of the theology, philosophy, and manners, of the northern nations of Europe; or of the Scandinavians, who had migrated from Asia, and from whom our Saxon ancestors were descended. Mr. Mallet apprehends that it was originally compiled, soon after the Pagan religion was abolished, as a course of poetical lectures, for the use of such young Icelanders as devoted themselves to the profession of a scald or poet. It consists of two principal parts; the first containing a brief system of mythology, properly called the Edda; and the second being a kind of art of poetry, and called Scalda, or Poetics. The most ancient Edda was compiled by Soemund Sigfusson, surnamed the Learned, who was born in Iceland about the year 1057. This was abridged, and rendered more easy and intelligible, about a hundred and twenty years afterwards, by Snorro Sturleson, who was supreme judge of Iceland in the years 1215 and 1222; and it was published in the form of a dialogue. He added also the second part in the form of a dialogue, being a detail of different events transacted among the divinities. The only three pieces that are known to remain of the more ancient Edda of Soemund, are the Voluspa, the Havamaal, and the Runic chapter.

The first edition of the Edda was published by Resenius, professor at Copenhagen, in a large quarto volume, in the year 1665; containing the text of the Edda, a Latin translation by an Icelandic priest, a Danish version, and various readings from different MSS. Mr. Mallet has also given an English translation of the first part, accompanied with remarks; from which we learn, that the Edda teaches the doctrine of the Supreme, called the Universal Father, and Odin, who lives for ever, governs all his kingdom, and directs the great things as well as the small; who formed the heaven, earth, and air; made man, and gave him a spirit or soul, which shall live after the body shall have mouldered away; and then all the just shall dwell with him in a place called Gimle, or Vingolf, the palace of friendship; but wicked men shall go to Hela, or death, and from thence to Nislheim, or the abode of the wicked, which is below in the ninth world. It inculcates also the belief of several inferior gods, and of goddesses, the chief of whom is Frigga, or Frea, i. e. lady, meaning hereby the earth, who was the spouse of Odin, or the Supreme God; whence we may infer that, according to the opinion of these ancient philosophers, this Odin was the active principle or soul of the world, which uniting itself with matter, had thereby put it into a condition to produce the intelligencies, or inferior gods, and men, and all other creatures. The Edda likewise teaches the existence of an evil being, called Loke, the calumniator of the gods, the artificer of fraud, who surpasses all other beings in cunning and perfidy. It teaches the creation of all things out of an abyss or chaos; the final destruction of the world by fire; the absorption of the inferior divinities, both good and bad, into the bosom of the grand divinity, from whom all things proceeded, as emanations of his essence, and who will survive all things; and the renovation of the earth in an improved state. Fables 1, 2. 10. 16. 33. For a farther accouut of the Edda, see Mallet's Northern Antiquities, vol. ii. 1770, passim.

To E'DDER. *v. a.* To bind a fence (*Mortimer*).

E'dder. *s.* Such fencewood as is commonly put upon the top of fences (*Tusser*).

EDDISH, or Eadish, the latter pasture, or grass, which comes after mowing, or reaping; otherwise called ear-grass, earsh, and etch.

E'DDY. *s.* (eꝺ, backward, again, and ea, water, Saxon.) 1. The water that by some repercussion, or opposite wind, runs contrary to the main stream (*Dryden*). 2. Whirlpool; circular motion (*Dryden*).

E'ddy. *a.* Whirling; moving circularly (*Dryden*).

EDDYSTONE or Edystone rocks, so remarkable for the light-house built on them, obtained their name from the great variety of contrary sets of the tide or current in their vicinity. They are situated nearly S.S.W. from the middle of Plymouth sound, according to the true meridian. The distance from the port of Plymouth is nearly fourteen miles, and from the promontory called Ramhead about ten miles. They are almost in the line, but somewhat within it, which joins the Start and the Lizard points; and as they lie nearly in the direction of vessels coasting up and down the channel, they were necessarily, before the establishment of a light-house, very dangerous, and often fatal to ships under such circumstances. Their situation, likewise, with regard to the bay of Biscay and Atlantic ocean, is such, that they lie open to the swells of the bay and ocean from all the south-western points of the compass: which swells are generally allowed by mariners to be very great and heavy in those seas, and particularly in the bay of Biscay. It is to be observed, that the soundings of the sea from the south-westward toward the Edystone are from eighty fathoms to forty, and everywhere till you come near the Edystone the sea is full thirty fathoms in depth; so that all the heavy seas from the south-west come uncontrolled upon the Edystone rocks, and break on them with the utmost fury.

The force and height of these seas is increased by the circumstance of the rocks stretching across the channel, in a north and south direction, to the length of above a hundred fathoms, and by their lying in a sloping manner toward the south-west quarter. This stiving of the rocks, as it is technically called, does not cease at low water, but still goes on progressively; so that, at fifty fathoms westward, there are twelve fathoms water; nor do they terminate altogether at the distance of a mile. From this configuration it happens, that the seas are swelled to such a degree in storms and hard gales of wind, as to break on the rocks with the utmost violence.

The effect of this slope is likewise sensibly felt in moderate, and even in calm weather; for the libration of the water, caused in the bay of Biscay in hard gales at south-west, continues in those deep waters for many days, though succeeded by a calm; insomuch, that when the sea is to all appearance smooth and even, and its surface unruffled by the slightest breeze, yet those librations still continuing, which are called the ground-swell, and meeting the slope of the rocks, the sea breaks upon them in a frightful manner, so as not only to obstruct any work being done on the rock, but even the landing upon it, when, figuratively speaking, you might go to sea in a walnut shell. A circumstance which still farther increases the difficulty of working on the rock is, there being a sudden drop of the surface of the rock, forming a step of about four and a half or five feet high; so that the seas, which in moderate weather come swelling to this part, meet so sudden a check, that they frequently fly to the height of thirty or forty feet.

Notwithstanding these difficulties, it is not surprising that the dangers to which navigators were exposed by the Edystone rocks should make a commercial nation desirous of having a light-house on them. The wonder is, that any one should be found hardy enough to undertake the building. Such a man was first found in the person of Henry Winstanley, of Littlebury, in Essex, gent. who, in the year 1696, was furnished by the master, wardens, and assistants, of the Trinity house, of Deptford Strond, with the necessary powers to carry the design into execution. He entered upon his undertaking in 1696, and completed it in four years. This gentleman was so certain of the stability of his structure, that he declared it to be his wish to be in it "during the greatest storm that ever blew under the face of the heavens." Mr. Winstanley was but too amply gratified in this wish; for while he was there with his workmen and light-keepers, that dreadful storm began, which raged most violently on the 26th of November, 1703, in the night; and of all the accounts of the kind which history furnishes us with, we have none that has exceeded this in Great Britain, or was more injurious or extensive in its devastation. The next morning, November 27th, when the violence of the storm was so much abated that it could be seen whether the light-house had suffered by it, nothing appeared standing, but upon a nearer inspection, some of the large irons by which the work was fixed upon the rock; nor were any of the people, or any of the materials of the building, ever found afterwards.

In 1709, another light-house was built of wood, on a very different construction, by Mr. John Rudyerd, then a silk-mercer on Ludgate-hill. This was a very ingenious structure: after it had braved the elements for forty-six years, it was burnt to the ground in 1755. On the destruction of this light-house, that excellent mechanic and engineer Mr. Smeaton was chosen as the fittest person to build another. It was with some difficulty that he was able to persuade the proprietors, that a stone building, properly constructed, would in all respects be preferable to one of wood; but having at last convinced them, he turned his thoughts to the shape which was most suitable to a building so critically situated. Reflecting on the structure of the former buildings, it seemed a material improvement to procure, if possible, an enlargement of the base, without increasing the size of the waist, or that part of the building which is between the top of the rock and the top of the solid work. Hence he thought a greater degree of strength and stiffness would be gained, accompanied with less resistance to the acting power. On this occasion, the natural figure of the waist or bole of a large spreading oak, occurred to Mr. Smeaton. "Let us (says he) consider its particular figure. Connected with its roots, which lie hid below ground, it rises from the surface with a large swelling base, which at the height of one diameter is generally reduced by an elegant curve, concave to the eye, to a diameter less by at least one-third, and sometimes to half its original base. From thence, its taper diminishing more slowly, its sides by degrees come into a perpendicular, and for some height form a cylinder. After that, a preparation of more circumference becomes necessary, for the strong insertion and establishment of the principal boughs, which produces a swelling of its diameter. Now we can hardly doubt, but that every section of the tree is nearly of an equal strength in proportion to what it has to resist; and were we to lop off its principal boughs, and expose it in that state to a rapid current of water, we should find it as capable of resisting the action of the heavier fluid, when divested of the greater part of its clothing, as it was that of the lighter, when all its spreading ornaments were exposed to the fury of the wind: and hence we may derive an idea of what the proper shape of a column of the greatest stability ought to be, to resist the action of external violence, when the quantity of matter is given of which it is to be composed."

With these views, as to the proper form of the superstructure, Mr. Smeaton began the work on the 2d of April, 1757, and finished it August 4, 1759. The rock, which slopes towards the S. W. is cut into horizontal steps, into which are dove-tailed, and united by a strong cement, Portland stone, and granite. The whole, to the height of thirty-five feet from the foundation, is a solid of stones, engrafted into each other, and united by every means of additional strength. The building has four rooms, one over the other, and at the top a gallery and lantern. The stone floors are flat above, but concave beneath, and are kept from pressing against the sides of the building by a chain let into the walls. It is nearly eighty feet high, and since its completion has been assaulted by the fury of the elements, without suffering the smallest injury.

We regret that we cannot with propriety trace out the progress of this great work, and shew with what skill and judgment this unparalleled engineer overcame the greatest difficulties: we, however, beg to recommend to our curious readers Mr. Smeaton's own Account of the Eddystone Light-house, not doubting that they will be highly gratified by the perusal. According to the Requisite Tables, this light-house is situated in lat. 50. 8 N. Lon. 4. 24 W. of Greenwich, or 4. 18. 23 W. of London.

EDELINCK (Gerard), an eminent engraver, born at Antwerp, in 1641. He resided in France, where he executed some fine pieces, as the picture of the holy family by Raphael, and the tent of Darius by le Brun. He was patronized by Louis XIV. and died in 1707.

EDEMA (Gerard), a Dutch landscape-painter, who went to America, on purpose to observe the plants and insects of that country. He came to London in 1670, and became famous for painting landscapes. He died abont 1700.

EDEMATO'SE. *a.* (οιδημα.) Swelling; full of humours (*Arbuthnot*).

EDEN. (*pleasure and delight.*) A province of the East, called by Moses the land and the garden of Eden. Many conjectures have been formed about the situation of Eden: it is not consistent with our purpose to wander into the field of conjecture, we shall, therefore, just state, that the most probable opinion is, that the garden of Eden was situated somewhat to the N. W. of the Persian gulph, in about lat. 31 N. lon. 65 E. from Ferró. The reasons which induce us to prefer this situation may be seen in Wells's Geography, vol. i. p. 9, &c. or in Worthington's Theory of the Earth. This word Eden, from its meaning, has been imposed as a proper name of several places of a more than ordinarily delightful situation: as, for instance, a town on mount Lebanon, mentioned in Amos i. v. 5. Sir William Jones says, "it is observable, that *Aden*, in the Eastern dialects, is precisely the same word with Eden, which we apply to the garden of Paradise: it has two senses, according to a slight difference in its pronunciation: its first meaning is *a settled abode;* its second, *delight, softness,* or *tranquillity.*"

Eden, a river which rises in Westmoreland, on the confines of Yorkshire, and running N. by Appleby and Carlisle, falls into Solway frith.

EDE'NTATED. *a.* (*edentatus,* Lat.) Deprived of teeth.

EDGAR, king of England, succeeded his brother Edwin in 959, at the age of sixteen, but was not crowned till he was thirty. The moderation of his reign procured him the name of Peaceable. He vanquished the Scots, and laid Wales under a yearly tribute of a certain number of wolves' heads, which effectually cleared the country of those animals. He subdued one part of Ireland, and fitted out a great fleet of ships, which defended his kingdoms from invasion. On the death of his queen Egelflida, he sent earl Athelwold to see whether the report of the beauty of Elfrida was true. The earl fell in love with the lady, gave his master a false report, and married her. He was afterwards slain in hunting, and Elfrida became the wife of Edgar, who died in 975, aged thirty-three.

EDGE. *s.* (ecȝe, Saxon.) 1. The thin or cutting part of a blade (*Shakspeare*). 2. A narrow part rising from a broader (*Mortimer*). 3. Brink; margin; extremity (*Pope*). 4. Sharpness; intenseness of desire (*Dryden*). 5. Keenness; acrimony of temper (*Shakspeare*). 6. *To set teeth on* Edge. To cause a tingling pain in the teeth (*Bacon*).

To Edge. *v. a.* (from the noun.) 1. To sharpen; to enable to cut (*Dryden*). 2. To furnish with an edge (*Dryden*). 3. To border; to fringe (*Pope*). 4. To exasperate; to embitter (*Haywood*). 5. To put forward beyond a line (*Locke*).

To Edge. *v. n.* To move against any power.

E'DGED. *part. a.* (from *edge*) Sharp; not blunt (*Digby*).

E'DGELESS. *a.* (from *edge.*) Blunt; obtuse; unable to cut (*Shakspeare*).

E'DGETOOL. *s.* (*edge* and *tool.*) A tool made sharp to cut (*L'Estrange*).

E'DGEWISE. *ad.* (*edge* and *wise.*) With the edge put into any particular direction (*Ray*).

E'DGING. *s.* (from *edge.*) 1. What is added to any thing by way of ornament (*Dryden*). 2. A narrow lace.

EDGINGS, among gardeners, the series of small but durable plants, set round the edges or borders of flower-beds, &c. The best and most durable plant for this use is box, which, if well planted and rightly managed, will continue in strength and beauty for many years. The seasons for planting are the autumn, and very early in the spring; and the best species for this purpose is the dwarf Dutch box.

EDHILING, Edhilingus, an ancient appellation of the nobility among the Anglo-Saxons. The Saxon nation, says Nithard, Hist. lib. iv. is divided into three orders, or classes of people; the edhilingi, the frilingi, and the lazzi; which signify the nobility, the freemen, and the vassals or slaves. Instead of edhiling, we sometimes meet with atheling, or ætheling; which appellation was likewise given to the king's son, and the presumptive heir of the crown. See ATHELING.

E'DIBLE. *a.* (from *edo*, Latin.) Fit to be eaten; fit for food (*More*).

E'DICT. *s.* (*edictum*, Lat.) A proclamation of command or prohibition (*Addison*).

EDICT, in matters of polity, an order or instrument, signed and sealed by a prince, to serve as a law to his subjects. We find frequent mention of the edicts of the prætor, the ordinances of that officer in the Roman law. In the French law, the edicts are of several kinds; some importing a new law or regulation; others, the erection of new offices, establishments of duties, rents, &c. and sometimes articles of pacification. In France, edicts are much the same as a proclamation is with us, but with this difference, that the former have the authority of a law in themselves, from the power which issues them forth; whereas the latter are only declarations of a law, to which they refer, and have no power in themselves.

Edicts can have no room in Britain, because that the enacting of laws is lodged in the parliament, and not in the king.

Edicts are all sealed with green wax, to shew that they are perpetual and irrevocable.

EDIFICA'TION. *s.* (*ædificatio*, Latin.) 1. The act of building up man in the faith; improvement in holiness (*Taylor*). 2. Improvement; instruction (*Addison*).

E'DIFICE. *s.* (*ædificium*, Lat.) A fabric; a building; a structure (*Bentley*).

E'DIFIER. *s.* (from *edify*.) One that improves or instructs another.

To E'DIFY. *v. n.* (*edifico*, Latin.) 1. To build (*Chapman*). 2. To instruct; to improve (*Hooker*). 3. To teach; to persuade: obsolete (*Bacon*).

E'DILE. *s.* (*ædilis*, Latin.) The title of a magistrate in old Rome (*Shakspeare*).

EDINBURGH, the capital of Scotland, situated in a county of the same name, on three hills, or ridges, which run from E. to W. in a direction almost parallel. On the middle ridge, which is narrow and steep, stands the Old Town. The North Town is seated on an elevated plain, gently sloping on every side; and the S. part of the city stands also on a similar sloping eminence. The situation of the Old Town is very peculiar and striking. A fine street, a mile in length, and generally ninety feet broad, extends from the castle on the W. summit of the hill, to Holyrood House. It is called the High Street. On each side of this steep hill, the houses form narrow lanes, which are called closes, and extend N. and S. Many of them are very lofty, but so crowded, and as it were piled upon each other, that they are far from being distinguished either for elegance or cleanliness. The form of the Old Town resembles that of a turtle; the castle being the head; the High Street, the ridge of the back; the closes, the shelving sides; and Holyrood House, the tail. On each side of this hill was once a lake. The S. valley, drained of its waters, is occupied by Cowgate Street. The N. valley is also drained; but a disagreeable morass remains, which is still called the N. Loch. The ancient castle (the origin of which no historian can trace) is seated on a high, craggy, and precipitous rock, with a drawbridge on the only side that is accessible. In former times, therefore, it was deemed impregnable. The visitors to this castle are here shewn the apartment in which was born James VI. of Scotland, afterwards James I. of England. On the S. side of the High Street is the ancient church of St. Giles, a fine Gothic structure, which has four churches under its roof. Near this is the building in which the Scotch parliaments were usually convened. It is now occupied by the courts of justice; and its magnificent lofty hall merits particular attention. The palace of Holyrood House forms a grand quadrangle, with a court in the centre surrounded by piazzas. The N.W. towers were built by James V. and the whole was completed in the reign of Charles II.

The North Town has many new squares and streets, adorned with uniform and elegant houses. The buildings of the South Town are likewise elegant and extensive, though not equal to those of the North: and the New College, began in 1789, forms a very striking object. The university of Edinburgh was founded in 1581, by queen Mary and James VI. and has risen to a very high degree of reputation. The professors have small salaries, and are classed into divinity, Hebrew, church-history, logic, Greek, humanity, mathematics, moral philosophy, natural philosophy, universal history, Scotch law, civil law, law of nature and nations, rhetoric, botany, materia medica, practice of medicine, chemistry, anatomy, midwifery, natural history, astronomy, and physiology. Most of the present professors are men of great eminence in their respective departments, as the bare mention of some of their names will prove: we adduce those of Dalzel, Leslie, Dugald Stewart, Playfair, Gregory, Hope, Monro, and Rutherford. The number of students is generally from 1000 to 1400, of whom about 400 study medicine. As a school of medicine, we may safely hazard the assertion, that no university in Europe is equal to that of Edinburgh, and this is sufficiently marked by the general resort of students in this profession, from every part of Europe. The city is governed by a lord provost, a dean of guild, a guild council, and twenty-five common-councilmen. Here are fourteen incorporated trades. The town, with N. and S. Leith, contains 82,560 inhabitants, and sends one member to the British parliament. Distance from London 378 miles. Lat. 55. 53 N. Lon. 3. 13 W.

EDINBURGHSHIRE, a county of Scotland, called also Mid-Lothian; bounded on the N. by Fifeshire, from which it is divided by the frith of Forth; on the E. by the shires of Haddington and Berwick; on the S. by that of Peebles; and on the N.W. by Lanerkshire and Linlithgow. Its length is thirty-five miles; its greatest breadth sixteen: its inhabitants amount to 122,954.

EDI'TION. *s.* (*editio*, Latin.) 1. Publication of any thing, particularly of a book (*Burnet*). 2. Republication, with revisal (*Baker*).

E'DITOR. *s.* (*editor*, Latin.) Publisher; he that revises or prepares any work for publication (*Addison*).

EDMUND I. king of England, son of Edward the Elder, succeeded his brother Ethelstan, in 941. He drove the Danes from the kingdom of Mercia, subdued Northumberland, and gave Cumberland to the king of Scotland, in consideration of his assistance. He was stabbed at a feast in Gloucestershire, by a robber, whom he had sentenced to be banished, in 948.

EDMUND II. or *Iron Side*, third son of king Ethelred, whom he succeeded in 1016; but being opposed by Canute, he agreed to a participation of the kingdom. Edmund dying the same year, Canute took the whole to himself.

To E'DUCATE. *v. a.* (*educo*, Latin.) To bring up a person; to give instruction to a person during his minority.

EDUCA'TION. *s.* The formation of manners in youth (*Johnson*). It may be otherwise defined as, that series of means by which the human understanding is gradually enlightened, and the dispositions of the human heart are formed and called forth: it occupies the period between the earliest infancy, and the time when we consider ourselves as qualified to take a part in active life.

There are few terms in the English language that convey so different an idea to different minds as that of education. Among the great majority of the middle classes of society, it means nothing more than imparting to their children the usual acquirements of reading, writing, and arithmetic, with some hopeless attempts to lay the foundations for a knowledge of the learned languages. With those employed in the active and mercantile world, it means the qualifying their sons, by habits of industry and acuteness, to avail themselves of the circumstances in which they may be placed, for the acquisition of wealth and consequence: but with those who estimate with an impartial eye the value of the blessings which life affords, the business of education is a still more important task. It is the formation of the heart to virtue, of the mind to cheerfulness, of the understanding to wisdom. It is the teaching a child to open his eyes to the circumstances by which he is surrounded; to distinguish virtue from vice; truth from falsehood; beauty from deformity; and happiness from misery; to qualify him to attribute neither more nor less than its proper importance to every acquisition and every pursuit; and instead of being borne along by the follies and the prejudices of mankind, to raise himself above them to that degree of mental eminence and moral excellence, which will enable him to judge distinctly of the value of all earthly enjoyments, and, by the strength of his own faculties, to select those, and those only, which will contribute to his temporal and eternal good.

Education, says Dr. Cogan, when developing its influence upon the passions, introduces to an intimate acquaintance with numberless objects which are totally unknown to the ignorant: and every object possesses some quality of a pleasant or unpleasant nature, proportionably multiplying or diversifying our agreeable or disagreeable sensations. With the ignorant, objects are comparatively few. Scenes before them are of no great extent; and even these are overlooked by the majority, whose years pass away in a kind of sensitive indolence, without apathy or affection.

Sometimes, however, a natural acuteness of understanding is observable among the most illiterate, accompanied with lively sensations and very strong affections; and when they are once aroused, by objects that appear interesting, their passions are most violent. What they know can alone appear important to them, and the very little they possess is their all. Their whole souls are concentrated in that which gives pleasure, and all the powers of body and mind are exerted to repel whatever gives pain. This will indicate the cause of that remarkable strength of passions and affections, both of the benevolent and malevolent kind, so observable in savage nations; and the impetuosity of character so often to be met with among the active and uninformed in every nation.

The cultivated mind, by increasing its acquaintance with innumerable subjects, will inevitably discover some pleasing quality in every object of its pursuit: of consequence, both attention and affections are divided and subdivided into innumerable ramifications; and thus, although enjoyment may upon the whole be augmented by aggregate numbers, yet each individual quality possesses but a moderate share of influence.

The young and inexperienced are generally affected by simple objects. The causes of their joy or anger, sorrow or fear, are seldom complex. As the powers of the mind are more enlarged, the affections are both more diversified, and rendered more complicated. Thus upon the perception of favours and obligations, the joy from good becomes united with gratitude to the author of that good; with love, veneration, respect, for his character; with admiration at the extent of the good, or at some peculiarity in the delicacy and liberality with which it was conferred. Experience introduces the passions of hope and fear, by teaching us the knowledge of good worth possessing, on the one hand, and the accidents to which it is liable on the other.

It is observable, farther, that the young and inexperienced, whose habits are not yet formed, and to whom every thing is new, are most apt to be influenced by the introductory emotions of surprise and wonder. This inexperience renders things and events, which are familiar to others, new and strange to them. They are prone to be in ecstasies for acquisitions and advantages comparatively trifling, and to be agitated by small or imaginary evils, because their imaginations have not been corrected by experience. But, if these passions, from more simple causes, are frequently stronger in them than in others, it is equally true that their affections are less permanent. A rapid succession of novelties, and the immense variety which increased knowledge introduces, quickly efface the preceding impression.

But the very extent of this subject enjoins brevity. A whole Encyclopædia could scarcely do it justice. The infinite diversity of pursuits which in this age engage the attentions of an awakened world, are accompanied by an equal diversity of predilections; they present an infinite variety of qualities to the inquisitive mind, which excite their correspondent emotions and affections.

The business of education comprehends much indeed. It includes the circumstances of the child in regard to local situation, and the manner in which the necessaries and conveniences of life are supplied to him; the degree of care and tenderness with which he is nursed in infancy; the examples set before him by parents, preceptors, and companions; the degree of restraint or licentiousness to which he is accustomed; the various bodily exercises, languages, arts, and sciences, which are taught him, and the method and order in which they are communicated; the arts of overcoming prejudices, of guarding against evil influences, of conquering temptations, and of governing himself; and it constantly regards, as of the greatest importance, the imbuing the mind with the principles of morality and religion.

In different periods of society, in different climates, and under different forms of government, various institutions have naturally prevailed in the education of youth; and even in every different family, the children are educated in a different manner, according to the varieties in the situation, dispositions, and abilities of the parents. The education of youth being an object of the highest importance, has not only engaged the anxious care of parents, but has likewise often attracted the notice of legislators and philosophers. Among the latter we recognise the names of some of the most illustrious. Our sublime poet Milton wrote a valuable treatise on education, as did the great Mr. Locke. But that which professes most immediately to follow nature is the treatise written by Rousseau: as we, however, are such old-fashioned moralists, as to be of opinion that many of the principles of human nature, in its present lapsed state, require rather to be corrected by education, than to be followed, we hope that none of our readers will so far follow nature, as to adopt either the system or the principles of Rousseau. Dr. Watts has also treated on education in his Improvement of the Mind; a work which merits high commendation. It was no less a moralist than Dr. Johnson, who said, "Whoever has the care of instructing others, may be charged with deficience in his duty if this book is not recommended." Of late, indeed, the subject of education has been well treated by several: at present we have in our recollection the performances of Knox, Edgeworth, Barrow, Miss Hamilton, and Miss H. More.

To EDU'CE. *v. a.* (*educo*, Lat.) To bring out; to extract (*Glanville*).

EDU'CTION. *s.* (from *educe.*) The act of bringing any thing into view.

EDU'LCORANTS. (from *edulco*, to make sweet.) The making sweet any substance, or the rendering a preparation more mild.

EDU'LCORATE. *v. a.* (from *dulcis*, Lat.) To sweeten.

EDULCORA'TION. (*absussen*, German.) This term is applied in chemistry to the process of washing out from a precipitate any excess of acid, or alkali, or compound salt, that may adhere to it. The usual way is to place the precipitate on a filter, and when nearly all the liquor has drained away from it, to fill up the filter again with clean and pure water, either hot or cold, and as soon as this has passed through, to replace it with fresh, till the last portions that drain are wholly tasteless, and produce no change on turmeric or litmus paper. This method, however, is often less effectual, and is always more tedious than the process which is had recourse to at present. When the precipitate is deposited, instead of throwing it on a filter, pour it into a large silver crucible, and boil it with some water; after this withdraw it from the fire, allow it a few minutes to subside, and draw off the clear liquor; then add fresh water to the residue, and again boil it; and proceed thus till all soluble impurities are got rid of. A single half hour thus employed will finish more work than a whole day in the common method, and the necessary loss upon the precipitate is considerably less, which is a circumstance of no small importance to the accuracy of an analysis.

EDWARD the Elder, son of Alfred the Great, succeeded his father in 900, and subdued the Danes who were settled in the north of England, and extended his dominions as far as Scotland. He died in 925. (*Watkins*).

Edward the Younger, son of Edgar the Great, king of England, born in 962, and crowned in 975. He was basely murdered by order of his stepmother Elfrida, at Corfe Castle, after a reign of three years. The church of Rome esteemed him a martyr. (*Watkins*).

Edward, king of England, called, on account of his piety, the Confessor, was the son of Ethelred. He succeeded Canute II. in 1041. He was very partial to the Normans, whom he employed and preferred rather than his own subjects, which opened the way to the Norman conquest. He conquered Macbeth, the Scottish tyrant, and reduced the Welch. He was weak enough to consult William of Normandy about the choice of a successor, which furnished that prince with a plea for invading the kingdom after the death of Edward, which happened in 1066. He rebuilt Westminster abbey, in which he was the first who was buried. He was canonized by pope Alexander III.

Edward I. king of England, surnamed Long Shanks, was son of Henry III. and born at Winchester, 1239. He was taller by the head than men generally are; and his person was well made; but his legs being rather too long, he thence obtained the name of Long Shanks. He carried on a crusade against the Saracens, where, with only ten thousand Englishmen, he struck a general panic into the infidels. He there narrowly escaped being murdered, being wounded by an assassin in the arm with a poisoned dagger; and it is said that he owed his life to the affection of Eleanor his wife, who sucked the venom out of the wound. While he was on his return from Palestine, he heard of the death of his father, which happened in 1272, and arriving in England with his queen, they were both crowned on the 19th of August, 1274. He began his reign by confirming the Magna Charta, and by making a strict enquiry into the affairs of his kingdom. He then defeated and slew Lewellyn, king of Wales, who had revolted, and afterwards summoning a parliament at Ruthen, it was there resolved that Wales should be united to England; when some of the Welsh nobles telling the king that he would never peaceably enjoy their country, till they were governed by a prince of their own nation, he sent for the queen to lie-in at Carnarvon, where being delivered of a prince, the states acknowledged him for their sovereign, and since that time the eldest sons of the kings of England have borne the title of prince of Wales. Soon after queen Eleanor dying at Grantham, in Lincolnshire, Edward erected a cross at every place where the corpse rested in the way to Westminster.

Edward then carrying his arms into Scotland, took Berwick, Dunbar, and Edinburgh; and John Baliol, their king, repairing to Edward, renewed his oath of fidelity, and put the whole kingdom in his power. But while Edward was endeavouring to recover some dominions he had lost in France by treachery, the brave William Wallace rose up in defence of his country, and having suddenly dispossessed the English of all the strong places they held, was declared regent of the kingdom; on which Edward hastily returned from France, advanced into Scotland at the head of a powerful army, and defeated Wallace, who several years after was betrayed into the hands of the English, and sent to London, where that great hero suffered the death of a traitor. Edward was seized with a dysentery, and died in the little town of Burgh, the 7th of July, 1307, in the sixty-eighth year of his age, and the thirty-fifth of his reign, and was interred in Westminster-abbey.

Edward II. king of England, was born at Carnarvon, April 25, 1284, and succeeded his father Edward I. in 1307, at twenty-three years of age. He recalled Pierce Gaveston, whom his father had banished. Then marrying Isabella, the daughter of the French king, they were both crowned at Westminster, the 24th of February, 1308. His ridiculous fondness for Gaveston occasioned innumerable disputes, till at length the barons had recourse to arms, and Gaveston was beheaded. In the mean time the Scots obtained three victories over the English, and made themselves masters of every place in Scotland. This weak prince raised the two Spencers, father and son, to the summit of power; who being banished by the parliament, the king levied an army, took some castles from the barons, and recalled his two favourites.

Some time afterwards, he invaded Scotland; but wanting provisions, he returned without striking a blow: on which Bruce, king of Scotland, pursued him to York, and, after having destroyed twenty thousand of the English, consented to a peace. The two Spencers soon incurred the general hatred; and queen Isabella flying to France with her son, the nobility sent for her; when landing, and proceeding towards London with a numerous army, the king fled into the west; she still pursued him, and he set sail for Ireland; but was driven back into Wales, and being taken, was sent prisoner to the queen. Hugh Spencer, the father, was hanged and quartered, without a trial, and the young Spencer hanged on a gallows fifty feet high.

The queen was entirely governed by Mortimer, earl of March, whom she took to her bed: and the king being obliged to resign the crown in 1327, his son Edward was proclaimed king. After which, the late sovereign was treated with the greatest indignities, and at last inhumanly murdered; for some assassins having covered him with a feather-bed, held him down, while others conveyed a horn-pipe up his body, through which they thrust a red-hot iron, and thus burnt his bowels.

Edward III. one of the greatest kings of England, was born at Windsor, November 15, 1312, and was placed on the throne on the 26th day of January, 1327, at fourteen years of age, while his father, Edward II. was living. Though a regency was appointed by the parliament, the queen and Roger Mortimer had the sole authority; and influenced by them, the young king not only renounced all pretensions to Scotland, but gave his sister in marriage to David Bruce, king of the Scots: yet afterwards becoming sensible of the queen's ill conduct, he confined her for life, and caused Mortimer, earl of March, to be hanged at Tyburn. He then broke the truce with Scotland, invaded that kingdom, and obliged king David to fly with his queen into France, when he set up Edward Baliol in his room. Edward now laid claim to France; for Charles, his mother's brother, dying, Philip of Valois had possessed himself of the kingdom, alleging the Salic law; but Edward asserted, that the Salic law, in excluding females from the succession, did not exclude their male issue, on which he grounded his title. His first campaign passed without bloodshed; but he took the title of king of France, and quartered his arms with the flors de lis, adding the motto, *Dieu et mon droit*, or, God and my right. However, in his next attempt he defeated the French fleet. He then besieged Tournay; but being called home to oppose the Scots, concluded a truce for one year, with Philip king of France. In the next campaign he ravaged all the country, up to the walls of Paris, and his son, the Black Prince of Wales, at sixteen years of age, won the glorious battle of Cressy. Six weeks after this, the queen defeated the Scots, and took king David prisoner. These memorable victories were obtained in 1346. Edward then laid siege to Calais, and having reduced it by famine, returned to England. He soon after sent the Black Prince, who, after taking several towns, totally routed the French army, commanded by king John, who had succeeded Philip; and in this glorious battle, which was fought near Poictiers, took the king, many nobles, and a multitude of private men prisoners, though the French army was six times as numerous as the English. Thus Edward had the honour of having two kings his prisoners at the same time, John of France, and David Bruce, king of Scotland. The king of Scotland, who resided at Odiham, in Hampshire, was afterwards ransomed for one hundred thousand marks; and the French king, who lived at the Savoy, agreed to pay for his ransom five hundred thousand pounds, and a considerable extent of country.

Charles, king of France, afterwards carried on a war with Edward, when the English were driven from all the places they had so nobly conquered, to which the death of the Black Prince greatly contributed.

Edward distinguished himself by instituting the order of the garter; and died at Richmond, in Surry, the 21st of June, 1377, in the fifty-sixth year of his age, and the fifty-first of his reign, and was interred in Westminster-abbey. He was succeeded by Richard II. the son of Edward the Black Prince.

Edward IV. king of England, was the son of Richard, duke of York, and disputed the crown with Henry VI. who was of the house of Lancaster. Between these two families a great number of battles were fought, with different success; but at length Edward obtained the crown, March 5, 1461, by gaining a signal victory over Henry VI. whom he forced to fly into Scotland, with Margaret of Anjou, his consort. He afterwards gained another victory over the same unhappy prince, who after his defeat, came into England in disguise, and being seized, was carried to London, with his legs tied under his horse's belly, and then confined in the Tower. The earl of Warwick, who had chiefly contributed to raise Edward to the throne, was employed by that prince to negociate a marriage for him in France, and in the mean time marrying Elizabeth, the widow of sir John Grey, with whom the earl was in love, that nobleman was so exasperated, that he raised a rebellion, in which he twice defeated the king's forces, and afterwards took his majesty prisoner, and confined him in Midleham castle; from whence he escaped, and joining lord Hastings, in Lancashire, returned to London, when another battle ensued, and Warwick being defeated, was obliged to fly into France; but soon after landing at Dartmouth with a few troops, he soon increased them to sixty thousand men; upon which Edward also raised a numerous army at Nottingham; but as his enemies were advancing, the cry of king Henry being raised in his camp, Edward fled, and escaped into Flanders. Warwick then took Henry out of the Tower, and caused him to be acknowledged king of England. But Edward afterwards returning with a small force, was received at London with acclamations of joy; and Henry was once more confined in the Tower. Edward then marched against the earl of Warwick, and routed his army in a great battle near Barnet, where the earl himself was slain, with seventeen thousand of his men.

Some time after, the queen having assembled an army, king Edward defeated her, and took her prisoner, with her son prince Edward, who was soon after massacred, in the eighteenth year of his age; and soon after, king Henry, his father, was murdered in the Tower, or, as others say, died with grief, in the fiftieth year of his age. Queen Margaret, after being four years confined, was ransomed by her father for fifty thousand crowns. Edward caused his brother, the duke of Clarence, to be drowned in a butt of sack. Edward being now at peace, spent his time in indolence and debauchery. His favourite mistress was Jane Shore. He died at Westminster, on the 9th of April, 1483, in the forty-second year of his age, and the twenty-third of his reign.

Edward V. king of England, eldest son of Edward IV. succeeded his father in 1483, at twelve years of age. He was at Ludlow when his father died; but being sent for to London, he on the fourth of May received the oaths of the principal nobility, and his uncle Richard, duke of Gloucester, was made protector of the king and kingdom. He obliged the queen to deliver up to him the duke of York, the king's brother, and sent them both to the Tower, under pretence of their waiting there till every thing was prepared for the coronation. Mean while the duke of Gloucester, by the assistance of the duke of Buckingham, sir John Shaw, lord mayor of London, and Dr. Shaw, his brother, had the two young princes declared illegitimate, and then caused himself to be acknowledged king of England; pretending to accept the crown with reluctance; though he had put to death lord Hastings for no other crime but his being warmly attached to the young king; however, as that nobleman was greatly beloved by the people, Gloucester pretended that his ambition and sorceries endangered the kingdom; the queen and Jane Shore were accused as his colleagues, and the latter was taken into custody, but was soon after released on doing penance. Sir Robert Brackenbury, lieutenant of the Tower, refusing to comply with Richard's cruel designs, he for one night only gave the command of that fortress to sir James Tyrrell, and he procured two villains, who in the dead of the night entered the chamber where the princes lay, and smothered them in bed. Thus died Edward V. after a reign of only three months.

Edward VI. king of England, and the only son of Henry VIII. and Jane Seymour, was born October 12, 1537, and ascended the throne at nine years of age, at which time he was well skilled in the Latin and French tongues, and had obtained some knowledge of the Greek, Italian, and Spanish. His person was very beautiful; he had great sweetness of temper, and was remarkable for his piety and humanity. He founded the hospitals of Christ-church, London, and St. Thomas, Southwark. He was committed to the care of sixteen persons, whom Henry had nominated regents of the kingdom, the principal of whom was the earl of Hertford, the king's uncle by the mother's side, who was soon after created duke of Somerset. The young queen of Scotland was demanded in marriage for king Edward, but the same proposal being made by France, in behalf of the dauphin, she was sent into that kingdom, on which the duke of Somerset invaded Scotland, and routed the Scots army at Musleburgh. The great power of the duke of Somerset raised him many enemies, the chief of whom was Thomas, lord Seymour; and articles of accusation being exhibited against him, he was attainted in parliament, and condemned and beheaded, without being brought to an open trial. However, the duke of Somerset himself was some time after impeached, and charged with a design to seize the king, and to imprison the earl of Warwick; for this he was condemned, and the young king being in a manner forced to sign the sentence, he was executed some time after. The earl of Warwick, now duke of Northumberland, succeeded to the earl of Somerset's power, and at length, on the king's being taken ill of the measles, married lord Guildford Dudley, his fourth son, to the lady Jane Grey, eldest daughter to the duke of Suffolk, and persuaded Edward to settle the crown on her, his sisters, Mary and Elizabeth, having been both declared illegitimate during the life-time of their father; and the prince, hoping to save the reformation from impending destruction, appointed her his successor, and soon after died at Greenwich, on the 6th of July, 1553, in the sixteenth year of his age, and the seventh of his reign.

Edward, prince of Wales, commonly called the Black Prince, from the colour of his armour. He was the eldest son of Edward III. and born in 1330. He accompanied his father to France when he was but sixteen years old, and distinguished himself there above all the warriors of his age, particularly at the battle of Cressy. He there took the standard of the king of Bohemia, embroidered with three ostrich feathers, and having this motto, *ich dien.* This he always wore, and it has continued to be the arms of the princes of Wales ever since. He also won the victory at Poictiers, where he took John, king of France, and his son prisoners, and brought them to London. This prince married the lady Joanna, daughter of Edmond, earl of Kent, brother to Edward II. a widow, by whom he had a son, who was afterwards Richard II. Edward died, to the grief of the whole nation, in 1376.

EDWARDS (George), an English ornithologist, born at Stratford, in Sussex, in 1694. He was bred to trade, but on the expiration of his apprenticeship he renounced the shop, and went abroad. In 1716 he visited Holland, and two years afterwards he went to Norway. On his return to England, he was appointed librarian of the college of physicians, where also he had apartments allotted to him. He published the History of Birds, in four vols. 4to. to which he afterwards added three volumes more, entitled, Gleanings of Natural History. He died in 1773. (*Watkins.*)

Edwards (Jonathan), the most celebrated of the American divines, was born in 1703. He entered at Yale-college, in Connecticut, in 1716, took his bachelor's degree in 1720, and his master of arts' degree in 1723. His mental powers expanded so early and so vigorously, that at the age of thirteen he read Locke's Essay on the Human Understanding; and, even then, discovered a penetration and comprehension of mind which portended his future celebrity. In August, 1722, Mr. Edwards was invited to preach to the English Presbyterians in New York; but the society being too small to maintain a minister, he left them in 1723, and the succeeding year was chosen tutor of Yale-college. In 1726 he resigned his tutorship, in consequence of an invitation from Northampton, in Connecticut, to assist Mr. Stoddard his grandfather: he continued to discharge the ministerial functions there till 1750, when he was dismissed for attempting to reform the church from some disgraceful principles and practices!

After this, Mr. Edwards employed six years in the instruction of savage Indians at Stockbridge: in this retirement he composed his most valuable works. In 1757, the trustees of the college of Prince Town, in New Jersey, chose Mr. Edwards to be the president of that seminary. He removed from Stockbridge to Prince Town, in January, 1758; where, however, he had scarcely entered upon the duties of his new office, before he fell sick of the small-pox, which terminated his highly useful and exemplary life, March 22, 1758, in the fifty-fifth year of his age.

The following is a list of president Edwards's works: 1. A Narrative of the Conversion of several hundred Souls in Northampton, New England, 1737. 2. Five Sermons on sundry Subjects, 1738. 3. Thoughts on the Revival of Religion in New England, 1742. 4. A Treatise on Religious Affections, 1746. 5. An Attempt to promote the Union of God's People, in extraordinary Prayer for the Revival of Religion. 6. The Life of Mr. David Brainard, Missionary. 7. An Enquiry into the Qualifications for Full Communion. 8. A Reply to the Rev. Mr. Williams's Answer to the Enquiry. 9. An Enquiry into the Freedom of the Will. 10. Several single Sermons. 11. The Christian Doctrine of Original Sin, was in the press when he died. Posthumous: 12. A History of Redemption, 1774; best edition, 1788. 13. His Life and eighteen Sermons, 1785.

The theological sentiments of president Edwards were highly Calvinistic; and they are often delivered in a very uncouth style. But his investigations are frequently profound, and conducted with much ability; he has, therefore, thrown much light on some very intricate subjects: so that his works, though (with one or two exceptions) not likely to continue popular among general readers, may be advantageously consulted by the theological student.

EDYSTONE. See Eddystone.

To EEK. *v. a.* (eacan, Saxon.) See Eke. 1. To make bigger by the addition of another piece. 2. To supply any deficiency (*Spenser*).

EEL, in ichthyology. See Murœna.

Eel-spear, a forked instrument, with three or four jagged teeth, used for catching eels, by striking it into the mud at the bottoms of rivers, pools, &c.

E'EN. *ad.* Contracted for *even* (*L'Estrange*).

E'FFABLE. *a.* (*effabilis*, Latin.) Utterable: that may be spoken; expressive.

To EFFA'CE. *v. a.* (*effacer*, French.) 1. To destroy any thing painted or carved. 2. To make no more legible or visible; to blot out; to strike out (*Locke*). 3. To destroy; to wear away (*Dryden*).

EFFE'CT. *s.* (*effectus*, Latin.) 1. That which is produced by an operating cause (*Addison*). 2. Consequence; event (*Addison*). 3. Purpose; meaning (*Chronicles*). 4. Consequence intended; success; advantage (*Clarendon*). 5. Completion; perfection (*Prior*). 6. Reality; not mere appearance (*Hooker*). 7. (In the plural.) Goods; moveables (*Shakspeare*).

In speaking of effects under the first of the above senses, the acute and amiable Andrew Baxter has some remarks, which from their excellency and importance demand a place here. "It is impossible (says he) that the effect should be perfecter than its cause, either in kind, or in degree. For if the effect were perfecter in degree than the cause of it, all that degree, or excess of perfection in the effect, which is not in the cause, would be really uncaused; or it would be a perfection effected, without being effected by any thing: that is, effected and not effected. And if the effect were perfecter in kind than the cause that produced it, or contained not only a greater degree of the same kind of perfection, but quite another and superior kind; then that whole species of perfection, and not any degree of it only, would be uncaused, or the effect of nothing; which is yet a greater contradiction than the former. Any one will find, by pursuing this in his own mind, that if it could be true, nothing could be false, nor nothing impossible. No man could assert a thing, which another could not justly deny. If the cause could communicate to the effect what it had not in itself, then any cause might bring to pass any effect, be the disproportion between them ever so great; nor could limits be set, where this giving away what it had not, or doing what it could not, would end. And at last, all would end in this; that in reality no cause was necessary to produce any effect: for one part of the effect might as well exist without a cause as another. And then I suppose it would be unnecessary to philosophise farther about any thing. If it were possible that one truth could fall, or be not truth; no other truth could be trusted to: but rather all truth would fall with it; because all truth proceeds equally from the same eternal reason or mind, and is equally necessary in it. And the final result of all would be, the denying of this eternal mind itself: and then, indeed, an endless night of darkness would cover the understanding, and the difference between truth and falsehood cease for ever." (*Enquiry on the Human Soul: sect.* 5.)

To Effe'ct. *v. a.* (*efficio*, Latin.) 1. To bring to pass; to attempt with success; to achieve (*Ben Jonson*). 2. To produce as a cause (*Boyle*).

EFFE'CTIBLE. *a.* (from *effect.*) Performable; practicable; feasible (*Brown*).

EFFE'CTIVE. *a.* (from *effect.*) 1. Powerful to produce effects (*Taylor*). 2. Operative; active (*Brown*). 3. Producing effects; efficient (*Taylor*). 4. Having the power of operation; useful.

EFFE'CTIVELY. *ad.* Powerfully; with real operation (*Taylor*).

EFFE'CTLESS. *a.* (from *effect.*) Without effect; impotent; useless (*Shakspeare*).

EFFE'CTOR. *s.* (*effector*, Latin.) 1. He that produces any effect; performer. 2. Maker; creator (*Derham*).

EFFE'CTUAL. *a.* (*effectuel*, French.) 1. Productive of effects; powerful to a degree; adequate to the occasion; efficacious (*Hook.*). 2. Veracious; expressive of facts (*Shakspeare*).

EFFE'CTUALLY. *ad.* In a manner productive of the consequences intended; efficaciously (*South*).

To EFFE'CTUATE. *v. a.* (*effectuer*, Fr.) To bring to pass; to fulfil (*Sidney*).

EFFE'MINACY. *s.* (from *effeminate.*) 1. Admission of the qualities of a woman; softness; unmanly delicacy (*Milton*). 2. Lasciviousness; loose pleasure (*Taylor*).

EFFE'MINATE. *a.* (*effeminatus*, Latin.) Having the qualities of a woman; womanish; voluptuous; tender (*Milton*).

To Effe'minate. *v. a.* (*effemino*, Latin.) To make womanish; to weaken; to emasculate; to unman (*Locke*).

To Effe'minate. *v. n.* To grow womanish; to soften; to melt into weakness (*Pope*).

EFFEMINA'TION. *s.* (from *effeminate.*) The state of one grown womanish; the state of one emasculated or unmanned (*Brown*).

To EFFERVE′SCE. *v. n.* (*effervesco*, Lat.) To generate heat by intestine motion (*Mead*).

EFFERVESCENCE. (*effervescentia*, from *effervesco*, to grow hot.) A small degree of ebullition. That agitation which is produced by mixing an acid and an alkali together.

Effervescence is a rapid disengagement of gass taking place within a liquid. In consequence of this, numerous bubbles rise to the surface, forming a head of froth and bursting with a hissing noise. There is some external resemblance between effervescence and fermentation, only the latter process is much slower and more durable; hence it was, that the ancient chemists applied the term fermentation to all the phænomena which are at present denoted by effervescence, and this misapplication of the term irresistibly induced them to explain the two processes by the same theory. Hence salt of tartar, of wormwood, and in short, all the mild alkalies, as well as the several varieties of carbonated lime, were ranked as fermentable bodies, and the muriatic, nitric, and sulphuric acids, the addition of which produced in them effervescence or fermentation, were called ferments; and as in these cases the ferment was an obvious acid, so they imagined that all real ferments were also essentially acids, but with their properties masked and obtunded by mixture with mucilage, &c. The gass of effervescence is produced by single or double elective affinity; in the former case, it is for the most part carbonic acid, in the latter, it is either nitrous gass or hydrogen. It is manifest, that the gass must have little or no affinity with the fluid in which it is immersed, in order to produce effervescence; hence it is, that although carbonic and muriatic acids are both gasses, and are both extricated from their alkaline combinations by sulphuric acid, yet a solution of carbonat of potash in water shall produce a vehement effervescence with sulphuric acid, while muriat of potash in the same circumstances shall occasion none at all, the carbonic acid having little or no affinity for water acidulated by sulphuric acid, while the muriatic acid will combine with the same very readily.

EFFE′TE. *a.* (*effœtus*, Latin.) 1. Disabled from generation (*Bentley*). 2. Worn out with age (*South*).

EFFICA′CIOUS. *a.* (*efficax*, Latin.) Productive of effects; powerful to produce the consequence intended (*Philips*).

EFFICA′CIOUSLY. *ad.* Effectually (*Digby*).

E′FFICACY. *s.* (from *efficax*, Latin.) Production of the consequence intended (*Tillot.*).

EFFI′CIENCE. Effi′ciency. *s.* (from *efficio*, Latin.) The act of producing effects; agency (*South*).

EFFI′CIENT. *s.* (*efficiens*, Latin.) 1. The cause which makes effects to be what they are (*Hooker*). 2. He that makes; the effector (*Hale*). 3. A factor in multiplication (*Chambers*).

Efficient. *a.* Causing effect (*Collier*).

An efficient cause is either physical, as the fire is the efficient cause of heat; or moral, as an adviser is the cause of a murder; or universal, which in various circumstances produces various effects, as God and the sun; or particular, as a horse which produces a horse; or univocal, which produces an effect like itself, as a horse begets a horse; or equivocal, according to the old doctrine, as the sun producing a frog; or natural, which acts not only without precept in opposition to artificial, but also from within, and according to its own inclination, in opposition to violent, as fire acts when it warms; or spontaneous, as a dog eating; or voluntary and free.

To EFFI′GIATE. *v. a.* (*effigio*, Latin.) To form in semblance; to image.

EFFIGIA′TION. *s.* (from *effigiate.*) The act of imagining things or persons.

EFFI′GIES. E′ffigy. *s.* (*effigies*, Latin.) Resemblance; image in painting or sculpture; representation; idea (*Dryden*).

EFFLORESCENCE, (*efflorescentia*; from *effloresco*, to blow as a flower.) A preternatural redness of the skin. In chemistry it means that phænomenon which takes place upon crystals, producing a white powder, when exposed to air. Indeed, it is applied to two distinct phænomena, which it is of consequence to be aware of. Salts are either unalterable in the air, or they attract part of its moisture and are resolved into a fluid, or they yield part of their water of crystallization to the air, and are in consequence first superficially, and afterwards entirely, reduced to powder. This effect, at least in its commencement, is called efflorescence, and such salts are denominated efflorescent: but there is another kind of efflorescence wholly distinct from this, as when we speak of the efflorescence of iron pyrites or of new mortar; in these cases it implies the appearance of a superficial covering of minute hair-like crystals, and is occasioned by the chemical changes that take place on the surface of the substance where these crystals appear. Thus sulphuret of iron is changed by efflorescence into sulphat of iron or green vitriol: whereas sulphat of soda when subjected to the efflorescence first mentioned, although changed in form, remains the same in composition, except that it has lost part of its water. The one destroys crystals, the other produces them.

EFFLORE′SCENT. *a.* (*effloresco*, Latin.) Shooting out in form of flowers (*Woodward*).

EFFLORESCE′NTIA, is a term sometimes used by botanists, to denote the precise time of the year and month in which any plant shews its first flowers.

E′FFLUENCE. *s.* (*effluo*, Latin.) That which issues from some other principle (*Prior*).

EFFLUVIUM. (from *effluo*, to spread abroad.) In physiology, a term much used by philosophers and physicians, to express the minute particles which exhale from most, if not all, terrestrial bodies in the form of insensible vapours. Sometimes, indeed, these effluvia become visible, and are seen ascending in the form of smoke; constituting what, in animals and plants, makes the matter of perspiration.

Nothing can exceed the subtilty of the odoriferous effluvia of plants and other bodies. Mr. Boyle tells us, that having exposed to the open air a certain quantity of asafœtida, he found its weight diminished only the eighth part of a grain in six days: hence, if we suppose, that during all that time a man could smell the asafœtida at the distance of five feet, it will appear that its effluvia cannot exceed the $\frac{1}{26250000000000000}$ part of an inch in magnitude.

The effluvia of mineral substances are called steams; and when collected in mines, or other close places, damps. See Gass.

Malignant effluvia are assigned by physicians, as the cause of the plague and other contagious diseases; as the jail-distemper, hospital-fever, and the like. See Contagion and Septon.

E'FFLUX. *s.* (*effluxus*, Latin.) 1. The act of flowing out (*Harvey*.) 2. Effusion; flow (*Hammond*). 3. That which flows from something else; emanation (*Thomson*).

To Efflu'x. *v. n.* (*effluo*, Latin.) To run out; to flow away (*Boyle*).

EFFLU'XION. *s.* (*effluxum*, Latin.) 1. The act of flowing out (*Brown*). 2. That which flows out; effluvium; emanation (*Bacon*).

To EFFO'RCE. *v. a.* (*efforcer*, French.) Obsolete. 1. To break through by violence (*Spenser*). 2. To force; to ravish (*Spenser*.)

To EFFO'RM. *v. a.* (*efformo*, Latin.) To shape; to fashion (*Taylor*).

EFFORMA'TION. *s.* (from *efform*.) The act of fashioning or giving form to (*Ray*).

E'FFORT. *s.* (*effort*, French.) Struggle; vehement action; laborious endeavour (*Addison*).

EFFO'SION. *s.* (*effodio*, Latin.) The act of digging up from the ground; deterration (*Arbuthnot*).

EFFRA'IABLE. *a.* (*effroyable*, French.) Dreadful; frightful: not used (*Harvey*).

EFFRO'NTERY. *s.* (*effronterie*, French.) Impudence; shamelessness (*K. Charles*).

EFFU'LGENCE. *s.* (*effulgeo*, Latin.) Lustre; brightness; clarity; splendour (*Milton*).

EFFU'LGENT. *a.* (*effulgens*, Lat.) Shining; bright; luminous (*Blackmore*).

EFFUMABI'LITY. *s.* (*fumus*, Latin.) The quality of flying away in fumes (*Boyle*).

To EFFU'SE. *v. a.* (*effusus*, Latin.) To pour out; to spill; to shed (*Milton*).

Effu'se. *s.* (from the verb.) Waste; effusion: not used (*Shakspeare*).

EFFU'SION. *s.* (*effusio*, Latin.) 1. The act of pouring out (*Taylor*). 2. Waste; the act of shedding (*Hooker*). 3. The act of pouring out words (*Hooker*). 4. Bounteous donation (*Hammond*). 5. The thing poured out (*King Charles*).

EFFU'SIVE. *a.* (from *effuse*.) Pouring out; dispersing (*Thomson*).

E FLAT, in music, the minor seventh of F, and the second flat introduced in modulating from the natural diatonic mode.

EFT, in amphibiology. See Lacerta.

Eft. *ad.* (eꝼꞇ, Saxon.) Soon; quickly; speedily; shortly: obsolete (*Fairfax*).

E'FTSOONS. *ad.* (eꝼꞇ and ꞅoon, Saxon.) Soon afterward: obsolete (*Knolles*).

E. G. (*exempli gratia*.) For the sake of an instance or example.

EGBERT, first king of England, and last of the Saxon heptarchy. He was the nephew of king Ina, and proclaimed king of Wessex in 800. In 828 he united all the other kingdoms under him. He distinguished himself greatly against the Danes, and governed with great wisdom and moderation. He died in 838, and was succeeded by his son Ethelwolf.

EGER. See Eagre.

EGERIA, in fabulous history, a nymph of Aricia in Italy. She was courted by Numa, and according to Ovid, she became his wife. This prince frequently visited her, and that he might introduce his laws and new regulations into the state, he solemnly declared before the Roman people, that they were previously sanctified and approved by the nymph Egeria. Ovid says, that Egeria was so disconsolate at the death of Numa, that she melted into tears, and was changed into a fountain by Diana.

To EGE'ST. *v. a.* (*egero*, Latin.) To throw out food at the natural vents (*Bacon*).

EGE'STION. *s.* (*egestus*, Latin.) The act of throwing out the digested food (*Hale*).

EGG. *s.* (œʒ, Saxon.) 1. That which is laid by feathered animals, and some others, from which their young is produced (*Bacon*). 2. The spawn or sperm (*Blackmore*). 3. Any thing fashioned in the shape of an egg (*Boyle*).

To Egg. *v. a.* (*eggin*, Islandick.) To incite; to instigate (*Derham*).

Egg. (*ovum*.) The shell or external covering of the embryo or fétus of oviparous animals; for the physiological doctrine of which, see Incubation, Ovation, Conception, Physiology, and Ornithology. The eggs of poultry are chiefly used as food; the different parts are likewise employed in pharmacy and in medicine. The calcined shell is esteemed as an absorbent.

The yolk consists of two parts, the one albuminous, resembling the pure albumen or white, and hence coagulable and hardened by heat, acids, and alcohol; and the other a mild fat oil, which appears to exist in the yolk as vegetable oil in the seeds of some plants, forming a striking analogy between the eggs of animals and the seeds of vegetables; and hence, well calculated for nutriment to the young chick. This oil is often applied externally and with success to burns and chaps.

The albumen, or white of the egg, is coagulable in the same manner as the serum of the blood, but with more facility. Upon chemical analysis it possesses the common properties and results of shell, quill, and nail. When left to itself, and exposed to a moist warm air, it progressively becomes thin and putrid, and then exhibits an urinary odour.

The shell is almost entirely carbonat of lime, cemented by secreted mucus. The lime is partly the result of the food taken into the stomach; but unquestionable experiments have also proved clearly, that a part of the lime is also secreted from the animal system of the hen or other fowl. These experiments have been made with much attention by Vauquelin, and the result has been always the same.

The fæces and urine of the cock, as well as of the hen, discover a solution of carbonat of lime: and hence it is not a vulgar prejudice alone that the cock himself has occasionally laid eggs, although eggs that, of course, have never been fecundated: for it is sufficient for this purpose, that a certain quantity of glair or albumen should loiter in the rectum for some time, and that the urine laden with carbonat of lime should pass over it, and give it a covering or tunic of this substance. The yolk of the egg renders oil miscible with water, and is triturated with the same view with resinous and other substances.

Egg, an ornament in architecture, whose name arises from its form. See Echinus.

Egg-plant. See Solanum.

Egg-shaped (Ovatus). In natural history. See Ovate.

EGLANDULOUS. In botany, applied to a petiole without glands.

EGLANTINE. In botany. See Rosa.

EGMONT (Justus van), an eminent painter, born at Leyden in 1602. He resided long in France, where he was appointed painter to the king, and one of the elders of the academy of painting and sculpture. He died at Antwerp in 1674. Egmont excelled in historical subjects.

E'GOTISM. *s.* (from *ego*, Latin.) The fault committed in writing by the frequent repetition of the word *ego*, or *I*; too frequent mention of one's self (*Spectator*).

E'GOTIST. *s.* (from *ego*, Latin.) One that is always repeating the word *ego*, *I*; a talker of himself (*Spectator*).

To E'GOTIZE. *v. n.* (from *ego*, Latin.) To talk much on one's self.

EGRA, a town of Bohemia, formerly imperial. It is seated on the Eger, and famous for its mineral waters. Lat. 50. 9 N. Lon. 12. 40 E.

EGRE'GIOUS. *a.* (*egregius*, Latin, from *e* ab *ex*, out of, and *grex*, *gregis*, a flock.) 1. One selected out of many for any distinguishing property. 2. Eminent; remarkable; extraordinary (*More*). 3. Eminently bad; remarkably vitious (*Pope*).

EGRE'GIOUSLY. *ad.* (from *egregious.*) Eminently; shamefully (*Arbuthnot*).

EGREMONT, a town in Cumberland, with a market on Saturdays. It is seated near the Irish Sea. Lat. 54. 32 N. Lon. 3. 36 W.

E'GRESS. *s.* (*egressus*, Latin.) The act of going out of any place; departure (*Woodward*).

EGRE'SSION. *s.* (*egressio*, Latin.) The act of going out (*Pope*).

EGRET. From *aigrette*, the French term for the pappus, down, or feathery crown of some seeds. See Pappus.

Egret, in mastiology. See Simia.

Egret, in ornithology. See Ardea.

EGRIOT, a species of cherry. See Prunus.

EGUILLATTE, in the manage. See Yerk.

EGYPT, a country of Africa; bounded on the north by the Mediterranean, on the east by the Red Sea and the isthmus of Suez, on the south by mountains, which separate it from Nubia, and on the west by the deserts of Lybia. Its length from north to south about 500 miles, its breadth about 160. Egypt is divided into Upper and Lower, the former extending in a long and narrow valley from Syene to Grand Cairo. Two ridges of mountains form the outlines of Upper Egypt, running along each side of the Nile, till, reaching Grand Cairo, the western ridge takes its course towards Alexandria, the other towards the Red Sea; the former consists of sandy hills, the base of which is a calcareous stone, the other of stony rocks. Beyond these mountains, on each side are deserts; between them lies a long plain, whose greatest breadth is not more than nine leagues. In this valley rolls the Nile. Lower Egypt includes all the country between Cairo and the Mediterranean on the north and south; and Lybia and the isthmus of Suez to the east and west; bounded by sandy deserts, it contains slips of land fertile and well cultivated on the borders of the river and canals, and in the centre, that tract which is called Delta, formed by the branches of the Nile. Some geographers divide Egypt into three parts, Upper, Middle, and Lower. The Upper Egypt was called by the Greeks Thebais, now Said, or al Said, which extends from Syene to Manfalout; Middle Egypt, called by the Greeks Heptanomis, now Vostani; and Lower Egypt, the best part of which was the Delta, now called Bahira, or Rif. The Thebais took its name from Thebes, the capital, and once contained many more cities; the other parts of Egypt contained a great number of magnificent and populous cities. The fertility of Egypt, and the excellence of its productions and fruits, are greatly celebrated by ancient writers, and by Moses himself, who must needs have been well acquainted with this country. It abounds in grain of all sorts, but particularly rice; insomuch, that, as it was formerly the granary of Rome while subject to the Roman empire, it is now the principal country which supplies Constantinople. The most plentiful parts of Egypt are the Delta, and that province which is now called Al Fayoum, supposed to be the ancient Heracleotic name, the capital of which, bearing the same name, is thought to have been either Heracleopolis, Nilopolis, or Arsinoe, and is said by the natives to have been built by Joseph, to whom they own themselves obliged for the improvements of this territory; which being much the lowest part of Egypt, was before nothing but a standing pool, till that patriarch, by cutting canals, and particularly the great one which reaches from the Nile to the lake Mœris, drained it of the water, and clearing it of the rushes and marshy weeds rendered it fit for tillage. It is now the most fertile and best cultivated land in the whole kingdom, containing a great number of villages, and yields grapes and other fruits in abundance; and it fails not bearing even in those years when the Nile not rising to its usual height occasions a scarcity in the other parts of Egypt. There are still eighty canals, like rivers, several of which are twenty, thirty, and forty leagues in length, receiving and distributing the inundation over the country. Except six, the others are almost all filled up, and are dry when the Nile is low. The grand lakes of Mœris, Bahira, and Mareotis, were vast reservoirs to contain the superabundant waters, and afterwards disperse them among the neighbouring plains. Besides these reservoirs, all the towns a little distance from the Nile are surrounded by spacious ponds, for the convenience of the inhabitants and agriculture. Twelve hundred years has this country been subjected to a people, who, not farmers themselves, have suffered these great works to perish, and the ignorance of its present government will complete their destruction. The limits of cultivated Egypt yearly decrease, and barren sands every where accumulate. When the Turks conquered Egypt, in 1517, the lake Mareotis was near the walls of Alexandria, and the canal through which its waters ran to that city was navigable. This lake has disappeared, and the lands it watered, which, according to historians, produced corn, wine, and fruits in abundance, are become deserts, where the melancholy traveller finds neither tree, shrub, nor verdure. The very canal, the work of Alexander, necessary for the subsistence of the city he had built, is almost filled up; it is dry except when the waters are at the highest point of inundation, and soon becomes so again. Population has equally suffered: ancient Egypt supplied food to eight millions of inhabitants, and to Italy and the neighbouring provinces likewise. At present, the estimate is not one half. Seed-time differs according to the province, and the height of the ground. Near Syene, wheat and barley are sown in October, and reaped in January. About Girge, the harvest month is February, and March round Grand Cairo: such is the general progress of the harvest through the Said. There are many exceptions, according as the lands are high or low, more or less distant from the river. They sow and reap all the year in Lower Egypt, wherever they can obtain the water of the river. The land is never fallow, and yields three harvests annually; there the traveller incessantly beholds the charming prospect of flowers, fruits, and corn; and spring, summer, and autumn, at once present their treasures. Descending from the cataracts, at the beginning of January, the wheat is seen almost ripe; farther on it is in ear; and still farther the fields are green. Lucerne is mowed three times between November and March, and is the only hay of Egypt, serving chiefly to fodder the cattle. The Egyptian art of hatching chickens is peculiar to themselves. Their manner of raising bees is not less extraordinary, and bespeaks great ingenuity. Upper Egypt preserving its verdure only four or five months, the flowers and harvest being seen no longer, the people of the Lower Egypt profit by this circumstance, assembling on board large boats the bees of different villages. Each proprietor confides his hives, with his own mark, to the boatman, who, when loaded, gently proceeds up the river, and stops at every place where he finds verdure and flowers. The bees swarm from their cells at break of day and collect their nectar, returning several times loaded with booty, and, in the evening, re-enter their hives, without ever mistaking their abode. Were heat the principle of diseases, the Said would not be habitable; but it only seems to occasion a burning fever, to which the inhabitants are subject, and which they cure by regimen, drinking much water, and bathing in the river; in other respects they are strong and healthy. Old men are numerous; and many ride on horseback at eighty. The food they eat in the hot season much contributes to the preservation of their health; it is chiefly vegetables, pulse, and milk. They bathe frequently, eat little, seldom drink fermented liquors, and mix much lemon juice in their food. This abstinence preserves vigour to a very advanced age. The waters of the Nile are lighter, softer, and more agreeable to the taste than almost any other. In Lower Egypt, the neighbourhood of the sea, the large lakes, and the abundance of the waters, moderate the sun's heat, and preserve a delightful temperature. The greatest torment of the inhabitants are the gnats and musquitos, which, rising by millions out of the marshes, swarm in the air and the houses. The handkerchief must be held in the hand all day. It is the first thing a visitor receives, and at night it is necessary to sleep under musquiteros. Diseases of the eyes are the commonest in Egypt, where the blind are numerous. Eight thousand of these unfortunate people are decently maintained in the great mosque of Grand Cairo. It is from this country that the English have, within a few years, imported that dreadful disorder, the ophthalmia. The small pox is very common in Egypt, without committing great ravages. As to pulmonary diseases, which in cold countries carry off so many in the prime of youth, they are unknown in this happy climate. The unhealthy season in Egypt is from February till the end of May; the south winds blow at intervals, and load the atmosphere with a subtile dust, which makes breathing difficult, and drive before them pernicious exhalations. Sometimes the heat becomes insupportable, and the thermometer suddenly rises twelve degrees.

Egypt was governed by its own kings till Cambyses became master of it 525 years B. C. This country continued under the Persian yoke till the time of Alexander the Great, who, having conquered Persia, built the city of Alexandria. He was succeeded by Ptolemy, the son of Lagus, 324 years B. C. Ten kings of that name succeeded each other, till Cleopatra, the sister of the last Ptolemy, ascended the throne; when Egypt became a Roman province, and continued so till the reign of Omar, the second calif of the successors of Mahomet, who drove away the Romans, after it had been in their hands 700 years. When the power of the califs declined, Saladine set up the empire of the Mamlouks, which became so powerful in time, that they extended their dominions over a great part of Africa, Syria, and Arabia. Last of all, Selim, a Turkish emperor, conquered Egypt. The present population of Egypt is computed at 3,300,000. The inhabitants are composed of four different races of people; the Turks, who pretend to be masters of the country; the Arabs, who were conquered by the Turks; the Cophts, who are descended from the first Egyptians that became Christians; and the Mamlouks, who were originally Circassian or Mingrelian slaves, but being the only military force, are the real masters of the country. Of these last, M. Volney observes, that during the 550 years they have been established in Egypt, not one of them has founded a subsisting family; not one family exists in the second generation; but all their children perish in the first or second year. The method of perpetuating them is the same as that by which they were established; that is, they are kept up by slaves transported from the original country. The Russians have, therefore, rendered a very important service to the Turks, by checking the traffic of slaves in Mount Caucasus. Egypt has been, for many years, distracted by the civil wars between the different contending beys, by which its 24 provinces were governed.

The animals found in Egypt are tigers, hyenas, antelopes, apes, camels, black cattle, horses, and asses; crocodiles, once thought peculiar to this country; camelions, ichneumons, ostriches, eagles, hawks, &c.

For a description of those stupendous and almost indestructible monuments of human grandeur, the pyramids, so often taken notice of by travellers, see the article Pyramids.

EGYPTIAN PEBBLE. See Jaspis.

EGYPTIANS, or gypsies. See Gypsies.

EHRENBREITSTEIN, a very ancient fortress, in the electorate of Treves, on the E. bank of the Rhine, opposite Coblentz. It stands on the summit of a stupendous rock, not less than 800 feet above the level of the river, and has been thought, when supported by a competent garrison, to be impregnable. This fortress, however, surrendered to the French, after a long siege, and a blockade of above a year's continuance, in Feb. 1799. It has a communication with Coblentz, by subterraneous passages cut out of the solid rock, and is plentifully supplied with water from a well 280 feet deep.

EHRE'TIA. In botany, a genus of the class pentandria, order monogynia. Drupe two-celled; nuts solitary, two-celled; stigma notched. Nine species; chiefly of the West Indies, and South America: generally shrubs: but e. tinifolia, a Jamaica tree; with alternate leaves, and white terminal flowers.

EHRHARTA. In botany, a genus of the class hexandria, order digynia. Calyx, glume two-valved, one-flowered; corol, glume double, each of them two-valved, the outer one with a semilunar cavity on each side at the base for the reception of the inner one. Thirteen classes; all natives of the Cape: of these, four have lately been admitted into this genus upon the authority and elucidation of Dr. Swartz, which were heretofore more commonly ranged under the genus melica. Of these curious grasses, some species are awned, but the greater number awnless.

EIA, and Ey, in our old writers are used for an island; sometimes for water: they generally have either one or other of these senses, when they terminate a word.

To EJA'CULATE. *v. a.* (*ejaculor*, Latin.) To throw; to shoot; to dart out (*Grew*).

EJACULA'TION. *s.* (from *ejaculate.*) 1. The act of darting or throwing out (*Bacon*). 1. A short prayer darted out occasionally (*Taylor*).

EJACULATORS, in anatomy, a name applied to two muscles of the penis, from their office in the ejection of the semen.

EJA'CULATORY. *a.* (from *ejaculate.*) 1. Suddenly darted out (*Duppa*). 2. Sudden; hasty (*L'Estrange*).

To EJE'CT. *v. a.* (*ejicio, ejectum*, Latin.) 1. To throw out; to cast forth; to void (*Sandys*). 2. To throw out or expel from an office or possession (*Dryden*). 3. To expel; to drive away (*Shakspeare*). 4. To cast away; to reject (*Hooker*).

EJE'CTION. *s.* (*ejectio*, Latin.) 1. The act of casting out; expulsion (*Broome*). 2. (In physick.) The discharge of any thing by an emunctory (*Quincy*).

EJECTMENT, in law, is a mixed action, by which a lessee for years, when ousted, may recover his term and damages; it is real in respect of the lands, but personal in respect of the damages. Since the disuse of real action, this mixed proceeding is become the common method of trying the title to lands or tenements. *Runn. on Ejectments.*

The modern method of proceeding in ejectment entirely depends on a string of legal fictions; no actual lease is made; no actual entry by the plaintiff; no actual ouster by the defendant; but all are merely ideal for the sole purpose of trying the title. To this end, a lease for a term of years is stated in the proceedings to have been made by him who claims title to the plaintiff, who is generally an ideal fictitious person, who has no existence, though it ought to be a real person to answer for the defendant's costs. In this proceeding, which is the declaration (for there is no other process in this action), it is also stated, that the lessee, in consequence of the demise to him made, entered into the premises; and that the defendant, who is also now another ideal fictitious person, and who is called the casual ejector, afterwards entered thereon, and ousted the plaintiff; for which ouster the plaintiff brings this action. Under this declaration is written a notice, supposed to be written by this casual ejector, directed to the tenant in possession of the premises; in which notice the casual ejector informs the tenant of the action brought by the lessee, and assures him, that as he, the casual ejector, has no title at all to the premises, he shall make no defence, and therefore he advises the tenant to appear in court, at a certain time, and defend his own title, otherwise he, the casual ejector, will suffer judgment to be had against him, by which the actual tenant will inevitably be turned out of possession. 2. Cromp. Prac. 152.

The ancient way of proceeding was by actual sealing a lease on the premises, by the party in interest who was to try the titles; and this method is still in use in the following cases:

First, Where the house or thing for which ejectment is brought is empty. Secondly, When a corporation is lessor of the plaintiff, they must give a letter of attorney to some person to enter and seal a lease on the land; for a corporation cannot make an attorney or a bailiff except by deed, nor can they appear but by making a proper person their attorney by deed, therefore they cannot enter and demise upon the land as natural persons can. *L. Raym.* 135. Thirdly, When the several interests of the lessor of the plaintiff are not known, for in that case it is proper to seal a lease on the premises, lest they should fail in setting out in their declaration the several interests which each man possesses. Fourthly, Where the proceedings are in an inferior court, they must proceed by actually sealing a lease, because they cannot make rules confess lease, entry, and ouster, inasmuch as inferior courts have not authority to imprison for disobedience to their rules.

It is a general rule, that no person can in any case bring an ejectment, unless he has in himself at the time a right of entry: for although by the modern practice the defendant is obliged by rule of court to confess lease, entry, and ouster, yet that rule was only designed to expedite the trial of the plaintiff's right, and not to give him a right which he had not before; and therefore, when it happens that the person claiming title to the lands has no right of entry, he cannot maintain his action. 3 *Black.* 206.

The damages recovered in these actions, though formerly their only intent, are now usually (since the title has been considered as the principal question) very small and inadequate, amounting commonly to one shilling, or some other trivial sum. In order, therefore, to complete the remedy, when the possession has been long detained from him that has right, an action of trespass also lies, after a recovery in ejectment, to recover the mesne profits which the tenant in possession had wrongfully received; which action may be brought in the name of either the nominal plaintiff in the ejectment, or his lessor, against the tenant in possession, whether he is made party to the ejectment, or suffers judgment to go by default.

EIGH. *interj.* An expression of sudden delight.

EIGHT. *a.* (from the Saxon.) A number consisting of twice four.

EIGHTEEN. *a.* A number consisting of ten and eight units added together.

EIGHTEENTH. *a.* The order of a thing, either in place or succession, which is removed the distance of seventeen from the first; or twice as much or as far as the ninth.

EIGHTH. *a.* A word expressing the order in which a thing stands from the first, when it is next beyond the seventh.

Eighth, in music, an octave.

EIGHTIETH. *a.* An ordinal, implying that a thing or succession is removed eighty times, including the first.

EIGHT-PETALLED COROL, in botany, consisting of eight distinct petals. Octopetala corolla; as in mimusops. When it is only deeply divided into eight parts, it is said to be eight-cleft or octofid; (corolla octofida) as in fuchsia and chlora. We have an example of an eight-cleft calyx (calyx octofidus) in tormentilla.

Eight-score. *a.* Eight times twenty, or 160.

EIGHTY. *s.* A number consisting of eight times ten added together.

EIGNE. *a.* (*aisne*, French.) In law, the elder, or first-born; not alienable; entailed.

EILE′MA. (ειλημα; from ειλεω, to involve; q. d. involution.) Contortion or involution of the eileum or ileum: iliac passion.

EI′LEUM. (ειλεον; from ειλεω, to involve.) The ileum; so called from its many circumvolutions.

EILEUS. (from the theme above.) The same as eilema, iliac passion.

EI′SEL. *s.* (eosıl, Saxon.) Vinegar; any acid.

EISETERIA. (from εισειμα, I enter.) In antiquity, the day on which the magistrates at Athens entered upon their office.

EI′THER. *pron.* (æᵹðeꞃ, Saxon.) One or other of two persons or things indifferently. 2. Each; both (*Hale*).

Ei′ther. *ad.* A distributive adverb, answered by *or*: *either* the one *or* the other (*Bacon*).

EJULA′TION. *s.* (*ejulatio*, Lat.) Outcry; lamentation; moan; wailing (*G. of the Ton.*).

EKE. *ad.* (eac, Saxon.) Also; likewise (*Prior*).

To Eke. *v. a.* (eacan, Saxon.) 1. To increase (*Spenser*). 2. To supply; to fill up deficiencies (*Pope*). 3. To protract; to lengthen (*Shakspeare*). 4. To spin out by useless additions (*Pope*).

EKEBIRGIA, in botany, a genus of the class decandria, order monogynia. Calyx four-parted; corol five-petalled; nectary a ring surrounding the germ; berry five-seeded. One species only; a Cape tree with pinnate leaves; leaflets ovate, lanceolate, entire; panicle axillary, corymbed; pedicels and calyxes woolly.

EKLYSIS, in ancient music, a particular kind of tuning in the enharmonic genus; in which the performer dropped from a certain sound to one that was lower by three quarter tones.

EKRON, in scripture history, a city and government of the Philistines.

To ELA′BORATE. *v. a.* (*elaboro*, Latin.) 1. To produce with labour (*Young*). 2. To heighten and improve by successive endeavours or operations (*Arbuthnot*).

ELA′BORATE. *a.* (*elaboratus*, Latin.) Finished with great diligence (*Waller*).

ELA′BORATELY. *ad.* Laboriously; diligently; with great study (*Newton*).

ELABORA′TION. *s.* (from *elaborate.*) Improvement by successive operations (*Ray*).

ELÆAGNUS. Oleaster, or wild olive. In botany, a genus of the class tetrandria, order monogynia. Corolless; calyx four-cleft, campanulate, superior; drupe beneath the calyx. Ten species; one or two from the south of Europe: the rest from India. Those more frequently cultivated among ourselves are,

1. E. orientalis: with oblong, ovate, opake leaves, paler underneath, but not glossy or silvery: flowers small, yellowish in the inside, and not unpleasantly scented when fully blown.

2. E. angustifolia: with lanceolate leaves, silvery white underneath. It is sometimes a thorny tree: very beautiful both in leaves and flower, and chiefly cultivated in our gardens.

3. E. latifola: with ovate, alternate leaves, elegantly silvered, and variegated with dark-coloured spots. It is a native of Ceylon.

The last species is too tender to be exposed to the changeful climate of this country, and must therefore always be treated as a greenhouse or a stove plant. The two former species are best propagated by laying down the young shoots in autumn: in a twelvemonth after which they will take root and may be separated from the parent stock, and transplanted to the places for which they are intended.

ELÆOCARPUS, in botany, a genus of the class polyandria, order monogynia. Calyx five-leaved, or five-parted; petals five, jagged; anthers two-valved at the tip; drupe with a grooved and tubercled nut. Five species; trees of India or New Zealand: of which e. copalliferus, with leaves very entire and terminal panicle, yields the resin called Gum Copal, so frequently employed in our varnishes.

ELÆOTHESIUM, in antiquity, the same as alipterium.

To ELA′NCE. *v. a.* (*elancer*, French.) To throw out; to dart (*Prior*).

ELAPHEBOLIA, an ancient festival in honour of Diana the huntress.

ELAPHEBOLIUM, the ninth month of the Athenian year, answering to the latter part of February and beginning of March. It contained 30 days, and took its name from the festival Ebolia which was celebrated in that month.

ELAPHOBOSCUM. (*elaphoboscum*, ελαφοβοσκον; from ελαφος, a stag, and βοσκω, to eat; so called, because deer eat them greedily.) The wild parsnip. See PASTINACA.

ELAPHRUS, in zoology, a tribe of coleopterous insects belonging to the genus cicindela thus denominated by Fabricius in his entomological system. See CICINDELA.

ELASMIS. See TALC.

To ELA′PSE. *v. a.* (*elapsus*, Lat.) To pass away; to glide away (*Clarissa*).

ELA′STICAL. ELASTIC. *a.* (from ελαω.) Having the power of returning to the form from which it was distorted; springy; having the power of a spring (*Newton*).

ELASTIC BITUMEN. See BITUMEN.

ELASTIC FLUIDS. See AIR, GASS, and VAPOURS.

ELASTIC GUM. See CAOUTCHOUC.

ELASTIC PERICARP, in botany, throwing open, or casting off its valves with a spring, as in dictamnus albus. Not different from DISSILIENT; which see.

ELASTIC STRINGS, such as possess the property of restoring themselves to the figure and position which they had lost by the action of some other body upon them. Strings of catgut and of gold, brass, and silver wire, are generally denominated elastic, and indeed have the term applied to them with more propriety than any other strings we are acquainted with: on this account they are made use of in the construction of musical stringed instruments. Mathematicians have endeavoured to investigate the nature of the curve into which a vibrating elastic string would form itself at any period of its vibration. The theorem of Euler and De La Grange, in the case where the stretched string is supposed to be first at rest, is in effect this: continue the figure each way alternately on different sides of the axis, and in contrary positions; then, from any point of the curve, take an absciss each way, in the same proportion to the length of the chord as any given portion of time bears to the time of one semivibration, and the half sum of the ordinates will be the distance of that point of the string from the axis; at the expiration of the time given. Experiments have fully proved the accuracy of this construction, and the non-existence of what has been called the harmonical curve. Dr. Thomas Young, in part I. Phil. Trans. 1800, has given an entertaining account of the multifarious figures of musical strings, according to the different ways in which they are put in motion; wherein he observes, that when a string is of unequal thickness, or when it is loosely tended and forcibly inflected, the apsides and double points of the orbits have a very evident rotatory motion. The compound rotations seem to demonstrate the existence of secondary vibrations, and to account for the acute harmonic sounds which generally attend the fundamental sound. This gentleman also remarks, that, there is one fact respecting these secondary notes which seems entirely to have escaped notice. If a chord be inflected at one-half, one-third, or any other aliquot part of its length, and then suddenly left at liberty, the harmonic note which would be produced by dividing the chord at that point is entirely lost, and is not to be distinguished during any part of the continuance of the sound. This demonstrates, that the secondary notes do not depend upon any interference of the vibrations of the air with each other, nor upon any sympathetic agitation of auditory fibres, nor upon any effect of reflected sound upon the chord, but merely upon its initial figure and motion. See CHORD, HARMONICS, and STRING.

ELASTICITY, that disposition in bodies by which they endeavour to restore themselves to the posture from whence they were displaced by any external force. The principal phenomena observable in elastic bodies are: 1. That an elastic body (*i. e.* a body perfectly elastic, if any such there be) endeavours to restore itself with the same force with which it is pressed or bent. 2. An elastic body exerts its force equally towards all sides; though the effect is chiefly found on that side where the resistance is weakest, as is evident in the case of a gun exploding a ball, a bow shooting out an arrow, &c. 3. Elastic bodies, in what manner soever struck, or impelled, are inflected, and rebound after the same manner: thus a bell yields the same musical sound, in what manner or on what side soever it be struck; the same of a tense or musical chord; and a body rebounds from a plane in the same angle in which it meets or strikes it, making the angle of incidence equal to the angle of reflection, whether the intensity of the stroke be greater or less. 4. A body perfectly liquid, if any such there be, cannot be elastic, if it be allowed that its parts cannot be compressed. 5. A body perfectly solid, if any such there be, cannot be elastic; because, having no pores, it is incapable of being compressed. 6. The elastic properties of bodies seem to differ, according to their greater or less density or compactness, though not in an equal degree: thus, metals are rendered more compact and elastic by being hammered: tempered steel is much more elastic than soft steel; and the density of the former is to that of the latter as 7809 to 7738: cold condenses solid bodies, and renders them more elastic; whilst heat, that relaxes them, has the opposite effect: but, on the contrary, air, and other elastic fluids, are expanded by heat, and rendered more elastic.

Some bodies are almost perfectly elastic, that is, when their shape is changed by external pressure, and that pressure is removed, they recover their former shape completely, and they recover it with great promptitude. Glass, ivory, hard steel, are of this kind. But most bodies either do not recover it completely, or they recover it very slowly; some hardly recover it at all. A rod of iron will, when considerably bent, not nearly recover its shape; a rod of lead still less; and a rod of soft clay will hardly recover it in any degree. These, however, are but gradations of one and the same quality: if the quiescent form of a body is very little disturbed, it will recover it again. Thus, a common soft iron wire of N° 6. and 12 inches long, if twisted once round, will return completely to its original form, and will allow this to be repeated for ever; but if it be twisted 1½ turns, it will untwist only 1: and in this new form, it will twist and untwist one turn as often as we please. Even a rod of soft clay $\frac{1}{10}$th of an inch in diameter, and 7 feet long, will bear one twist as often as we please; but if twisted 4 times, will untwist itself only one turn, and will do this as often as we choose. In short, it appears that the particles of bodies, usually called unelastic, will admit a small change of distance or situation, and will recover it again, exhibiting perfect elasticity, in opposition to very small forces; but if they are forced too far from this situation, they have no tendency to return to it completely, but find intermediate situations, in which they have the very same connections with the surrounding particles; and in this new situation, they can again exhibit the same perfect elasticity, in opposition to very small forces. Mr. Coulomb conceives such bodies to consist of elastic particles: they manifest perfect elasticity, so long as the forces employed to change their shape do not remove the particles from their present contacts; but if they are removed from these, they slide on to other situations, where they again exhibit the same appearances.

If two bodies perfectly elastic strike one against another, there will be or remain in each the same relative velocity as before, *i. e.* they will recede with the same velocity as that with which they met. For the compressive force, or the magnitude of the stroke in any given bodies, arises from the relative velocity of those bodies, and is proportional to it; and bodies perfectly elastic will restore themselves completely to the figure they had before the shock; or, in other words, the restitutive force is equal to the compressive, and therefore must be equal to the force with which they came together, and consequently they must by elasticity recede from each other with the same velocity. Hence, taking equal times before and after the shock, the distances between the bodies will be equal: and therefore the distances of times from the common centre of gravity will, in the same times, be equal. Whence the laws of percussion of bodies perfectly elastic are easily deduced.

The cause or principle of elasticity has been variously assigned. The Cartesians account for it from the materia subtilis making an effort to pass through pores that are too narrow for it. But others, setting aside the precarious notion of a materia subtilis, account for elasticity from that great law of nature *attraction*, or the cause of the cohesion of the parts of solid and firm bodies. Thus, say they, when a hard body is struck or bent, so that the component parts are moved a little from each other, but not quite disjointed or broke off, or separated so far as to be out of the power of that attracting force whereby they cohere; they must certainly, on the cessation of the external violence, spring back to their former natural state. Others resolve elasticity into the pressure of the atmosphere: for a violent tension, or compression, though not so great as to separate the constituent particles of bodies far enough to let in any foreign matter, must yet occasion many little vacuola between the separated surfaces; so that upon the removal of the force they will close again by the pressure of the aërial fluid upon the external parts. (See ATMOSPHERE.) Lastly, others attribute the elasticity of all hard bodies to the power of resilition in the air included within them; and to make the elastic force of the air the principle of elasticity in all other bodies. But all these explications are unsatisfactory.

M. Libes, the ingenious author of the Nouveau Dictionnaire de Physique, has given at p. 341, &c. of his first volume, a new explication of the phenomena of elasticity, which depends upon the following principles:

1. The signs of elasticity suppose a compression effected, that is, an alteration in the figure of bodies produced by the mutual approach of the moleculæ: whence it results, that bodies, whose moleculæ yield with a very great facility to the slightest pressure, so as to roll one over another without changing their figure, cannot give sensible signs of elasticity. Such in general are liquids.

2. When an elastic body is compressed, some of its integrant moleculæ are brought nearer to one another, while others undergo a farther separation nearly equal to the approach of the former.

3. At the habitual degree of heat and pressure which we experience, all bodies have a volume determined by the ratio of equality, which exists between the attractive force of their particles, and the repulsive force communicated by the caloric combined with those particles.

These being granted, the re-establishment of solid bodies, after the compression, appears to be the result of the combined action of the caloric and of attraction. For in the moleculæ brought nearer by the compression, the repulsive force augments, and the attractive force likewise augments; but the augmentation of the former force exceeds that of the latter. For, at the epoch of the formation of the body, such as it existed previous to the compression, the repulsive force communicated to its moleculæ by the caloric was sufficient to give the degree of separation that was peculiar to the body: it was, therefore, superior to the attractive force until the moment when the moleculæ had become so far separated as was consistent with the natural state of the body. Whence it results, that if the particles are brought nearer together by compression, that is, if they are contracted with the caloric into a smaller space, the ratio of equality which subsisted between the attraction and the repulsion before the compression, must be destroyed in favour of the repulsion; and consequently, on the cessation of the compression, this surplus of repulsive force will act so as to separate again the moleculæ brought nearer by the compression until the equilibrium is re-established between the attraction and the repulsion: and this equilibrium can only be re-established, when the molecules have recovered the degree of separation which they had previous to the compression.

For similar reasons the attraction will predominate over the repulsion in those particles which have suffered a farther separation than is due to the natural state: it must, therefore, act to draw the particles nearer, and re-establish the equilibrium of those forces: and this equilibrium cannot be re-established until the molecules have recovered the relative distance which they had before the compression.

This theory M. Libes applies to an elastic sphere, as an ivory ball when falling upon a plane, to a plate of steel, whose extremities are brought towards each other by bending, and to the known effects of tempered metals, &c.

In explaining the elasticity of aëriform fluids, M. Libes calls in to his aid a new force. For, in this kind of substances, the repulsion having prevailed over the attraction, their particles are retained in their mutual position by the pressure of the atmosphere. But this force, it may be observed, being constant, makes no change in the results just stated: except that if the pressure be taken away, the particles of the gass will be separated from one another, until their relative distance attains a point determined by the equality between the attraction of the earth, and the repulsion of those particles.

Now since all bodies contain caloric, it may be asked how it happens that all bodies are not elastic, if caloric be the principle of elasticity? To this M. Libes replies by the following remarks:

1st. Since there is not in nature any body, either perfectly hard, or perfectly soft, there is none but what possesses some degree of elasticity.

2dly. Perceptible signs of elasticity suppose the compression effected: it is not therefore surprising, that bodies in which we cannot produce compression should not give any sign of elasticity.

3dly. Although caloric be the principle of elasticity, it does not follow that all bodies which contain caloric must exhibit this property. 1. Too much or too little caloric may equally weaken the elastic force. The different forms which distinguish the integrant moleculæ of different bodies, the different arrangement assumed by those moleculæ, according to circumstances, may be sometimes more or less favourable, at others more or less prejudicial to elasticity. 2. Soft bodies, such as butter, humid clay, &c. experience in their soft state a commencement of solution by water, which must alter the repulsive force of their moleculæ, and consequently hurt the elasticity. This is so true, that these bodies, freed from their aqueous parts, without changing their temperature yield sensible signs of elasticity.

M. Libes, instead of attempting to explain, as some would expect, why caloric is elastic, says it is not necessary to suppose it so. For it may communicate this property to other bodies without being so itself. This position he illustrates as follows: when dry bread is immersed in water, that bread becomes swoln, its particles being farther separated from one another: water, therefore, by penetrating the pores of the bread, communicates to its particles a repulsive force; yet it would be ridiculous to conclude from hence, that the moleculæ of water mutually repel one another. In like manner, when we subject a body to the action of heat, its integrant molecules are separated from one another, and acquire a repulsive force by their combination with caloric: but this phenomenon, like the preceding, probably depends upon the concourse of several attractive forces, such as that of the moleculæ of the caloric, that of the particles of the body for one another, and, lastly the reciprocal attraction of the particles of the caloric and those of the body penetrated by that fluid; whence it results that the elasticity of bodies by no means presupposes that of the caloric which has given rise to it.

Indeed, M. Libes does not regard as completely demonstrated the existence of the fluid called caloric, he assumes the hypothesis as a matter of convenience, which enables us to abridge the language of philosophical discussions, and to found upon our reasonings an analytical calculus. He next, therefore, proceeds to state his theory analytically; and deduces from his formulæ the following results among others. 1. That when we compress elastic fluids, the repulsive force becomes more powerful than the attractive, and consequently when the compression ceases, the moleculæ ought to return towards their first position. 2 That liquids and aëriform fluids have the exclusive privilege of assuming a larger volume when the pressure of the atmosphere is taken away. (*Dict. de Phys. Retrospect*, No. 8.)

Elasticity of the air. See Air and Pneumatics.

ELA′TE. *a.* (*elatus*, Latin.) Flushed, puffed up, or haughty, on account of success.

To Ela′te. *v. a.* To puff up; to make one proud with praise, prosperity, or success; to exalt or heighten.

Elate, in botany, a genus of the class monoecia, order triandria. Male; calyx three-toothed; corol three-petalled; anthers six, sessile. Female; calyx one-leafed; corol three-petalled; pistil one; stigmas three; drupe one-seeded. One species only: an Indian palm, about fourteen feet high, the nut of which is chewed by the natives as the areca or betel-leaf.

ELA′TER, in zoology, a genus of the class insecta, order coleoptera. Antennas filiform, lodged in a groove under the head and thorax terminating in an elastic spine placed in a cavity of the abdomen; by which means the body, when placed on the back, springs up and recovers its natural posture. A hundred and eighty-three species, inhabiting the four quarters of the globe; and about thirty found in our own country, most commonly in our gardens; these ar e generally of a dun, dusky, or black hue. They may be conveniently divided into the following tribes or subtribes.

A. Feelers hatchet-shaped, which includes nearly the whole.

B. Feelers clavate, the club round; which includes the Fabrician tribe parnus.

Many of these insects are phosphorescent, and are thence specifically denominated noctilucens, phosphoræus, ignitus, fulgens, &c. Of all these the noctilucens is the most curious, which is specifically distinguished by a glabrous yellow spot on the sides of the thorax. This insect affords a phosphorescent light in the night time, the streams of which are so strong that a person may see to read the smallest print by it. When placed on its back, moreover, it will spring four or five inches from the level on which it is put to recover its natural position. See Nat. Hist. Pl. LXXXVII.

ELATERIUM, in botany, a species of momordica, of the monoecia monandria class and order. Natural order of cucurbitaceæ. Essential character: Male, calyxless; corol salver-shaped. Female, calyxless; corol salver-shaped; capsule inferior, one-celled, two-valved. See Momordica.

Elaterium, in pharmacy, a violently purgative medicine, prepared from the above.

ELATINE. Water-wort. In botany, a genus of the class octandria, order tetragynia. Calyx four-leaved; petals four; capsule superior, four-celled, four-valved, many-seeded; the partitions opposite to the fissures. Two species; aquatic annuals of Europe, and one of them, e. hydropiper, with opposite leaves, common to the ditches of our own country.

Ela′tine. (*elatine*, ελατινη; from ελαττων, smaller, being the smaller species.) Fluellen. Female speedwell. Antirrhinum elatine of Linnéus. The leaves of this plant have a roughish bitter taste but no smell. It was formerly much used against scurvy and old ulcerations, but now wholly forgotten. See Antirrhinum.

ELA′TION. *s.* (from *elate.*) Haughtiness proceeding from success (*Atterbury*).

ELBE, a large river of Germany, which rises in the Mountain of the Giants, on the confines of Bohemia and Silesia. After passing by Koningsgratz, Dresden, Magdeburg, &c. it falls into the German ocean a little below the fortress of Gluckstadt.

ELBING, a town of Marienburg, in Regal Prussia. It is subject to Poland, and is 30 miles S.E. of Dantzic. Lat. 54. 9 N. Lon. 19. 35 E.

E′LBOW. *s.* (elboga, Saxon.) 1. The next joint or curvature of the arm below the shoulder (*Pope*). 2. Any flexure, or angle (*Bacon*). 3. *To be at the* Elbow. To be near (*Shakspeare*).

To E′lbow. *v. n.* (from the noun.) 1. To push with the elbow (*Dryden*). 2. To push; to drive to a distance (*Dryden*).

To E′lbow. *v. n.* To jut out in angles.

Elbow, or Cubit of a horse; the hind part of the arm that points towards the sternum.

E′LBOWCHAIR. *s.* (*elbow* and *chair.*) A chair with arms to support the elbows (*Gay*).

E′LBOWROOM. *s.* Room to stretch out the elbows; freedom from confinement (*South*).

ELCESAITES, in church-history, a sect who made their appearance in the reign of the emperor Trajan, and took their name from their leader Elcesai. The Elcesaites keep a mean between the Jews, Christians, and Pagans; they worshipped but one God, observed the Jewish sabbath, circumcision, and the other ceremonies of the law. They rejected the Pentateuch and the Prophets: nor had they more respect for the writings of the apostles, particularly those of St. Paul.

ELCOSIS. (*elcosis*, ελκωσις; from ελκος, an ulcer.) A disease attended with fetid, carious, and chronic ulcers. The term is seldom used.

ELDER TREE. See Sambucus.

Elder (Dwarf). See Sambucus.

Elder. *a.* (the comparative of *eld*, now obsolete.) One who surpasses another in years; one who is born before, or one who survives another.

E′LDERS. *s. plur.* 1. Persons whose ages give them a claim to reverence (*Sandys*). 2. Ancestors (*Pope*). 3. Those who are older than others (*Hooker*).

Elders, among the Jews, were persons of great age, experience, and wisdom: the denomination is known in the Presbyterian discipline. They are officers who, with the ministers and deacons, compose the sessions of the kirk. The elder's business is to assist the minister in visiting the congregation upon occasion, to watch over the morals of the people of his district, and to give them private reproof in case of any disorder; but if the scandal be gross, or the person obstinate, he lays the thing before the session. The elders are chosen from among the most substantial, knowing and regular people, by the session or consistory of the kirk. There is an indefinite number of elders in each parish; generally about twelve. There is a ruling elder in every session: he should be a man of spotless character, and of principal consideration and interest in his parish; he is chosen out of the kirk session: the congregation is to approve of the choice: the minister ordains him before the congregation: he may be chosen to assist in any church judicatory, and in all manner of government and discipline has an equal vote with the minister.

E′LDERSHIP. *s.* (from *elder.*) 1. Seniority; primogeniture (*Rowe*). 2. Presbytery; ecclesiastical senate (*Hooker*).

E′LDEST. *a.* (The superlative of *old.*) 1. The oldest; that has the right of primogeniture (*Shakspeare*). 2. That has lived most years (*Locke*).

ELEATIC PHILOSOPHY, among the ancients, a name given to that of the Stoics, because taught at 'Ελεα, in Latin, Velia, a town of the Lucani.

The founder of this philosophy, or of the Eleatic sect, is supposed to have been Xenophanes, who lived about the fifty-sixth Olympiad, or between five and six hundred years before Christ. This sect was divided into two parties, which may be denominated metaphysical and physical; the one rejecting, and the other approving, the appeal to fact and experiment. Of the former kind were Xenophanes, Parmenides, Melissus, and Zeno, of Elea. They are supposed to have maintained principles not very unlike those of Spinoza; they held the eternity and immutability of the world; that whatever existed was only one being; that there was neither any generation nor corruption; that this one being was immoveable and immutable, and was the true God; and whatever changes seemed to happen in the universe, they considered as mere appearances and illusions of sense. The other branch of the Eleatic sect were the atomic philosophers, who formed their system from an attention to the phenomena of nature; of these the most considerable were Leucippus, Democritus, and Protagoras. See Epicureans, and Stoics.

ELECAMPANE, in botany. See Inula.

To ELE′CT. *v. a.* (*electus*, Latin.) 1. To choose for an office or use (*Daniel*). 2. (In theology.) To select as an object of eternal mercy (*Milton*).

Ele′ct. *a.* (from the verb.) 1. Chosen; taken by preference from among others (*Shakspeare*). 2. Chosen to an office, not yet in possession (*Ayliffe*). 3. (In theology.) Chosen as an object of eternal mercy (*Hammond.*)

ELEC′TION. *s.* (*electio*, Latin.) 1. The act of choosing; choice (*Whitgift*). 2. The power of choice (*Davies*). 3. Voluntary preference (*Rogers*). 4. Discernment; distinction (*Bacon*). 5. The determination of God by which any were selected for eternal life (*Atterbury*). 6. The ceremony of a public choice (*Addison*).

There seems this difference, however, between choice and election, that election has usually a regard to a company or community, which makes the choice; whereas choice is seldom used but when a single person makes it.

Election, in British polity, is the people's choice of their representatives in parliament. (See Parliament.) In this consists the exercise of the democratical part of our constitution: for in a democracy there can be no exercise of sovereignty but by suffrage, which is the declaration of the people's will. In all democracies, therefore, it is of the utmost importance to regulate by whom, and in what manner, the suffrages are to be given. And the Athenians were so justly jealous of this prerogative, that a stranger who interfered in the assemblies of the people was punished by their laws with death; because such a man was esteemed guilty of high treason, by usurping those rights of sovereignty to which he had no title. In Britain, says Blackstone, where the people do not debate in a collective body, but by representation, the exercise of this sovereignty consists in the choice of representatives. The laws have therefore very strictly guarded against usurpation or abuse of this power, by many salutary provisions; which may be reduced to these three points, 1. The qualifications of the electors. 2. The qualifications of the elected. 3. The proceedings at elections.

1. As to the qualifications of the electors. The true reason of requiring any qualification,

with regard to property, in votes, is to exclude such persons as are in so mean a situation, that they are esteemed to have no will of their own. If these persons had votes, they would be tempted to dispose of them under some undue influence or other. This would give a great, an artful, or a wealthy man a larger share in elections than is consistent with general liberty. If it were probable that every man would give his vote freely, and without influence of any kind; then, upon the true theory and genuine principles of liberty, every member of the community, however poor, should have a vote in electing those delegates to whose charge is committed the disposal of his property, his liberty, and his life. But since that can hardly be expected in persons of indigent fortunes, or such as are under the immediate dominion of others, all popular states have been obliged to establish certain qualifications; whereby some, who are suspected to have no will of their own, are excluded from voting, in order to set other individuals, whose will may be supposed independent, more thoroughly upon a level with each other.

And this constitution of suffrages is framed upon a wiser principle with us, than either of the methods of voting, by centuries or by tribes, among the Romans. In the method by centuries, instituted by Servius Tullius, it was principally property, and not numbers, that turned the scale: in the method by tribes, gradually introduced by the tribunes of the people, numbers only were regarded, and property entirely overlooked. Hence the laws passed by the former method had usually too great a tendency to aggrandize the patricians or rich nobles: and those by the latter had too much of a levelling principle. Our constitution steers between the two extremes. Only such are entirely excluded as can have no will of their own: there is hardly a free agent to be found, but what is entitled to a vote in some place or other in the kingdom. Nor is comparative wealth, or property, entirely disregarded in elections; for though the richest man has only one vote at one place, yet, if his property be at all diffused, he has probably a right to vote at more places than one, and therefore has many representatives. This is the spirit of our constitution: not that we assert it is in fact quite so perfect as we have endeavoured to describe it; for if any alteration might be wished or suggested in the present form of parliaments, it should be in favour of a more complete representation of the people.

But to return to the qualifications; and first those of electors for knights of the shire. 1. By stat. 8 Hen. VI. c. 7. and 10 Hen. VI. c. 2. (amended by 14 Geo. III. c. 58.) the knights of the shire shall be chosen of people, whereof every man shall have freehold to the value of 40 shillings by the year within the county; which (by subsequent statutes) is to be clear of all charges and deductions, except parliamentary and parochial taxes. The knights of shires are the representatives of the landholders, or landed interest of the kingdom: their electors must therefore have estates in lands or tenements within the county represented. These estates must be freehold, that is, for term of life at least; because beneficial leases for long terms of years were not in use at the making of these statutes, and copyholders were then little better than villains, absolutely dependent upon their lords. This freehold must be of forty shillings annual value; because that sum would then, with proper industry, furnish all the necessaries of life, and render the freeholder, if he pleased, an independent man: for bishop Fleetwood, in his Chronicon Preciosum, written at the beginning of the present century, has fully proved 40 shillings in the reign of Henry VI. to have been equal to 12 pounds per annum in the reign of queen Anne; and, as the value of money is very considerably lowered since the bishop wrote, we may fairly conclude, from this and other circumstances, that what was equivalent to 12 pounds in his days, is equivalent to 20 at present. The other less important qualifications of the electors for counties in England and Wales may be collected from statutes 7 and 8 Will. III. c. 25. 10 Ann. c. 23. 2 Geo. II. c. 21. 18 Geo. II. c. 18. 31 Geo. II. c. 14. 3 Geo. III. c. 24. which direct, 2. That no person under 21 years of age shall be capable of voting for any member. This extends to all sorts of members as well for boroughs as counties; as does also the next, viz. 3. That no person convicted of perjury, or subornation of perjury, shall be capable of voting in any election. 4. That no person shall vote in right of any freehold, granted to him fraudulently to qualify him to vote. Fraudulent grants are such as contain an agreement to reconvey, or to defeat the estate granted; which agreements are made void, and the estate is absolutely vested in the person to whom it is so granted. And, to guard the better against such frauds, it is farther provided, 5. That every voter shall have been in the actual possession, or receipt of the profits, of his freehold to his own use for 12 kalendar months before; except it came to him by descent, marriage, marriage-settlement, will, or promotion to a benefice or office. 6. That no person shall vote in respect of an annuity or rent-charge, unless registered with the clerk of the peace 12 kalendar months before. 7. That in mortgaged or trust-estates, the person in possession, under the abovementioned restrictions, shall have the vote. 8. That only one person shall be admitted to vote for any one house or tenement, to prevent the splitting of freeholds. 9. That no estate shall qualify a voter, unless the estate has been assessed to some land-tax aid, at least 12 months before the election. 10. That no tenant by copy of court-roll shall be permitted to vote as a freeholder. Thus much for the electors in counties.

As for the electors of citizens and burgesses, these are supposed to be the mercantile part or trading interest of the kingdom. But as trade is of a fluctuating nature, and seldom long fixed in a place, it was formerly left to the crown to summon, *pro re nata*, the most flourishing towns to send representatives to parliament. So that as towns increased in trade, and grew populous, they were admitted to a share in the legislature. But the misfortune is, that the deserted boroughs continued to be summoned, as well as those to whom their trade and inhabitants were transferred; except a few, which petitioned to be eased of the expence, then usual, of maintaining their members; four shillings a-day being allowed for a knight of the shire, and two shillings for a citizen or burgess; which was the rate of wages established in the reign of Edward III. Hence the members for boroughs now bear above a quadruple proportion to those for counties; and the number of parliament men is increased since Fortescue's time, in the reign of Henry VI. from 300 to above 500, exclusive of those for Scotland. The universities were, in general, not empowered to send burgesses to parliament; though once, in 28 Edw. I. when a parliament was summoned to consider of the king's right to Scotland, there were issued writs, which required the university of Oxford to send up four or five, and that of Cambridge two or three, of their most discreet and learned lawyers for that purpose. But it was king James I. who indulged them with the permanent privilege to send constantly two of their own body; to serve for those students who, though useful members of the community, were neither concerned in the landed nor the trading interest; and to protect in the legislature the rights of the republic of letters. The right of election in boroughs is various, depending entirely on the several charters, customs, and constitutions of the respective places; which has occasioned infinite disputes: though now, by statute 2 Geo. II. c. 24. the right of voting for the future shall be allowed according to the last determination of the house of commons concerning it; and, by statute 3 Geo. III. c. 15, no freeman of any city or borough (other than such as claim by birth, marriage, or servitude) shall be intitled to vote therein, unless he hath been admitted to his freedom 12 kalendar months before.

2. Next, as to the qualifications of persons to be elected members of the house of commons. Some of these depend upon the law and custom of parliament, declared by the house of commons; others upon certain statutes. And from these it appears, 1. That they must not be aliens born or minors. 2. That they must not be any of the 12 judges, because they sit in the lords' house; nor of the clergy, for they sit in the convocation; nor persons attainted of treason, or felony, for they are unfit to sit any where. 3. That sheriffs of counties, and mayors and bailiffs of boroughs, are not eligible in their respective jurisdictions, as being returning officers; but that sheriffs of one county are eligible to be knights of another. 4. That, in strictness, all members ought to have been inhabitants of the places for which they are chosen; but this, having been long disregarded, was at length entirely repealed by statute 14 Geo. III. c. 58. 5. That no persons concerned in the management of any duties or taxes created since 1692, except the commissioners of the treasury, nor any of the officers following, (viz. commissioners of prizes, transports, sick and wounded, wine-licences, navy, and victualling; secretaries or receivers of prizes; comptrollers of the army-accounts; agents for regiments; governors of plantations, and their deputies; officers of Minorca or Gibraltar; officers of the excise and customs; clerks or deputies in the several offices of the treasury, exchequer, navy, victualling, admiralty, pay of the army or navy, secretaries of state, salt, stamps, appeals, wine-licences, hackney-coaches, hawkers, and pedlars), nor any persons that hold any new office under the crown created since 1705, are capable of being elected or sitting as members. 6. That no person having a pension under the crown during pleasure, or for any term of years, is capable of being elected or sitting. 7. That if any member accepts an office under the crown, except an officer in the army or navy accepting a new commission, his seat is void; but such member is capable of being re-elected. 8. That all knights of the shire shall be actual knights, or such notable esquires and gentlemen as have estates sufficient to be knights, and by no means of the degree of yeomen. This is reduced to a still greater certainty by ordaining, 9. That every knight of a shire shall have a clear estate of freehold or copyhold to the value of 600*l.* per annum, and every citizen and burgess to the value of 300*l.*: except the eldest sons of peers and of persons qualified to be knights of shires, and except the members for the two universities; which somewhat balances the ascendant which the boroughs have gained over the counties by obliging the trading interest to make choice of landed men: and of this qualification the member must make oath, and give in the particulars in writing, at the time of his taking his seat. But, subject to these standing restrictions and disqualifications, every subject of the realm is eligible of common right: though there are instances wherein persons in particular circumstances have forfeited that common right, and have been declared ineligible for that parliament, by a vote of the house of commons; or for ever, by an act of the legislature. But it was an unconstitutional prohibition, which was grounded on an ordinance of the house of lords, and inserted in the king's writs, for the parliament holden at Coventry, 6 Hen. IV. that no apprentice or other man of the law should be elected a knight for the shire therein: in return for which, our law-books and historians have branded this parliament with the name of *parliamentum indoctum*, or the lack-learning parliament; and sir Edward Coke observes with some spleen, that there was never a good law made thereat.

3. The third point, regarding elections, is the method of proceeding therein. This is also regulated by the law of parliament, and various statutes; all which we shall blend together, and extract out of them a summary ac-

count of the method of proceeding to elections.

As soon as the parliament is summoned, the lord chancellor (or if a vacancy happens during the sitting of parliament, the speaker, by order of the house, and without such order if a vacancy happens by death in the time of the recess for upwards of 20 days) sends his warrant to the clerk of the crown in chancery; who thereupon issues out writs to the sheriff of every county for the election of all the members to serve for that county, and every city and borough therein. Within three days after the receipt of this writ, the sheriff is to send his precept, under his seal, to the proper returning officers of the cities and boroughs, commanding them to elect their members; and the said returning officers are to proceed to election within eight days from the receipt of the precept, giving four days notice of the same; and to return the persons chosen, together with the precept, to the sheriff.

But elections of knights of the shire must be proceeded to by the sheriffs themselves in person, at the next county-court that shall happen after the delivery of the writ. The county-court is a court held every month or oftener by the sheriff, intended to try little causes not exceeding the value of 40*s.* in what part of the county he pleases to appoint for that purpose: but for the election of knights of the shire, it must be held at the most usual place. If the county-court falls upon the day of delivering the writ, or within six days after, the sheriff may adjourn the court and election to some other convenient time, not longer than 16 days, nor shorter than 10; but he cannot alter the place, without the consent of all the candidates: and, in all such cases, 10 days public notice must be given of the time and place of the election.

And, as it is essential to the very being of parliament that elections should be absolutely free, therefore all undue influences upon the electors are illegal, and strongly prohibited. For Mr. Locke ranks it among those breaches of trust in the executive magistrate, which, according to his notions, amount to a dissolution of the government, "if he employs the force, treasure, and offices of the society to corrupt the representatives, or openly to pre-engage the electors, and prescribe what manner of persons shall be chosen: For thus to regulate candidates and electors, and new-model the ways of election, what is it (says he) but to cut up the government by the roots, and poison the very fountain of public security?" As soon, therefore, as the time and place of election, either in counties or boroughs, are fixed, all soldiers quartered in the place are to remove, at least one day before the election, to the distance of two miles or more; and not to return till one day after the poll is ended. Riots likewise have been frequently determined to make an election void. By vote also of the house of commons, to whom alone belongs the power of determining contested elections, no lord of parliament, or lord lieutenant of a county, hath any right to interfere in the election of commoners: and, by statute, the lord warden of the cinque-ports shall not recommend any members there. If any officer of the excise, customs, stamps, or certain other branches of the revenue, presumes to intermeddle in elections, by persuading any voter or dissuading him, he forfeits 100*l.* and is disabled to hold any office. See an interesting little pamphlet by Edward Randall, esq. of Cambridge, entitled, Freedom of Election the Law of the Land.

Thus are the electors of one branch of the legislature secured from any undue influence from either of the other two, and from all external violence and compulsion. But the greatest danger is that in which themselves co-operate, by the infamous practice of bribery and corruption. To prevent which it is enacted, that no candidate shall, after the date (usually called the *teste*) of the writs, or after the vacancy, give any money or entertainment to his electors, or promise to give any, either to particular persons, or to the place in general, in order to his being elected; on pain of being incapable to serve for that place in parliament. And if any money, gift, office, employment, or reward be given, or promised to be given, to any voter, at any time, in order to influence him to give or withhold his vote, as well he that takes as he that offers such bribe forfeits 500*l.* and is for ever disabled from voting and holding any office in any corporation; unless, before conviction, he will discover some other offender of the same kind, and then he is indemnified for his own offence. The first instance that occurs of election bribery, was so early as 13 Eliz. when one Thomas Longe (being a simple man, and of small capacity to serve in parliament) acknowledged that he had given the returning officer and others of the borough for which he was chosen four pounds to be returned member, and was for that premium elected. But for this offence the borough was amerced, the member was removed, and the officer fined and imprisoned. But as this practice hath since taken much deeper and more universal root, it hath occasioned the making of these wholesome statutes; to complete the efficacy of which, there is nothing wanting but resolution and integrity to put them in strict execution.

Undue influence being thus guarded against, the election is to be proceeded to on the day appointed; the sheriff or other returning officer first taking an oath against bribery, and for the due execution of his office. The candidates likewise, if required, must swear to their qualification, and the electors in counties to theirs; and the electors both in counties and boroughs are also compellable to take the oath of abjuration, and that against bribery and corruption. And it might not be amiss, if the members elected were bound to take the latter oath as well as the former; which, in all probability, would be much more effectual than administering it only to the electors.

The election being closed, the returning officer in boroughs returns his precept to the sheriff, with the persons elected by the majority; and the sheriff returns the whole, together with the writ for the county and the knights elected thereupon, to the clerk of the crown in chancery; before the day of meeting, if it be a new parliament, or within 14 days after the election, if it be an occasional vacancy; and this under penalty of 500*l.* If the sheriff does not return such knights only as are duly elected, he forfeits, by the old statutes of Henry VI. 100*l.*; and the returning officer in boroughs, for a like false return, 40*l.*; and they are besides liable to an action, in which double damages shall be recovered, by the later statutes of king William: and any person bribing the returning officer shall also forfeit 300*l.* But the members returned by him are the sitting members, until the house of commons, upon petition, shall adjudge the return to be false and illegal. The form and manner of proceeding upon such petition are now regulated by statute 10 Geo. III. c. 16. (amended by 11 Geo. III. c. 42. and made perpetual by 14 Geo. III. c. 15.), which directs the method of choosing by lot a select committee of 15 members, who are sworn well and truly to try the same, and a true judgment to give, according to the evidence.

Election of Scots peers. See Lords.

Election is also the state of a person who is left to his own free will, to take or do either one thing or another, which he pleases. See Liberty.

Election, in theology, signifies the choice which God of his good pleasure makes of angels or men, for the objects of mercy and grace.

ELECTIONS, or Choice, in mathematics, signify the several different ways of taking any number of things proposed, either separately, or as combined in pairs, in threes, in fours, &c.; not as to the order, but only as to the number and variety of them. Thus, of the things a, b, c, d, e, &c. the elections of
one thing are $(a,)\ 1=2^1-1$,
two things are $(a, b, ab)\ 3=2^2-1$,
three things are $(a, b, c, ab, ac, bc, abc)\ 7 = 2^3-1$, &c.; and of any number, n, all the elections are 2^n-1; that is, 1 less than the power of 2 whose exponent is n, the number of single things to be chosen, either separately or in combination.

ELE'CTIVE. *a.* (from *elect.*) 1. Regulated or bestowed by choice (*Bacon*). 2. Exerting the power of choice (*Grew*).

Elective attraction, in chemistry. See Affinity.

ELE'CTIVELY. *ad.* By choice; with preference of one to another (*Grew*).

ELECTOR, a person who has a right to elect or choose another to an office, honour, &c. Elector is particularly, and by way of eminence, applied to those princes of Germany in whom lies the right of electing the emperor; being all sovereign princes, and the principal members of the empire. The electoral college, consisting of all the electors of the empire, is the most illustrious and august body in Europe. Bellarmine and Baronius attribute the institution of it to pope Gregory V. and the emperor Otho III. in the tenth century; of which opinion are the generality of historians, and particularly the canonists: however, the number of electors was unsettled, at least till the thirteenth century. In 1356 Charles IV. by the golden bull, fixed the number of electors at seven, three ecclesiastics, viz. the archbishops of Mentz, Treves, and Cologne; and four seculars, viz. the king of Bohemia, count palatine of the Rhine, duke of Saxony, and marquis of Brandenburg. In 1648, this order was changed, the duke of Bavaria being put in the place of the count palatine, who, having accepted the crown of Bohemia, was outlawed by the emperor; but being at length restored, an eighth electorate was erected for the duke of Bavaria. In 1692, a ninth electorate was created by the emperor Leopold, in favour of the duke of Hanover, of Brunswick Lunenburg.

There are now, or at least were a short time since, ten electors, viz. the king or elector of Bohemia; the elector of Bavaria, now a king also; the elector of Saxony; the elector of Brandenburg (king of Prussia); the elector of Hanover; the elector arch-chancellor of the empire, whose residence is at Ratisbon; the elector of Saltsburgh; the elector of Baden; the elector now king of Wurtemburg; and the elector of Hesse. We cannot enter into the changes that have been produced and still are producing by the present war. The object of Bonaparte has been to annihilate the high office of emperor of the Romans, and to make himself acknowledged as protector of the Rhenish confederacy in its stead.

ELE'CTORAL. *a.* (from *elector.*) Having the dignity of an elector.

ELE'CTORATE. *s.* (from *elector.*) The territory of an elector (*Addison*).

ELE'CTRE. *s.* (*electrum*, Lat.) 1. Amber; which, having the quality when warmed by friction of attracting bodies, gave to one species of attraction the name of electricity, and to the bodies that so attract the epithet *electric.* 2 A mixed metal (*Bacon*).

ELE'CTRICAL. Ele'ctric. *a.* (from *electrum.* See Electre.) 1. Attractive without magnetism; attractive by a peculiar property, supposed once to belong chiefly to amber (*Newt.*). 2. Produced by an electric body (*Bro.*).

Electric, in physics, is a term applied to those substances, in which the electric fluid can be excited, and accumulated, without transmitting it; and which are therefore called *non-conductors.* They are also called *original electrics*, and *electrics per se.*

The word is derived from ηλεκτρον, amber, one of the most observable non-conductors. To this class also belong glass, and all vitrifications, even of metals; all precious stones, of which the most transparent are the best; all resins, and resinous compositions; also sulphur, baked wood, all bituminous substances, wax, silk, cotton, all dry animal substances, as feathers, wool, hair, &c.; also paper, white sugar, and sugar-candy; likewise air, oils, chocolate, calces of metals and semimetals, the ashes of animal and vegetable substances, the rust of metals, all dry vegetable substances, and stones, of which the hardest are the bes
